High Speed Expansion Reamers

The special tough steel body of the "Peerless" High Speed Reamer lends itself to expansion to a phenomenal degree, greatly increasing the usefulness of the reamer.

No other High Speed Reamer on the market possesses this feature.

Write for catalog No. 36-K which shows twenty-four other styles of the "Peerless."

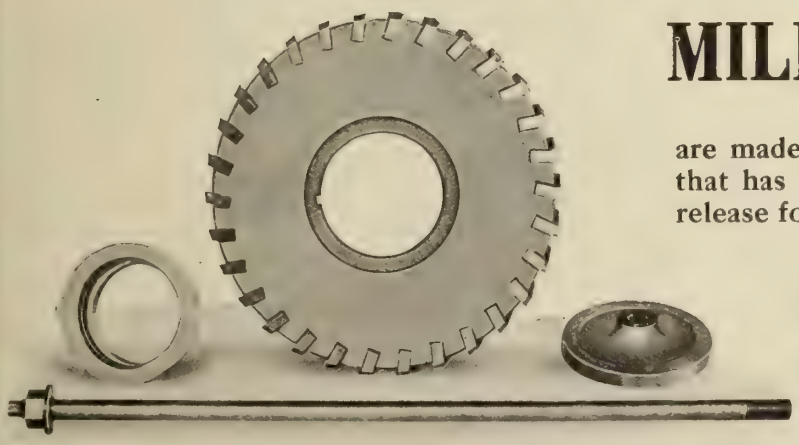
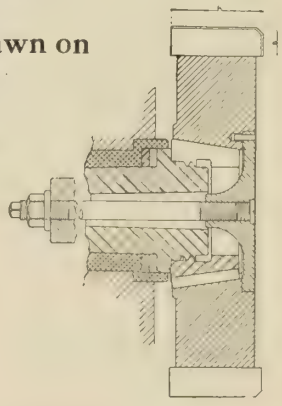
Here's a New Cutter from a New Design Providing Ready Release and Interchangeability

B. & S. INSERTED TOOTH FACE MILLING CUTTERS



are made to be drawn over a split sleeve that has a taper sufficient to provide ready release for the cutter when desired.

The Cutter is drawn on to this sleeve by a drawing-in bolt, and is held so that it will take heavy cuts.



When it is desired to use one cutter on machines of different sizes of spindles special sleeves are furnished. These sleeves are of a uniform size on the outside in order to fit the cutter, but the bores will vary so as to fit the different sp ndles.

Our new Cutter List, just issued, gives more information about these Cutters

STUDY THE CUTS

Post free to any part of the world, at published prices.

	NET PRICE s.	d.
INVENTIONS, PATENTS AND DESIGNS, with notes and the full text of the new British Patents and Designs Act, 1907. By G. Croydon Marks, M.P. 126 pages. In handsome cloth. Now offered in a **Popular Edition** at the reduced price of	2	0
Workshop Costs, for Engineers, etc., by S. and F. Pearn. 2nd Edition	12	6
How to Use Water Power (Chatley), illustrated	2	6
Modern Steam Traps (English and American) by Gordon Stewart	3	0
Sand and Clay: Their Analysis and Physical Properties, by A. Passmore	2	0
Air Compressors and Blowing Engines, by Chas. H. Innes, M.A.	4	6
The Fan; including the Theory and Practice o Centrifugal and Axial Fans, by Ch. H. Innes, M.A	4	0
The Proportions and Movement of Slide Valves, by W. D. Wansbrough	4	6
Machines and Tools Employed in the Working of Sheet Metals, by R. B. Hodgson, A.M.I.M.E.	4	6
Governors and Governing Mechanism, by Hall	4	0
Specification of a Modern Lancashire Boiler and its Seating (200 lbs. pressure), by "Inspector" M.E.	2	6
Continuous Current Dynamos and Motors and their Control, by W. R. Kelsey, B.Sc., A.I.E.E., F.Ph.S.	5	0
Notes on Construction and Working of Pumps, Marks	4	6
Modern Ironfoundry Practice, by G. R. Bale, A.M.I.C.E.		
Part I., Hand Moulding,	5	0
Part II., Machine Moulding,	3	6
Modern Gas and Oil Engines, by F. Grover, A.M.I.C.E., M.I.M.E. 4th Edition	5	0
The Indicator and its Diagrams, by Chas. Day, Wh. Sc. 4th Edition	4	6
The Chemistry of Materials of Engineering, by A. H. Sexton. 2nd Edition	5	0
The Management of Small Engineering Workshops, A. H. Barker, B.A., B.Sc., Wh. Sc., etc.	7	6
Problems in Machine Design, by C. H. Innes, M.A. 2nd Edition	4	6
Heat and Heat Engines; a Treatise on Thermo-Dynamics, by W. C. Popplewell, M.Sc.	6	0
Centrifugal Pumps, Turbines and Water Motors. By C. H. Innes, M.A. 4th Edition. Revised and enlarged	4	6
Application of Graphic Methods to the Design of Structures. 2nd Edition. W. W. F. Pullen, Wh. Sc., A.M.I.M.E.	5	0
Engineering Estimates and Cost Accounts, Burton.	3	0
Graphic Methods of Engine Design, Barker. 2nd Ed.	3	6
Injectors: Theory, Construction and Working, Pullen.	3	6
Construction of Cranes and Lifting Machinery, Marks.	3	6
Marine Engineers: Their Qualifications and Duties	5	0
A.B.C. of the Differential Calculus, Wansbrough	3	0
The Theta-Phi Diagram Applied to Steam, Gas, Oil, and Air Engines, by H. A. Golding, A.M.I.M.E.	3	0
Mechanical Engineering Materials, 2nd Ed., by Marks	2	6
The Naval Engineer and Command of the Sea, Burton	2	6
Directions for Splicing Wire Rope, by W. N. Brunlon & Son	0	7

55B CHANCERY LANE

LONDON, W.C. - - ENGLAND

Thor AIR TOOLS

ARE SUPREME

MECHANICALLY AND ECONOMICALLY.

They are easily superior to all others in power, durability, ease of handling, economy of air consumption and general efficiency. THOR TOOLS are simple in construction; they run without vibration, and little attention and repairs are necessary. ADOPTED AS THE STANDARD IN THE PRINCIPAL PLANTS THROUGHOUT THE WORLD.

SENT ON THIRTY DAYS' TRIAL—express charges paid both ways if unsatisfactory. WRITE FOR DESCRIPTIVE MATTER.

Made in 50 different sizes, covering every possible Air Tool requirement.

Exclusive Canadian Agents—H. W. PETRIE, LTD., 131 Front St. W., Toronto Cor. St. James and Little St. Antoine Sts., Montreal; 422 Abbot St., Vancouver.

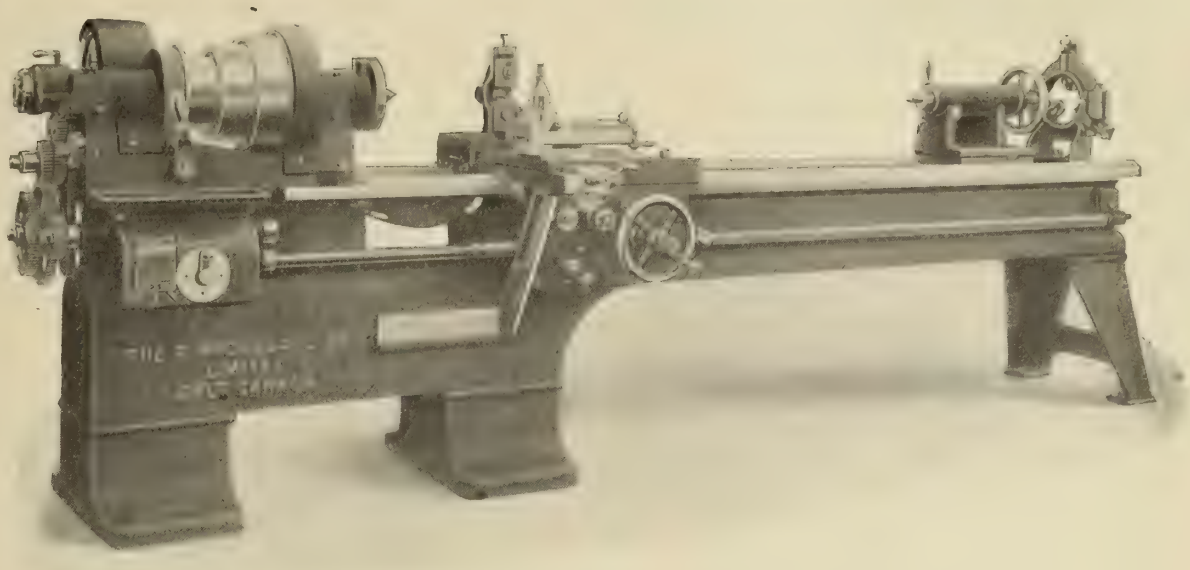
MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe-Screwing Machines



GAP LATHES—16, 18, 20, 24," in any length of Bed.

A Gap Lathe for a Jobbing Shop is an almost absolute necessary Machine Tool.

The improvements embodied in our Lathes made for absolute solidity and steadiness of cut.

The Brace under Carriage allows Gap diameters to be turned at High Speeds with resultant work as good as can be done on an Engine Lathe of large swing.

Double Back Gears give a range of Spindle Speeds which are all found useful.

Our extra large belt surfaces, combined with specially heavy spindles, ensure highest efficiency both in quantity and quality of work

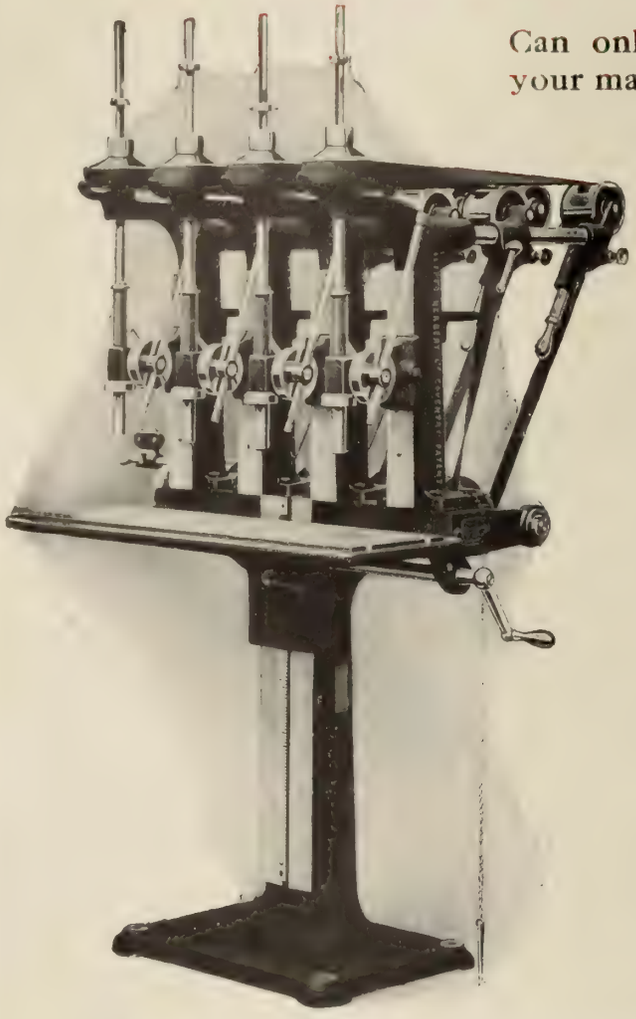
We invite the closest scrutiny of materials, workmanship and finish, and have adapted Highest Quality as standard from which we will not deviate.

Particulars, yours for the asking.

The R. McDougall Co., Limited

The Canadian Fairbanks Co., Sales Agents. GALT, CANADA

PRODUCTION AND PROFIT



Can only be obtained by the careful selection of your machine shop equipment.

Compare your drilling times with these guaranteed results obtained on the

PATENT BALL-BEARING DRILLS

1, 2, 3 or 4 Spindles

Dia. of Drill.	Revs. per minute.	Time to dril 1 in. deep.
1/4 in.	2,050	2 2/5 seconds
3/8 in.	900	3 2/5 "
1/2 in.	900	4 — "
5/8 in.	900	5 3/5 "
3/4 in.	900	6 — "
7/8 in.	900	7 1/5 "

MATERIAL { Mild Steel, 26 tons per sq. in. Tensile

Every machine completes the above test before shipment from the maker's works.

Catalogue Section "D1" tells you all about it — free on request.

Makers: ALFRED HERBERT LTD.
COVENTRY, - ENGLAND

Can be seen in stock at Canadian Sales Agents

MUSSENS LIMITED MONTREAL

We also handle a complete line of High-Class English and American Machine Tools, including:

Automatic Screw Machines, for Bar Work.
Automatic Turning Machines, for Chuck Work.
Turret, Capstan and Engine Lathes.
Horizontal, Vertical, and Universal Milling Machines.
Universal Tool and Cutter Grinders.
Vertical Boring and Turning Mills.
Planing, Shaping and Slotting Machines, etc., etc.
"VELOS" High Speed Steel and Twist Drills.

Special Steel for all purposes.

PARTICULARS SENT ON REQUEST

The John Bertram & Sons Company, Limited

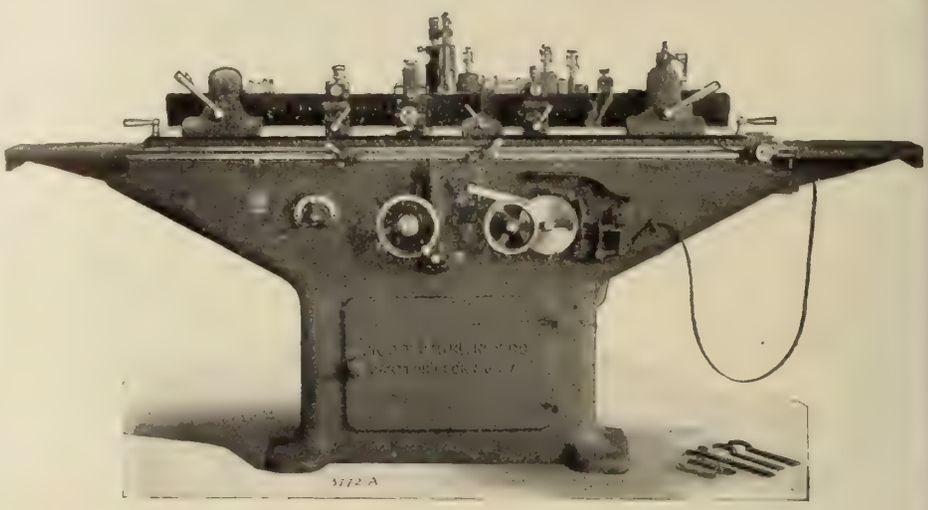
Dundas, Ontario, Canada

Sales Agents: The Canadian Fairbanks Company, Limited. Offices: Montreal, Toronto, Winnipeg, Vancouver Calgary, St. John

A Perfect Cylinder Ground Automatically

and exactly to size without any further attention than to place work in position, set sizing device to any desired size and throw in power.

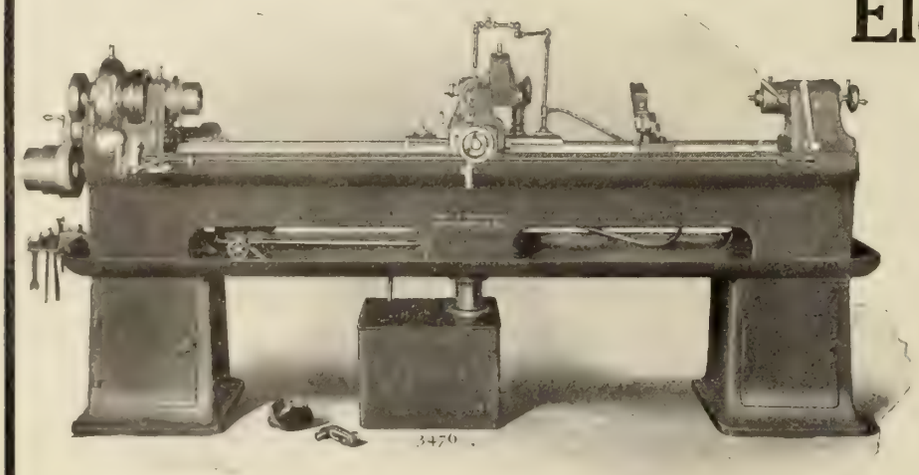
Work is first roughed down with coarse feed which automatically changes to a very fine feed to remove the last thousandth and produce the mirror finish.



Feed automatically stops after grinding to exact size

The P. & W. Automatic Sizing Grinder

From a Small Precision Screw to a Large Elevator Worm



60 x 80 in. P. & W. Thread Milling Machine. Especially for cutting Lead Screws.

There is no thread cutting operation, single or multiple, or hardly a gear cutting operation that a

P. & W. Thread Miller

cannot do, and do faster, with greater accuracy, better finish and at a lower cost than any other thread cutting machine on the market. Built in six sizes.

It will be worth your time to write for Catalog "Thread Millers"

Westinghouse Individual-Motor Drive
For Machine Tools

No progressive manufacturer can afford to disregard the advantages of individual-motor drive.

It means that machines can be equipped with motors to operate them continuously at exactly their highest producing speed, resulting in the greatest output, and, owing to the absence of shafting and belting, the friction load is practically eliminated, resulting in a marked saving in power. Other results, not to be underestimated, are the increased safety and the improved conditions in operation.

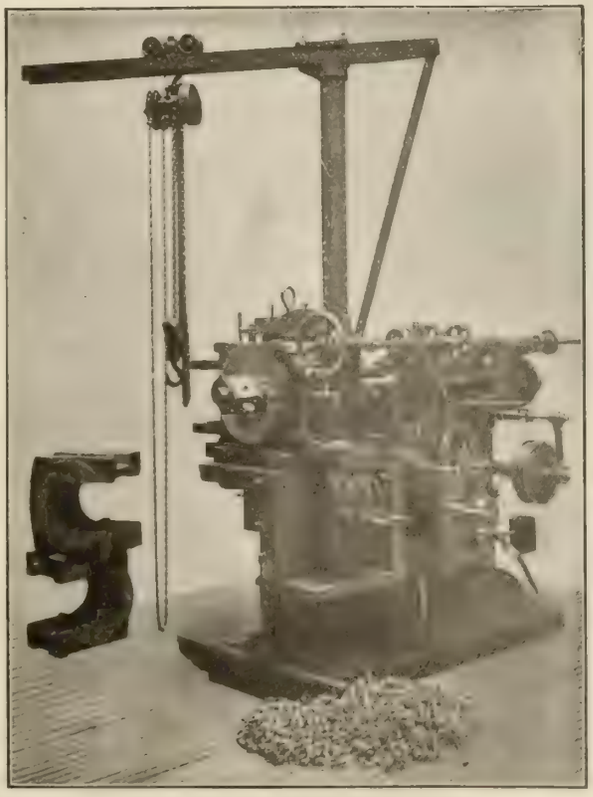
DIRT-PROOF GAS-TIGHT
BALL-BEARING
PIPE-VENTILATED
RUGGEDLY CONSTRUCTED
RELIABLE MOTOR

The compact design of our motors makes them very suitable for individual drives of all kinds. This compactness is not obtained by a sacrifice of strength or efficiency, but by good design and the use of the very best materials only. It is the result of many years' experience in the manufacture of motors and generators, and knowledge of the severe conditions machines have to work under. Whilst compact, the machines are liberally rated, and will stand up to their output and a good deal beyond it, without fear of breakdown of any kind.

The Morton Draw-Cut Railroad Shaper



This shaper will crown and plane axle boxes, plane the brass shells to fit, and plane shoes and wedges, at a saving of from 25 to 40 per cent. over ordinary methods. This machine is also equipped for doing a general line of shaper work.

This Barrel Leaks Your Money

¶ Every wooden shop barrel you have is leaking away your money. You are paying more than you used to for wooden barrels — but even when you bought them cheapest you were really losing money that you might have saved with our STEEL SHOP BARRELS.

¶ Steel Shop Barrels you'd need, cost just about what you would pay for wooden barrels used during a year. But the second and third, and maybe other, years you would buy no barrels at all. That looks like 100 a year saving, doesn't it?

¶ Besides, our Steel Shop Barrels are easier to handle, take up less room, look better, and don't fall apart when you are not expecting it or any other time.

¶ Even a small shop can save hundreds of dollars a year with our Steel Shop Barrels, Boxes, and other money-saving things for factories.

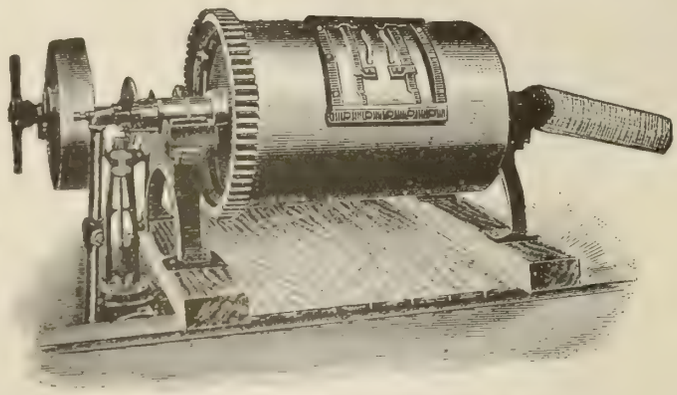
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

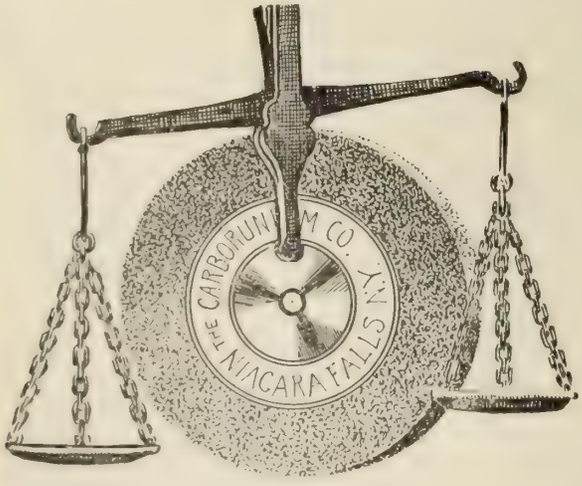
STOCK CARRIED BY

MUSSENS LIMITED, - Montreal and Winnipeg



Weigh cost against efficiency to get actual value—

Carborundum Grinding Wheels not only cut faster and cleaner—but in many instances last two or three times as long as other grinding wheels before wearing out—

The saving in cost of wheels is a big item—but an even bigger item is the saving in cost of labor—

Carborundum enables a man to do so much more work in a day that labor cost is often reduced 40 to 50 per cent.

And these two essentials to shop economy—

Decreased wheel cost—because Carborundum lasts so much longer—

Decreased labor cost—because Carborundum works so much faster—

Are the things that make the profit side of your ledger look good to you.

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our ware house in all current sizes, flat, squares and rounds; annealed and unannealed.

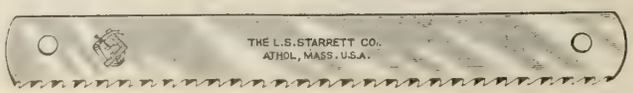
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH

HACK SAWS



These blades are made of the finest grade of steel. The teeth are sharp, with square cutting points, and evenly set. They are tempered by our improved process, which leaves them hard and tough, so that they will not "shell off." They are too hard to file. The set of the teeth is just enough to ensure a free, smooth and rapid cut, removing no more stock than is necessary.

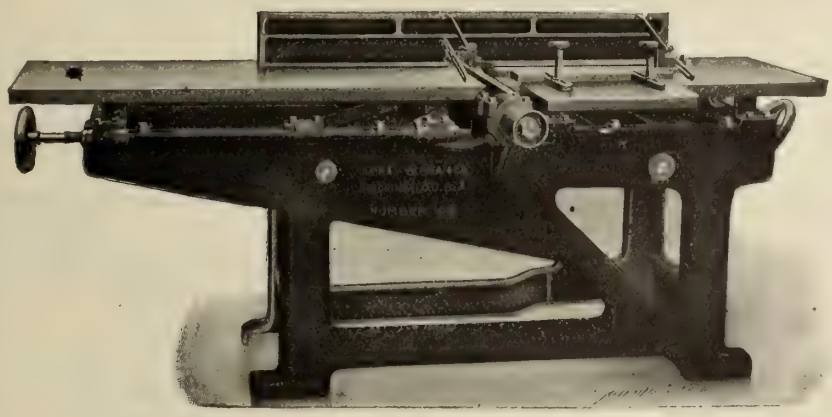
A Splendid Tool for the Pattern Shop

For over Fifty Years Fay & Egan's Line of Pattern Shop Tools have been Considered the Standard of the World.



No. 195 Hand Planer and Jointer
Capacity: 20, 24 & 30 In. widths

Their No. 195 Hand Planer and Jointer is designed especially for the Pattern Shop. It accomplishes perfectly any work to which it may be applied in the Pattern Shop, such as planing straight or out of wind, cornering, chamfering, beading, grooving, rabbeting, gaining and making plain, convex and concave glue joints.

AN ATTACHMENT FOR ANGLING THE FRONT TABLE to give the desired draft of pattern work, is a feature which appeals strongly to pattern makers.

You are invited to write for descriptive circular, sheet No. 4-H.

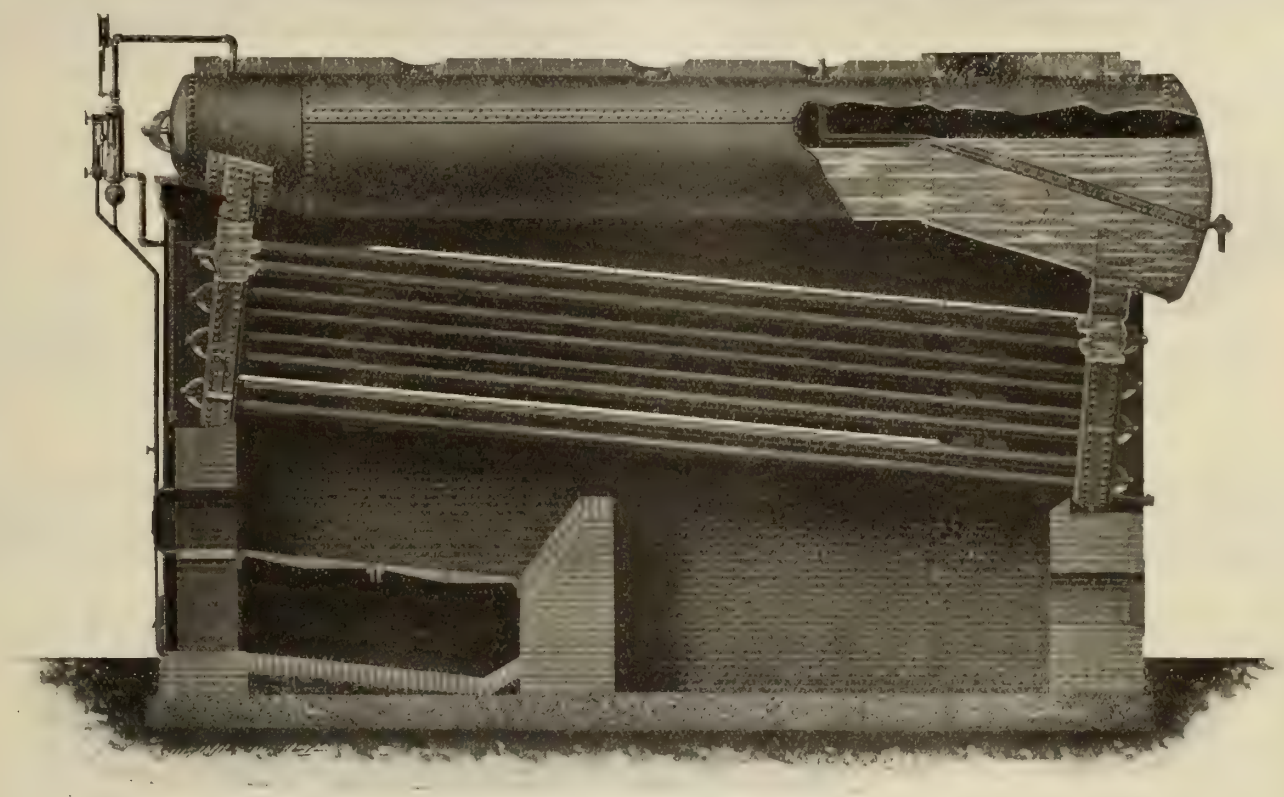
"ERIE CITY" WATER-TUBE

BOILERS

Horizontal and Vertical



The Erie City Water-Tube Boiler.

These boilers are built so as to combine *"Safety," "Durability" and "Economy."* Unless a boiler can endure reasonable, or, we may say, extreme usage for a long time without deterioration, it has within itself the elements of failure and is no longer worthy of being called a *"Safe"* Boiler. The durability of these boilers is unquestionable. They are properly designed and built in the beginning, and by the very correctness of that design are eliminated the active causes that lead boilers to fail, to give out, and to be condemned. They are constructed so as to secure the required power from the least amount of coal.

We invite an investigation of these claims. Write us for catalogue and full particulars.

The Details of a Modern Shop Management System

This System, used in Actual Practice, was Described before the National Metal Trades Association, by Frederick A. Waldron, Consulting Engineer, New York.

By Frederick A. Waldron.

PRODUCING consists of manufacturing and delivering a complete article of maximum quality in a profitable quantity with reasonable profit at lowest cost and selling price.

The ideal organization for the manufacturer is to carry it all in his head—money received in the left-hand pocket, money to be paid out in the right-hand pocket, pay in cash, then what is left is the profit, plus or minus the mental estimate of gain or loss from work in process or stock. This method eliminates non-producers, clerks, selling force, cost department, draftsmen, promotion charges, high finance, etc. Fortunately for the employed, a man's capacity is limited and where his business exceeds a certain amount it is necessary for him to unload and organize to handle large problems. How can this be done with maximum profit?

The answer in part is the subject of this paper.

I wish to discuss the phases and details of this problem, not as a mentor to those assembled but to suggest what can be done with many plants that are running on the principle of 1885 or 1886 with a few fashionable so-called system frills on the outside.

Principal Point in Shop Management

Having been asked by many of what the principal point in shop management consists, I was at a loss at first to find an answer. After analyzing in detail and by a process of elimination it boils down to "knowing where you are at." The organization and methods hereafter described will tell you this with reasonable accuracy and expense and economic results:

The symbol method localizes expenditures.

The stock cards, stores or worked materials.

The time tickets, the efficiency of men and the cost of labor and machine hours.

The payroll, the expense and classification of labor.

The operation cards, sequence of work.

The instruction cards, how to do work and what to do it with.

The route cards, location of work in shop and a means of valuation of work in process.

Time study and operation analysis establish basic conditions.

Functionalizing of duties, an increase of machine output.

Bonus for superintendent and foremen gives co-operation.

Study of weakness in shop organization and methods develops an astonishing lack of basic detail and truth, with a desire to play to the galleries, local and shop politics, on the part of many who desire to hold their jobs, combined with the following:

A. Incapacity for those in charge to give clear and explicit orders and instruct those under them.

B. Corresponding lack in those receiving orders to carry them out, spending more energy and time in thinking of some other way to do the work than doing it.

C. Too many minds for the orders to filter through before reaching the man behind the lathe.

D. Disregard of promises of completion of work in shop and the shipment of the same.

E. Lack of conception of the meaning of the words "thorough" and "complete."

F. Trying on of new ideas without knowing how to make them fit.

G. Patent medicine ideas of new systems, such as high prices, cost systems, Doolittle time system, P.T's. premium system, etc.

H. Expecting too much from managers, superintendents, and foremen and getting too little.

I. Humanity on the part of managers, superintendents and foremen in holding on to the job and protecting themselves. "Self-preservation is the first law of nature."

J. Lack of specific knowledge of capacity of speeds and feeds of machines by men and foremen.

SHOP MANAGEMENT SYSTEM.

The article by Mr. Waldron gives a clear statement of what a modern shop system *should* and *should not* be. The value of *machine hours* is pointed out and illustrations are given.

The importance of *routing* the work through the shops is shown in a way that must impress the reader. *Routing* the work is *more remunerative* than a hap-hazard way of getting the work through the shops.

K. Lack of detail, instructions and systematic methods of seeing them carried out.

L. No system of routing work through shop.

M. Extravagant and injudicious advertising.

N. Jealousy.

O. Lack of team work.

P. Too much brain work in proportion to hand work.

Q. Too much unused and useless information.

R. Overcultivation of the inventive mind in proportion to capital invested.

S. No method for the training of the workmen.

From observation and experience covering a number of years has been evolved a method of organization for industrial work which, while it is not perfect, has shown such improvement in results over the regulation methods that I believe its description would be of interest to you. There is nothing new in it, except the results, other than the co-ordinating of the best obtainable into an elastic organization which obtains the most direct results with the minimum number of forms and red tape. Thus is increased the efficiency not only of the hands, but the brains of an organization by making the brain work more complete and thorough and compelling the machines to work harder and more constantly, thereby cutting down the time elapsing between the receiving of an order and shipping of the goods, which will necessarily reduce the value of the work in process and increase the volume of output. The time which work is operated upon is oftentimes less than one-half the time that the work lies round the shop.

Data Needed for Shaping a Policy.

To gauge the management of a factory intelligently the following information is necessary:

1. Capital invested.
2. Productive and betterment labor.
3. Productive and betterment materials.
4. Expense, all kinds.
5. Average annual business, past.
6. Average annual business, estimates for future.

These facts are necessary as a guide for the most efficient policy to follow in shop management. The successful manager must know them to guide him in his work. The factory should then have the divisions as called for later and and each should have apportioned to it, as nearly as possible, the expense burden it has to carry; next an estimate or record of the amount of productive labor and materials used in these groups or sections of the divisions. We now have data on which to shape the policy for the first year and will proceed to apply the following:

1. Functionalizing duties.
2. Forming an Advisory Committee.
3. Control of expenditures.
4. Time study for piece rates.
5. Distribution of information.
6. Determination of premium or bonus.
7. Machine hours.
8. Routing.
   - a. Operation lists, stores and worked material cards.
   - b. Production orders.
   - c. Standing orders.
   - d. Instruction card and drawings.
   - e. Requisition on stores.
   - f. Time card, clocks, and production department.
   - g. Inspection ticket.
   - h. Move orders.
   - i. Route card or schedule of work.
9. Payroll.

10. Analysis sheet.
11. Accounting.
    a. Symbol sheet.
    b. Proper use of symbol sheet with analysis sheet, time tickets and requisitions.
12. Costs.
13. Tickler.
14. Bonus system for superintendents and foremen.
15. Decision as to whether goods are to be made on special order or from stock.

Nos. 1, 4, 6, 7 and 10 are the vital points of this type of organization, and concentration on these will develop the necessity of the others and show gain even if carried out in a somewhat crude and amateur manner. Time will permit me to talk on these points only.

The essential difference in this type of organization from the ordinary type is the arrangement of duties and the dividing of the technical and mechanical work from the business or hustling end of the factory more definitely than is usually done.

All designing of product and tools, issuing of lists of machines on which the work is to be done, etc., are the function of the engineering division, while the chief of the producing division pushes it along the different lines by means of the routing system, and looks ahead, anticipating where the work is to be done and that all is ready to do with at the proper time. This insures greater rapidity in the work passing through the shop.

Importance of a Routing System.

My observations in this have shown that a well arranged method for routing work through the factory with duties properly functionalized increases its productive efficiency more than any premium, piece rate or bonus system, and, given the choice of only one, I should take a logical and consistent routing system to any of the others.

Take two factories exactly alike with an oversold product—one with a good piece rate or bonus system and a happy-go-lucky routing system, the other with a day work system and a first-class routing system—there is no question in my mind as to the latter showing a greater profit than the former, while a combination of the two will show results far beyond the most sanguine expectations. A good routing system automatically results in the following :

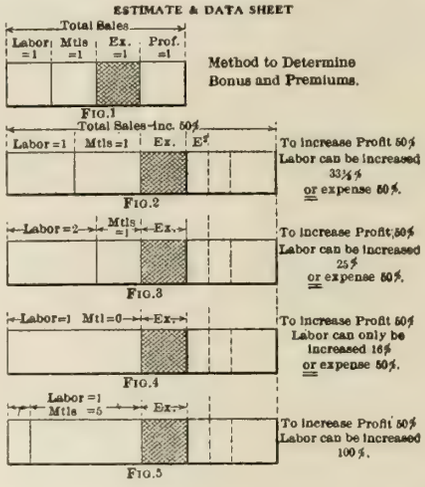
1. Gives basic cost information.
2. Locates a fall-down in output at once.
3. Locates all work and its conditions.
4. Relieves chiefs of divisions of "still hunts."
5. Compels chief and assistants to "watch out."
6. Records machine hours.
7. Insures accurate time charges.
8. Insures accurate account charges.
9. Shows up delays and their causes at once.
10. Shows work ahead for each machine and allows for rearrangement and redistribution.
11. Allows of most minute cost analysis if required ; and if not, no unnecessary expense is insured for useless information.
12. Compels closer attention to details all along the line.
13. Reduces amount of wasted energy and materials.

In conjunction with the above a tickler system is most important, and a shop can be run on this system alone better than on no system at all.

The tickler form is a 4 x 6 in. slip of paper or card, provided with a blank space for the name of the party to whom it is to be delivered, with the subject and remarks. Below is a ruled space for dates on which the card is to be returned to the party whose name is on it. These cards are collected at night from a receptacle provided at desks and distributed in a filing cabinet by date ; early the next morning all cards in folios of that date are taken out and distributed by a boy to those whose names appear on the card. This system is flexible and memoranda can be sent up and down the line. When once used, it becomes an indispensable adjunct to the factory.

Machine Hours.

The value of an accurate record of machine hours for computing costs approaches more accurately the ideal than



any other method, and is of far more importance to the factory than is generally admitted or recognized. A machine, bench or vise should carry with it its exact proportion of the overhead expenses, and it is much more important that these overhead charges should be distributed by the machine hours than charged as an aggregate per cent. to the item of labor. This is especially true where a factory operates a large variety of machines of extremely low and high valuations.

Illustration : A machine costing $10,000 would have an annual overhead charge against it for depreciation, rental, power, etc., of $1,500, based on 3,000 hours a year, or 50 cents per hour. This would be as much if not more than the hourly rate paid the man who runs it. If the machine was run 1,500 machine hours, the hourly charge would be $1.04, or double the man's time.

The universal practice of adding a certain percentage to flat labor costs for overhead charges handicaps the actual cost of the work on smaller machines and at times causes the manufacturer to discontinue making an article which shows no profit on account of its having to carry the burden of the work done on a heavier machine. The machine hour, therefore, is a very logical method for distributing the overhead factory charges.

Another advantage of the record of machine hours is the check on foremen or superintendents applying for additional machinery when it is really additional tools that are needed or a reasonable method of maintaining the tools and machinery which he already has.

The machine hours are a better criterion of the efficiency of production than any records of the man's time. It is the machine through which the work must pass and the more constantly this machine is operated in turning out work the greater the volume of output becomes. It is therefore important that in the selection of the machines they should be selected with a regard to the interchangeability of tools and fixtures. It is much better to spend a few dollars for tools and repairs than a larger amount for machinery.

There are many level-minded business men who will spend any amount of time and money for correct methods of bookkeeping involving a bank balance of a few thousand, and yet will absolutely refuse to allow a factory to use sufficient clerical help whereby the means and methods of handling investments amounting to many thousand dollars can be increased in earning power. I cannot blame them, however, as the method of obtaining, recording and compiling manufacturing data is an expensive luxury, especially when such data is very old or cold when it reaches the eyes it was intended for. I have some rolls of paper collecting dust that have never been looked at that must have cost hundreds, yes, thousands, of dollars to compile. What is required is information on the spot that costs little to obtain and can be readily filed and compiled when required.

If basic conditions as to work in the shop are right and information as to fall-down in production is caught first hand and corrected at once, the bank balance will take care of itself.

Determination of Bonus for Workmen.

The amount of premium or bonus to be paid a workman depends on the following :

Ratio of labor to material, expenses, selling price.

After assuming the amount of annual increase in business that is warranted by the condition of the market and comparing this with the producing capacity of the plant, it can then be determined from the relation of these two or to the advisability of offering additional reward to labor for increased effort. If the plant is oversold there is no question, and the amount it is oversold will form a guide for the initial calculation. Of course additional business turned out in a given time at the same price for labor and material will give you an increased profit, and from this increased profit it is to be decided what proportion can be divided between the expense and the additional rewarding of labor. Time study will then determine the basic condition in your factory and the above will serve as a guide as to how far you can afford to go. These data will also show what proportion you can afford to give to your superintendents and foremen as an additional reward for closer co-operation.

The accomkanying diagram shows graphically the application of the above, which can be modified to suit different conditions.

Divisions and Their Chiefs.

Manufacturing can be grouped into the following general divisions, all of these functions entering into the manufacture of even the simplest article :

1. Engineering.
2. Producing.
3. Inspecting.
4. Accounting.
5. Maintenance.

Full authority should centre on a works manager, who should be an official of the company. Competent chiefs should be selected for each division in cases where they will have plenty to do. If the shop is small and the product simple there can be a combination of any number or all divisions under one man. It is a very small business, however, that can afford to do too much loading up of division chiefs. The specific duties of each should then be clear and detailed.

The organization and duties being outlined, letters of instructions are issued and forwarded to those interested, so that each division may be kept in touch as to what is required of them and also that which is taking place in other divisions.

Where new products, fixtures, plant expenses or other special expenditures are required a letter of authorization is issued by the works manager to the chiefs of the divisions giving the information required.

An advisory committee composed of division chiefs should be organized and should meet at the option of the works manager to discuss matters relating to shop operation.

Engineering Division.

An engineering division in this type of organization is of paramount importance, and should have at its head an able and practical engineer of excellent executive ability and broad mechanical experience. Upon the competency of this man depends the methods of manufacturing and arranging of machinery, for the following reasons :

With a thoroughly organized engineering department, manufacturing can be carried on by grouping of machine tools of a similar character. On the other hand, if there is no engineering department, or the engineer is incompetent, manufacturing must be done by group methods by a variable class of machine tools, which involves a large original investment and duplicate of machinery in a plant and a man above the average ability and experience in charge of each group. Such men as will attain to the highest efficiency are hard to find, and the volume and quality of output cannot be obtained by this method that can be obtained by the grouping of similar tools with proper inspection. It will thus be seen that the entire economical problem of manufacture is primarily dependent on the chief of the engineering division.

Producing Division.

In this type of organization the chief of the producing division is not called upon to exercise any great ingenuity or skill on mechanical matters or detail methods of operation. These are supplied in the form of specific information by the engineering division.

The manufacturing or producing of an article commercially should not call for change of methods and operations every fifteen minutes. It should be the economical effort to turn the work out under constant pressure, a certain value for each day for every day in the year.

The instructions from the engineering department as to the routing of work, the tools to be used, the limits or toleration which are to be worked and the drawings for the work should be placed at the disposal of the chief of the producing division, his duty being to see that all hands and machines are working at the highest efficiency and every machine that is possible is kept running the maximum number of hours producing work. He should also see that there is as little delay as possible between one set of operations and the next.

The chief of the producing division, therefore, comes next in importance to the chief of the engineering division. On the latter depends the accuracy of the instructions to the chief of the producing division, or the path the work has to follow, and to the former the speed with which these instructions are carried out. In other words, the chief of the producing division should be a hustler rather than a fine mechanic or engineer.

Inspection Division.

The most sensitive and delicate division in this type of organization is the inspection division, and its chief should be a diplomat and at the same time a man with sufficient firmness in his make-up to stand back of decisions which are made under his jurisdiction. He should be able to say "No" in such a way that it will not antagonize the entire organization.

Instructions as to inspection, gauges and fixtures for testing work are given to this division by the chief of the engineering divsion, and the chief of the inspection division has to see that they are lived up to. All troubles occurring in the making or assembling of the work are referred to the chief of the inspection division, who decides as to the quality of the work, and in case of serious trouble takes the matter up with the engineering division, where it is rectified, not only in itself, but also where it may relate to the other parts of the mechanism.

This division has entire jurisdiction over the inspection of all raw materials, work in process, finished stock or materials, and tools, jigs and fixtures.

Where machine operations are many and particular, as to limits and finish, traveling inspectors should be placed in the factory, who pass on these operations before the machine foremen are allowed to proceed with the machining of any number of parts on any operation ; also checks speeds and feeds of machines. These inspectors save from three to five times their salaries in a year by bringing up the standard of work, saving of material costs, together with accumulative profits from increased output of acceptable parts.

They are of great assistance to the chief of the producing division and to the foreman, as well as increasing the volume of output by preventing extended operations on bad work.

On this division depends largely the smoothness with which the work passes through the shop and its cost, together with the grouping of work in assembling room ready for quick and accurate assembling. You will note that the operation of this division is dependent upon the judgment of the chief of the engineering division for the accuracy with which tolerations are determined and instructions given as to the quality and finish of work.

Maintenance Division.

The chief of the maintenance division, where the factory is large, should be a

good executive mechanic, with a reasonable amount of technical education. Many of the larger concerns employ a high grade engineer to supervise this division, which furnishes plans and specifications for new buildings and equipment and handles the work of new construction as well as maintenance. Many firms consider this economical. The speaker, however, is of the opinion that the practice adopted by the textile organizations of this country in having most of their construction and engineering work done by outside parties, leaving the routine work of the maintenance to one of fair executive ability, is much more economical in the long run than to have plans and specifications for buildings and their equipment prepared by themselves.

Where the organization is not large or the duties of the chief of the maintenance division are not sufficient to keep him fully occupied this division is combined with the producing division or the engineering division, preferably the latter.

Accounting Division.

The chief of the accounting division should be a man well trained in the principles of bookkeeping, a good analyst and with enough familiarity with shop methods to prevent being fooled entirely by figures. He should be systematic and a good disciplinarian, and insist upon his subordinates maintaining records to date.

With these methods a large part of the maintaining of records is automatic, and a general supervision of the accuracy of the figures and their prompt posting by his subordinates are particular qualifications. In addition to the above, he should watch the value of stock on hand, notifying the proper parties when abnormal conditions are approached and see that orders are entered or canceled as conditions require.

The instruction card is the means of transmitting to the chief of the producing division and his foremen details as to operations, jigs, tools and fixtures, etc., to be used; speeds and feeds of machines and other instructions which might be pertinent to the economical and accurate production of the work.

The operation card gives a description and sequence number of operation on the different parts and should be arranged so that it can be locked in a box in charge of the engineering division, and when changes are made in the sequence of operations these cards are taken out and placed in their new position. This saves rewriting lists every time a change is made.

An inventory of stock on hand in storeroom should be taken and transferred to cards.

There should be separate cards for stores and worked materials. By stores are meant all finished or raw materials kept in stock on which no work has been performed by the factory. After the pieces for the stores have been issued and work done upon them in the factory they are returned to the storeroom as "worked materials" and issued to the assembling room for assembling into final product. Requisitions for worked materials are not entered on analysis sheet when issued for same symbol numbers under which they are manufactured.

Routing.

I can positively state that the location of every piece of work covering 1,200 operations in active circulation in a factory can be determined without hunting around the shop. This is practically the block signal system of the shop, in which the workmen or work is the train and the clerk in the production department is the signal man.

The man's pay is made up on his time card, and no man can get a new ticket on a job until his own time ticket is returned and stamped, the new ticket being stamped out at the time the old is stamped in by a block registering hours and tenths of hours.

The time ticket has the letters "F." and "N.F." provided on it. If a job is not finished at the end of the day, the "F." is crossed off and a new ticket made out for the man, which is given to him the next morning with the same charge symbol upon it. If, however, the "N. F." is crossed off, indicating that the job is finished, the man in charge of the production department places his ticket in a box, and before it goes to the time clerk, it is marked off on the route card and an order to move work to next machine is issued for the next operation.

Move orders are not issued for operations that run in sequence on different machines of the same group. They are issued, however, where work passes from one group to another or to the inspection and storerooms. The use of move orders will reduce the number of men used for trucking in the factory 50 per cent.

The one requisite for efficient management is a simple and comprehensive accounting system, accurate in its information and inexpensive to maintenance. For this purpose all transactions can be captioned as follows:

1. Capital.
2. Profit and loss.
3. Production.
4. Betterments.
5. Expense.

There can be subdivisions so as to give detailed information as requested either by symbols or charge numbers, or both.

The analysis sheet as used in this method is a combination of a loose leaf shop ledger and cost card. These can be taken out for any one of the charge symbols, authorization numbers or other special order numbers, the details posted thereon directly from requisition, vouchers or payroll. These sheets are then closed in the final productive accounts.

The production account sheets are credited with sales, increase in inventory and closed to profit and loss sheet.

The betterment account sheets are closed in to expense accounts and capital by a predetermined ratio or actual charges.

Law Efficiency of the Average Machine Shop.

The average cotton mill produces from 80 to 92 per cent. of its theoretical efficiency, while the average machine shop seldom reaches 30 per cent. With proper training and management this can be brought up to 80 or 85 per cent., yet when Dr. Fred W. Taylor, dean of industrial engineering, says that the output of the average factory can be doubled, the satisfied owner or manager wonders why the other fellow does not take advantage of it, never stopping to think that he needs it as much if not more. This is not impossible. It is possible and probable; and some of the illustrations will show that with even an ultimate efficiency of 60 to 70 per cent. the output of many plants can be doubled over what they are now producing.

I do not think that the sole reason for the increase in the output cited was the introduction of the forms illustrated, because you may carpet a factory with forms and not obtain the desired results. It requires intelligence to use forms, also requires a persistent, untiring energy and firmness on the part of the management to keep an organization working together with them at the start.

More diplomacy and patience have to be used in teaching those at the top than the rank and file to adopt economical and systematic shop methods. In no case have wages been reduced, and in every case the earning capacity of the men per day has been increased and the total cost of the product reduced.

The fundamental principles, however, are summarized in the training of the superintendent, foremen and workmen to systematic habits and convincing the officials of a company that a constant and systematic endeavor to classify and functionalize duties and route work is more remunerative than the continual harassing of the overburdened and oftentimes underpaid shop manager or superintendent.

Forget the ratio of nonproductive help to productive and gauge the efficiency of a factory by the value of output per dollar of total payroll.

The Power Required by Machine Tools to Remove Metal*

Cutting Tools are Divided into three Classes—Lathe Tool Type, Drills and Milling Cutters, Calculators for these Classes of Tools.

The power required to remove metal depends upon the nature of the cutting tool and the amount of metal removed per minute. Cutting tools may be divided into three general classes: (a) lathe-tool type; (b) drills; (c) milling cutters.

Lathe-Tool Type.

The lathe tool is used on lathes, boring mills, planers, shapers and slotters. Tests show that the power required by a tool of this kind when removing metal depends upon the cutting angle of the tool and the number of cubic inches of metal removed per minute. From observation and data obtained by means of the graphic recording meter, and the use of tools having a cutting angle of about 75 to 80 degrees, the curve shown in Fig. 1 was obtained. The results were independent of the cutting speed, feed and depth of cut, and show that a definite relation exists between the horsepower required to remove metal and the number of cubic inches removed per minute. The cubic inches of metal removed per minute were found to be as follows:

(a) area of cut (square inches) × cutting speed (feet per minute) × 12

(b) area of cut (square inches) = depth of cut (inches) × feed (inches per revolution.)

The h.p. required to remove metal with the tools ordinarily employed can be expressed by:

h.p. = a constant × cubic inches removed per minute.

The constant varies with the kind of metal removed.

In order to estimate the amount of power required to remove a given amount of metal per minute the graphic method shown in chart 1 has been designed. This diagram is a multiplication table; those familiar with analytical geometry will recognize the equilateral hyperbola whose equation, referred to its asymptotes, is x y = constant.

To determine the cutting speed the usual procedure is as follows.

$$\frac{\text{Cutting speed (ft. per min.)} = \text{n} \times \text{diameter} \times \text{r.p.m.}}{12} = \text{constant} \times \text{diameter} \times \text{r.p.m.}$$

In the diagram each hyperbola corresponds to a given cutting speed. The coordinates of all diameters and spindle speeds producing the same speed intersect on the same hyperbola. The cutting speed corresponding to any diameter, rotation at any number of revolutions per minute, is found indicated on the hyperbola passing through the intersection of the co-ordinates corresponding to the given values of diameter and revolutions per minute.

In a similar manner an area corresponding to any depth of cut in ins. and feed in inches is obtained, and also the cubic inches of metal removed per minute can be determined from the area of cut and the cutting speed. The directions for using the diagram are given in connection with it.

With the cutting tools ordinarily employed the following values have been found by tests to exist for the h.p. required to remove 1 cubic inch of the following metals, per minute:

Brass and similar alloys	0.2 to 0.3
Cast Iron	0.3 to 0.5
Mild steel (0.30%-0.40% carbon) / Wrought iron	0.6
Hard Steel (0.50% carbon)	1.00 to 1.25
Very hard tire steel	1.50

It must be remembered that these constants represent general average conditions; considerable variation may occur where special cutting tools are used and special grades of metal are encountered.

Lathes.

The following examples will explain the application of chart 1 to lathe work: Eaxample: Diameter of work=5.5 in.; spindle speed = 45 revolutions per minute; depth of cut = 0.45 in.; feed per revolution = 0.06 in.

Find the intersection of the horizontal line through 5.5 inches diameter of work, and the vertical line through 45 revolutions per minute spindle speed. The curves passing nearest this intersection correspond to a cutting speed of 63 and 68 feet per minute, indicating by interpolation a cutting speed in this case of 65 feet per minute. The area of cut, with depth of cut 0.45 inch and feed 0.06 inch in 0.027 square inch. The cubic inches of metal removed per minute, corresponding to an area of cut 0.027 square inch and a cutting speed of 65 feet per minute, is determined by findthe intersection of the horizontal line passing through 0.027 square inch area of cut and 65 feet per minute. This intersection is between the curves corresponding to 19.2 and 21.6 cubic inches, showing that about 20 cubic inches of metal are removed per minute. If the metal removed is wrought iron, the h. p. required is 0.6×20=12 h.p. If 0.50 per cent. carbon steel is turned, 1×20 =20 h.p., is required. Brass would require 0.25×20=5 h.p.

Boring Mill.

Example: Diameter of work = 45 inches; speed of table = 4.5 revolutions per minute; depth of cut = 0.25 inch; feed = 0.10 inch per revolution.

The diameter of work goes only to 10 inches in the vertical column of the diagram. These may be multiplied by 10, and if used with the spindle speeds as they stand, the results in the oblique column of cutting speeds must be multiplied by 10. In case of large diameters the spindle or table speeds are usually low. The simplest way to use the diagram in these cases is to interchange diameter of work and spindle speed, i.e., assume that the diameter of the work is and the table speed under 1, 2, 3, etc., in the vertical column. In the problem under consideration the cutting speed is as follows:

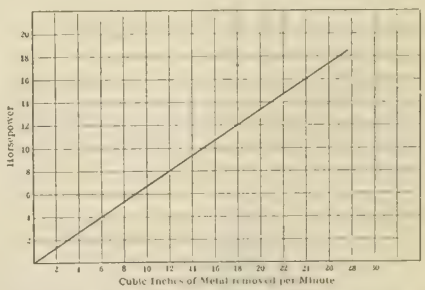


Fig. 1.—Relation Between Horse Power and cu. ins. metal removed; Mild Steel, 0.40 per cent. Carbon.

The intersection of the horizontal line through 4.5 and the vertical line through 45 correspond to a cutting speed of 52 feet per minute. The area of cut is 0.025 square inch. The intersection of the horizontal line through 0.025 square inch area of cut and the vertical line through 52 feet per minute cutting speed lies between curves representing 14.4 and 16.8 cubic inchs, indicating that 15 cubic inches are removed per minute. If cast iron of a soft quality is removed the power required for cutting will be 15× 0.3 = 4.5 h.p. If the cast iron is of hard quality, 0.5×15=7.5 h.p., will be required.

Shaper or Planer.

Example: Depth of cut = 0.75 inch; feed per stroke = 1-16 inch; cutting speed = 45 feet per minute (from characteristic of planer or shaper).

Area of cut 0.75 × 1-16 = 0.046 square inch.

* From Journal of American Society of Mechanical Engineers.

The cubic inches of metal removed per minute, corresponding to an area of cut of 0.046 square inch, and a cutting speed of 45 feet per minute, is 24. The power required for cutting in the machine a hard grade of cast iron will under these conditions be $24 \times 0.5 = 12$ h.p.

In a planer the power required for reversing is usually considerably more than that required to cut metal, depending upon the design of the reversing mechanism, the flywheel effect, and the speed characteristic of the motor. In a shaper the power required to reverse is not very great, and is usually less than the power required for cutting.

Slotter.

In most cases the cutting tool is fed inwardly on this type of machine; the following example shows how the diagram is used to determine the rate of removing metal. With other methods of feeding the tool the diagram is used in the same way as in the case of a planer or a shaper:

Example—

Width of tool and cut	0. 5
Feed per stroke	0.06
Cutting speed	35 f.p.m.
Area of cut 0.5 x 0.06.....	0.03 sq. in.

Drills.

The power required in drilling operations can also be expressed as a constant times the cubic inches of metal removed per minute. The conditions are, however, more complicated than in the lathe tool, since the friction of the drill and the chips on the sides of the hole increase the power requirement as the drill enters the metal. This is especially true when cast iron is drilled, as chips have a jamming action. The variable cutting speed at the cutting edge of the drill, from zero at the centre to the peripheral speed of the drill, also causes a jamming action and tends to increase the power per cubic inch per minute over that required to remove the same amount of metal by means of the lathe tool type. With drills generally employed, the value per h.p. per cubic inch of metal removed per minute, is about double that required by ordinary lathe tools.

Plate 2 is a diagram with full instructions for determining the cubic inches of metal removed with drills. The constants for determining the power required are about double those for lathe tools:

Example—

Size of drill	2 in.
Feed per minute	2.5 in.
Speed of drill	150 r.p.m.

Metal drilled: cast iron.

The peripheral or maximum cutting speed of the drill is found as follows. (Rule a, Plate 2): The horizontal line corresponding to a diameter of 2 in. intersects the vertical line corresponding to 150 r.p.m. on the curve corresponding to a cutting speed of 77.5 ft. per min. The area of the 2 in. drill (rule c) is 3 sq. in. This area at a feed of 2.5 in. per min. corresponds to removing 7 cu. in. per min. (rule d). For cast iron the h.p. per cu. in. per min. is about 0.8, twice that for lathe tools, hence the power required to drive the drill in this case is 0.8×7. . . . 5.6 h.p., which agrees closely with an actual test. For mild steel the power required is 1.2×7 . . 8.4 h.p. In drilling a hole of this size the friction of the chips does not increase the power materially as the depth of the hole increases, since there is sufficient space for the drill to free itself of chips.

Milling Cutters.

Plate 3 is a diagram with full instructions for determining the amount of metal removed per minute by a milling machine.

Example:

Width of cut	8 in.
Depth of cut	0.2 in.
Advance of table per min. ..	5 in.
Area of cut is 8×0.2.....0.16 sq. in.	

To find the cubic inches of metal removed per minute, find on the diagram the intersection of the horizontal line through 0.16 sq. in., and a vertical line corresponding to a table advance of 5 in. per min. The curve passing through this intersection corresponds to a rate of cutting of 16 cu. in. of metal per min. For machinery steel or mild steel, the power required by a horizontal milling machine of this type is about 1.6 per cu. in. per min., making the total requirement 1.6×16 . . . 25.6 h.p. A

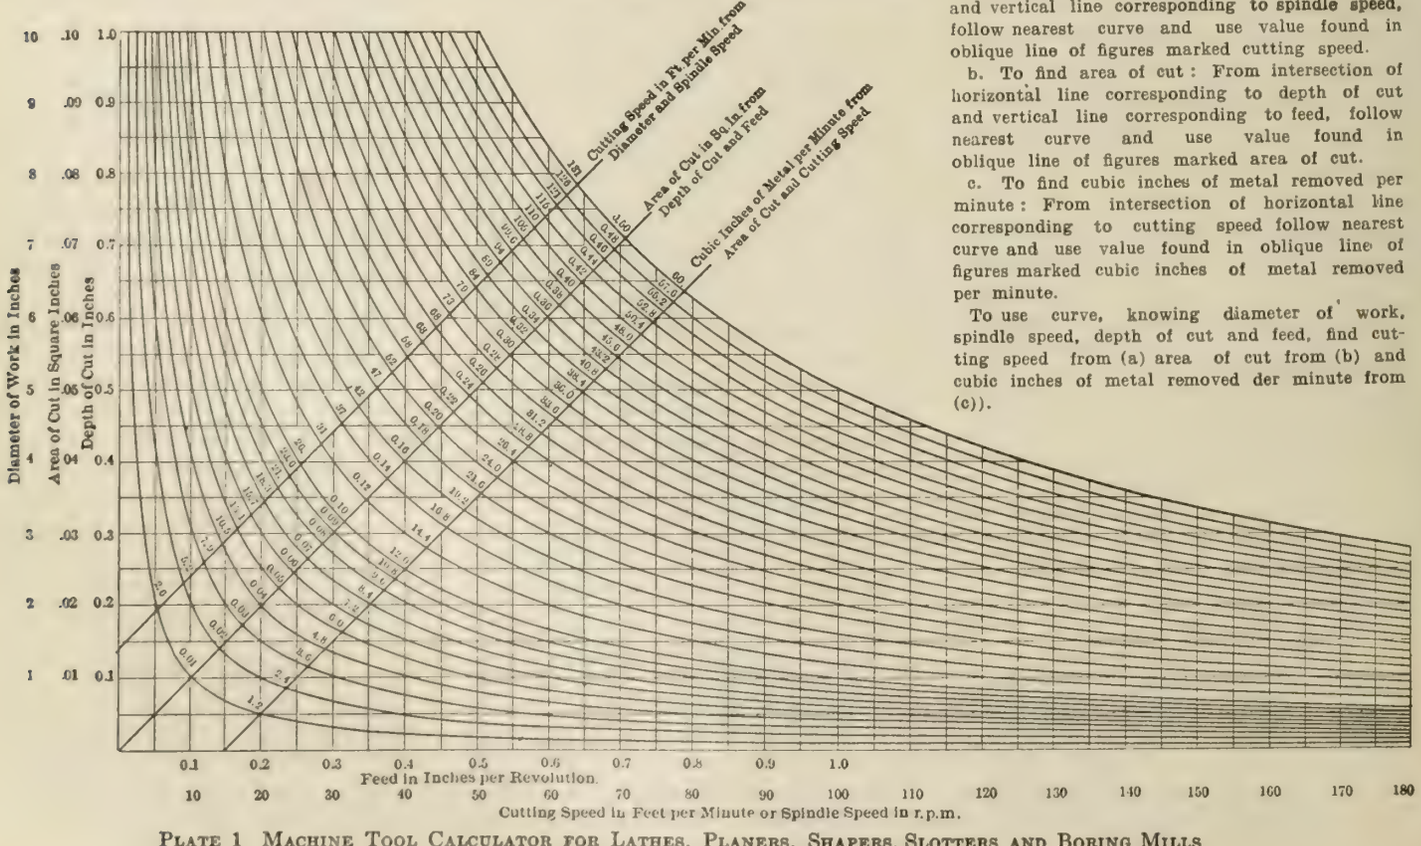
DIRECTIONS FOR USING PLATE 1.

a. To find cutting speed: From intersection of horizontal line corresponding to diameter and vertical line corresponding to spindle speed, follow nearest curve and use value found in oblique line of figures marked cutting speed.

b. To find area of cut: From intersection of horizontal line corresponding to depth of cut and vertical line corresponding to feed, follow nearest curve and use value found in oblique line of figures marked area of cut.

c. To find cubic inches of metal removed per minute: From intersection of horizontal line corresponding to cutting speed follow nearest curve and use value found in oblique line of figures marked cubic inches of metal removed per minute.

To use curve, knowing diameter of work, spindle speed, depth of cut and feed, find cutting speed from (a) area of cut from (b) and cubic inches of metal removed der minute from (c)).



Diameter of Work in Inches
Area of Cut in Square Inches
Depth of Cut in Inches
Cutting Speed in Ft. per Min. from Diameter and Spindle Speed
Area of Cut in Sq. In. from Depth of Cut and Feed
Cubic Inches of Metal per Minute from Area of Cut and Cutting Speed
Feed in Inches per Revolution.
Cutting Speed in Feet per Minute or Spindle Speed in r.p.m.

PLATE 1 MACHINE TOOL CALCULATOR FOR LATHES, PLANERS, SHAPERS, SLOTTERS AND BORING MILLS

vertical miller requires about 1 h.p. per cu. in. per min., or 16 h.p. under the foregoing conditions.

The power required by milling cutters varies according to their construction, and care should be employed to determine the proper constant for each class of cutters. By means of tests made with the graphic meter on motor-driven tools the proper constant can easily be determined in any given case.

DIRECTIONS FOR USING PLATE 2.

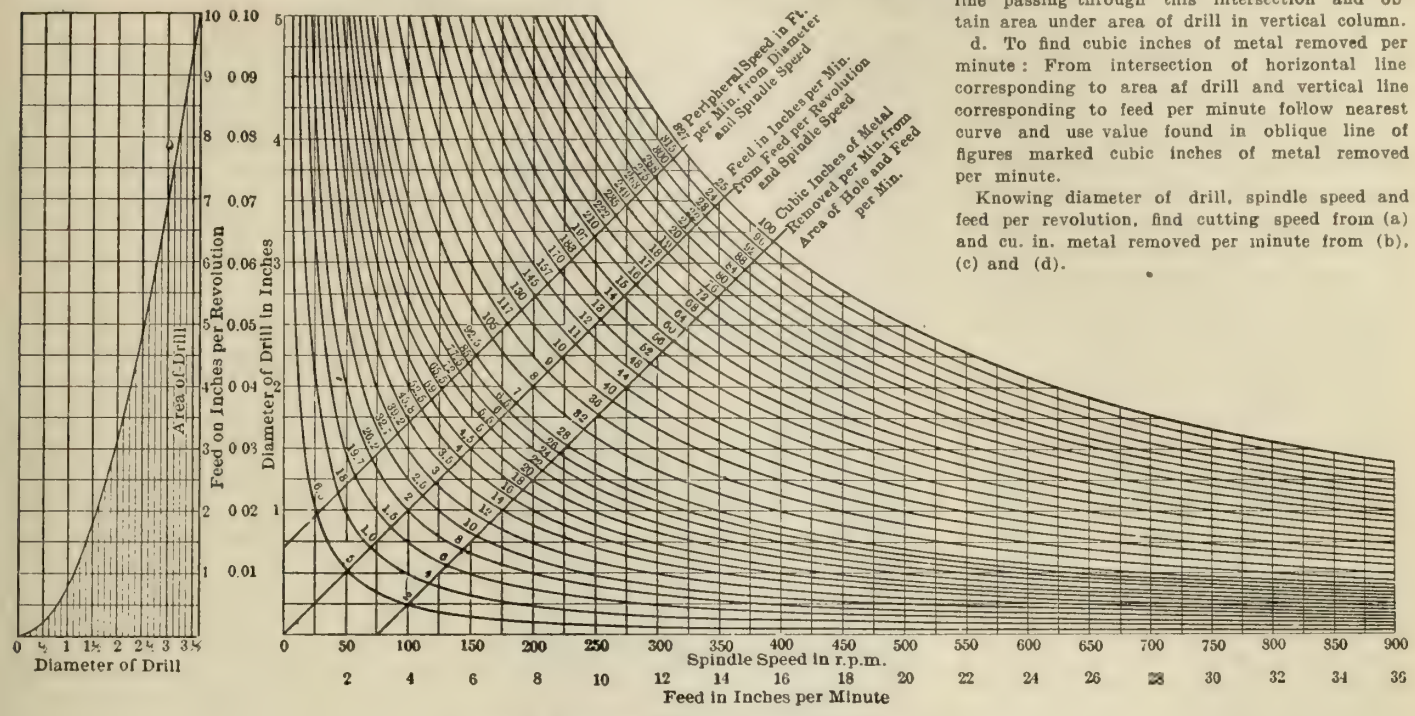
a. To find cutting speed: From intersection of horizontal line corresponding to spindle speed follow nearest curve and use value found in oblique line of figures marked cutting speed.

b. To find in inches per minute from feed per revolution and spindle speed: From intersection of horizontal line corresponding to feed in inches per revolution and vertical line corresponding to spindle follow nearest curve and use value found in oblique line of figures marked feed in inches per minute.

c. To find area of drill from diameter of drill use curve on left side of figure: Find intersection of vertical line corresponding to diameter of drill with the curve; follow the horizontal line passing through this intersection and obtain area under area of drill in vertical column.

d. To find cubic inches of metal removed per minute: From intersection of horizontal line corresponding to area af drill and vertical line corresponding to feed per minute follow nearest curve and use value found in oblique line of figures marked cubic inches of metal removed per minute.

Knowing diameter of drill, spindle speed and feed per revolution, find cutting speed from (a) and cu. in. metal removed per minute from (b), (c) and (d).



Area of Drill
Feed on Inches per Revolution
Diameter of Drill in Inches
Peripheral Speed in Ft. per Min. from Diameter and Spindle Speed
Feed in Inches per Min. from Feed per Revolution and Spindle Speed
Cubic Inches of Metal Removed per Min. from Area of Hole and Feed per Min.
Diameter of Drill
Spindle Speed in r.p.m.
Feed in Inches per Minute

PLATE 2 MACHINE TOOL CALCULATOR FOR DRILLS

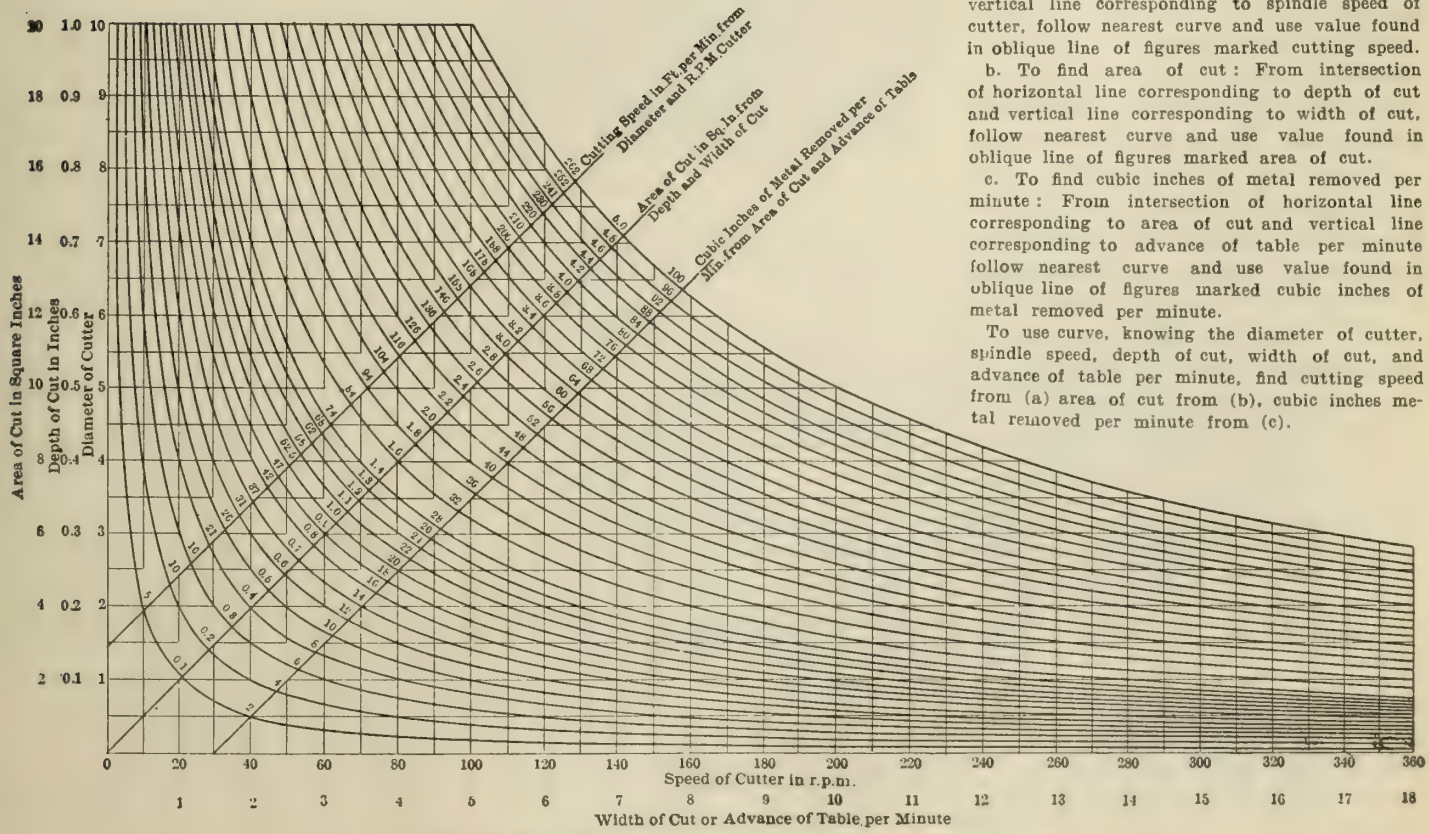
DIRECTIONS FOR USING PLATE 3.

a. To find cutting speed: From intersection of horizontal line corresponding to diameter and vertical line corresponding to spindle speed of cutter, follow nearest curve and use value found in oblique line of figures marked cutting speed.

b. To find area of cut: From intersection of horizontal line corresponding to depth of cut and vertical line corresponding to width of cut, follow nearest curve and use value found in oblique line of figures marked area of cut.

c. To find cubic inches of metal removed per minute: From intersection of horizontal line corresponding to area of cut and vertical line corresponding to advance of table per minute follow nearest curve and use value found in oblique line of figures marked cubic inches of metal removed per minute.

To use curve, knowing the diameter of cutter, spindle speed, depth of cut, width of cut, and advance of table per minute, find cutting speed from (a) area of cut from (b), cubic inches metal removed per minute from (c).



Area of Cut in Square Inches
Depth of Cut in Inches
Diameter of Cutter
Cutting Speed in Ft. per Min. from Diameter and R.P.M. Cutter
Area of Cut in Sq. In. from Depth and Width of Cut
Cubic Inches of Metal Removed per Min. from Area of Cut and Advance of Table
Speed of Cutter in r.p.m.
Width of Cut or Advance of Table per Minute

PLATE 3 MACHINE TOOL CALCULATOR FOR MILLING MACHINES

SPEAKING TUBE ECONOMY.

By M. E. D.

Our stock room is on the ground floor while the cost department is on the second floor. In connection with our cost keeping system it was often necessary to make trips from the cost department to the stores department to look up prices. This consumed a great deal of time of the cost clerk, who desired the information and one of the stores clerks.

It was decided, after considering the question, to instal a speaking tube between the two departments, with a whistle on either end so that a clerk in the stores department could call a clerk in the cost department or vice versa without having to walk up stairs.

This arrangement also saved considerable time. Formerly a cost clerk had to walk downstairs and wait while the stores clerk hunted up the desired information. Now the cost clerk can call up the stores department, ask the question and receive the answer through the speaking tube, without losing the time walking up or down stairs or in waiting in the stores department, while the stores clerk was looking up the information desired.

The tube, installed, cost about $15. During the day about ten trips were made on the average by clerks up and down stairs. Estimating the time lost by one person on each trip, the total loss per day would be 100 min. per day or 300,000 min. per year equals 500 hrs. If the average wage is 20 cents per hour the total loss is $100 per year, which is practically wholly eliminated by an expenditure of only $15.

FIGURING OVERHEAD CHARGES.

By K. Campbell.

In shops it is a difficult matter to fix the overhead charges. Take a jobbing shop for instance with a machine and plating department. A manager of one of these wondered why he always "fell down" in obtaining contract for the plating department, his price being invariably higher than his competitors. He began to do some thinking. He figured it out and by his new way of figuring he was able to keep the plating plant busy.

He had been accustomed to figure the overhead charges for the whole plant, and this came, with profits, to about 80 per cent., so that if an article cost $1 for productive labor, the charge to the customer would be $1.80. As a result of his thinking, he investigated and found the overhead charges in the plating department were not as high as that of the machine department, and the percentage added was reduced to about 60 per cent., which fact allowed him to compete satisfactorily with other companies in the same line.

In figuring overhead charges or "Department Diffused Expense," Mr. Daly, of the National Cash Register Co., Toronto, has found it satisfactory to figure the per centage on the preceding twelve months. Thus for April, 1910, the percentage is taken from the twelve months preceding. As soon as May 1 comes the month of April, 1909, will be dropped and the percentage will be figured on the twelve months, May, 1909, to April, 1910, inclusive.

In some plants it is customary to take a fixed percentage as the overhead charge, but this does not appear to be the best practice though several arguments have been given in its favor, that of making the factory attain the minimum overhead charge. When a plant is not busy the charge increases, while if the shops are busy, the machinery is in continuous operation, and the men crowded with work are kept busy, the percentage is lower. The system of using the figures of the previous twelve months for calculating overhead charges, therefore, appears to me to be a good system.

DEPRECIATION IN VALUE OF MACHINE TOOLS.

A method frequently used in calculating the depreciation in value of a machine tool is to allow 10 p.c. of a reducing balance; that is, 10 p.c. of the first cost if charged off the first year, 10 p.c. of the remaining cost, the second year, and 10 p.c. of the second remainder the third year, etc. This method is based upon the fact that the apparatus actually decreases in value year by year. Allowance for depreciation in any given year can be made easily by the aid of the curve in Fig. 2. This curve gives the percentage of the first cost corresponding each year to 10 p.c. on the reduced balance. For example, the curve shows that the depreciation on a tool that has been in service five years will be 6.6 p.c. of the

Type of Machine	Charges per Hour				Depreciation	Power	Total or Mch. Hr. Rate
	Fixed	Variable	Salaries	Interest			
Vertical Boring Mills.							
40-in.-60 in.	$0 02	$0.25	$0.15	$0.05	$0.05	$0.01	$0.53
72 in.-100 in.	0 04	0 45	0.25	0.08	0.08	0.01	0.91
10 ft.-14 ft.	0.05	0.80	0.40	0.15	0.15	0.02	1.57
16 ft.-24 ft. Ext.	0 08	2 00	1.00	0 30	0.30	0.03	3.71
Average per cent of total	3%	52%	28%	8%	8%	1%	100%
Radial drills, 5 ft	$0 02	$0.30	$0.20	$0.03	$0.03	$0.01	$0.59
Radial drills, 10 ft.	0 04	0 60	0.35	0.09	0.09	0.01	1.18
Average Per Cent of Total	3%	51%	31%	7%	7%	1%	100%
Engine Lathes:							
30 in.-40 in.	$0 02	$0 25	$0.12	$0.04	$0 04	$0.01	$0.48
40 in.-60 in	0 03	0 50	0.25	0.10	0.10	0.01	0.99
Average Per Cent of Total	3%	51%	25%	10%	10%	1%	100%
Planers:

Average Per Cent of Total	3%	55%	30%	5 5%	5.5%	1%	100%

Fig. 1.—Table of Machine—Hour Rates.

original cost. If this cost was $4,500, the allowance for depreciation during the sixth year according to the 10 p.c. reducing balance method is $4,500 X .066 equals $297. Since this is 10 p.c. of the reduced cost, the value of the tool at the end of the fifth year is $2,970.

Tools designed for special work will be discontinued after a comparatively limited period, and therefore, depreciate

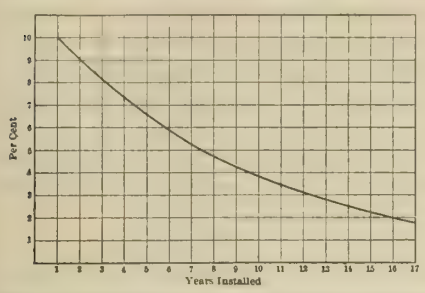

Fig. 2.—Depreciation at 10 p.c., Reducing Balance

in value much more rapidly than is indicated by the foregoing method : a special allowance frequently made for such tools is generally known as utility depreciation.

Fig. 1 contains a summary of machine hour rates obtained by this method. It is assumed that machines have been installed six years, so that the depreciation is 6 p.c. on a basis of 10 p.c. reducing balance.

NEW OFFICES OF MUSSENS LIMITED.

Mussens Limited, Montreal have just moved from their old offices on the corner of Victoria Square to a large five storey building on the opposite side of St. James St. at 318 St. James St.

Increases to the staff caused by the expansion of business had rendered the old offices too congested, and the show space for machinery and supplies was entirely inadequate. By the new move they have been enabled not only to lay out more commodious offices but reserve two floors for exhibition purposes. The new offices and show-rooms and also their warehouses which were purchased several years ago and which are excellently equipped for handling heavy machinery are shown here. The warehouses have a capacity of about 100 carloads of stock, and have a wide driveway running clear through the building from end to end opening on two streets. They are excelently located near the railroads and navigation companies.

Mussens Limited now have branch offices and warehouses in Cobalt, Winnipeg and Vancouver and also offices alone in Toronto and Calgary. From a small beginning this firm has become one of the largest of its kind in the Dominion of Canada. Their principal lines are machinery and supplies for railways, mines, contractors, municipalities and machine shops. They have a well equipped engineering department which looks after the designing, supplying and erecting of complete plants for various purposes such as quarrying, mining, etc.

Their latest move is another indication of the rapid and steady growth of this firm, which has since its inception attained a reputation for reliable and efficient business methods.

New Head Offices of Mussens Limited, Montreal.

OVERHEAD CHARGES AND MACHINE-HOUR RATES.*

The following analysis outlines a method of determining the hourly overhead charges per machine tool, which will be called the machine-hour rates. Over-head charges can be grouped in three main classes :

A Charges against the entire factory.

a Fixed charges : these include interest and depreciation, taxes and insurance on buildings, grounds and accessories.

b Variable charges : these include repairs and renewals on buildings and accessories, omitting all charges which can be set off directly to a particular section of the factory ; charges against the store room and the tool room ; defective design, material or workmanship ; printing and stationery ; lubricants and general manufacturing supplies.

c Salaries (not chargeable to a definite section) : these include cost of superintendence (manager, superintendent, foreman) ; engineering and drawing ; clerical force, including office boys and general laborers.

B Charges against each section of the factory.

a Fixed charges : including an equitable portion of the total factory fixed charge and interest, and depreciation on auxiliary apparatus located in the section (except machine tools).

b Variable charges : these include a portion of the variable charges as well as similar charges belonging to the section, such as repairs and renewals, storeroom and tool room charges, defective design, material

* From a paper on Electric Motor Applications read before American Society of Mechanical Engineers by Charles Robbins.

Warehouses of Mussens Limited Montreal.

and workmanship, lubricants and manufacturing supplies.

e Salaries: including a portion of the total salaries as well as those belonging exclusively to the section, that is, foremen, clerks, errand boys, laborers, cranemen, etc.

C Charges against each machine tool.

a Portion of fixed charge.

b Portion of variable charge.

c Portion of salaries charge.

d Interest on cost of tool, fairly taken at 6 p.c.

e Depreciation of value of tool (see explanation below).

f Cost of power to operate tool, including also lighting and crane service.

How a Machinist Made 3000 p.c. in Twenty Days

How Walter E. Flanders, Machinist, now President and General Manager of the E-M-F Co., a Branch of which is being Established in Walkerville, Ont., turned $195,000 into $6,000,000 in Twenty Days.

Walter E. Flanders, left school at fifteen years of age and became a machinist. Later, he dropped the lathe to sell machinery. The risk he ran was nothing compared with the benefits that might accrue if he succeeded. Failure did not figure in his plans. He combined personality with business, and to those to whom he sold his machines, he imparted knowledge of their uses. And Flanders succeeded—HIS HEART WAS IN HIS WORK.

It soon dawned upon the machinist, that if he could sell other men's tools he could sell those of his own manufacture. He discerned an increasing demand for certain special machines and machine tools and became a producer. He felt that the great problem in manufacturing was to minimize the cost of production through mechanical means without detracting from the quality of the output, and this was one step towards success.

He then became interested in the automobile business. He mastered the details of construction, the business of direction and the art of organization. As, when in his machinist's days he had selected steel so now he selected men with an eye to quality, strength, temper and durability. In perfecting his organization, HE PICKED THE RIGHT MEN.

Flanders has in the E-M-F plant at Detroit, thousands of men at the drills, forges and in the management of the business. All are contented and are helping in the success of the business. He has succeeded in enthusing them in the work and he gives this as a solution "I LET HIM SHARE RESULTS."

What Efficiency Will do.

A good example of what enthusiasm on the part of the men and consequent high efficiency on their part will do, is shown in the Detroit, No. 1 plant of E-M-F Co. That particular factory has a capacity of thirty cars a day. A visitor, one quite familiar with the automobile business, discovered in looking over the institution that sixty-five cars a day were being turned out.

"How do you do this?" he asked somewhat bewildered. "Your equipcalls for thirty cars a day. Yet you turn out more than twice that number."

"I share results with my men. I make it worth while to them in dollars and cents. Every car that leaves this plant for shipment represent a premium to every employe here. It is true that the plant calls for thirty cars per day, but I AM FORTUNATE IN HAVING A SIXTY-FIVE CAR CREW."

This was the condition when a change of salesmanship was made, which resulted in an investment of $195,000 being turned over for $6,000,000. The plan of distribution and sale was found to be inadequate and after due deliberations, a change of the selling plan was made by which motor-cars were sold direct from the factory to agents. The following contributed by Flanders formed part of an advertisement inserted in half-page space in the leading city dailies, which brought results from every quarter:—

> "A splendid opportunity for hustling young men of good standing, having experience in selling large quantities of automobiles, and with sufficient backing to finance this proposition to form a sales company. The E-M-F Co. will co-operate with you in establishing a permanent business corporation."

Within ten days 1,200 cars were sold, 400 more were ordered and $1,000,000 had poured into the coffers of the company added to which were $19,000,000 additional in future orders.

It does not require a mathematician to figure out just what Flander's plunge meant to the E-M-F Co. Let us calculate the value of those forty-six words that he contributed to the advertisement, based on the $20,000,000 results. In actual money, it figures out $434,782.60 per word.

This woke up Wall Street. It was business and salesmanship, but it woke up the money market, which two years ago would not advance a dollar on an automobile proposition. Bankers, who previously held aloof, now made propositions to the machinist. He presented his case briefly. His total investment in twenty months amounted to $195,000; his pay-roll numbered about 12,500, and it was agreeable to him that the probable purchaser instal an expert accountant to go over his books. He was of the opinion that about $6,000,000 would be sufficient to close the deal and turn over the E-M-F Co. to whoever wished to secure possession of the property, together with what it meant to the future of automobile manufacturing.

The banker, with that foresight which has marked his course in similar large industrial enterprises, considered the Flander's proposition a fair one, and the transaction was closed upon those terms. Thus, the E-M-F Co.'s original investment was turned over in twenty months multiplied thirty-two times.

Secret of Management.

Walter E. Flanders still continues the management of the E-M-F Co. When the deal was put through his assistants received compensation at the rate of eight to one for their stock holdings. He attributes his secret of successful management to "whacking up" with the other fellow, to — ORGANIZATION PLUS COMPENSATION.

Geo. Wedlake, of the Cockshutt Plow Co., Brantford, is on a trip to Cuba to further the interests of that company.

A. S. Herbert, manager for Canada of the Siemens Dynamo Works, has returned to Toronto, from the Old Country, after an absence of four months.

J. J. Brooks, Jr., general sales manager of the Harbison-Walker Refractories Co., Pittsburg, has been elected to its directorate.

$10 For An Idea

For the "Business Management" department of Canadian Machinery.

We want ideas for this department—ideas of practical, labor-saving, cost-reducing value. We will pay at regular rates for each idea accepted, and in addition will pay $10 for the best idea submitted during the next five months—that is, until Sept. 30, 1910.

Address all communications to the Editor of Canadian Machinery, 111-127 University Ave., Toronto, Ont.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

ATTACHMENT FOR TURNING OVALS.

By J. H. R., Hamilton.

The accompanying sketch shows an attachment, used on a lathe for turning and boring ovals and other shapes as shown. The object of the device is to cause a lateral motion to the tool, while the lathe spindle revolves.

The eccentric E is keyed to shaft S, supported and kept in position by bracket H. Motion is transmitted to the tool through the eccentric H, rod R, bell crank L and rod I; bracket A being secured to the cross slide as shown. The shaft S is revolved by a train of gears similar to the lead screw.

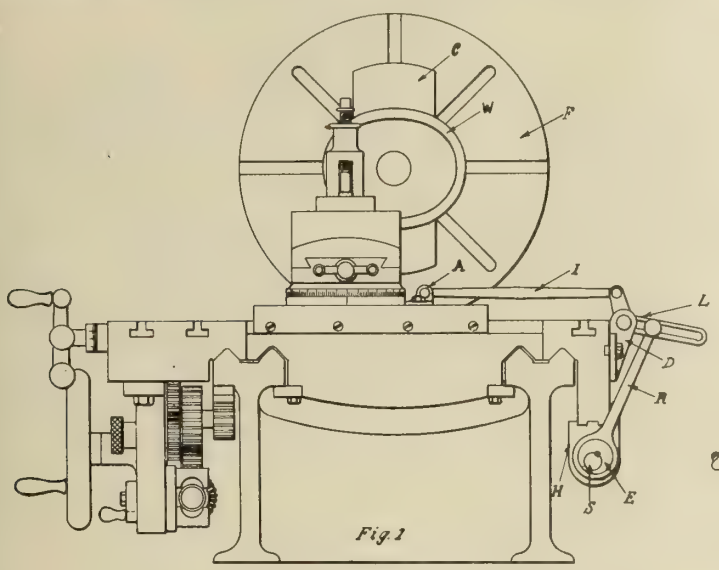

Fig. 1

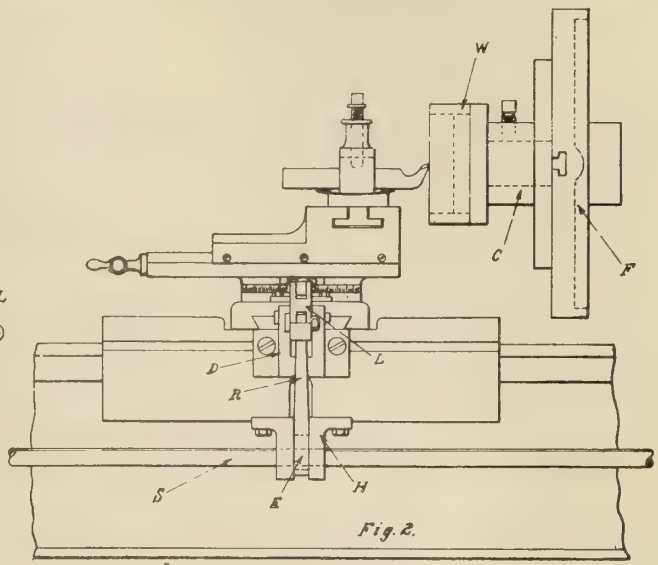

Fig. 2.

For an oval, shaft S must revolve twice while the spindle revolves once, or a ratio of 2 : 1.

In Fig. 3 the skeleton sketch shows the action of the device.

A represents a 2 : 1 ratio.

B represents a 3 : 1 ratio.

C represents a 4 : 1 ratio.

As the lateral motion of the tool is the same as bracket A, Fig. 1, the skeleton sketch shows the different positions of the tool as the work revolves.

Take the oval for illustration. When the eccentric is in the position 1, the tool is also at point 1; eccentric at 2, tool at 2'; eccentric at 3, tool at 3'.

The index figure as (4'') denotes the tool position for the ('') second revolution of the eccentric E.

The cycles of operations in B and C are similar to A, but with different ratio, and should be clearly understood by the sketch. The arrow shows direction of motion of lathe spindle.

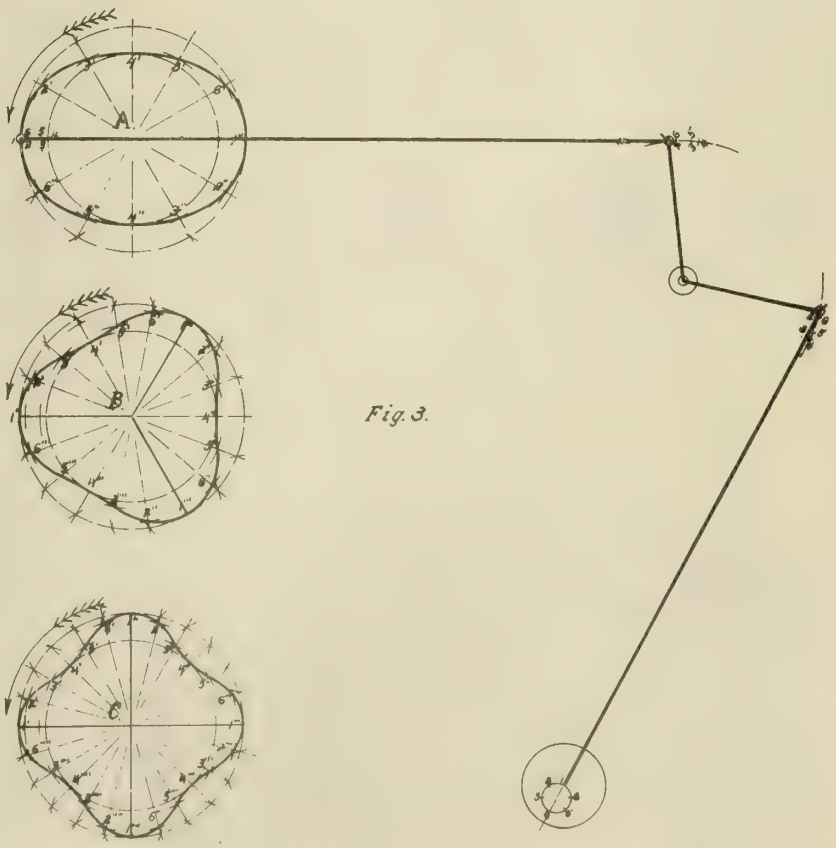

Fig. 3.

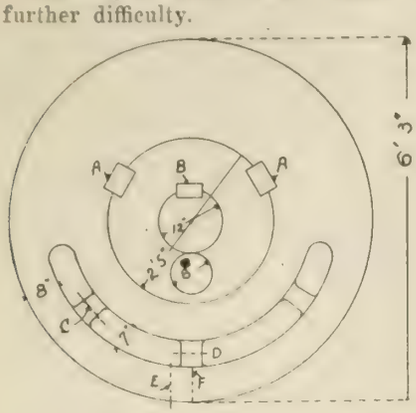
The lateral motion of the tool must be equal to one-half of the difference between the major and minor diameters. If the major diameter is 3'', minor diameter 2½'', the motion of the cross slide must be ¼''.

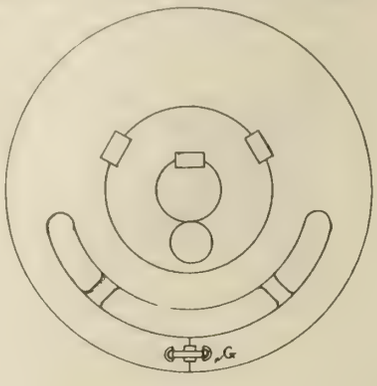
FLYWHEEL DESIGN.

The accompanying illustrations show a difficulty that was encountered recently in a machine shop and foundry when casting a flywheel for a Stock Gate for McLaughlin Bros., Arnprior. Fig. 1 shows the flywheel when first designed and Fig. 2 shows the redesigned flywheel when completed.

The flywheel is 6 ft. 3 in. in diameter; A A are 2 in. x 2 in. pins, B is a 3 in. x 1½ in. pin. When the piece was cast the inspector found the casting was broken at C and D, and cracked at E. On account of the metal contracting

when cooling this design could not be used and Fig. 2 was the second and successful design. The centre arm was eliminated and the pattern slit at F. The two other arms were moved nearer F. The casting was then made without any further difficulty.





In finishing the flywheel, the two parts of the outer rim were fastened together as shown at G. The wheel is cast to allow the insertion of the steel forging shown, on either side of the rim. The steel rod is upset at both ends, heated, put in position and allowed to cool. It shrinks 1-16 inch, thus holding the two parts of the rim closely together and successfully completing a rather difficult task in designing, pattern and foundry work.

CRANK PIN OILER.

By K. Campbell.

The accompanying illustrations show a crank pin oiler with provision being made for water cooling of crank. It is a sure cure for hot cranks and has been tried out successfully. Recently saw gates were made by John Inglis, Toronto, for McLachlin Bros., Arnprior, and these were equipped with these crank pin oilers.

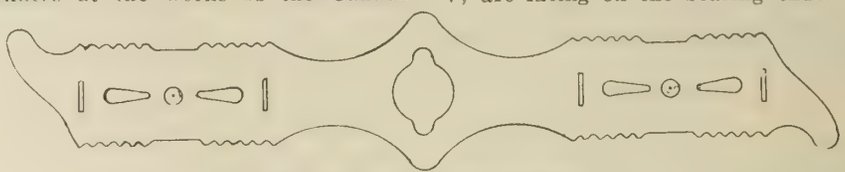
The oil is fed to the centre hole, a packing nut being provided. The two outer tubes are for the water supply, inward and outward flow. The water provides cool bearings at all times.

In the illustration 1 is a brass crank arm, 2 is a brass collar, 3 a brass sleeve, 4 a brass nut, 5 a brass nut, 6 a brass ring, 7 wrought iron set screw, 8 wrought iron oil pipes and 9 tap bolts.

COLD PRESS WORK.

A fine piece of cold press work is shown by the accompanying drawing. This is made from steel 3-32 inch in thickness at the works of the Canada Cycle and Motor Co. The piece is a good example of multiple die work, the piece itself and all the openings being made at one stroke of the press.

It will be noted that there are eleven openings made in addition to the rather intricate outline of the piece itself. The whole arrangement necessitated some careful punch and die work.

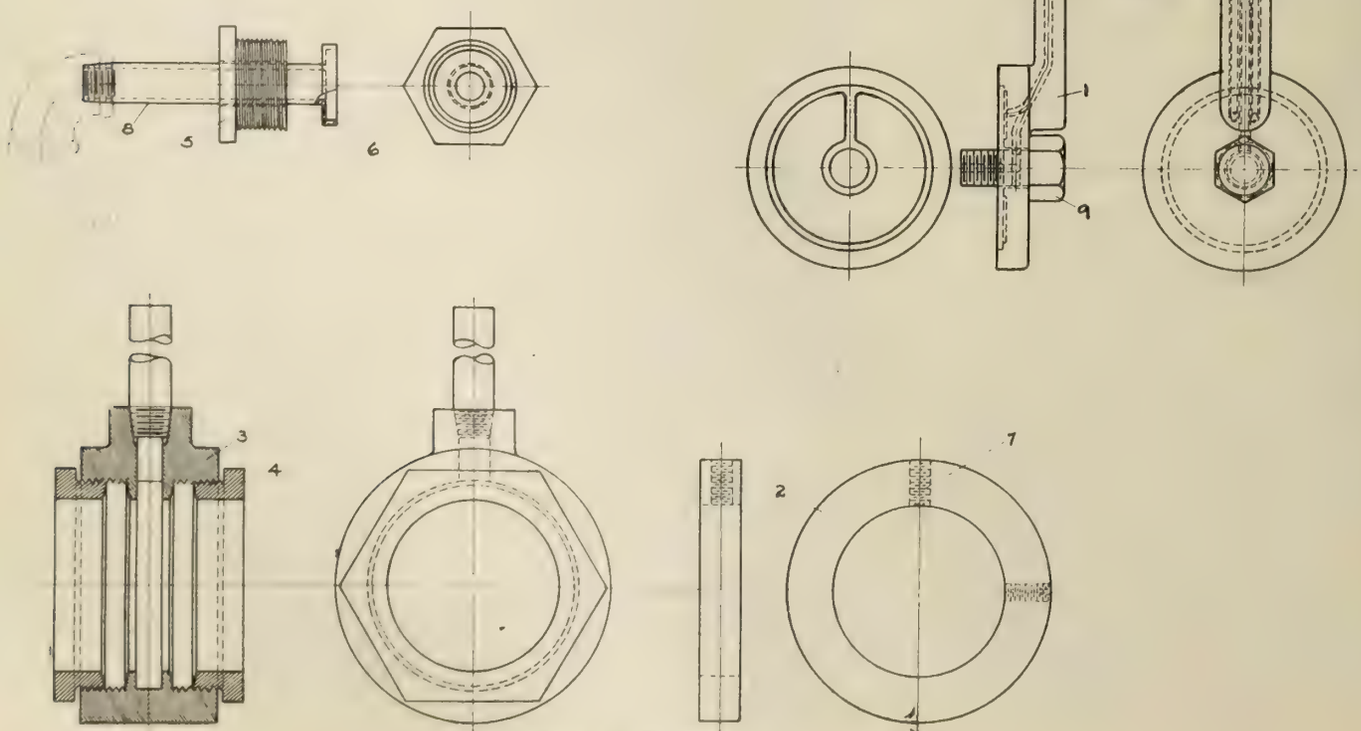


A Fine Piece of Cold Press Work.

COMBINATION BORING MACHINE.

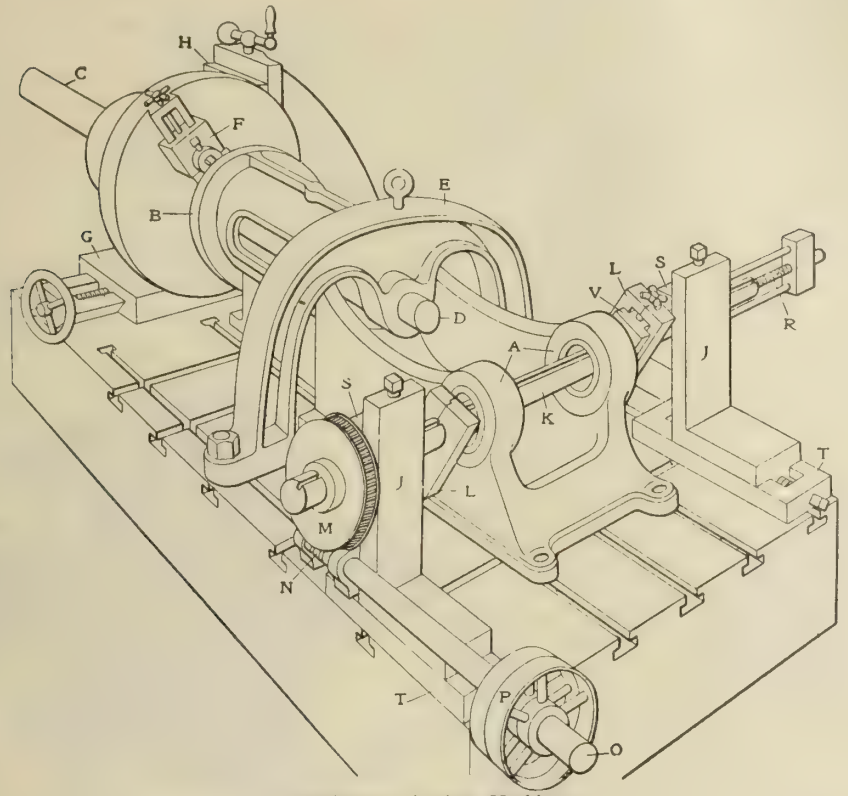
In the accompanying line cut is illustrated an interesting machine made by modifying a standard type so as to very greatly increase its rapidity of operation for turning out one particular product. This machine is used for boring the guide barrel, facing the flange and boring and facing the main bearings of small engine beds.

As seen from the cut, the boring bar C D, supported in the head carried on the guides H and G at one end and by the frame E at the other end, is boring out the cylindrical crosshead guide, while at the same time, the tool held in the tool block F, is facing off the flange B. While this is going on, the boring bar K, driven by the worm and wheel N M, and the pulley P, on the shaft O, is boring out the babbitted main bearings A. Also, by means of the facing arms L L, facing tools held in tool boxes, one of which is shown at V, are facing off the bearing ends.



Crank Pin Oiler Cooled by Water Flowing Around the Crank.

The facing tool in the block F, is traversed radially by the star wheel shown at the top of the rotating guide and the facing tools in the blocks L L are also traversed radially by star wheels, one of which is shown at the right. The blocks L L are split, and, by taking out suitable bolts, may be removed from the bar K, to which they are keyed.



A Combination Boring Machine.

When boring by means of the bar K, the horizontal traverse is given to this bar by the screw R, which is held stationary in the head, at the right. The bar K is threaded internally and, consequently, as it rotates, it must travel along the stationary screw R.

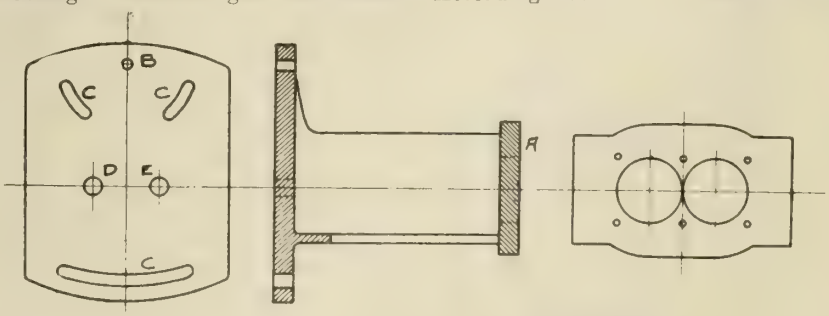
Uprights J J are angle blocks and are adjustable horizintally in the guides T T, the latter being bolted down to the main bed of the machine. By means of the blocks S S, the hight of the bar K may be made to suit the work. With these various adjustments, engine beds of a very considerable range in size may be finished with this same machine.

Of course, the near end of the shaft O is supported by a separate bearing which is not shown in the illustration. This machine is in use at the plant of the Newburgh Ice Machine and Engine Co., at Newburgh, N.Y.—American Machinist.

FACING TOOL FOR SMALL BEARINGS.

This tool is made use of to smooth up small babbitted bearings in automobile frames in the works of the Canada Cycle and Motor Co., Toronto. The bearing ends, after being babbitted do not present a perfectly smooth surface, and to save re-machining this device is used, which proves perfectly accurate. As may be seen, the tool is double ended, one end having a fillet to give the round edge to the bearing to correspond to the fillet in the crank shaft, while the other end is left without, for places where no such fillett occurs. Considering one end only, A A A A form four cutting edges. The shank B is clamped in the cap bearing, just tight enough not to wobble. By means of a nut or stud, the facing edge is drawn up as desired. The washer D has a key in it which engages with a similar key seat in stud C, which prevents the cutting edge from tightening more than the desired amount. It has proved a very useful tool for rapidly finishing up these bearings, being much superior to the breast drill which was formerly used.

Facing Tool for Small Bearings.



Twin Cylinder Boring Jig.

TWIN CYLINDER BORING JIG.

This is a handy jig made use of in the shops of the Canada Cycle and Motor Co., Toronto, for both boring and grinding twin cylinders. The finished end of the cylinder casting is bolted to the inside face of the plate A. The main part of the jig is pinned to the lathe faceplate by a pin B, and can be clamped in any position by bolts at C C C. The lathe spindle is hollow and has a rod which fits perfectly at the face plate, and which can be shoved through to fit corresponding holes D or E when the jig is swung into the proper position to engage. By this means exact alignment is readily obtained. To operate one cylinder is bored with pin engaging at D. Then, the pin is removed, jig swung over till it engages at E, and the other cylinder is in position. It provides a ready means for quick production. It is accurate to within one-thousandth of an inch.

The electric operation of trains through the Saint Clair tunnel is showing the same economies, as compared with steam operation, as have been obtained in similar installations elsewhere. According to the Electric Railway Journal, the cost of coal for one year under electric operation was only thirty-nine per cent. of that for the last year of steam operation. The total service charges were but sixty per cent. of those for steam, and the sum of service and fixed charges was 84.5 per cent. which represents the operating economy of the new over the old service. The cost of maintenance and repairs for the electric system is fifty-five per cent. of that of steam during the same period.

New Jaw and Friction Clutch and "Ideal" Split Pulley

The Positive Clutch and Pulley Works, Limited, Toronto, Have Placed Several Improved Transmission Appliances on the Canadian Market.

THE combined jaw and friction clutch combines the advantage of a friction clutch, to gradually pick up the speed of a driven shaft or pulley, etc., under load, with the positive drive of a jaw clutch The frictions are not obliged to carry the load, but are used only for the purpose of operating the jaws.

The engaging portions of the jaws narrow slightly to their outer ends and are provided with suitable clearance to eliminate all contact and permit freedom of movement during operation. The springs prevent the frictions and jaws from engaging and disengaging except by movement of the operating lever, but assist in each operation. The friction and jaws operate independently by means of the one lever.

All parts are interchangeable, enabling a coupling or a pulley clutch to be converted to the other, and each to be used on other sizes of shafting. Sleeves are provided with graphite lubrication, and are made to standard diameters to fit the standard bores of pulleys.

The frictions are made of fibre, which prevents them burning. The friction capacity need be only sufficient to pick up the speed of the unloaded shaft or pulley as the jaws when engaged will carry the load which is afterwards applied, up to their rated capacity.

Description of Clutch.

The power shaft is indicated at B, and the load shaft at A. Mounted on the shaft A is a hub C, formed with a flange to which the disk D is bolted. Projecting through a central aperture in the disk D is an annular jaw E. The disk D at its periphery is formed with annular flange, which incases part of the clutch mechanism. A ring F is fitted within this flgnge and keyed to it, for rotation, but free for longitudinal movement. The ring has openings at suitable points to receive fibre blocks G, which protrude from the opposite faces of the ring. Keyed to the shaft B is a member H, on which is fitted a sleeve I formed with a flange at its inner end A series of bolts J are fitted between this flange and a ring at the opposite end of the sleeve. A ring K is mounted to slide on the sleeve I, and the bolts J pass there through, while coil springs on the bolts J bear against the ring K, tending to press the latter outward. The flange of sleeve I and ring K have annular bearing surfaces adapted to engage the blocks G at opposite sides. They are pressed into engagement by means of levers L fulcrumed to the ring at the end of the sleeve I, and links M fitted between the levers L and the ring K. The levers L are connected by links to a sliding collar N, operated by a lever O fitted with a split collar in the usual manner. The collar N slides on a sleeve P, which at its inner end is provided with jaws R. These jaws are adapted to slide in recesses at opposite sides of the member H and the jaw E.

In operation to engage the clutch (see Fig. 1), by means of lever O, the collar N is moved forward along the sleeve P until it comes in contact with member R. This serves to process the flange I and ring K against the friction blocks G, by the toggle action of the levers and links connected to collar N, and to pick up the speed of the load shaft. When the load shaft is approximately brought up to speed the springs on the bolts J act through the levers and links to engage the jaws R with the recesses in member E and to disengage the frictions. When it is desired to disengage the clutch the reverse takes place. The frictional surfaces are first thrown into contact to relieve the jaws of the load and the springs then act in like manner to disengage the jaws and then the frictions. The frictional engagement is only momentary and the transfer of the load is almost instantaneous.

Ideal Split Pulley.

The split pulley manufactured by the Positive Clutch & Pulley Works, Limited, 11-13 Jarvis St., Toronto, has a wood rim, steel arms and malleable hub. A test of "Ideal" combination arm pulley 36" diam., 8" face was made in the mechanical laboratory of the S.P.S., by W. W. Gray. It transmitted 20 h.p. at 100 r.p.m., being the rated maximum power of an 8" double leather belt, based on a belt pull of 90 lbs. to the inch. The "Ideal" pulley consumed 1409 watts with sides uncovered and 1405 with sides

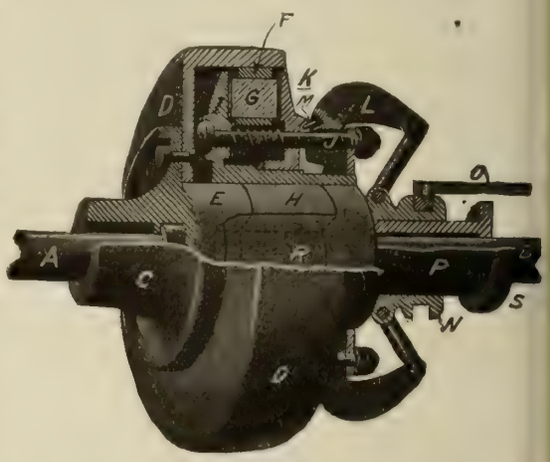

Fig. 1.—Section of Clutch Showing Essential Parts.

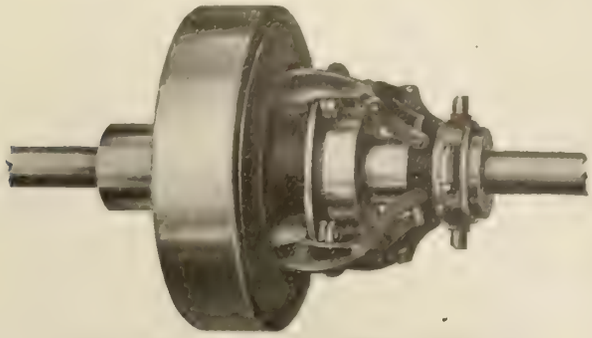

Fig. 2.—As it Appears in Service When Disengaged.

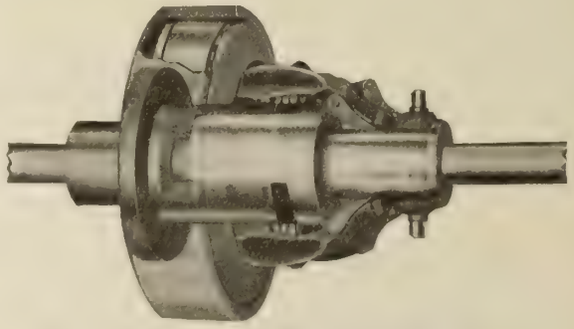

Fig. 3.—Showing the Position of the Jaw Parts and Friction.

covered. The windage was 4 watts or .005 h.p. ; the weight and balance was 27 watts or .036 h.p. The test was performed with shaft running at 400 r.p.m. at which speed the watts consumed to run shaft free of pulleys was 1378 watts.

Construction of Pulley.

The rim is made ol well-seasoned maple thoroughly kiln dried, each segment being nailed and glued to the adjoining segments. The arms are made of cold drawn seamless steel tubing, pressed into a ribbed form under enormous pressure.

The hub is made of malleable iron with a number of bosses ribbed together to impart strength and reamed out to receive the arms. The bolt holes are cored to fit the heads of the bolts, to prevent the bolts from turning. The bushings are made of cast iron and provided with sufficient bearing to prevent them slipping in the pulley or on the shaft. The bushings are interchangeable.

The arms are connected to the rim by means of saddle plates which are squeezed over the flattened ends of the arms and are fastened thereto, also to the rim, by means of stout pins driven through the saddles and arms and into the rim across the face of the pulley. The ends of the saddles are fastened to the interior of the rim.

The arms are connected to the hub under enormous pressure. They are forced inwardly on a taper, expanded outwardly at their inner ends and upset at the extreme outer ends of the hub bosses, thus making perfect connections without the use of rivets or screw threads.

Fig. 5 shows the parts of the "Ideal" combination split pulley, which is patented in all countries. In this figure, 1 illustrates the rim connection showing saddle and pins ; 2, the saddle plate ; 3, the arm before being forced into the hub ; 4, the hub connection showing the manner in which the arm is secured ; and 5, the bushings showing the large area of contact with the hub and the shaft.

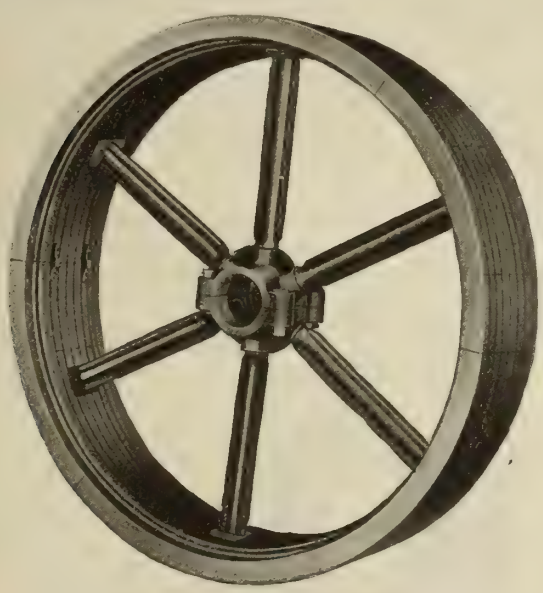

Fig. 4.—"Ideal" Split Pulley.

TEST OF STEAMER LEVIS.

The first production by the Canadian General & Shoe Machiney Co., of Levis, Que., in their new departure in engineering lines, is the steamer Levis, built for the Levis Ferry Co., Ltd., tested April 27, 1910, at Quebec. This firm built the machinery while the hull was constructed by the firm of Davie & Sons, also of Levis. The test of the steamer proved quite satisfactory, the machinery running smoothly, with little vibration. The stearing gear proved to be remarkably sensitive, everything showing careful design.

A notable feature about the ship was the great expediency of its construction, for the contracts, for it and its sister ship, Lauzon, which is nearing completion, were only let November 25, last. These two boats are for summer traffic; but the contract for two winter boats has been let to the same firms, on the recommendation of the supervising naval architect, A. Angstrom, of Toronto. These latter boats are to be delivered next November.

The companies interested are worthy of comment. The hull builders, Messrs. Davie & Sons are an old established firm, having been in business in Levis some 25 years. The Canadian General & Machinery Co., Ltd., who built the engines and boilers and installed the same, is a newer concern, having been established in Quebec by its managing director, Ernest Caron, in 1901, for the sole purpose of manufacturing shoe machinery. That field not proving sufficiently extensive, the works of Carrier, Laine & Co., in Levis were leased from the Federal Government for a term of 30 years, and the old plant moved across the river to this newer place, where a general engineering business is now carried on. In their new premises, the firm is well situated for the rapid and efficient production of all kinds of machinery.

WESTERN CANADA RAILWAY CLUB.

In his recent annual report, W. H. Rosevear, the secretary of the Western Canada Railway Club, Winnipeg, claimed that no railway club on the American continent had grown so quickly as had the Winnipeg organization. The membership of the society increased from 35 to 450 in one year. Officers for this year were elected as follows: Hon. president, Wm. White, (second vice-president of the C.P.R.); hon. vice-presidents, E. J. Chamberlain (vice-president and general manager of the G.T.P.), G. J. Bury, (general manager of the C.N.R.), and W. Phillips, (general manager of the Winnipeg Electric Railway); president, A. E. Cox, first vice-president, G. W. Caye, second vice-president, R. R. Neild; secretary, W. H. Rosevear; treasurer, E. Humphries. The executive committee was selected as follows: Grant Hall, J. Hillis, S. J. Hungerford, J. G. le Grand, F. H. Crane, W. S. Fallis, E. W. du Val and L. O. Genest. A. H. Mulcahey and E. O. Balleine were made to form the audit committee.

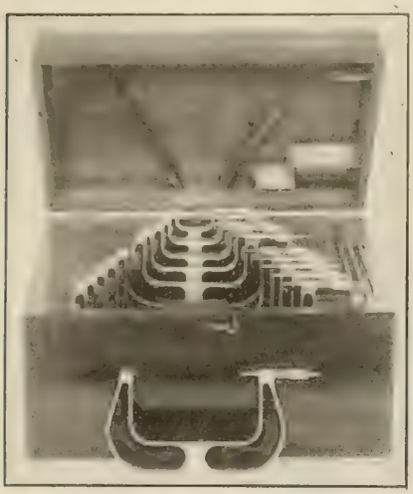
DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

MICROMETER CALIPERS.

The Brown & Sharpe Mfg. Co., of Providence, R. I., have recently added to their line of Micrometer Calipers a new series that will measure all classes of work from one to 12 inches and from 25 to 300 millemetres.

The micrometers embody the new style of frame recently adopted and which is a distinctive B. & S. feature. This is made with an I section that tends to strengthen the frame at the very points



Micrometer Calipers, Brown & Sharpe.

where strength is needed, to give rigidity to the whole tool, and also to lighten it so that it is convenient to handle.

Although the frame is lightened it does not interfere with the accuracy of the tool, each of the micrometers being rigidly inspected for accuracy before they leave the shop. All of the parts that are subject to wear are hardened and means of adjustment are provided to compensate for wear. A standard gauge for testing the accuracy of the micrometer is sent with each one.

Another feature that still further enhances the value of the tool is the fact that the measuring points are left square to aid in measuring small projections on a plane surface.

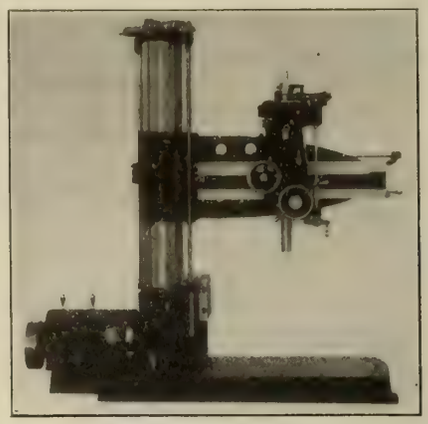
These micrometers are furnished singly or in sets, the full line of eleven micrometers in one set and six sizes in the other.

RADIAL DRILL.

The illustration shows a new design 4 ft. and 4½ ft. Radial Drills, brought out by the Meuller Machine Tool Co., Cincinnati, to meet all the requirements of modern drilling. Strength and massiveness are exhibited in every part of the machine. The column is of heavy construction, insuring rigidity. It is well ribbed internally and ground to size. The arm is of hollow rectangular section and has been increased considerably in weight. It can be securely locked to the column by the one tightener handle shown. This is convenient for the operator as he does not have to bother with two handles. The arm can be raised and lowered by a coarse pitch screw, conveniently controlled. It can be lowered at twice its elevating speed.

The head has been strengthened, and is traversed on the arm by a rack and pinion. It can be locked to the arm by two small tightener handles. Our back gears are located on the head and the operating handle is located in front of the operator, making it very convenient. They are of simple construction and may be engaged or disengaged without the slightest shock while the machine is in motion. The tapping mechanism will take care of unusually heavy tapping operations without showing a strain. It has a device to prevent breaking of taps, and also permits taps to be backed out at accelerated or even speed. The handle for starting, stopping, and reversing the spindle is located on the head in front of the operator.

Spindle is equipped with a depth gauge and automatic stop, and twenty-four changes of speed are available. All speeds are given on a brass plate attached to the arm of the machine. Spindle is counterbalanced and has quick advance and return. The machine is furnished with a combination positive and friction feed and arranged for eight changes to each change of spindle speed, any one of which is instantly available without stopping the machine.

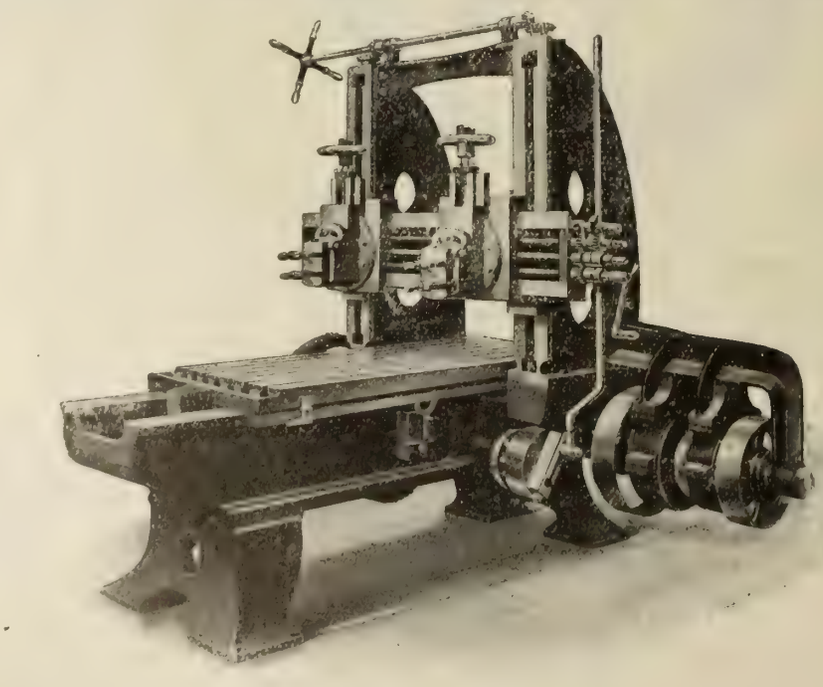


New Radial Drill, Mueller Machine Tool Co., Cincinnati.

The speed-box is of the geared friction type and permits twelve changes of speed. Changes are made by moving the without the slightest shock.

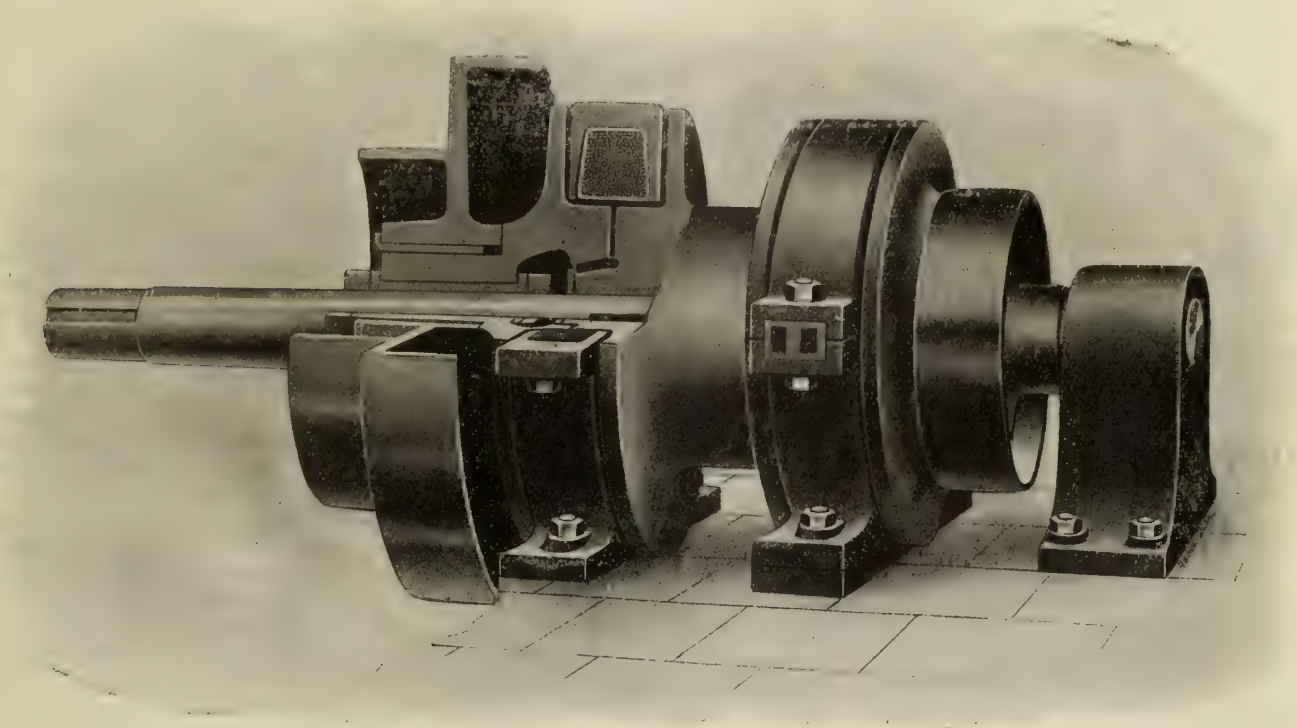
NEW PLANING MACHINE DRIVE.

For some years engineers have been trying to develop systems to improve the driving of reciprocating machine tools, such as planing machines. In about 1902 Electro Magnetic Clutches were tried and now a very large num-



Planer, C. E Lugard & Co., Chester.

ber have been installed with great success. Planers from 2 ft. 6 in. by 5 ft. up to 9 ft. by 35 ft. are now running and giving every satisfaction. C. E. Lugard & Co., of Chester, have put this system on the market under the name of the S. M. Electro Magnetic Drive.



New Planer Machine Drive, C. E. Lugard & Co., Chester.

Many engineering shops have in their works what is now considered an old planing machine, built perhaps 10 or even 15 years ago, but strong and capable of doing good work. Such a machine cutting at 25 ft. per minute resting for 3½ seconds for the belt to come over and returning at 35 ft. per minute, which if fitted with a Magnetic Drive can be speeded up without any damage to the machine to give two cutting speeds of say 28 ft. per minute for cast iron and 50 ft. per minute for steel or brass, with no appreciable rest at the end of the stroke, and a return of 100 ft. per minute or more, thus giving at least 2½ times its former output. The conversion is carried out by replacing the shaft carrying the 3 belt pulleys, the quick return sleeve and pinion, by a shaft carrying a double S.M. Electro Magnetic Clutch fitted with pulleys. The old striking gear is replaced by a two-way switch.

Fig. 1 shows an S. M. Electro Magnetic Reversing Shaft, fitted for two cutting speeds and a constant return speed. The clutches each consist of a stationary magnetic body containing a coil, a divided armature, one part running loose on the shaft between two collars, and carrying the pulley, the other part secured by a feather on the shaft, but capable of sliding end ways, fitted with a renewable cone of hard fibre. As soon as the circuit is closed the 2 parts of the armature re-sucked together by magnetic attraction, the drive being partly magnetic and partly frictional.

An air gap is always maintained between the stationary magnetic body and the revolving armatures, also the two parts of the armature only engage through the medium of a non-magnetic body so that sticking from residual magnetism is impossible.

The chief advantages claimed for this system are : (1) No shifting belts ; (2) Constant speed for any length of cut ; (3) Accurate reversal ; (4) Simplicity of apparatus and electrical gear. It will be noticed that owing to the stationary magnet no slip rings or brushes are required, and the drive can be installed as well from an existing line shafting as a motor.

Three methods are put forward of utilizing the drive, an open and cross belt direct from the line shafting, the clutch shaft being connected direct to the planer, open and cross belts, the clutch being mounted on a countershaft and connected to the belt pulley of the planer by a short belt, and a gearing drive through the ordinary 5 wheel change connected direct to the planer and motor. It must not be supposed that the system is only applicable to old machines, new planers have been fitted with it at a low cost. Clutches of 1,200 and 1,400 h.p. at 200 r.p.m. have been supplied for rolling mills, as a protective device against overload.

MULTI-SPEED PLANER.

A new multi-speed planer operated by a four speed belt variator has been placed on the market by the American Tool Works Co., Cincinnati.

The four speeds are obtained through a pair of opposed four step cone pulleys operated by an endless belt between them, the whole being mounted upon a substantial platform on top of the housings. The belt is shifted from step to step and provides a range of speeds calculated to cover the most exacting requirements. These, with the constant high speed return of the platen, insure the greatest working economy.

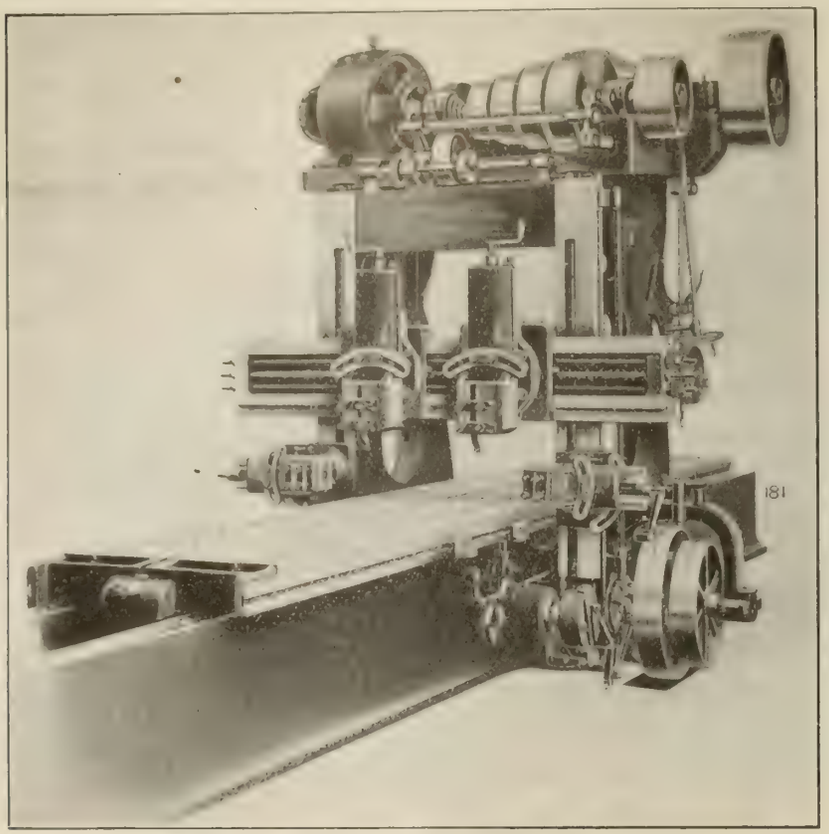
The drive has primarily two distinct advantages, viz. : simplicity of design and freedom from destructive vibration.

The shifting of the belt is novel and very effective. A pair of belt forks are moved alternately along guide rods by means of a pair of cylindrical cams, which revolve alternately through the medium of a set of intermittent gears operated by the hand wheel shown at rear. One revolution of this wheel shifts the belt from one step to another and a shot pin indicates the complete revolution. The cam rolls have spiral slots milled in their peripheries, each belt fork being moved along the guide rods through the medium of a roller operating in the spiral slots. The relation between the cams and forks is such as to shift the belt off of the high step of one cone before placing it on the high step of the opposing cone.

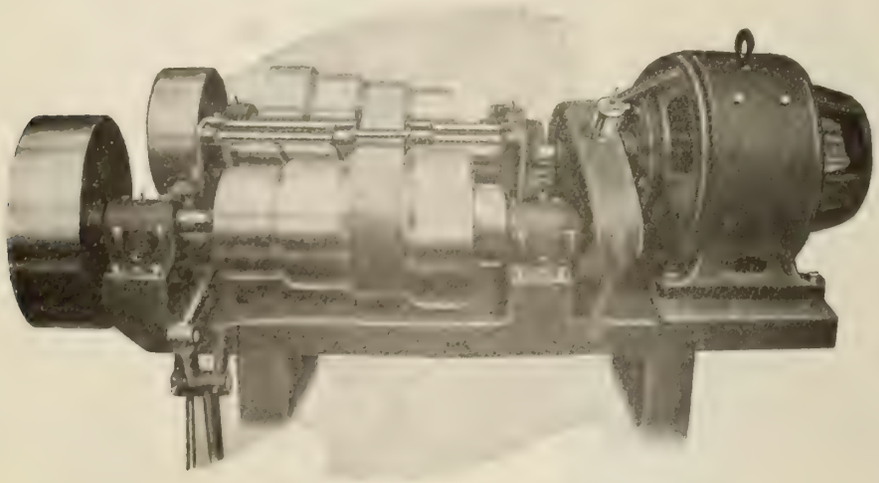
The tension of the belt is controlled by the vertical lever shown at the rear, operating in a radial slot. This lever is

of convenient height and operates a pair of bell cranks through link connections. The bell cranks serve as levers to slide the "driven" cone towards the "driver" thus slackening the belt. This feature, together with the mechanical belt shifting device and the fact that the steps of the pulleys are beveled on the edge, so as to offer no resistance to the passage of the belt, permits of easily making rapid changes of speed, even though the belt is very wide. After the belt is located for the desired speed, it is brought up tight by moving the hand lever to the point where tension is sufficient for the work, after which the lever is securely clamped by the binder handle shown.

The driven cone being moved towards the driver, which latter carries the planer driving belts, is a distinct feature, inasmuch as the tension of the vertical belts is not disturbed when making speed changes, and the danger of their flying off, from becoming loose, is overcome.



Planer of the American Tool Works Co., Cincinnati.



Planer Drive, The American Tool Works Co., Cincinnati.

Speeds are changed without stopping. This is a valuable feature of this drive. With this drive it is far easier to make the changes while in motion than otherwise. Driving pulleys have fly-wheel rims, the momentum of which reduces to a minimum all shocks to the driving mechaninism due to intermittent cutting and at reversing, also insuring a steady even pull at the cutting. They are perfectly balanced, running without the least vibration even on the highest speeds. This, coupled with the smoothness of the drive, the scientific design and accuracy of the planer itself, insures a finished job which is free from imperfections, requiring the least, if any, attention from the vise hands in fitting.

Cutting speeds can be arranged suitable to individual requirements, but are regularly furnished to provide 20 ft., 30 ft., 40 ft. and 50 ft., with a constant return speed of about 80 ft.

Beltdrive is regularly furnished with this variator, the tight and loose pulleys being applied to the rear cone shaft. The drive can be obtained direct from a line shaft provided same has a sufficient speed, but slow shafts of about 150 r.p.m., require an intermediate or "jack" shaft. With our construction it is a simple matter to convert the belt drive into a motor drive at any time after the machine is installed.

A constant speed motor is required, either of the direct or alternating current type. The motor is direct connected to the variator through spur gearing. A starting box is all the controlling mechanism necessary. Should the motor at any time become disabled, the driving gear on end of variator shaft may be replaced by a pulley, and the planer driven by belt from a countershaft or another motor conveniently placed.

MACHINE TOOL BUILDERS.

The eighth annual convention of the National Machine Tool Builders' Association opened at Hotel Seneca, Rochester, on May 24. Over one hundred representatives of machine tool manufacturing concerns being in attendance. Papers were read on Cancellation of Orders, Cincinnati Continuation School, Future of the Automobile Business with Reference to Machine Tools, Cone Drive vs. Gear Drive, etc. Committees reported on Aprrenticeship, Uniform Costs, and Standardization of Motors.

It is announced that W. A. Bowden, designing engineer of the Department of Railways and Canals for the last five years, has been appointed chief engineer of the department. He is a graduate of McGill, was appointed by M. J. Butler some five years ago, and has done good work. He designed the new Intercolonial Railway shops at Moncton, New Brunswick.

Stephen H. Chapman, president and general manager of the Ontario Wind Engine & Pump Co., Toronto, is traveling through Western Canada in the interests of the firm.

CANADIAN MACHINERY
AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

Vol. VI. June, 1910 No. 6

PROGRESS OF CANADIAN TRADE.

Since Confederation to date the statistics of Canadian trade have indicated the curious fact that the crests of each marked wave of trade expansion have followed each other in cycles of almost ten years.

Commencing in 1873, all previous records were broken with a total trade of a little over $131,000,000. In 1883 a new high record of over $230,000,000 was established; and in 1893, the third marked expansion and new high record of over $247.600,000 was attained. No halt in the trade followed until the new high record of over $472,700,000 was reached in 1904. A temporary halt was experienced in 1905 and again in 1909, but 1910, when the figures for that fiscal year are announced will show it to have been the greatest in the history of Canada.

Canada started off the first month of the present fiscal year with a gain of nearly eleven million dollars, or 31 per cent., in her total trade, as compared with the total trade for April of last year. Imports for the month totaled $30,682,438, an increase of $8,150,765, or about 36 per cent., as compared with the corresponding month of last year.

Exports of domestic products totaled $14,502.681, an increase of $2,644,884, or about 22 per cent. Exports of agricultural products for the month totaled $6,061,072, an increase of a little over one and a quarter millions. Exports of manufactures totaled $2,380,011, an increase of $632,011.

If the present rate of increase is maintained for the rest of the year the total trade of the Dominion will considerably pass the eight hundred million mark. The customs revenue for the month was $4,883,015, an increase of $1 094,555.

PROTECT BELTING AND MACHINERY.

Caught on the belting of the machine at which he was working, and carried along against the floor above where his body lodged, while the shafting pounded him into insensibility, W. A. Gon met a horrible death in the concentrating mill at Eustis. Gon was an employe of the mill, and was busy at his work, when his clothes accidentally caught on the belting, which carried him off his feet.

After being whirled with lightning rapidity through a sixteen-inch space between the belting and the ceiling over some machinery in the mill at Greer's camp at Mack's Siding until every particle of clothing was torn off him, Daniel McCullouch now lies in St. Joseph's hospital with his right leg broken and one shoulder badly shattered, fortunate in having escaped with his life.

Canadian Machinery has pointed out on numerous occasions the necessity of protecting belting and machinery. Unless moving parts, belting, etc., are properly protected, by caging, fencing or in any convenient but effective manner, employes are in constant danger. We do not know whether or not the accidents here described are due to carelessness on the part of the men or the companies, but we believe it is to the interests of companies generally, to look after the physical well-being of the engineers and employes. By protecting the workmen from possible accidents they are kept always at work and there is no danger of such reports being published as those here given.

NEW QUEBEC BRIDGE.

The new Quebec bridge will be of cantilever design and tenders will be called for by public advertisement in the leading engineering journals of Canada, U. S. and Great Britain in the course of a few days. The Minister of Railways received a cable recently from Engineer Fitzmaurice, who is now in England, stating that after consultation with his colleagues, Modjeska and Vautelet, the other members of the board of experts appointed by the Government to supervise plans and construction of the new bridge, they had agreed that the tests which have been recently made, both in England and the United States, as to the suitability of the cantilever design submitted last fall by the Board of Engineers showed that it was the best possible. Tests have also been made of the suspension design, but the engineers have decided in favor of the cantilever. About three months' time will be given for tenders to be submitted, and all tenders must comply with the condition requiring a sufficient guarantee that the bridge will be constructed strictly according to specifications, and that in case of any failure, the contractor will be liable for all loss.

THE MAN WHO DOES.

To-day the man who *does* is the only one who is recognized.

What he has been or what he has done—

What he expects to do in the future—all these make a pretty story.

But we like the sound of the footsteps of the man with red blood in his veins—

The man with fire in his eyes, energy in his movements.

Not a man who *expects* to do—some day,
But the man who is doing things—*now.*

—*Obermayer.*

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

WADSWORTH CORE MACHINE.

For a number of years George H Wadsworth, of the Falls Rivet & Machine Co., Cuyahoga Falls, has presented the foundry public with a new type of core machine each year, and at the coming convention in Detroit he will have on exhibition a new and interesting type known as the Wadsworth Vertical Jar-Ramming Core Forming Machine.

This is clearly illustrated in the accompanying views The mechanism is shown in Fig. 1. The machine consists of a table supported upon suitable legs between which the operating mechanism is situated. The core is formed in a vertical shell or core box, sand being supplied from the swinging hopper above the machine. As the sand is fed into the core box or shell the crank at the right is slowly rotated so that the ratchets upon the shafts at each side of the centre of the machine alternately lift and drop the core box or core tube. The stool which supports the entire mechanism for forming the core has projected from it wings in the form of pawls. These wings rest on two ratchets, so that the mechanism is lifted from both sides at the same time. The ratchets are kept in proper position by the gears seen at the back of the machine. The core tube A works in a sleeve B, and is controlled by the adjusting screw C. This screw is first adjusted as to the proper length of core to be made and then the tube forced through the table of the machine by lifting the adjusting screw and turning it into the groove at one side of the vertical slot as shown.

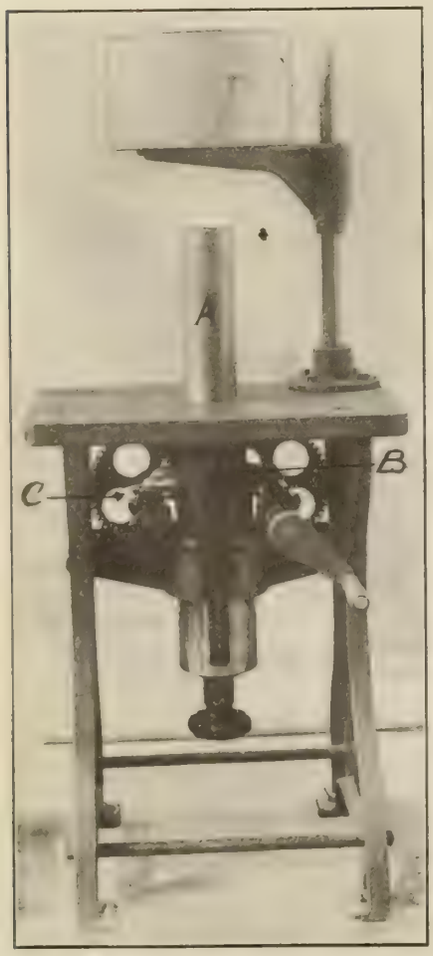

Fig. 1.—Wadsworth Moulding Machine Showing Mechanism.

GEO. H. WADSWORTH,
Falls Rivet and Machine Co., Cuyahoga Falls.

For making an ordinary straight core the straight tube itself is all that is necessary. For irregular cores special dies or core boxes are introduced on the inside of the tube A, and the jarring motion of the machine compacts the sand into the box, causing it to feed out under the shoulders of chamber cores. A group of cores made in this machine is shown in Fig. 2. At the rear are shown straight cores and cores with tapered prints on one or both ends.

The front row contains a number of chambered cores. The core at the left is not only chambered but provided with tapered prints at both ends. The large diameter is 2¾, and the main body of the core two inches. The difference in diameter between the various parts of the other cores is plainly shown. A group of the machines which will be shown at Detroit can be seen in Fig. 3. In this illustration all of the dies have been drawn down through the tables. In the three machines at the left the vent rods have been drawn and are lying on the table, while in the three machines at the right the vent rods are in place. At the left of the central spindle of several of the machines can be seen the bushing which is placed in the top of the die to form the upper tapered print. At the right of the central spindle on three of the machines can be seen the split core box or special die which is introduced into the machine for forming chambered cores.

The lower end of these die-boxes is tapered in such a way that when the outer casting or tube is drawn down through the table of the machine the dies fall away automatically, leaving the core standing upon the lower stool.

Fig. 4 shows the machine after the cores have been formed. The two cores at the left each have tapered prints top and bottom, and in the illustration the lower tapered print is standing in the lower die. These cores are turned over onto a former or drier which is placed against the side of the core, while it is still in a vertical position. After the core is turned over the bushing forming the lower tapered print, and which also acts as a stool, is withdrawn from the sand. On the third machine from the left is shown a straight or parallel core. The three machines at the right all show chambered cores. These also have to be turned on to special driers or pans. Cores with tapered prints can also be dried on end standing in the stool which forms the lower part of the die on the machine. These stools are exceedingly simple in construction and can be made in quantities on an au-

Fig. 2.—Set of Cores.

tomatic screw machine so that they furnish very convenient core pans.

The machines with all of the dies in place ready for ramming cores are shown

Fig. 3.—Wadsworth Machines to be Shown at Detroit.

in Fig. 5, and it will be noted that the vent rods project above each one of the dies, thus insuring a clear vent through the entire length of the core. The vent rods are drawn up out of the cores before the dies are stripped down. In the case of the three machines shown at the left the stripping of the tube or die through the table of the machines leaves the upper thimble for forming the upper tapered print standing on the core. This is picked off by hand and is shown at the left of the machines in Fig. 4.

The mixtures for use on this machine have to be somewhat different from those employed in the screw type of core machine. In general, these mixtures approach more nearly those used in multiple core boxes in turning out work by hand. Any good grade of core oil can be used as well as linseed oil, and a considerable portion of old core sand could be introduced into the mixture. Mr. Wadsworth has found the best results are obtained when the batch is made in one of the Wadsworth mixing mills, as the grinding action of the rolls improves the bond in the sand. In the general practice in his own foundry Mr. Wadsworth is using a black core compound as the principal binder. For wetting down he is using glutrin, and he has experimented with several different grades of linseed oil and core oil, all of which have given very fair satisfaction.

Fig. 4.—Wadsworth Machines After Cores have been Formed.

UNITED STATES AND CANADIAN FOUNDRIES.

A census of the foundry industry of the United States and Canada made by The Foundry shows a total of 6,594 foundries on April 1, 1910, against 6,366 in 1908, a net increase of 228. A similar census in 1906 showed 6,108, so that the net increase in four years is 486. In compiling the figures each plant was regarded as a unit, though there might be several departments. Counting each foundry department as a unit—there being many cases where gray iron and brass foundries are operated by one company, sometimes with a connected malleable or steel foundry—the total for the United States and Canada is 9,158. The total number of foundries producing gray iron castings is 5,157, as compared with 5,105 in 1908 and 4,956 in 1906. The plants melting non-ferrous metals exclusively, including brass, bronze, aluminum, etc., number 1,240, against 1096 in 1908, an increase of 144. Brass foundries operated as departments of works number 2,318, making the total number of brass foundry operations 3,558. The number of foundries making castings into which aluminum enters is found to be 1,679. The increase in malleable and steel foundries is noteworthy. The total number of malleable castings plants is now 178, of which 168 are in the United States. The total for the United States and Canada in 1908 was 153. The number of steel foundries is 265, against 211 two years ago.

Fig. 5.—Machines Ready for Ramming Cores.

CENTRAL RAILWAY CLUB.

The regular monthly meeting of the Central Railway Engineering Club, Toronto, was held on May 17. J. Jay Dunn, chief engineer of the Shelby Steel Tube Co., Ellswood City, Pa., gave an interesting paper on "Seamless Steel Tubes." He described the manufacturing processes and the properties of steel tubes.

It was decided that the annual club picnic will be held at Beaverton Beach on June 18. A special C.N.R. train will convey the club and friends to Beaverton Beach. President Duguid occupied the chair.

Lawrence L. Anthes, of the Anthes Foundry Co., Toronto, is home from a business trip through Western Canada.

Annual Convention of Foundrymen at Detroit, June 6 to 10

The 1910 Convention of Allied Foundry Associations at Detroit Promises to Eclipse all Previous Conventions—Canadian Foundrymen Should Attend.

Preparations by the Detroit committee for the coming convention of the American Foundrymen are being made with the view of having everyone who attends this convention, leave "the city where life is worth living" with the remark "this convention is the best yet."

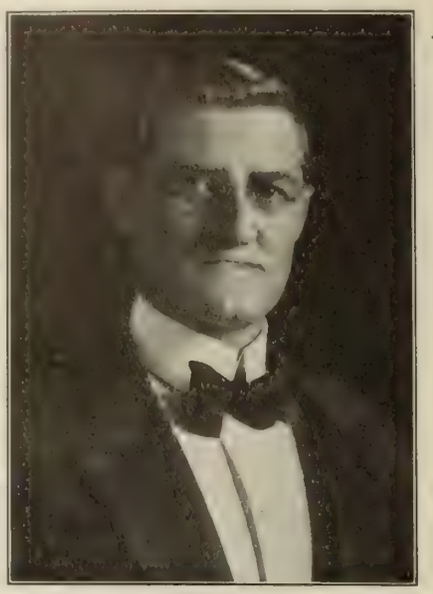
To further the plans and to assure the proper entertainment of the ladies accompanying the members, a dinner will be given at the Fellowcraft Club on Monday evening, May 16th, for the committee, chairmen and members of all local committees, together with their wives, to discuss ways and means to further the plans for this part of the entertainment.

In the reception and entertainment work for the convention the Detroit ladies will occupy a prominent position, particularly at the time of the theatre party and the automobile ride around the city which will be given for the visiting ladies.

The programme which will be gotten up will be full to overflowing of just the proper information to aid the visitors in getting around the city and enjoying the sights to the very best of advantage, and will in itself be a souvenir worthy of being taken home and placed among the treasures of happy days.

Some unique features and surprises are promised by the chairman of the entertainment committee at the smoker to be given on Tuesday evening of the convention.

JOSEPH T. SPEER, PITTSBURG,
Vice-President A.F.A.



ARTHUR M. WATERFALL, DETROIT,
President A.F.A., Detroit Foundrymen's Assoc. and Local Convention Comm.

Every means is being used to create the proper enthusiasm among the local Foundrymen, and to this end a dinner will be given on Thursday evening, May 19th, by the Detroit Foundrymen's Association, to which every Foundryman in Detroit, together with all those identified with the foundry or supply interests in any way is bidden. It is hoped at this dinner and meeting, which will be followed by a lecture with lantern slide pictures, that many ideas and suggestions may be brought out which will aid in the good work.

Chairman F. T. F. Stephenson delivers a lecture on Saturday evening, May 14th, before the Foundrymen's Association in Cincinnati.

Secretary C. E. Hoyt, of the Foundry and Manufacturer's Supply Association is in Detroit, and will remain there, except at short intervals in Chicago, until after the convention. He has already 30,000 square feet of space sold, for the exhibits, and all indications point to the banner convention of the association.

Dr. Richard Moldenke, secretary of the American Foundrymens' Association, will be in the city on Monday, May 16th. He will deliver a lecture with lantern slide pictures before the Pittsburgh Foundrymen's Association on June 2nd or 3rd.

Vice-President Eugene W. Smith, of the A.F.A., also President of the Foundry Foremen of America, recently organized a Foundrymen's Association in St. Louis, and we are advised that 40 of their members will arrive in Chicago on Sunday, June 5th, and will come from there on the special train with the Chicago delegation.

The Commandant of the United States Navy Yard of Brooklyn, has expressed a desire to send his Foundrymen, together with an officer to the Detroit Convention, and a cordial invitation has been extentded to have these people present.

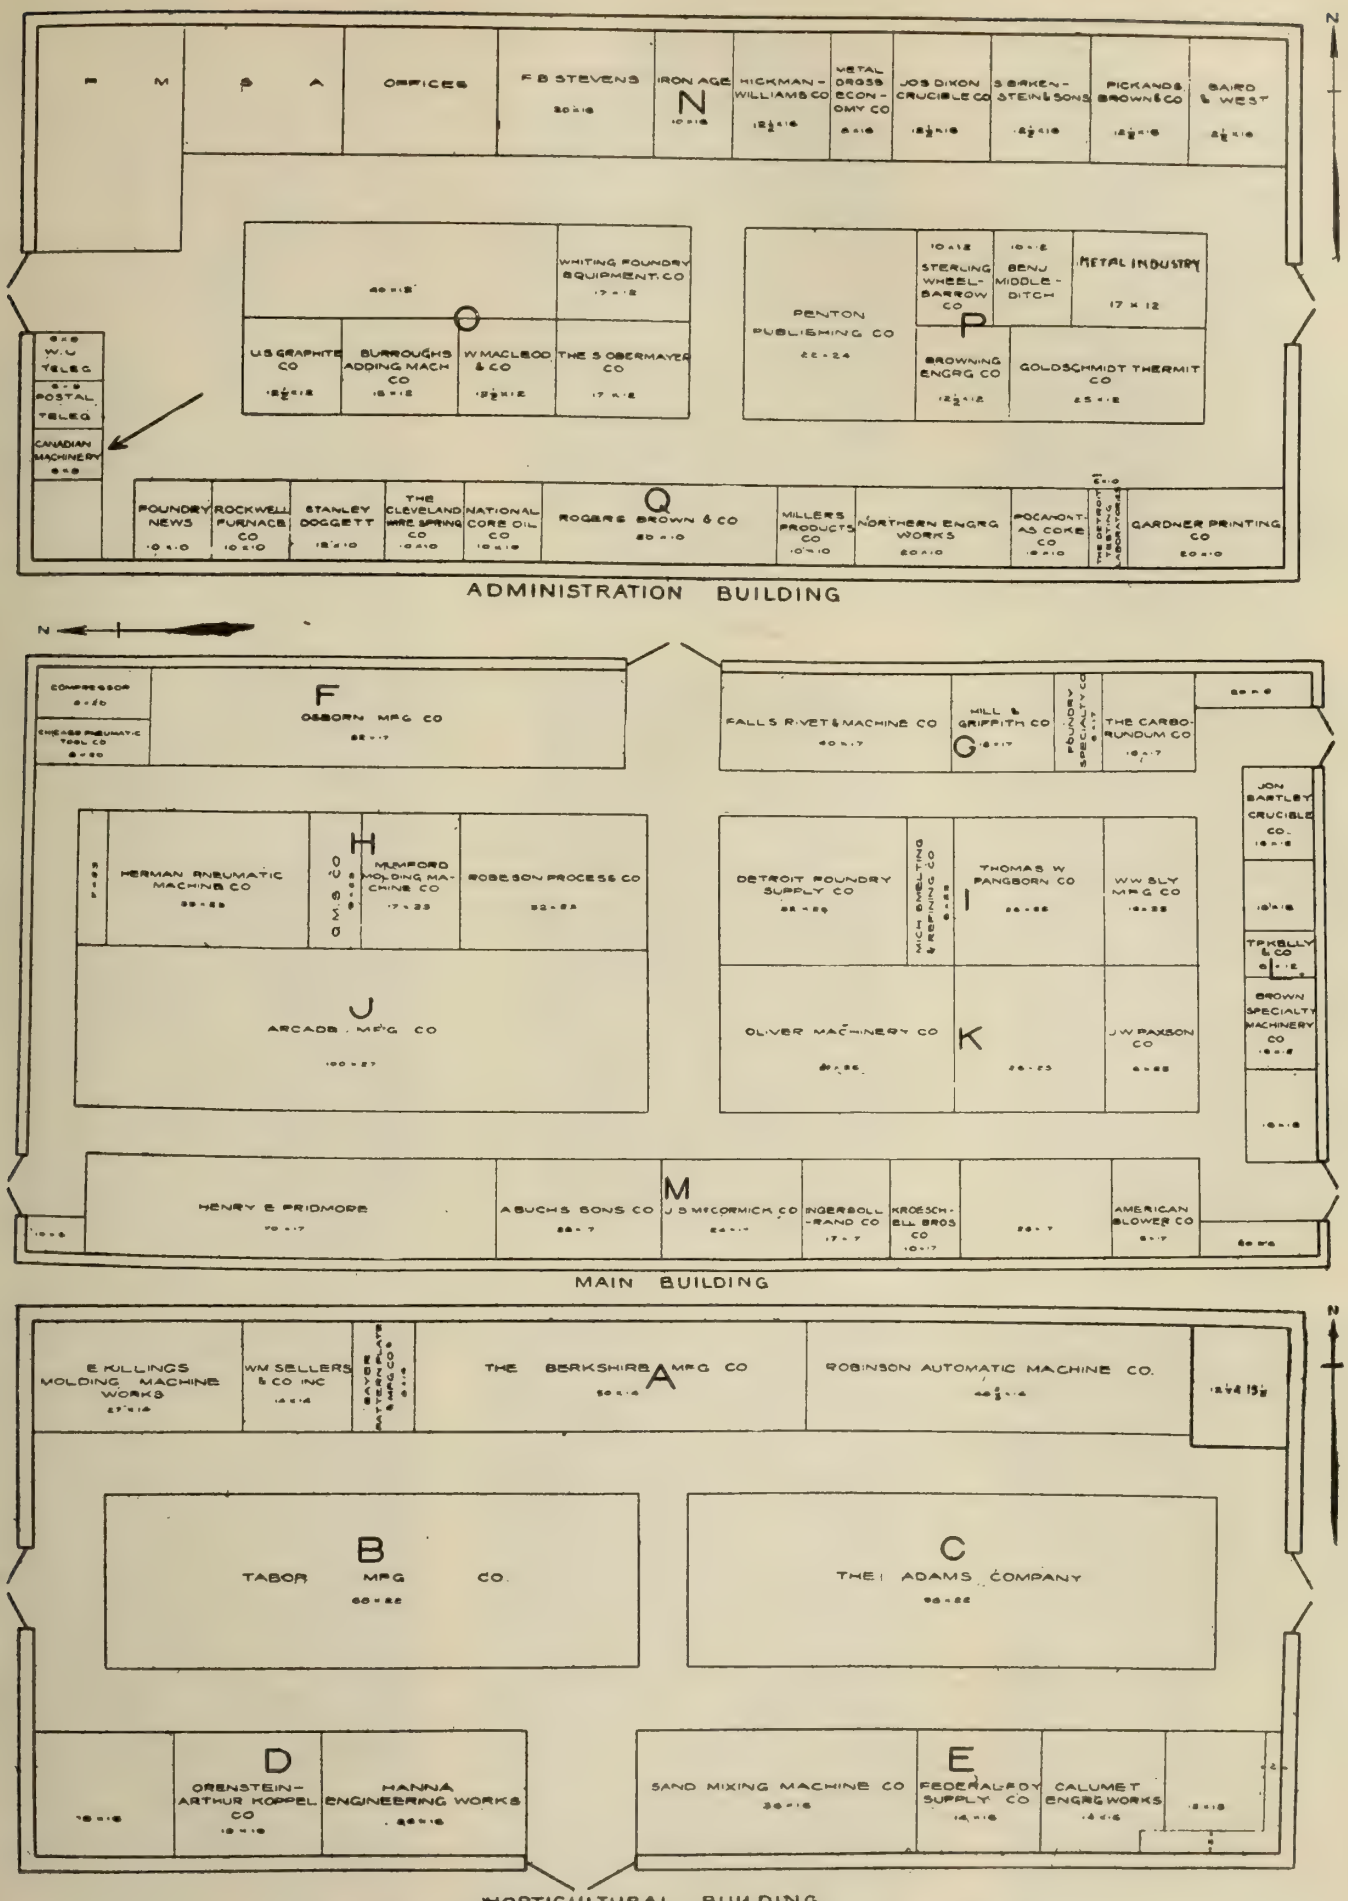
The Sessions Committee are rapidly getting their programme in shape, and it is expected that the discussions following the reading of most of the papers will be most interesting, it being thought that the programme is exceptionally good, and it has been the aim of this committee to bring out stronger than ever the educational feature of the convention.

All delegates are requested to be sure to have membership cards with them, as this will facilitate registration at headquarters.

The commissioner of the Central Passenger Association has arranged to have an agent stationed here at the registration headquarters at the State Fair Grounds, so that all tickets may be validated and taken care of, without going to any other place, and causing unnecessary inconvenience.

The Michigan State Building at the

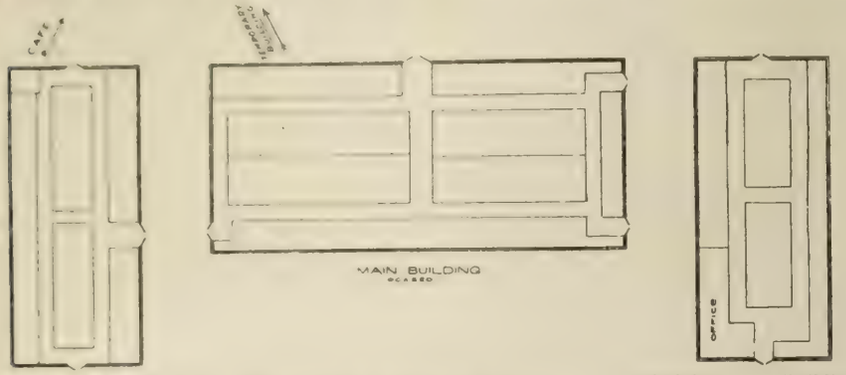
DR. RICHARD MOLDENKES,
Secretary American Foundrymen's Association.



Plan View of the Exhibition Buildings, Detroit, and the Location of Exhibits.

Fair Grounds, where the sessions of the convention will be held is beautifully located, with large verandas on both floors, and will be an admirable place for the ladies to congregate and visit, if they do not care to attend the sessions as closely as the gentlemen.

The Detroit committee is working hard, we might say day and night, and it is hoped that they will not be disappointed in the attendance. The gates are wide open, and the key thrown away, so there is no danger of being locked in or out, but we are satisfied that no pleasanter spot in the United States can be found for a week's sojourn, and it will prove a happy vacation to those who attend the convention.



Horticultural Building. Administration Building.

Plan View of Exhibition Buildings.

Temporary Building.

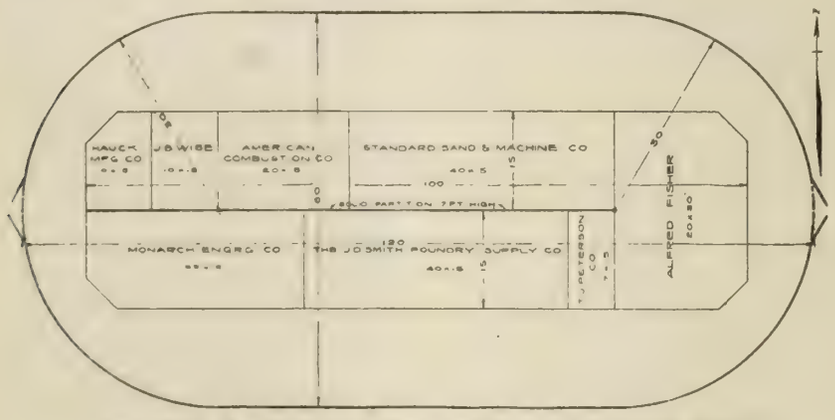
The Foundry and Manufacturers' Supply Association has decided to use a tent for temporary building at the convention and Secretary Hoyt has made an arrangement for a tent 30 feet in width and whatever length may be found necessary. The present tent is 120 feet in length, and the ends can be winged out to any desired extent. A heavy timber partition will be put down the centre of the tent, thus making the back wall for each exhibit, and the aisles will be laid on each side.

Over 30,000 ft. of floor space has already been asked for this convention. Only about 17,000 ft. were in use at the Cincinnati convention, therefore the idea that the Detroit convention is to be the banner one of the organization, appears to have a firm foundation.

The Detroit local committee has provided a set of lantern slides dealing with convention matters, which will be loaned to any Foundrymen's organization in the country that sees fit to use them. Application for these slides, which are all properly labelled and with data to go therewith, should be made to Frank T. F. Stephenson, chairman of the local committee, at once, as several Foundrymen's Associations have already requested the use of these slides.

The Exhibits.

The illustrations show the layout of the buildings, and the names of the various exhibitors who will attend the convention. The Administration, Main and Horticultural buildings will house the exhibitors. The Michigan State Fair Grounds offer every facility for the convention. They are reached by the Woodward Ave. cars, which run direct to the fair grounds.



Plan View of Temporary Building, Showing Location of Exhibits.

Dixon Crucible Co. at A. F. A.

The Joseph Dixon Crucible Co., Jersey City, N.J., will exhibit at the coming convention of the American Foundrymen to be held this year in Detroit. The exhibit will include a display of crucibles, stoppers, nozzles, sleeves, muffles, skimmers, stirrers, retorts, graphite bricks, special crucibles for patent furnaces, foundry facings and motor brushes. Representatives from the various branch offices will be in attendance.

Foundry and Manufacturers' Supply Association.

President, F. N. Perkins, Freeport, Ill.; Secretary, C. E. Hoyt, Lewis Institute, Chicago, Ill.; Treasurer, J. S. McCormick, J. S. McCormick Co., Pittsburg, Pa. The objects of the Association are for the commercial and technical education of iron and metal industries by co-operating with all foundry and manufacturing interests in making an annual exhibit of supplies and equipments in conjunction with the meeting of the American Foundrymen's Association.

American Brass Founders' Association.

President, Wm. R. Webster, Bridgeport, Conn.; Secretary and Treasurer; W. M. Corse, 1155 Sycamore Street, Buffalo, N.Y. The objects of the Association are for the educational welfare of the metal industry.

TOOL STEEL FROM IRON ORE.

Tool steel at an initial 9 6-10 cents per pound has been produced direct from iron ore by J. W. Evans, Belleville, in a small electric furnace of 150 lbs. capacity. The steel was tested at Hamilton and McGill University, Montreal, with excellent results. At Belleville, where the furnace is installed, electric energy costs $50 per horsepower per year. The cost per pound mentioned above is based upon this rate for power, and includes all charges, such as depreciation, briquetting, etc., etc.

Mr. Evans first produced tool steel direct from titaniferous iron ores in the electric furnace in 1906, and since then he has been following up the work perfecting the work to make it useful commercially.

The value of Mr. Evans' work has been recognized by the Canadian Mining Institute. During its recent annual meeting, the following resolution was passed: "Resolved, that the Institute desires to express its appreciation of the results achieved by J. W. Evans in his electric furnace, and regrets that illness prevents his attendance at this meeting."

WILLIAM R. WEBSTER, BRIDGEPORT,
President A.B.F.A.

N. K. B. PATCH, TORONTO.
Chairman Papers Comm., A.B.F.A.

C. E. HOYT, CHICAGO.
Secretary M. & M. S. Assoc.

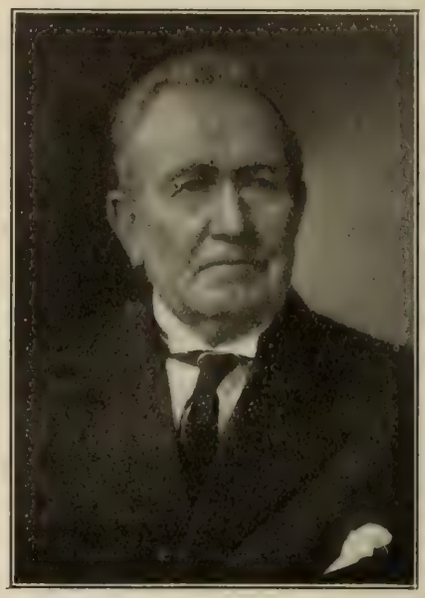
Steamer "Britannia", Excursion Boat for Convention.

W. W. SLY MFG. AT DETROIT.

Among the exhibitors at the Detroit Convention A.F.A. and allied associations, will be the W. W. Sly Mfg. Co., Cleveland. W. W. and W. C. Sly are popularily known as the "cleaning mill" men, their tumbling mills being a specialty with them. Mr. W. W. Sly is a dog fancier and the Sly dogs (thoroughbreds) are well known among his friends.



W. W. SLY.

President W. W. Sly Mfg. Co., Cleveland. New Radial Drill, Mueller Mch. Tool Co., Cincinnati.

W. C. SLY,
Secy. and Treas. W. W. Sly Mfg. Co.

Opportunity is represented as having long hair in front and being bald behind. He may be grasped when he meets you, but not after he passes.

FOUNDRYMEN'S CONVENTION PROGRAMME.

The following is the program of the convention of the American Foundrymen's Association and allied organizations:

Opening Session, Tuesday, June 7, 10 a.m.

Addresses of welcome.
Response.
Presidential address, Arthur T. Waterfall, for the A. F. A.
Presidential address, Wm. R. Webster, for the A. B. F. A.
Secretary and treasurer's report, W. M. Corse, for the A. B. F. A.
Secretary and treasurer's report, Dr. Richard Moldenke, for the A. F. A.
"Acetylene-Oxygen Repairs in the Foundry," with an exhibition of the art as practically applied, by Steelman Stephenson, of Detroit.

Second Session, 2 p. m.

American Brass Founders' Association.

"Analyses of Lead in Brass Alloys," by C. P. Carr, New York City.
"Fluxes as Applied to the Brass Foundry," by Wm. R. Sperry, Bridgeport, Conn.
"Use of Magnesium in Deoxidizing Aluminum Alloys," by H. M. Lane, Cleveland.

3 p.m.

American Brass Founders' Association.

"Foundry Efficiency," by Benjamin D. Fuller, Cleveland.
"The Personal Equation in Accidents," by Thomas D. West, Cleveland.
"The Permanent Mold," by Edgar A. Custer, Philadelphia, illustrated by lantern slides.

Evening.

Smoker, given by the Detroit Foundrymen's Assosciation to members of the allied associations at the Light Guard Armory.
Theatre party for the ladies at the Temple theatre.
Headquarters for visiting ladies at Parlor H. of the Pontchartrain hotel, where members of the ladies' committee of Detroit will be present at all times to give the necessary assistance and information to the visiting ladies.

Third Session, Wednesday, June 8, 10 a.m.

American Brass Founders' Association.

Address on "Brass Foundry Practice," by Jesse L. Jones, Pittsburg, Pa.
"Electric Power Required to Melt Brass, Bronze, Etc.," by Prof. J. W. Richards, South Bethlehem, Pa.
"Electric Furnaces for Melting Non-Ferrous Alloys," by A. L. Marsh, Detroit, Mich.

11 a.m.

American Foundrymen's Association.

Report of Committee on Chemical Standards for Iron Castings, by Prof. J. J. Porter, Cincinnati.
"Physics of Cast Iron," by H. M. Lane, Cleveland.

Wednesday Afternoon, 2 p.m.

Pleasure boat ride on Detroit river, steamer Brittania, stopping at Semet-Solvay coke ovens, and Detroit Iron & Steel Co.'s blast furnaces, continuing down the river to see the government work on Livingstone channel.

Fourth Session, Thursday, June 9, 10 a.m.

American Brass Founders' Association.

"The Value of the Association to Its Members," by Frank T. F. Stephenson, Detroit.
"Co-Operative Course of Metallurgy," by Prof. J. J. Porter, Cincinnati.
"Cost and Cost Systems Applied," by C. R. Stevenson, New York City.

11 a.m.

American Foundrymen's Association.

"The Shockless Jarring Machine," by Wilfred Lewis, Philadelphia.
"The Universal Principle of Efficiency and Rational Organization Applied to Foundry Practice," by S. D. Emerson and W. J. Powers, New York City.

Thursday, 2 p. m.

Automobile sight seeing trip around points of interest for the ladies, starting from Hotel Pontchartrain.

Fifth Session, Thursday, 2 p. m.

American Brass Founders' Association.

Unfinished business.
Election of officers.
New business.

3 p. m.

American Foundrymen's Association.

Report of committees.
Unfinished business.
Election of officers.
New business.
"Overhead Tramrail Systems for the Foundry," by A. W. Moyer, Philadelphia, illustrated by lantern slides.
"The Electric Furnace," by H. M. Lane, Cleveland, illustrated by lantern slides.

Sixth Session, Friday, June 10, 10 a. m.

American Foundrymen's Association.

"Foundry Transportation Methods," by David Gaehr, Cleveland.
Report Committee on Industrial Education, by P. Kreuzpointer, Altoona, Pa.
"Specifications for Foundry Coke," by Dr. Richard Moldenke, Watchung, N.J.
Discussion of continuous conveying methods and foundry mixer.
Adjournment.

HE GOT THE JOB.

"Norman MacLean, Foreman," printed in large letters on the door of the little office overlooking the machinery department, looked as if he had gotten along well in the world. He wasn't in the office when I called, but glancing over the shop I saw him showing two

How He Got the Job.

young fellows how to attack a new job, and decided to wait until he was free.

I just got seated when an old grey fellow, covered with grime, came in from the foundry with a message. I said good-day to him and we talked of the weather, etc. Then the talk drifted to Norman MacLean, Foreman. The old man was quite familiar with things around the place and remembered when "Norm" started to work.

I hadn't heard how Norm got his first job, and was interested in hearing the old man tell the story. Norm couldn't and wouldn't plow and left for town to find a job. That much I knew. There comes a time to most of us when we must approach the "boss" for a job, and it is usually a very timid applicant that meekly asks the high and mighty man for a job. There is a certain "art" about getting a job, and Norm evidently meant to secure one at the first place he called.

On reaching town he at once made his way to the Harte Engineering Works, where he approached the "boss." The boss was not in a particularly quiet frame of mind. His "What on earth are you good for?" somewhat surprised Norm, and his answer somewhat surpristhe boss. "I want to be foreman here, but since that position is filled, I'll be content to be one of his assistants."

The boss looked him over and hesitated. There was some more talk ending with the boss telling him, "If I call you back before you reach the pavement, I'll give you a job."

Norm was resourceful. He walked out of the little office and started for the door of the works. Then he hesitated. He had an idea. On the floor, lying close to the door was a new die stock that had just been delivered.

Norm looked back at the little office saw the foreman was looking, picked up the die stock on his shoulder and ran for the works door. Of course, the foreman was after him in a second, shouting to bring the die stock back.

Norm walked back, took off his coat, looked at the boss, and asked what he would do. The boss looked him over for the second time and said "Youngster, I'll hire you," and that is how Norman MacLean began his career in the shops in which he is now foreman.

Factory expenses can vary tremendously. Repairs is an especially elusive item. By keeping repair accounts separately, when old equipment, poor piping, wiring and machinery are proving expensive, the accounts will show at once that it is wise to replace old equipment with new.

Pure cement, one manager has found, mixed neat with water shows a slightly alkaline chemical reaction, and has proved a good preservative for steel and iron when applied to such surfaces with a paint brush. It is necessary that the coating be continuous if this method of rust-proofing is to prove satisfactory.

One manager includes the item of packing expense in shop cost instead of grouping this item with the selling expenses. While most concerns follow this latter procedure, this manufacturer believes that since his warehouse is his stockroom and nothing is packed except orders and no crated stock appears on the inventory, the packing expense can logically be a part of shop cost.

PATTERN MAKING KINKS.

By F. G. C.

There are many things in pattern making which appear trifling, but which really are of the greatest importance and chief of these is the fillet.

We all know how much the appearance of a pattern or casting is improved when nicely rounded instead of sharp at the edges, and with all the corners filletted. We also learn by experience that the moulder has much less trouble drawing such a pattern from the sand. But the greatest reason for filletting all

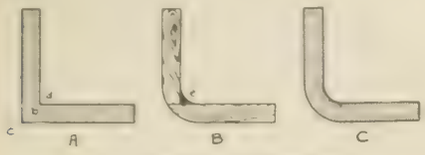


Fig. 1.—Strength of Castings.

corners wherever possible is for maximum strength with minimum weight whether iron, steel, brass, bronze or any other cast metal be used.

This difference of strength is shown clearly in Fig. 1. A represents a casting having sharp corners. When the metal crystallizes after being cast the crystals form into a kind of grain running at right angles to the face of the casting; and, wherever a sharp corner occurs these grains become broken, leaving a bad spot as shown at b, thereby making the casting weak across the line c-d. But if a fillet is put in the pattern as shown in the section B at the corner c, then we will get a casting as shown at C, without having any irregular crystalization as in section A.

A good illustration of the faulty results that may happen where sharp corners are allowed to exist is shown in Fig. 2. The cylinder shown at A was

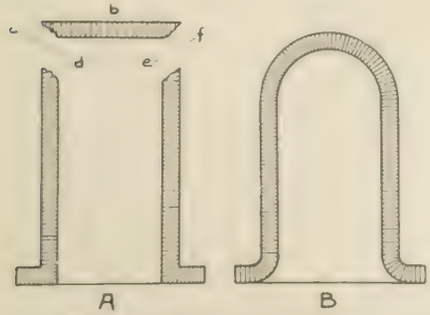

Fig. 2.—Results of Sharp Corners.

cast with sharp corners and a square bottom. When the pressure is applied to the interior of the cylinder the head b will be forced out, as shown in the illustration, the break occuring along the line c-d and e-f. If this cylinder had been cast as shown in Fig. 2-B with a round end, it would be proportionately strong all over, and, in fact, the end would be even stronger than the sides which withstood the pressure in the cylinder a.

The best fillet material is wood, whether put on from a strip or worked out of the wooden pattern. For irregular curves, the leather fillet is best, fastened to the pattern with shellac rather than glue, as the glue often gives away when the pattern is put in the wet sand. Then for small, very irregular patterns, we can use beeswax, in its pure state or in composition with tallow, rosin, linseed oil and red ochre or whiting, making a dark or light fillet or pattern filler, as the case may be. The formula for one of the compositions is: 1 quart linseed oil, 7 pounds beeswax, 7 pounds of whiting, and 1 pound of rosin, the whole heated in a pot till thoroughly mixed and applied when warm.

Wood, leather and metal fillets are on sale in every city, so require no comment, but the wax filletts are usually made by the pattern maker. A very convenient way to make them is to take a small piece of brass tube about 1¼'' inside diameter and about 8'' long, securing a cover on one end with a round hole or an opening, the shape of a leather fillet, if so desired. Inside have a plunger secured on the end of a threaded rod, about ⅜'' diameter, which passes through the cover on the other end, which must be removable (a screwed on cap is best to permit the warm wax solution to be poured in and forced through the small hole at the bottom. The ⅜'' threaded rod which screws through the cap is usually squared on the projecting end, suitable for turning with an ordinary hand brace.

The wax fillets when cold are pressed into the corners of the pattern by means of a warm iron, which is rounded to make the proper size fillet from material used.

CANADIAN RAILWAY CLUB.

A. A. Maver, Master Mechanic of the Grand Trunk, was last night elected president of the Canadian Railway Club, Montreal, to succeed H. H. Vaughan.

The election of officers went by acclamation, the report of the nominating committee being unanimously accepted, and resulting as follows:

President—A. A. Maver, master mechanic, Grand Trunk.

Vice president—A. A. Goodchild, auditor of stores and mechanical accounts, C.P.R.

Second Vice president—James Coleman, superintendent of the car department, Grand Trunk.

Secretary—James Powell, box 7, St. Lambert near Montreal.

Treasurer—S. S. Underwood, chief draftsman of the Grand Trunk.

Executive committee—Messrs. A. L. Grayburn, 3rd vice-pres., C.N.R., Toronto; R. W. Burnett, master car builder, C.P.R., Montreal; H. C. Butler, C. Kyle, general master mechanic eastern lines, C.P.R., Montreal; William McNab and F. Ditchfield, Supt. Dominion Car & Foundry Co., Montreal.

Auditors—Messrs. H. A. White, J. S. Johnstone and G. I. Evans.

Some discussion arose as to the advisability of putting this surplus, which amounts to $2,905 this year, to some practical use instead of leaving it to draw interest in the banks. It was proposed by A. A. Goodchild that this fund should be utilized for the establishment of a reference railway library in connection with the club.

This idea met with immediate approval, and on motion of Mr. Goodchild, it was decided to authorize the new president to appoint a committee to look into the matter and report at the next general meeting.

As soon as this business was concluded, S. King, of the Canada Car Co., called H. H. Vaughan, the retiring president, to the front and presented him with an engraved gold past-president's jewel, which was duly acknowledged by Mr. Vaughan amidst applause.

A brief address by Grant Hall, president of the Western Canadian Railway Association, of Winnipeg, closed the formal proceedings. These were followed by a smoking concert, at which piano solos were given by N. Eichorn; Scotch songs by Mr. Ferguson; instrumental selections by Messrs. Wilson and Smith; songs by Messrs. Rice, Clark and Armstrong, and some interesting card tricks by "Doc" Ware.

The Detroit Foundry Supply Co., Detroit and Windsor, have closed several agencies for foundry equipment for Canada. One of these is for the Anthony Co., New York, manufacturers of Nebulyte Crucible Oil Furnaces. These will be manufactured in Windsor. They use a fine spray as atomizer, combustion is excellent. The life of the crucible is prolonged 50 per cent. and it will melt brass with ¾ gallon to 100 lbs. It is a noiseless furnace. Another agency is for adjustable eccentric clamp. A third is for an aluminum snap flask.

J. Walter Keith, formerly treasurer of the Frost & Wood Co., Smith's Falls, Ont., has accepted a position in Calgary, Alberta.

INDUSTRIAL and CONSTRUCTION NEWS

Establishment or Enlargment of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bricges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop News.

The John Deere Plow Co. are erecting a 100,000 block at Saskatoon.

The C. P. R. will build a new roundhouse and machine shop at London.

Bennett & Phelan, brass and bronze founders, Montreal, have been registered.

M. H. Braden was awarded the contract for a $25,000 garage for the Northern Automobile Co., Fort William.

The Vancouver Exhibition Association have decided to erect a new Machinery Hall to cost $20,000.

M. H. Braden, of Fort William, has been awarded the contract for the new C. P. R. shops at that place.

The machine shop of John Ballantyne & Co., Preston, together with the pattern rooms, was burned on May 26.

The Morrisburg Tack Mfg. Co., Morrisburg, Ont., after the erection of the tack factory will erect one for the manufacture of nails.

Heinbuch & Kischell, machinists, Stratford, Ont., have dissolved, George Heinbuch will continue alone under his own name.

The Denis Wire & Iron Works Co. have been authorized by the Dominion Government to increase their capital from $50,000 to $100,000.

The Canada Cycle & Motor Co., Toronto, is in its busiest season and reports a decisive demand over last year for bicycles and automobiles.

The Eastern Canada Steel & Iron Works wil erect a plant for the manufacture of structural steel for buildings, bridges, etc., at Quebec.

C. H. Macmillan, in charge of the Bethlehem Steeel Works is rejoining the staff of the Dominion Iron and Steel Co., as assistant general manager.

W. Minto, Jr., has taken over the bicycle and machine shop business conducted for some years by George J. Barrett at Fredericton.

The Silliker Car Works, Halifax, have at present six hundred hands on their pay roll and the company are running a double shift —day and night.

The Waterloo Mfg. Co., Waterloo, manufacturers of steam engines and threshers, is going into the manufacture of gasoline engines extensively, for western trade.

W. G. Chater, manager of the Hespeler Machinery Co., Hespeler, Ont., has returned from an extended trip through the west in the interests of the company.

The Corbet Foundry & Machine Co., Owen Sound, is enlarging. To carry on the increased work the company has been incorporated with a capital of $40,000.

The Atikokan Iron Co. will build 100 more ovens in connection with the blast furnace plant at Port Arthur, and will increase the capacity from 100 to 150 tons of pig iron per day.

The Maloney Mono-rail System Co. have been organized with a capital of $200,000, and it is stated that shops will be erected at Montreal, Levis, Toronto, Ottawa and Medicine Hat.

The Canadian Locomotive Works, Kingston, have received an order for 25 locomotives for the Grand Trunk Pacific, and 10 for the Grand Trunk. They are all of the mogul pattern.

The D. J. Barker Co., of Picton, Ont., will build a large addition to their stove foundry A new furnace for smelting iron, has been installed with fifty per cent. more capacity than the old one.

The new plant of the Mounted Steel Works, is to be started immediately at Longue Pointe, Que., and it is estimated that nearly two million dollars will be spent within two years.

One of the buildings of Hillis & Sons' foundry, Halifax, on the Campbell road was gutted by fire this morning and the firm's loss is estimated at $7,000 or $8,000 beyond the amount of insurance.

The London Concrete Machinery Co., London, have acquired a large section of land on Kitchener avenue, East London, where they will erect new buildings, enlarge their plant and employ forty more men.

The Kootenay Engineering Works, Nelson, will remove their plant to Vancouver in June. Manager B. C. Travis has decided to engage in marine repair work, which he followed for years in Portland before coming to Canada.

J. & J. Taylor, safe manufacturers, Toronto, have been steadily increasing their working force during the spring and now employ about 300 men. They have extensive orders on hand and are completing the extension to their plant.

At a conference with the Council of the Board of Trade, Quebec, May 18, the assurance was given by Hon. S. N. Parent, Chairman of the National Transcontinental Railway, that the workshops of the railway would be located at Quebec.

John McDonald, moulder of the foundry department of the Dominion Iron & Steel Co., Sydney, has resigned his position with that concern to take the post of foreman in charge of the foundry department of the Sydney Foundry and Machine Works.

Canadian American Gas & Gasoline Engine Co., Dunnsville, capital $150,000, to manufacture business of iron, steel and wood construction; directors, F. R. Lalor, W. J. Aikens, G. R. Smith, R. A. Harrison, J. Bradford, G. McCrea, H. M. Burgar, B. S. DePotty.

The Perritt Iron & Roofing Co., incorporated under the laws of New Jersey, have been granted a license by the Ontario Government to manufacture and deal in iron, steel, machinery, Portland cement and hardware. J. E. Swinburne, Fort William, is appointed attorney for the company.

The Canadian Locomotive Works at Kingston were awarded contracts by the Temiskaming & Northern Ontario Railway that will reach $160,000. These include the building of four powerful locomotives of the Pacific type for $90,000, twelve cinder cars for $15,000 and fifty box cars with steel frames for $55,000.

The London Bolt & Hinge Works was sold by auction by J. W. Jones Monday afternoon, for $55,000, to George C. Gibbons, acting for T. S. Hobbs, one of the present partners. The works now employ about 100 hands. The factory, which has been closed 60 days for stock-taking, will be opened immediately, and will be enlarged to double its present size.

At the annual meeting of the Provincial Steel Co., Cobourg, F. W. Coolbough, who has acted as manager since the industry commenced operations, a year ago, resigned. He is succeeded by Mr. Reeding, a former Government inspector of rails. Mr. Coolbough has disposed of his interests to Robert Heath, of England, who now holds the controling interest in the industry.

The Gurney Foundry Co., Toronto, have opened their new warehouse at Toronto. It will now be possible to systemize the working of the factory by running the cast iron stoves through their process of manufacture to the left, on to the new warehouse, while the steel prodmucts will work their way in the opposite direction. The company's plant at Toronto Junction has also been enlarged recently.

The Nova Scotia Steel & Coal Co. have placed a large order for steam turbine plant with an English firm. The plant is for use at their steel works at New Glasgow and consists of two 750 horse-power Rateau patent steam turbines direct, coupled to electric generators, also one Rateau patent heat accumulator, two sets condensing plants with electrically driven pumps, switchboard, etc.

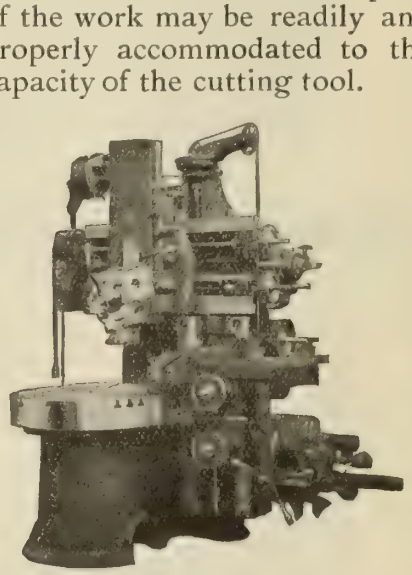
A factory has been started in Port Arthur under the name of the Port Arthur Chain Works by practical men from Birmingham, England, who, realizing the demand for chain in this country and the northwest, selected Port Arthur as the most advantageous point at which to manufacture.

A Constant-Speed Drive

A fundamental underlying principle of a constant-speed drive and the mechanically obtained speed changes incident thereto is convenience.

Any machine so designed as to entail the absolute stoppage of the driving pulley, as well as the machine in order to change speeds by the shifting of a tumbler gear or engagement of a positive clutch does not in any way meet the requirements of the case.

Friction back gears are, comparatively, an advantage, but the quick change so obtained is too great. Quick speed changes should have but a slight increment from one to another, in order that the surface speed of the work may be readily and properly accommodated to the capacity of the cutting tool.



A perfect constant-speed drive is one of the many features incorporated in the VERTICAL TURRET LATHE which tend to make it such a remarkable machine for rapid production of absolutely perfect work.

This feature is only one of the many incorporated in the VERTICAL TURRET LATHE which is fully illustrated in catalog C-15, which is free for the asking.

HERE IS A SPLENDID

Sensitive Column Drill

For drilling holes up to 5/16 of an inch it gives remarkable satisfaction. The spindle has two speeds and is driven by a 1" flat belt. It is relieved of all belt strain, is counterbalanced and provided with means for taking up wear. As the column is graduated by a vertical line its full length, the centre of the table may be set in line with the spindle at any point of vertical adjustment. A cup centre is furnished with each machine as a substitute for the table in centreing small work. *Write for Circular and Price.*

BEST LEATHER BELT MADE

THE J.C. McLAREN BELTING CO. OAK EXTRA TANNED EST 1856

TORONTO MONTREAL WINNIPEG

ST. JOHN, N.B. VANCOUVER

They intend bringing out a number of practical chain men from Birmingham during the year.

The New Way Motor Co. is the latest addition to Welland's industries. It is capitalized at $50,000, and will manufacture gasoline engines. The directors are: W. H. Newborough, president; E. W. Goodnow, L. M. Gleason, H. E. Thomas, C. D. Woodbury, all of Lansing, Mich. The factory will be the Canadian branch of the Lansing factory.

Jas. Pender, of the J. Pender Co., St. John, manufacturers of wire nails, was in Montreal and Ottawa, last month, in connection with the patenting of an invention of his own developing which has been put through most of the preliminaries necessary for its protection. It is an improvement upon the present process of manufacturing wire nails which Mr. Pender believes will be of great value to the art.

The Positive Clutch & Pulley Works have equipped a shop at 11-13 Jarvis St., Toronto, where they will manufacture the combined jaw and friction clutches, "Ideal" wood rim steel centre pulleys and improved power transmission appliances. These appliances are patented in Canada and foreign countries. Thos. Hook is president of the company; Chas. S. Hook is vice-president and manager, and Norman F. D. Beard is secretary-treasurer.

The Wind Engine & Pump Co., Toronto, having recently increased its capital from $250,000 to $750,000, is planning the establishment of a plant for the manufacture of gasoline engines. Negotiations are in progress with the town of Dundas, Ont., looking to the location of the industry there. An addition is being made to the company's warehouse in Winnipeg and a new warehouse is being opened in Calgary, where a distributing branch was established in January. A distributing warehouse will also be built in Regina.

The Canadian Pacific machine shops at Fort William are to be doubled in capacity. An addition of 128 feet by 70 wide is to be added to the present building. This will bring the Fort William shops next to those at Montreal, Winnipeg and Vancouver in point of size. Tenders for this construction are now being called for. When these enlargements are completed Fort William will be the headquarters of the mechanical department betweeen Chalk River and Winnipeg. Machinery to the value of $70,000 has been already ordered and will be installed as soon as the building is completed.

The Polson Iron Works, Toronto, has more work on hand than at any time during the last three years. It has since the beginning of the year, increased its force by over 200 men and now employs about 500. Among the contracts now on hand are a dredge for the harbor commissioners of Montreal, carrying a five cubic yard bucket; a suction dredge, 22-inch pipe, for the Great Lakes Dredging Co., of Port Arthur; a steel passenger steamer for the Canadian Pacific Railway, to be forwarded to British Columbia in knock-down condition and put together on the Kootenay lakes; a large new ferry for the Toronto Ferry Co., and several smaller orders. They have also several orders for boilers on hand.

The plant of Hillis & Sons, Halifax, suffered from a fire on May 3. It destroyed the pattern shop and storage room, together with part of the stove patterns and all of the wood patterns, the accumulation of thirty-five years. The machinery and power plant were saved, and the molding and machine shops are running as usual. A large stock of stoves was on hand in another building, which will be sufficient to take care of the spring business. The lost patterns will be replaced in time to continue without serious inconvenience to customers. The burnt building is being rebuilt as rapidly as possible, and improvements are being made which will greatly facilitate the progress to the work.

General Manufacturing News.

The Eli Sand Co., Winnipeg, will erect a factory to cost $50,000.

The B. F. Nelson Mfg. Co., Minneapolis, will erect a factory at Regina.

The Maple Leaf Milling Co., Winnipeg, have let contracts for the building of 17

elevators in Saskatchewan to the W. A. Harper Construction Co., at $102,000.

The Dominion Oil Cloth Co. will erect a factory at Montreal, to cost $80,000.

The Western Canada Flour Mills Co. will build a grain elevator at St. Boniface to cost $275,000.

The Dougall Varnish Co., Montreal, have specifications out for a $40,000 factory at Point St. Charles.

David Elliott, of the Elliott Mfg. Co., Toronto, will establish a paper box industry in Ashbridge's marsh.

A. A. Barthelmes & Co., Toronto, have a permit to erect a five-storey and basement factory, to cost $46,000.

The Trussed Concrete Steel Co. will erect a $75,000 flour mill at Saskatoon for the Saskatchewan Milling Co.

The James Power Co., Toronto, are seeking to locate a factory for the manufacture of motor car requisites at Ottawa. Estimated expenditure on building, $10,000

The contract for the building for the Supreme Heating Co., Welland, was secured by Contractor Patton. It is anticipated that more additions will be necessary in the near future.

The Dominion Iron & Steel Co., Sydney, have just placed a big contract with the Morgan Construction Co., of Worcester, Mass., for the construction of a new rod and bar mill.

The box business of Wm. Rutherford & Sons Co., and the more recently formed Montreal Wire Bound Box Co., have been merged under the name of the Dominion Box and Package Co.

Negotiations are on with the Kingston City Council, to sell a part of the city smelter site to the Canadian Lead Mining & Smelter Co., which desires the land for the establishment of their smelting business.

At Wakefield, Quebec, the MacLaren woollen mill, the MacLaren grist mill, and four houses owned by the company, were burned, involving a destruction of property to the value of $50,000, nearly all covered by insurance.

The Sykes woollen mills Georgetown, were destroyed by fire May 17. Manufactured goods valued at $12,000, which were stored ready to ship, and a quantity of valuable machinery used in the plant were burned. The total loss is estimated at about $30,000, largely covered by insurance.

The Bryan Mfg. Co., Collingwood, have prepared plans for extensions which they propose to make to their premises. A new dry kiln will be erected at once. The contract for the equipment of this building has been given to the Sheldon Mfg. Co., Galt. In the fall a second factory is to be constructed as well as a new office building.

The H. S. Peters Co., Dover, N.J., manufacturers of Brotherhood overalls and kindred garments, will locate in Welland. The site is on Alexander street and a three storey brick factory building will be constructed. About twenty-five hands, mostly girls, will be employed at the start, to be increased to two hundred. The town will be asked to fix the assessment at $1,000 for ten years.

Municipal Enterprises.

A by-law was voted on at Regina to issue $280,000 sewer debentures.

The Dauphin, Man., waterworks and sewerage by-law to raise $175,000 was passed.

A by-law to expend $55,000 on the Ingersoll, Ont., water works was carried by the ratepayers.

Windsor ratepayers approved of the expenditure of $20,000 to induce industries to locate there.

Chipman & Powers, Toronto, have been asked to outline plans for waterworks at High River, Alta.

Fernie, B.C., has decided to raise $1,900 for water extensions, $2,700 for surface drainage and $41,000 for sewers.

A by-law to raise $27,000 will be submitted shortly for the installation of a waterworks system at Chippewa, Ont.

Amherst, N.S., ratepayers have authorized the Town Council to borrow $30,000 for the purpose of extending the sewerage system.

The Private Bills Committee of the Quebec Legislature has authorized Montreal to borrow $5,000,000 for the establishment of a filtration plant.

The Campbellton, N.B., Council let the contract for bar lead, lead pipe, wrought iron pipe and fitttings, and brass goods to the Jas. Robertson Co., St. John.

The Strathcona City Council will engage Engineer A. C. Potter, of New York, to look over and make recommendations for the best sewerage system for that city.

A new six-million-gallon turbine pump, costing $30,000, will be among the items in the $375,000 bill for water extensions at Montreal.

J. D. Whitmore, formerly city engineer of Moose Jaw, with T. A. Murray, is planning a new waterworks and sewerage system for Swift Current, Sask.

The Lethbridge Council have adopted the following estimate of expenditure on anticipated works: Sewer main extensions, $40,000; water main extension, $67,000; sewer outlet, $42,000.

The Winnipeg Board of Control will call for tenders for the following sewers and water mains in Elmwood: Sewers—Martin Avenue, $4,251; Tweed Avenue, $4,983; Basswood place, $2,411; Sherbourne Street and Andrews Street.

Sealed tenders addressed to C. O. Davidson, City Clerk, Prince Albert, Sask., will be received until June 11th, 1910, for two Return Tubular Boilers, 72 inch x 18 feet, to maintain a working pressure of 150 pounds per square inch.

At a meeting of the St. Johns City Council the city engineer was authorized to expend some $38,000 in the renewal of water mains about the city. The city is calling for tenders for permanent street pavement, to cost about $90,000.

James Milne, Vancouver, consulting engineer for Prince Rupert, B.C., sends the following list of successsful tenders for the $60,000 Prince Rupert power plant: Boilers, induced draft apparatus and steam pipes, Goldie & McCulloch, Galt; switchboard and exciter, Canadian Westinghouse Co.; surface condenser and pump, John Ingles Co., Toronto; alternator and arc light apparatus, Canadian General Electric Co., and two cross compound engines to Robb Engineering Co. Goldie & McCulloch's tenders were submitted by Mather & Yuill, Vancouver.

Sawmills.

Another sawmill will be built at Naksup, B.C.

W. Craig will build a sawmill at Stoneham, Que.

Desrosier's planing mill, Ottawa, was burned on May 26.

Jno. McCrea has opened a sash and door factory at Port Arthur.

U. Boucher & Co. will erect a sash and door factory at Farnham, Que.

The Fort George Lumber & Navigation Co., Vancouver, B.C., will shortly enlarge their plant.

The sash and door factory of S. Hill & Son, Saskatoon, was totally destroyed by fire on May 26.

The planing mill owned by John Pierson, Stevensville, Ont., was destroyed by fire. Estimated loss $10,000.

The sash and door factory of H. Fauteau, Fauteau avenue, Montreal, was damaged to the extent of about $9,000.

The saw mill and planing mill, owned by J. S. Deschamps, Rossland, B.C., were destroyed by fire. Estimated loss, $35,000.

The Taplin Timber Co., Toronto, have commenced the erection of a large sawmill on the shore of Lake Sasaginaga, near Cobalt.

Fire which broke out on May 4th in Robert Balcom's lumber and planing mills at Vienna, Ont., destroyed the entire plant. The loss is partly covered by insurance.

The National Timber & Pulp Co., Toronto, intend to erect a large pulp mill at the junction of the Ste. Anne and St. Lawrence rivers, in Quebec, as well as a new sawmill.

T. Harrison, of Kenora, states that his mill will give employment to a large force of men this year and will be in full operation all summer as a good supply of logs is on hand.

Atkins & Hardy, Owen Sound, have let contracts for their new factory for the manu-

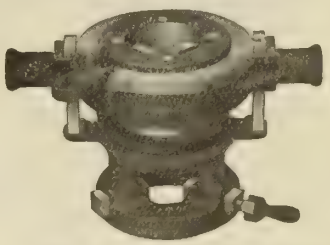
ONE MAN

can cut threads on 6-in. pipe with a

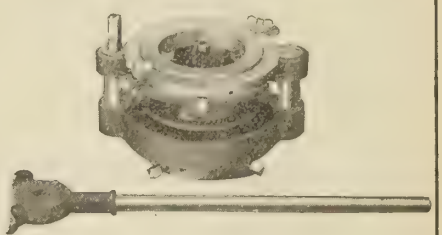
"BEAVER"

ADJUSTABLE DIE STOCK

No. 6, threading 1-4, 3-8, 1-2, 3-4 in. complete. No changing of Dies or Bushings.

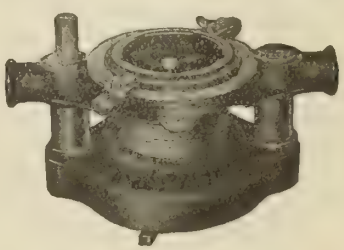


No. 25B, 1 in. to 2 in., R.H. complete.



No. 60, cuts 2½, 3, 3½, 4, 4½, 5, and 6 inch pipe.

NOTE—That with the three tools shown above you can thread from 1-4 in. to 6 in. pipe. No loose parts.



No. 41, cuts 2½, 3, 3½ and 4 in. pipe.

"WARREN" DIE STOCK

(Non-receding dies—adjustable.)

Each stock cuts two sizes. Made in four sizes

Prices $5.00, $5.50, $6.00 and $7.00.

Brantford, Canada

facture of wood fibre. The building will be of concrete and machinery of the latest type will be installed.

Fire broke out May 18 in one of the drying kilns of the Rider & Kithener factory, situated on George street, Lindsay, Ont. The kiln was full of veneer at the time. The extent of the damage will approximate $2,000, partly covered by insurance.

Dickenson & Scott, New Westminster, B. C., have almost completed the erection of a new sash and door factory at North Vancouver. The factory is being equipped with the latest types of machinery for the manufacture of interior house finishings.

The A. R. Rodgers Lumber Co., Enderby, B.C., will operate their mill both night and day during the present season. Extensive improvements have been made to the mill, two carloads of machinery having been installed during the last two months.

O'Neil's planing mill, shingle mill and chopping mill, Kenilworth, Ont., were totally destroyed by the explosion of a defective boiler. The loss of the mill at this time will be a serious one to the owner, as he has several contracts for the coming season.

The Emerson Lumber Co., Port Moodie, B.C., have sold to the National Finance Co., 3,000 feet of Burrard Inlet water frontage, near Port Moodie, for $600,000. The Emerson Lumber Co. will have the use of the property for three years to give them time to secure a new site.

A statement has recently been issued by the Hastings Sawmill Co., Vancouver, B.C., showing an exportation of 34 million feet of lumber to foreign points this year. The largest consumer was Australia. Chili was the next largest customer. The value of the product exported was $472,200.

New Companies.

The Standard Brick Co., Toronto, capital $25,000, has been incorporated. Incorporators are Charles A. Miller, G. J. Steele, R. W. Pike and L. Wright.

Crown Electric Mfg. Co., Brantford, capital $200,000 to manufacture electrical appliances; Incorporators: J. S. Dowling, J. H. Ham, J. Ruddy, Brantford, and F. J. Mosedale, St. Charles, Ill.

Dominion Pacific Lumber Co., Montreal; capital, $3,500,000, to manufacture and deal in timber and wood of all kinds. Incorporators, H. A. Lovett, G. V. Cousins and P. F. Brown, Montreal.

The Atlantic Coal Co., Maccon, N.S., capital, $290,000, to explore, work and develop coal mines, Incorporators, R. O'Leary, Richibucto; W. S. Montgomery, Dalhousie; T. Nagle, St. John.

The Canadian Malleable Iron and Steel Co., Toronto; capital $500,000; to manufacture and deal in iron, steel and other metals. Incorporators, J. A. Brown, J. H. Alexander and E. S. George, Toronto.

The Granville Power Co., Ottawa; capital, $1,500,000, to work, maintain and manage gold, silver, copper, nickel, lead, coal and iron mines. Incorporators, F. H. Chrysler, C. J. Bethune, M. G. Larmonth.

Atlantic Sugar Refining Co., Montreal; capital, $4,500,000; to manufacture, refine, buy, sell and deal in sugars, syrups, and molasses. Incorporators, A. Chase-Cosgrain, J. W. Weldon, E. M. McDougall, Montreal.

The A. H. Coplan Co., Ottawa; capital $60,000; to manufacture and deal in new and waste metals, rubber, paper stock, babbits and all kinds of base metals. Incorporators, A. H. Coplan, H. Pullan and M. P. Walters, Ottawa.

The Laurentian Chemical Co., Montreal; capital, $590,000; to produce, manufacture, buy and sell wood alcohol, alcohol, turpentine, charcoal and tar. Incorporators, A. D. Gall, F. E. Lovell and W. Galbraith, all of Montreal.

The Westport Manufacturing and Plating Co., Westport, Ont.; to manufacture and deal in gas lighters, electrical fixtures, electroplating work and electrical goods. Incorporators, F. F. Dies, W. C. Whitcher, S. A. Conklin, Ottawa.

Seller's Anchor Bottom Tie Plate Co., Quebec; capital, $100,000, to manufacture and deal in tie plates, railway supplies and iron amud steel specialties of all sorts. Incorporators, R. J. Mercer, S. W. Jacobs and A. R. Hall, Montreal.

The Dominion Estate and Mining Investment Co., Cobalt; capital, $50,000; to mine, smelt and amalgamate, asbestos, minerals, ores or metallic substances. Incorporators, C. G. D. Kelley, G. F. Greener, J. J. Anderson, Cobalt.

The Tutshi Lake Mining Co., Dawson City, Yukon Territory; capital, $1,600,000, to refine and smelt gold and other minerals produced from quartz mining. Incorporators, W. O. Oppenhoff, M. Devig and N. Krings, Dawson City.

Blaugas Company of Canada, Montreal; capital, $3,500,000, to manufacture, buy and dispose of all kinds of gas, electricity, illuminents, or any source of light, heat or pow-

Electrical Notes.

An electric light by-law was carried at Regina.

The electric light by-law at Fort Frances was carried.

The power by-law for $85,000 has been passed at Stratford.

A by-law to give the electric light company a new contract was carried.

An electric light system will be installed at Yorkton, Sask., to cost $24,000.

A by-law was carried at Ingersoll, Ont., to buy the electric light plant for $39,800.

A power house is being erected at Port Elgin by the Sackville Electric Light Co.

An electric lighting system will be installed in the town of La Tuque, Que., to cost $50,000.

Goldie & McCulloch, of Galt, were awarded the contract for a new boiler for the Mt. Forest electric light plant.

Walter Mitchell, of Port Stanley, will supply 600 poles for the Hydro-Electric transmission line at St. Thomas.

M. A. Maxwell, of Boston, has been asked to draw plans and specifications for an electric plant at Camrose, Alta.

The by-law authorizing the expenditure of $25,000 for a municipal electric light plant at Estevan, Sask., has been passed.

The Brockville ratepayers voted the light and power department $50,000 for the purpose of improving and extending the town lighting system.

The Western Canada Power Co. are planning to commence the manufacture of electric power at its new power plant at Stave River Falls, B.C.

The Fort Saskatchewan, Alta. ratepayers will be asked to vote on the expenditure of $10,000 for construction of electric light plant on Sturgeon river.

At a meeting of the Merritt Electric Light & Water Co., at Merritt, B.C., it was decided to install a modern electric lighting system costing over $15,000.

The Lloydminster, Sask. ratepayers ratified a by-law passed by the Town Council granting a franchise for eight years to W. Johnson for the operation of an electric light plant.

The Moose Jaw, Sask. ratepayers voted in favor of street railway franchise, which goes to a company composed of Ottawa capitalists. An up-to-date system will be installed at once.

The work of constructing the Niagara Power transmission station at Woodstock city is progressing rapidly and it is expected that the building will be completed in the near future.

Plans have been prepared for the development of a water power on the Coaticook river about a mile below Waterville, Que. Of this, 250 horse power will be required to

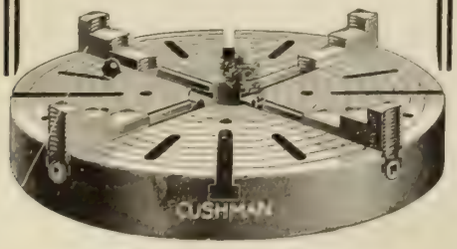
The Cushman Chuck Co.
Hartford, Conn., U.S.A.
Established 1862



operate the factory of Geo. Gale & Sons, and the company will also light Compton as well as Waterville.

New Westminster, B.C., is looking into the question of power supply from a falls near Harrison. The falls are capable of developing 25,000 horse power. Three miles of piping will give a fall of 1,500 feet.

By-laws to raise $39,000 for the purchase of power plant, etc., and another to provide a sum of $15,000 to augment equipment and prepare for distribution of electricity will be submitted to the ratepayers of Ingersoll.

The Bergmann Electric Works, of Berlin, Germany, have established a branch office in Montreal. They are now feeling their way towards opening a factory for making the Tungsten lamp. Dr. C. Rossner is representative.

The report that the C. P. R. will electrify the Crow's Nest Pass line is revived by the statement of an incorporation of a company capitalized at $1,000,000 to develop power from the Pend D'Oreille river at its junction with Salmon river.

Work has been started on the construction of a concrete dam seventy feet high across the cascades at St. Alban, Portneuf, where three hydro-electric units will be installed with a capacity of 750 horse power each. Power will be distributed to eight villages situated between Ste Anne de la Perade and Portneuf, Que.

The Dominion Power & Transmission Co., Hamilton, intend making a number of changes in the operation of its subsidiary companies. The street railway system will be centred at the new barns that are being built on King street east, with Fred Griffiths in charge. A big open-air switch is being installed at Bartonville to control the power lines from Decew Falls.

The Western Power Co. expects to generate 80,000 when their plant is completed. The first power is now being generated at Stone River Falls and will be used for work in connection with their power plant and dam construction and for the running of locomotives between Stone River Falls and Ruskin. It is expected that power will be delivered to Vancouver early in 1911.

The city of Vancouver has adopted a system of lighting of the principal thorough fares by light standards, which will be ornamental as well as useful, and which are something on the same pattern as those of other Pacific Coast cities. The business men started the movement, and will pay for the installation of the standards, which will total $46,908, and after they are in place, the city will pay the lighting bill.

The contract for pole line supplies for the Toronto Hydro-Electric System was awarded to the Canadian H. W. Johns-Manville Co., at $1,157. Wire required for the Hydro-Electric System will be supplied by the Northern Electric & Mfg. Co., at 16.5 cents a pound. The Safety Insulated Wire & Cable Co., of New York, were awarded the contract for laying conduits under the crossings in connection with the installation of the Toronto Hydro-Electric System.

A company in which Vancouver capital will be largely represented is now being formed for the purpose of establishing a large electric lighting and power plant in the upper Okanagan valley. It is stated that plans have been so far matured that incorporation of the company will be completed at an early date. The principal business of the new company will be the construction and operation of lines of electric railway which, according to present plans, will radiate from the town of Vernon, B.C.

Trade Notes.

Chapman & Walker, engineers and contractors, 69 Victoria St., Toronto, have opened offices at 429 Coristine Bldg., Montreal.

The Holden Co., general railway and contractors' supplies, has removed its head office in Montreal from 302 St. James St., to 354 St. James St.

The Dominion Wire Rope Co., at its annual meeting in Montreal recently, re-elected the directors, the organization for the current year being as follows:—President, F. W. Fairman; Vice-President and Man-

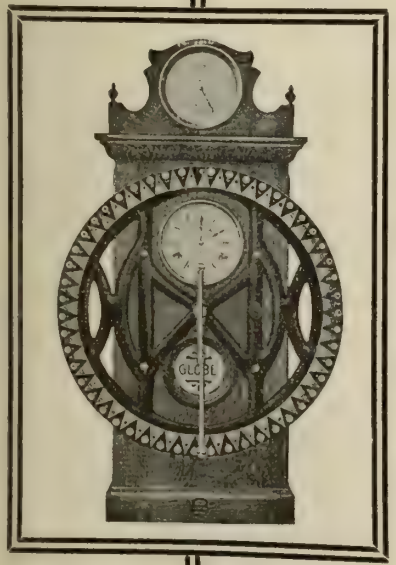
Money Saved in Wages



Many dollars are lost each year by not having a proper TIME-KEEPING SYSTEM to keep track of your employees as they arrive and depart. What you require is a machine that will not only reduce the work of your time-keeping department, but one that will give positive knowledge of the working hours of your employees. The small cut on the left represents the WEEKLY MODEL of the **"GLOBE" TIME RECORDERS** and the cut on the right represents the DAILY MODEL. The WEEKLY MODEL is the latest and most up-to-date TIME RECORDING CLOCK in the market. It will record with absolute accuracy the arrival and departure of your employees TO THE MINUTE and requires no attention whatever during the week, as all changes are automatic. (Done by clock work.) The DAILY MODEL is being used mostly in large shops, etc. where a large number of hands are employed. We manufacture a large number of TIME RECORDING CLOCKS for different purposes and are in a position to meet the requirements of any business no matter how large or small. Write us for full particulars. Catalogues free on request.

WE SOLICIT YOUR INQUIRY

W. A. WOOD, Manufacturer

Head Office and Factory, 10 St. George St., MONTREAL

Branches at

19 Bleury Street, MONTREAL and **65-67 Victoria Street, TORONTO**

...ctor F. H. Hopkins, other directors E. E. Eatman, G. P. Butters and C. W. Colby, Secretary-Treasurer, J. J. Rosevear.

Wallace Robb, son of W. E. Robb, Superintendent of Motive Power, G. T. R., has been appointed sales manager for the Anchor Packing Co., for the Province of Quebec, with headquarters in Montreal.

Welland has secured another industry, the Canadian New Way Motor Co., a branch of the New Way Motor Co., of Lansing, Mich. The new company is capitalized at $50,000 and the directors are Wm. H. Newbrough, C. D. Woodbury, E. W. Goodnow, L. M. Gleason and H. E. Thomas, all of Lansing, Mich. The company will manufacture air-cooled gas and gasoline engines and will employ one hundred hands. Their reason for coming to Canada is largely to supply the export trade from this plant, from which they can export to advantage owing to the preferential tariff Canada holds with Great Britain and her possessions.

The Smart-Turner Machine Co., 191 Barton St. east, Hamilton, report the following recent orders for their various lines of pumps: Jos. Pelletier, Amqui, P.Q.; S. C. Shorey, Napanee, Ont.; Pure Milk Co., Hamilton; Pure Milk Co., Silverdale, Ont.; Nova Scotia Steel & Coal Co., New Glasgow, N. S.; Chas. C. Punchard & Co., Toronto; Capt. Geo. Ross, Port Robinson, Ont.; Canadian Pressed Brick Co., Hamilton; Edwin Crabtree & Sons, Crabtree Mills, P.Q.; Dominion Mining Co., Dresden, Ont.; H. F. Way, Brighton, Ont.; Deloro Mining Co., Deloro, Ont., and three pumps for Weston, Ont. They also have installed a jet condenser in the plant of F. W. Fearman Co., Hamilton.

Canadian Knowles Co.

This company have opened an office in Toronto at 205 Yonge street, representing the C. S. Knowles Co., Boston, and affiliated companies, selling electrical supplies of all kinds; the Steel City Electrical Co., Pittsburg, Pa.; the Lovell, McConnell Manufacturing Co., Newark, N.J.; H. Guttman, Chicago, who holds patents for knock-down furniture for shops, tumbling barrels, etc.

This company also represents J. H. Parker, Boston, for all the United States manufacturers of standard poreclain.

G. H. Morgenstern is Vice-President and General Manager, and he informed a representative of this paper that his company intended taking up the manufacture of standard poreclain in Canada.

Oliver Chilled Plow Works.

The Oliver Chilled Plow Works, South Bend, Ind., has purchased 75 acres at Hamilton, where it will establish an extensive plant. The tract includes a water front of one-quarter of a mile, with facilities for deep draught vessels and connections with all important railways. Announcement was made by James Oliver that the company will immediately begin construction work, plans having been completed for the plant, which will cost more than $1,500,000, and will employ 2,000 men. The general arrangement of the plant, its equipment, etc., is in charge of R. A. Smart, Works Manager of the South Bend plant, while the entire design in its details has been entrusted to Prack & Perrine, architects and engineers of Pittsburg and South Bend.

Application for a charter for the Oliver Chilled Plow Works of Canada, Ltd., has been filed, with capitalization being placed at $500,000. The incorporators named include James Oliver, Edwin Nicar, Richard A. Smart and W. A. McInerney.

All the buildings will be of structural steel frame, with re-inforced concrete floors and roofs, pressed brick walls and terra cotta trimmimngs. Sawtooth roof construction will also be used together with side wall windows, insuring the maximum diffusion of the north light. Plans for the grading will be ready for bids immediately.

C. P. R. Irrigation Work.

The contract for an extension of the C. P. R. irrigation system into the eastern section of the irrigation block has been awarded to James McDonnell & Co., of Vancouver, with whom are associated Winter, Boomer & Hughes and Grant, Smith & Co., of Spokane, Wash. The contract is for $5,230,000, and includes canals calling for excavation of twenty-eight million cubic yards of earth. The contract price is about a quarter of a million under the estimate of the C. P. R., and carries a time limit of five years. The work is to be started immediately and will irrigate 540,000 acres.

National Fireproofing Co.

The National Fireproofing Co., Pittsburg, announces the formation of the National Fireproofing Co. of Canada, with $1,000,000 capital stock paid up. The headquarters of the Canadian company will be at Hamilton, where the National some time since secured 125 acres of land, and on which it announces it will at once erect a plant at the cost of $1,000,000. This plant will be completed by January 1, 1911, and will be put on full time making fireproof tiles for office buildings and other goods made by the parent body in the United States.

The company will build a dock immediately in front of the warehouse 50 feet long and 80 feet wide. The various other buildings to be constructed, include: Forge shop, one story, 100 x 420 feet; assembly building, three stories, 100 x 400 feet; malleable iron foundry, one story, 120 x 420 fet; core room, two stories, 40 x 100 feet; gray iron foundry, one story, 120 x 420 feet; six-story warehouse, 100 x 300 feet, boiler shop and storage, 70 x 100 feet, and a number of other wood shops, storage shed, power house, etc., and an office building two stories, 60 x 100 feet.

Walkerville Industries Busy.

The Globe Furniture Co. is installing natural gas for fuel. The Ford Motor Co. is busy and anticipates a busy season. The E. M. F. Co. are assembling parts at present but are preparing to manufacture. The Regal Motor Co. are also assembling parts, but have installed some machinery and will manufacture.

The McCord Mfg. Co., Detroit, have secured a factory adjacent to the Kerr Engine Works and will manufacture heaters for automobiles. They expect to start manufacturing about July 1.

The large manufacturers in Walkerville find it hard to get skilled labor. David Kerr, of the Kerr Engine Works, said it was a hard proposition to secure mechanics, consequently it is with great difficulty that orders are filled promptly. The shipments to the Northwest provinces have increased greatly. A recent addition to the staff of the Kerr Engine Works is W. M. Ewart, formerly of the Standard Ideal Co., Port Hope. Mr. Ewart occupies the position of chief draftsman.

A great number of the Walkerville factories use natural gas for fuel, the wells being at Tilbury.—W. J. R.

Owen Sound Drydocks.

A syndicate of English capitalists will construct a million-dollar shipbuilding and repair plant and two drydocks at Owen Sound. An agreement has just been signed with the town by Edward Box, their representative, who, for the past month, has been sizing up the shipping of the great lakes, and visiting the different ports before deciding on the best point to locate. The plant will be built on the C. P. R. waterfront here, and that company is taking a block of stock in the concern.

The company proposes to build in Owen Sound two drydocks, a graving dock 650 feet long, and a floating drydock, capable of handling steamers up to 300 feet in length, and, in addition, to put in a shipbuilding and repairing plant.

The yard plans will include building berths for three vessels, so that three boats may be under construction at the same time. Complete machine shops, boiler shops, etc., will be built, and a large modern plant for the handling of large shipbuilding contracts erected. The construction will cost in the neighborhood of $1,000,000.

The ratepayers of Owen Sound will vote on a by-law granting a bonus of $50,000, and sanctioning the taking stock for $50,000.

Orillia's Outlook.

The Tudhope Automobile Company's new plant is in course of erection and 200 men are on the pay roll of the Tudhope Carriage Co. This latter company has been working overtime for the past three months.

Work is progressing satisfactorily on the new E. Long foundry. As soon as completed additions will be made to the staff.

The buildings of the Couchiching Leather Co. have been greatly improved. The tannery is running to full capacity to keep up with the orders.

The National Hardware Company's lock works are employing 50 hands where only 35 were required a year ago.

The Dominion Wrought Iron Wheel Co. have doubled their staff during the past year and have also added two buildings to their plant.

The Canada Wood Specialty Co. have 130 employees at their yard and mill. The company turn out broom handles and ship them to South Africa, United States, and Western and Eastern Canada. Chair rails are shipped to England, Germany and Belgium, and hardwood flooring to British markets.

FIRE INSURANCE. INSURE IN THE HARTFORD. Agencies everywhere in Canada. (tf)

FREE TEST. Prove our claim that "Klear Copy" Carbon gives the best, clearest, unsmudged copies of all typed matter at our expense. Send for sample package "K" free. Peerless Carbon & Ribbon Mfg. Co. of Canada, Limited, 180 Richmond West, Toronto.

FOR FILING PAPERS, LETTERS, and Vouchers, fastening bulky envelopes or backing statements the ACME No. 2 Binder is indispensable in every shop. Penetrates the thickest paper and perforates and binds in one operation. For sale by all stationers. A. R. MacDougall & Co., Canadian Agents, Toronto.

GET THE BUSINESS. Increase your sales. Use Multigraph Typewritten letters. The Multigraph does absolutely every form of printing. Saves you 25 p.c. to 75 p.c. of your printing bill. Multigraph your office forms, letterheads, circular letters. Write us. American Multigraph Sales Co., Ltd., 129 Bay St., Toronto.

MODERN FIREPROOF CONSTRUCTION—Our system of reinforced concrete work, as successfully used in many of Canada's largest buildings, gives better results at lower cost. "A strong statement," you will say. Write us and let us prove our claims. That's fair. Leach Concrete Co., Ltd., 100 King St West, Toronto. (tf)

MR BUSINESS MAN, are you progressive? It's up to you to test "Consolidated," our new process carbon paper. Because it costs less. Soft finish, without smutting, and clear, permanent copies. Write for sample sheets and prices. "Consolidated." Stratford, Ont.

SAVE 50% OF THE COST OF HANDLING merchandise by installing a Beath System of Overhead Carriers. Saves valuable floor space because the trackage is on the ceiling. Systems for all kinds of businesses, large or small. Write us for illustrated catalog. W. D. Beath & Son, 193 Terauley Street, Toronto. (tf)

SCOTCH PLAID STATIONERY is the latest creation for business and society correspondence. Paper and envelopes present a finished linen surface, most agreeable to the pen touch. Leading sattioners have it. Write for samples. The Copp, Clark Company, Ltd., Toronto. (tf)

"SYSTEMS" stand for all that is best in loose-leaf binders and supplies, letter-heads, statements and in fact your office stationery of every description. Send us samples of what you are using—we will send you prices that will interest you. Business Systems, Limited, Manufacturing Stationers, Toronto. (tf)

WAREHOUSE AND FACTORY HEATING SYSTEMS. Taylor-Forbes Company, Limited-Supplied by the trade throughout Canada. (tf)

MISCELLANEOUS.

THE "Kalamazoo" Loose Leaf Binder is the only binder that will hold just as many sheets as you actually require and no more. The back is flexible, writing surface flat, alignment perfect. No exposed metal parts or complicated mechanism. Write for booklet. Warwick Bros. & Rutter, Ltd., King and Spadina, Toronto.

THE METAL REQUIRED in a Modern Concrete Building. Our special facilities enable us to produce at minimum cost Concrete Reinforcements, Fenestra Steel Sash, Automatic Fire Shutters and Steelcrete Metal Lath. Complete stock, quick delivery. Before deciding write us for catalogue and prices. Expanded Metal and Fireproofing Co., Ltd., Fraser Ave., Toronto. (tf)

WANTED—A splendid opportunity for dealers to handle the best combination Duplicating, Addressing and Office Printing Machine on the market. Exclusive territory. Send name and address, giving occupation and references, to the Canadian Writerpress Company, Ltd., 33 John St., Hamilton, Ont. (tf)

YOU CAN DISPLAY YOUR GOODS TO BETTER ADVANTAGE through the use of up-to-date fixtures. We are specialists in the planning of stores and offices. Our catalogue contains illustrations of many new features and several handsomely equipped stores and offices. Shall we send you our catalogue J? Jones Bros. & Co., Ltd, 30-32 Adelaide St. West, Toronto. (tf)

MACHINERY WANTED.

ONE PRESS, foot power preferred. Also ¼ or ½ h.p. alt. current motor, 104 volt, 60 cycle. E. D. Smith, Magog, Que.

BUSINESS OPPORTUNITY.

A PARTY holding a large interest in a well-established prosperous machinery manufacturing company on the Pacific coast wishes to dispose of part of his holdings to meet personal obligations. Can arrange if necessary for purchaser with proper qualifications to take an active part in the management. This is a splendid opportunity and investment for anyone wishing to get a start in a good, steady, legitimate, profitable business, in a young, growing country. Applicants who mean business, must have at least $20,000, are invited to investigate. Write Box 102, CANADIAN MACHINERY, Toronto. (4)

FIRE PROOF SAFES, VAULTS, ETC.

YOU need the best possible protection from fire! If your valuables are in one of our safes you can rest at ease; no fire is too hot for our safes and vaults to withstand. We manufacture vaults and safes to meet every possible requirement. Write for catalogue "S." The Goldie & McCulloch Co., Ltd., Galt, Ont. (tf)

MACHINISTS, ATTENTION!

MACHINIST'S TOOL-CASE FREE to one man in every shop. Address, with stamp, O. BURCH, Grand Rapids. Mich. (3)

POSITIONS WANTED.

HIGH speed and carbon tool steel salesman, practical steel man, expert on forging, hardening and treating. High speed and carbon steel tools; capable of demonstrating and securing all possible results, conducting tests and selling. Experienced with modern machine shop methods, conversant with all the High grade steels on the market. Practical experience backed with intelligent diplomacy, metallurgy and chemistry. Open for position with house handling billets, pig, metal and tool steels. Address, High speed, Box No. 104, CANADIAN MACHINERY, Toronto. (4)

PRACTICAL MACHINIST desires position as general foreman or superintendent. Good systematizer, with executive ability. Can handle all grades of labor. Box 106, CANADIAN MACHINERY, Toronto. (6)

SITUATIONS VACANT.

TWO SALESMEN, having thorough knowledge of mill and factory supplies. State experience. Apply by letter only. CANADIAN FAIRBANKS CO., Ltd., Toronto.

MISCELLANEOUS.

A BOOK-KEEPING STAFF IN ITSELF — doing the work with machine precision and accuracy, the National Cash Register. Write us for demonstration literature. National Cash Register Co., 285 Yonge St., Toronto.

ANY MAN who has ever lost money in the mails has had occasion to learn by painful experience that the only proper way to remit money is by Dominion Express Money Orders and Foreign Drafts. If lost or delayed in the mails, a prompt refund is arranged, or new Order issued without further charges. (tf)

ARE YOU wanting space in your shop set apart for office use? We make every kind of office partition and will submit designs and estimates. Our illustrated catalogue "W," showing many interiors we have fitted, would interest you. Send for it to-day. Walker Bin and Store Fixture Co., Ltd., Berlin, Ont.

AT LAST—A really practical pencil sharpener. The "Spiro" sharpener built on a new principle, positively does not break the lead. Ten blades. Sharpener lasts lifetime. Every pencil user needs one. Pencil sharp in a second. Ask your stationer or write us direct. A. R. MacDougall Co., Canadian Agents, Toronto.

EGRY business systems are devised to suit every department of every business. They are labor and time savers. Produce results up to the requiremen s of merchants and manufacturers. Inquire from our nearest office. Egry Register Co., Dayton, Ohio; 123 Bay St., Toronto; 258½ Portage Ave , Winnipeg; 308 Richards St., Vancouver.

KAY'S FURNITURE CATALOGUE contains 160 pages of fine half-tone engravings of newest designs in Carpets, Rugs, Furniture, Draperies, Wall Papers and Pottery with Cash prices. Write for a copy—it's free. John Kay Company, Limited, 36 King St. West, Toronto.

IF you have been afflicted with one of those Fountain Pens that won't write when you want it to, or leaks when you don't want it to, give it to one of your poor relations and buy a Moore Non-Leakable Fountain Pen and you will be happy. Consult your stationer. W. J. Gage & Company, Toronto, Sole Agents for Canada.

JUST NOW we are holding a special sale of second-hand typewriters. All makes are represented—Underwood, Remingtons, Olivers, Empires, Smith Premiers, etc. They have been carefully rebuilt and are in good workable, wearable condition. The Monarch Typewriter Company, Limited, 98 King St. W., Toronto, Ont. (tf)

PROBABLY the most talked about machine in Canada is the Hainer Book-keeping Machine. It combines in one machine the cash and credit register, time recorder and account register. Representatives wanted everywhere. Write for our proposition. Book-keeping Machines, Ltd., 424 Spadina Ave., Toronto.

SAMPLES FREE—Write us to-day for free samples of our new two-color Counter Check Books—white and yellow leaves. We make Check Books endfold and sidefold, single and triplicate pads. Lowest prices. Dominion Register Company, Ltd., 100 Spadina Ave., Toronto.

STRETCHING THINGS

I am mighty careful not to stretch the facts in these publicity efforts.

You see, I base all my statements from information received from practical foundrymen, who know the subject.

I have reports from more than fifty progressive Foundrymen who say my KING KORE KOMPOUND is a new era in economy, in investment of money, in time-saving and in saving of castings. If there is now any one whose detail differs from the majority, I make it to fit his case.

It's the same way with GENUINE EAST INDIA PLUMBAGO, the only Lead any foundryman can afford to use.

With the Core Compound goes STEVENS' CARBON BLACKING, the ideal core-wash; there is no trouble, when making hollow castings, with this combination.

I manufaoture FOUNDRY FACINGS, FOUNDRY SUPPLIES, BUFFING COMPOSITIONS and PLATERS' SUPPLIES.

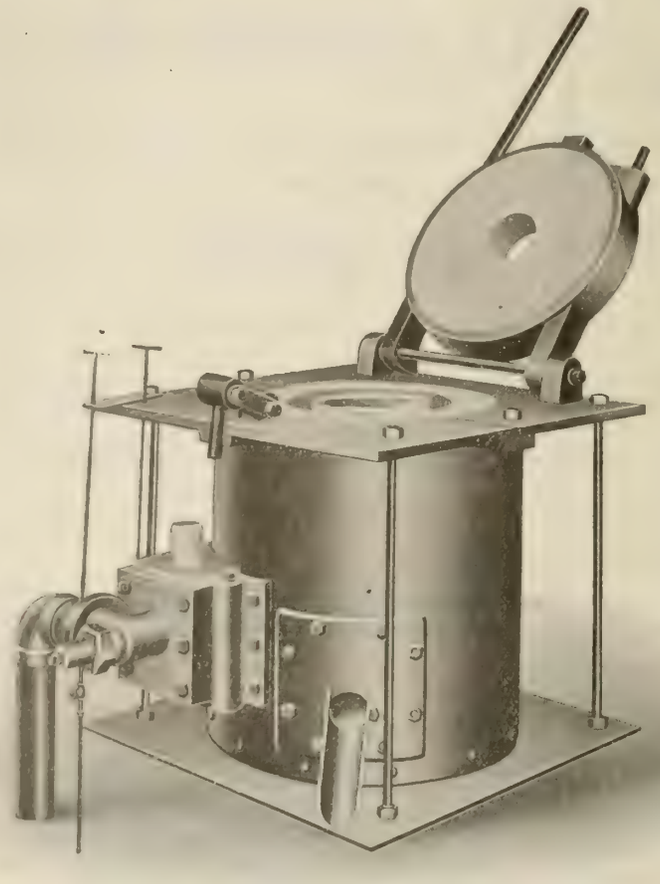
JONATHAN BARTLEY CRUCIBLE CO.
TRENTON, N. J., U. S. A.
MANUFACTURERS OF
Crucibles of Quality

Made in Canada, under Canadian Patents

The "King" Fuel Oil Furnace



Built in sizes from No. 30 to No. 400 Crucible capacity, Burner and all parts working in full view of operator at all times.

This is also made in the same size in the Tilting Type.

The "KING" Furnace is the least complicated, and the most economical on the market to-day, operating on from four to five ounces of blast.

When at the American Foundrymen's Convention in Detroit, do not be deceived into believing that Canada does not, nor cannot, produce goods of equal quality to those manufactured in the U.S.A. Hear what they have to say, but give the Canadian manufacturer preference, providing he can show you superiority.

We also manufacture Melting Furnaces for use without Crucibles, and a full line of Forging, Annealing Furnaces, etc.

By June 1st, we will have the Foundry of the Montreal Technical School fully equipped. All the equipment was made in our own shops, and we invite every foundryman in Canada to see for himself what we can do in that line.

Do not forget that we also handle FOUNDRY SUPPLIES, of all descriptions, and the quality is right, also the price.

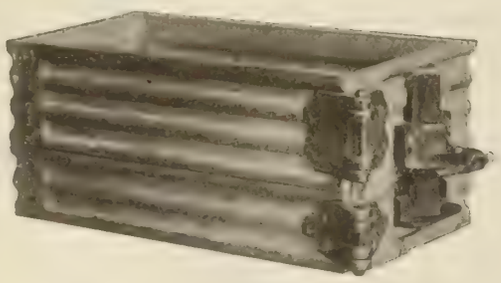
Foundry Engineers CLEVELAND, O.

The Goodale Aluminum Snap Flasks

As light or lighter than wood—much stronger. As strong as iron or steel—much lighter; no splitting, no warping, no loosening of joints, no burning; in fact, no repairs.

Heavily ribbed to prevent ramming out. Note extra heavy brass hinges and locks. Adjustable guides so made as to permit the use of a patented match plate guide.



Consensus of opinion of foundrymen that wood snaps in constant use last not over one year before entire replacement is necessary. The Aluminum Snap Flask never wears out. The only parts that ever require attention are the hinges and locks, which can be replaced for a few cents.

The cuts do not show the corner braces. On the two corners which are not fitted with hinges or locks, corner blocks are cast in solid to give these snaps additional rigidity. It did not develop in use that it was necessary to have these blocks; we simply wished to make assurance doubly sure.

PRICE $15.00 to $20.00 f.o.b. Windsor

HIGH GRADE CASTINGS are not made with low grade materials. Think this over over when you see a poorly finished casting in your cleaning room, and remember if you please if you wish to place the pattern in the high grade class our No. 48 Plumbago will do it, also that the saving in cleaning room expense would pay for three times the necessary No. 48 Plumbago to have made it high grade.

Another vital point is that you have a core wash which will peel clean and not run before the metal. Try our Eureka Blacking, the best core wash on the market.

Grimes Roll-Over Molding Machine

This is a simple, standard machine, requiring small floor space.

It is perfectly balanced, requiring no counter-balancing mechanism as center of gravity is center of rotation.

By means of small hand wheel shown in cut, one man can turn largest flask smoothly and without jerk.

Pattern is drawn by absolute straight gravity drop.

This machine is adjustable for deep flasks and can readily take care of flask 24 in. x 36 in., and 4 to 12 in. in depth, with maximum pattern draft of 12 in.

Positive adjustable pins at four corners of clamping device, Fig. 4, compensates for unevenness of floor boards.

PRICE, f.o.b. cars Windsor, $125.00

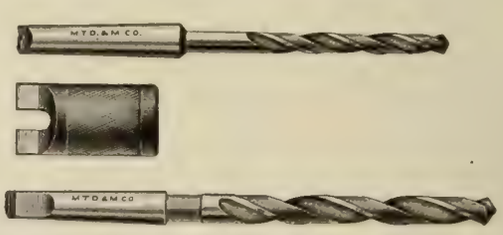
TANG GAUGE FOR SHORT SHANK SOCKETS

The short drill represents the tang broken off.
The long drill shows a new tang milled to fit a short taper socket.
The gauge gives the width and length of tang to be milled on the broken shank.



Drills on which the original tangs have been broken can be fitted for use in a short taper socket by re-milling the shanks to fit the gauge. This will insure a strong drive.

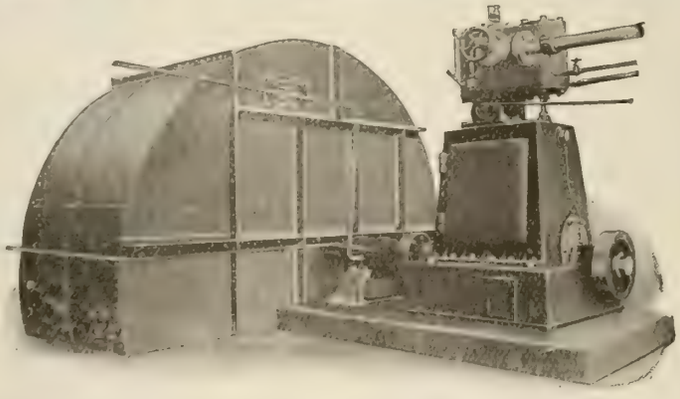
CYCLONE FANS



STEEL PLATE CENTRIFUGAL TYPE are extensively used for **INDUCED DRAUGHT** because they Save Coal, Increase Steam and Stop Smoke.

Also for **REFUSE** and **DUST COLLECTION** from Wood Working Machinery.

And **PLENUM VENTILATION** with **HEATING** for Works and Public Buildings of all kinds.

OPEN PROPELLER TYPE

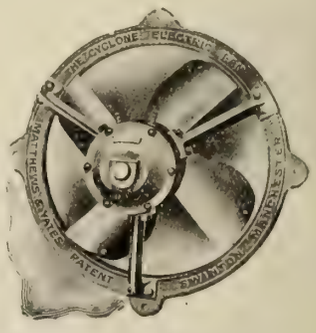
Belt, Electric or Steam Driven, are still unrivalled for **General Ventilation,** because of their

SIMPLICITY, EFFICIENCY and RELIABILITY.

CYCLONE FANS are in use, amongst many other Public Buildings, in the following:—

Houses of Parliament
Buckingham Palace
Law Courts
Natural History Museum
Junior Carlton Club
Hyde Park Hotel

and thousands of others. Names on application.



Prices Low
Workmanship High Class

MATTHEWS & YATES, LTD. SWINTON, MANCHESTER, ENGLAND.

Use Your Drills With Broken Tangs

You have heaps of drills whose tangs are broken off, lying around your shop. They are no use and considered loss.
The Perfect Double Tang Socket is a simple, inexpensive means of reclaiming them. *Grind or mill* a new tang below the old one and which is from 25% to 60% stronger, according to the size of the shank.
All our regular taper shank drills are fitted with double tangs at no additional cost. *Send for Circular 18c.*

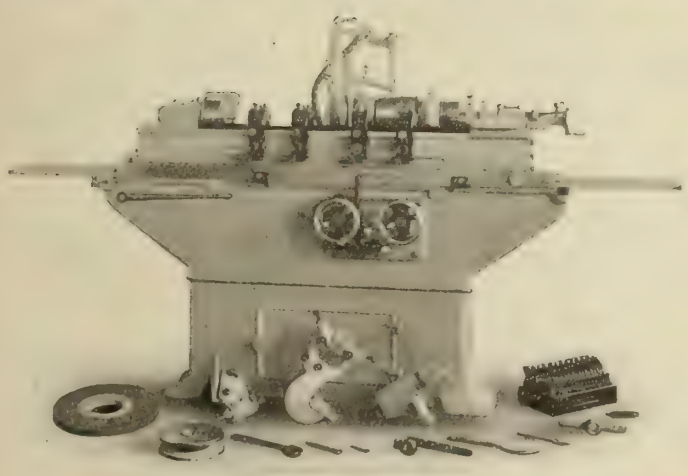
Steam Derricks
Locomotive Cranes

Send for catalogue and Prices.

You can secure the proper feed for any speed because the table feeds and work speeds are completely separated

B. & S. Plain Grinding Machines



embody this feature, as they are designed primarily for manufacturing machines.

This arrangement is of special advantage when it is desired to remove stock rapidly, as it is possible to secure a slow speed and fast feed, the proper combination for the work.

A further advantage is that the changes of the table feed or work speed, controlled by one handle on the front of the machine, can be made without stopping the wheel, work or table.

Send for circulars of various sizes.

Manufacture in Canada

The City of Brantford is acknowledged as the leading manufacturing city of Canada in the past, present and future. Some 70 busy factories now, the best Labor Market in Canada.

CHEAP POWER

Both Niàgara Electric and natural gas in abundance,

RAILWAYS

Unexcelled railway facilities, Grand Trunk, T. H. & B., C. P. R., N. Y. C., Lehigh and numerous electric radials.

LIVING

Cost is very reasonable both for rich and poor.

FACTORY SITES

Excellent sites available on either railways.

SITUATION

Unexcelled in Canada, in the heart of the workshop of Canada.

DISTANCES

Chicago 14 hours, Montreal 10 hours, New York 14 hours, Buffalo 2½ hours. 35 passenger trains daily.

We now have a number of very successful American factories which have located here and are satisfied. If you are now shipping to Canada, you contemplate a branch here.

MAY WE HEAR FROM YOU? Write to-day for information.

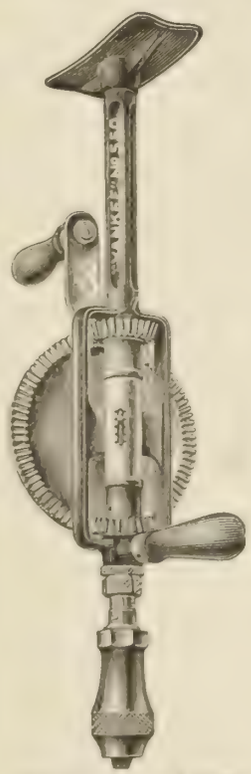
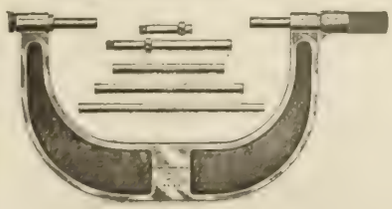
Canada's Leading Tool House



Yankee Breast Drill



Micrometer

YANKEE BREAST DRILL

With Right and Left-hand Ratchet movement. Note the little shifter between the gears—move it to the first notch nearest the chuck and you have an ordinary or plain Breast drill. In the second notch it becomes a left-hand Ratchet. In the third notch it becomes a right-hand Ratchet. In the fourth notch it becomes an alternating right and left-hand Ratchet, where any movement of the crank, however short, or in whatever direction, causes the drill in the chuck to always turn to the right and drill continuously. In the fifth, or lowest notch, the spindle is locked tight, so that the drill chuck can be rapidly opened or closed. Chuck holds square or round-shank drills up to ½-in.

Single Speed and Double Speed

L. S. Starrett and Brown & Sharpe's complete line of machinists' tools.

ST. THOMAS, ONTARIO

The Railroad City of the Province

Can offer manufacturers who contemplate the establishment of manufacturing industries unexcelled railroad facilities. The systems reach every part of the American continent.

We can give you cheap Hydro-Electric power, light, etc.

We have a good lake port at our door and within one hundred miles of the coal regions of Pennsylvania.

We have good roads, schools, waterworks, gas, electric street cars, etc., and we are situated in the midst of the finest farming, fruit and dairying district in Canada.

Get in touch with us and we will meet you fairly.

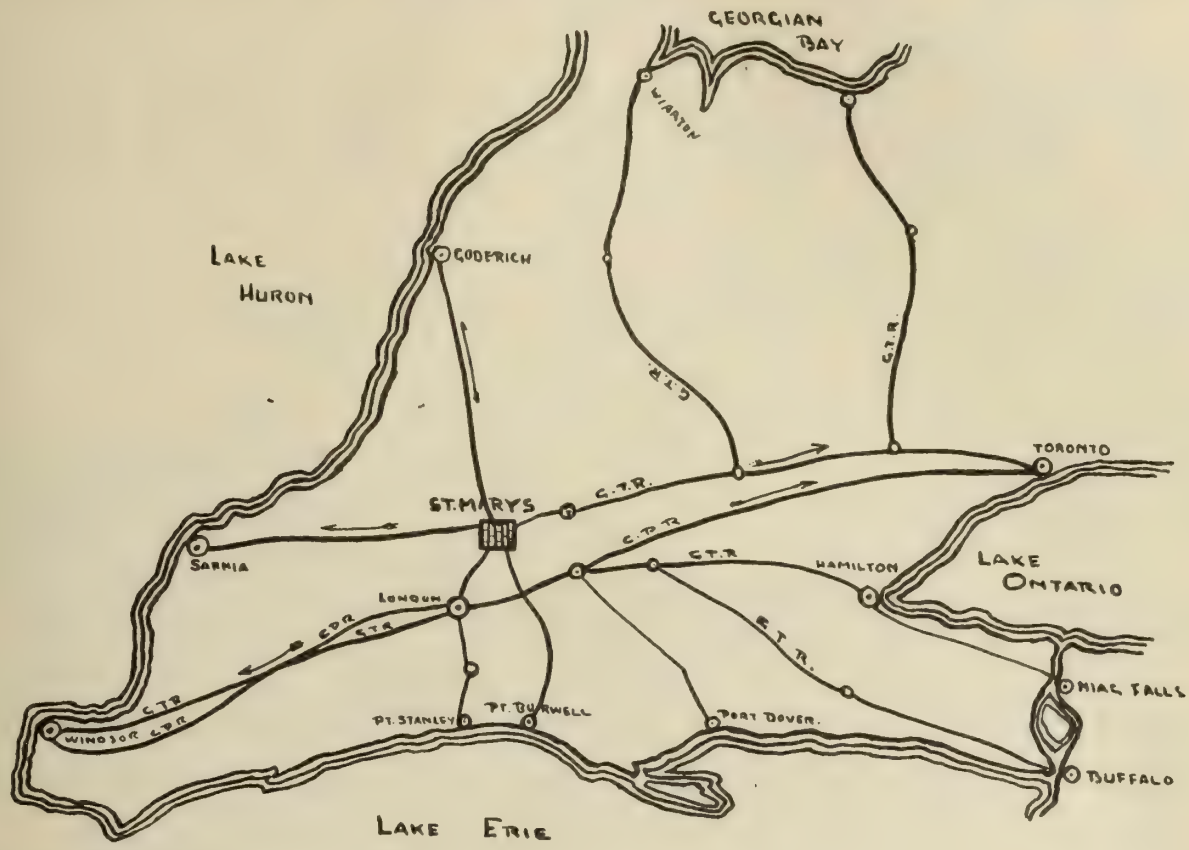
The advertiser would like to know where you saw his advertisement—tell him.

Town of St. Mary's, Ont.



MR. MANUFACTURER:

Are you looking for a location where you may establish your factory?

St. Mary's is looking for you.

Please take time to consider its advantages.

Located in the heart of the finest agricultural district in Canada. Niagara power always on tap. C.P.R. and G.T.R. One million population within a radius of one hundred miles. Splendid water. Healthy surroundings. Beautiful. Good schools and churches. Abundance of labor. Get in touch with T. M. CLARK,

Secretary of Industries Commission.

The Fact:—

Our belts STRETCH LESS by 15 per cent. to 25 per cent. than any other leather belts on this market. This means that if you use our belts you won't have to shut down so often to take up the slack. This saves time and money and also

You don't pay for belting you can't use, that is, the scraps taken out.

The Reason Why

The stretch in our belts is more thoroughly taken out during manufacture and the unstretched parts are NOT used in the make up. Therefore there is no part of the belt to stretch on the pulley. Our brands are "EXTRA," "STANDARD," "ACME WATERPROOF." If your dealer doesn't stock our belts write

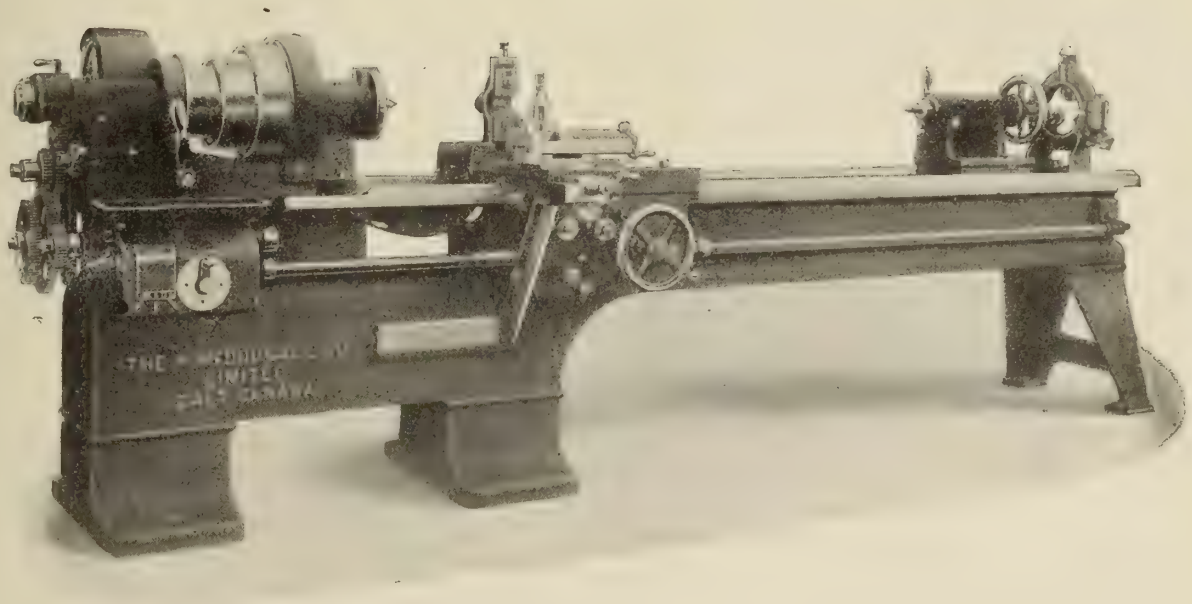
MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe-Screwing Machines



GAP LATHES—16, 18, 20, 24," in any length of Bed.

A Gap Lathe for a Jobbing Shop is an almost absolute necessary Machine Tool.

The improvements embodied in our Lathes made for absolute solidity and steadiness of cut.

The Brace under Carriage allows Gap diameters to be turned at High Speeds with resultant work as good as can be done on an Engine Lathe of large swing.

Double Back Gears give a range of Spindle Speeds which are all found useful.

Our extra large belt surfaces, combined with specially heavy spindles, ensure highest efficiency both in quantity and quality of work

We invite the closest scrutiny of materials, workmanship and finish, and have adapted Highest Quality as standard from which we will not deviate.

Particulars, yours for the asking.

Marks A New Epoch In Surface Machining

For Rapidity, Convenience, Accuracy, Finish and Reduced Operating Expenses

The P. & W. Vertical Surface Grinder

The machine that works directly on hardened castings or forgings, and machines and finishes in one operation.

That permits forgings to be directly hardened at time of forging.

That relieves all apprehensions of warping of thin forgings during the hardening process, as all such faults can be corrected later by flat surface grinding.

That saves the time ordinarily wasted in carting machine parts back and forth between forging, machining, hardening and finishing departments.

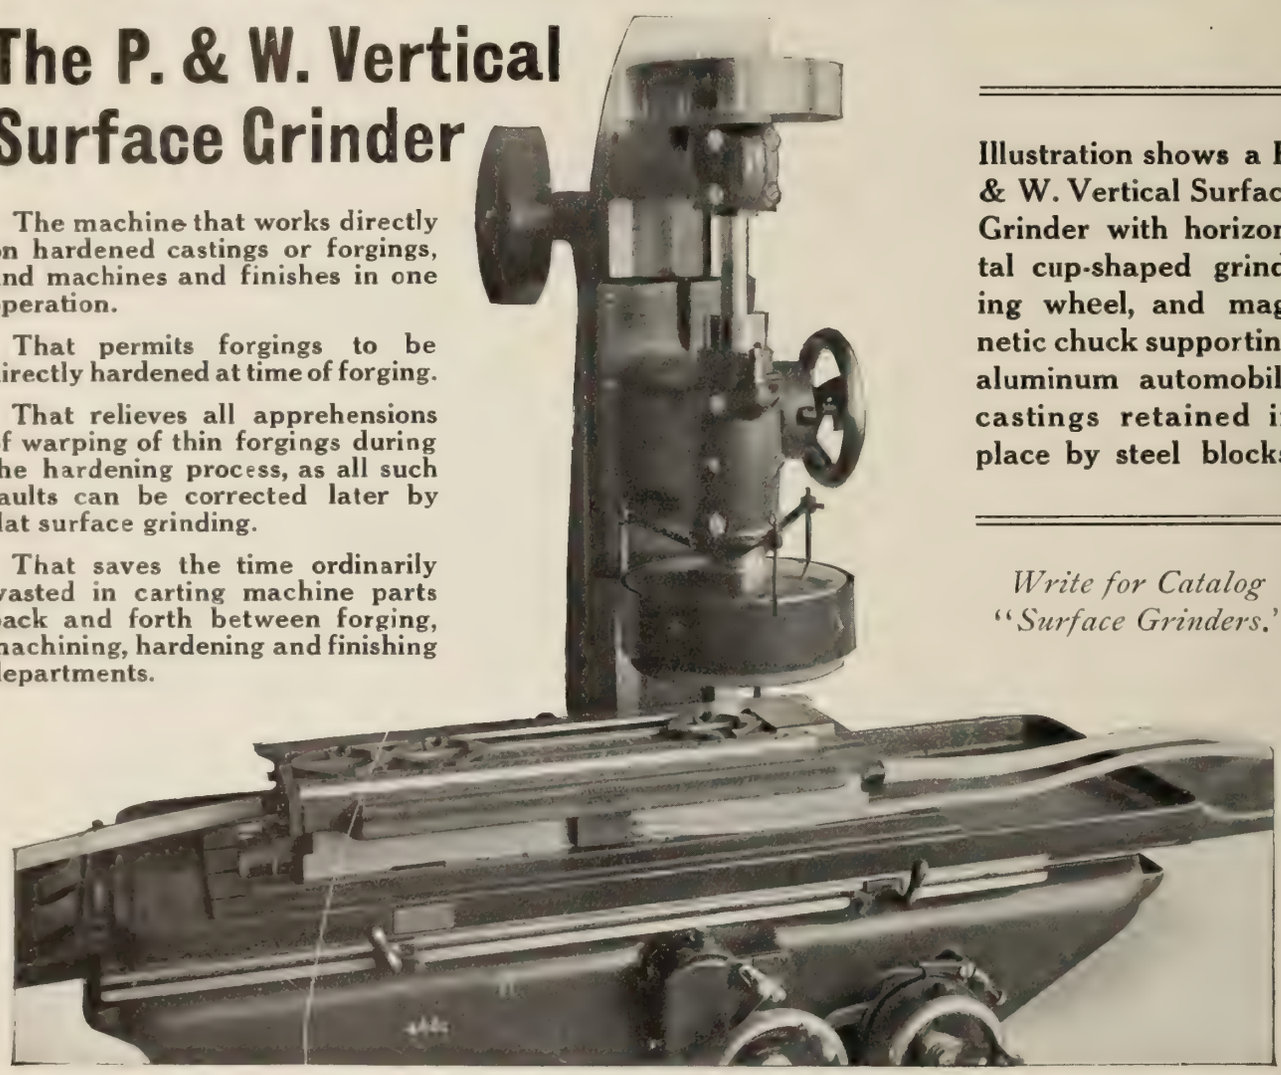

Illustration shows a P. & W. Vertical Surface Grinder with horizontal cup-shaped grinding wheel, and magnetic chuck supporting aluminum automobile castings retained in place by steel blocks.

Write for Catalog "Surface Grinders."

That produces absolute flatness and a mirror finish and does away with expensive and tedious lapping or scraping operations.

Send blue prints, or the actual parts to be ground, for time estimates, and have skepticism turned into conviction.

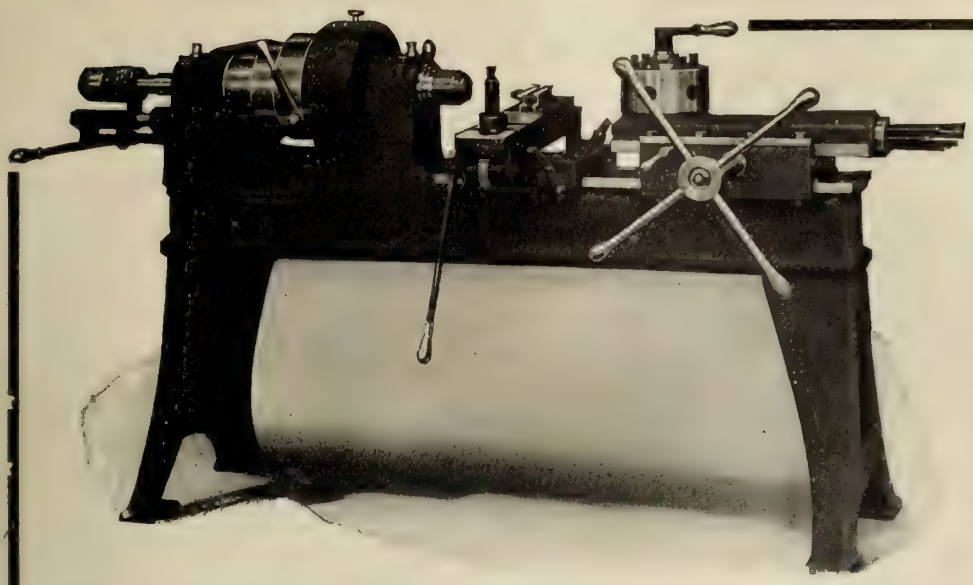
Don't fail to mention "Canadian Machinery" in writing to advertisers.



14, 16 and 18 inch Forming Lathes with or without plain Set- ver or Universal Turret; Geared-friction Head, Automatic Chuck, Cut-off, Forming Attachment (under cut or vertical) Chasing Attachment.

These Forming Turret Lathes

with geared-friction head, giving two spindle speeds for any one speed of the cone, enables the operator to use two speeds without stopping the machine to throw in the back gears. By moving the handle at the side of the cone to the right or left, the back gears are thrown in or out while the machine is in motion, thus securing the necessary speeds for changing from boring to tapping, and for turning different diameters in the same piece without stopping the machine.

A circular of this machine, describing it in detail, sent to any address upon application—No annoying follow up, so do not hesitate to ask about any style Turret Lathe or Screw Machine in which you may be interested. We are specialists in the manufacture of these machine tools, and if we can be of service in any way, please do not hesitate to command us.

BARR DRILLS

We show a 4-spindle Style A Drill. These machines are furnished with 2-3-4-5-6 or 7 spindles. We arrange these with one or more spindles power feed, automatic stop if desired. You should know all about the automatic drilling and tapping features that go with our machines. We are the patentees and only manufacturers of this device. These A drills weigh from 500 to 1700 pounds. Tables 15 ins. x 24 ins. up to 15 ins. x 61 ins. All tables raised and adjusted by crank and screw. These machines will drill up to ½ in., but for continuous hard service, we recommend Style E or F for all steel work having over ⅜ in. holes. We shall show a six spindle Style E next month. Watch for it. It is worth looking at anyway, and we are paying money so that you can see it illustrated. We do not believe in sensational advertising, but we have the goods.

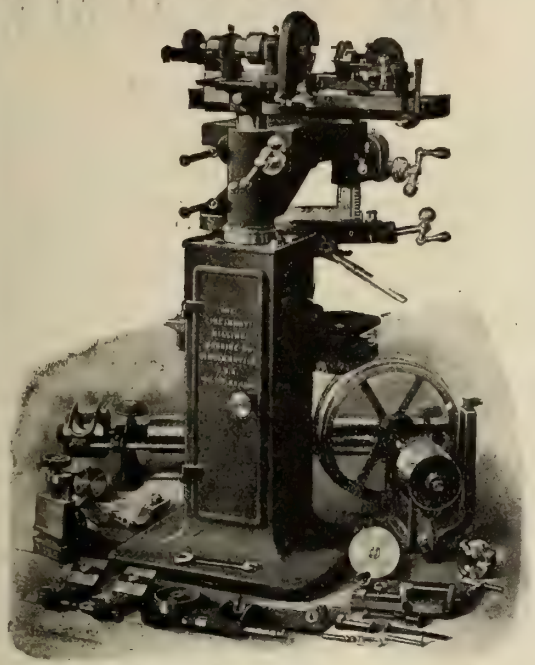
WILLIAMS & WILSON, Montreal
A. R. WILLIAMS MACHINE CO., Montreal, Toronto, Winnipeg



The No. 1 Cincinnati Cutter Grinder

Takes 8½ x 16" between centres.
Has dial on all movements. May be set to any angular relation between the wheel and the work.
Quick lever feed for cutter sharpening.
It is unexcelled for handiness, accuracy and the variety of work that it will do right.

The Cincinnati Cutter Grinders

WE make two sizes of Grinder, both adapted for all kinds of cutter, reamer, hob and formed tool sharpening.

Also equipped for tool-room work---cylindrical, surface, internal, and disk grinding.

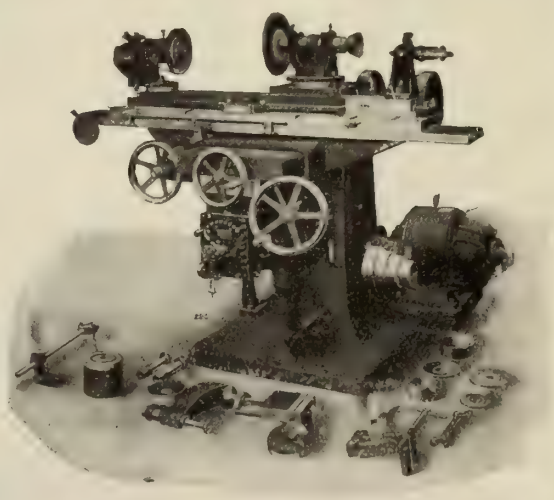
They sharpen cutters by holding them on their own shanks, the same as if the sharpening were done with the cutter in place on the miller, thus insuring accuracy.

Both are simple in construction, have no cumbersome overhead works, and are easy to operate.

Ask for further details.

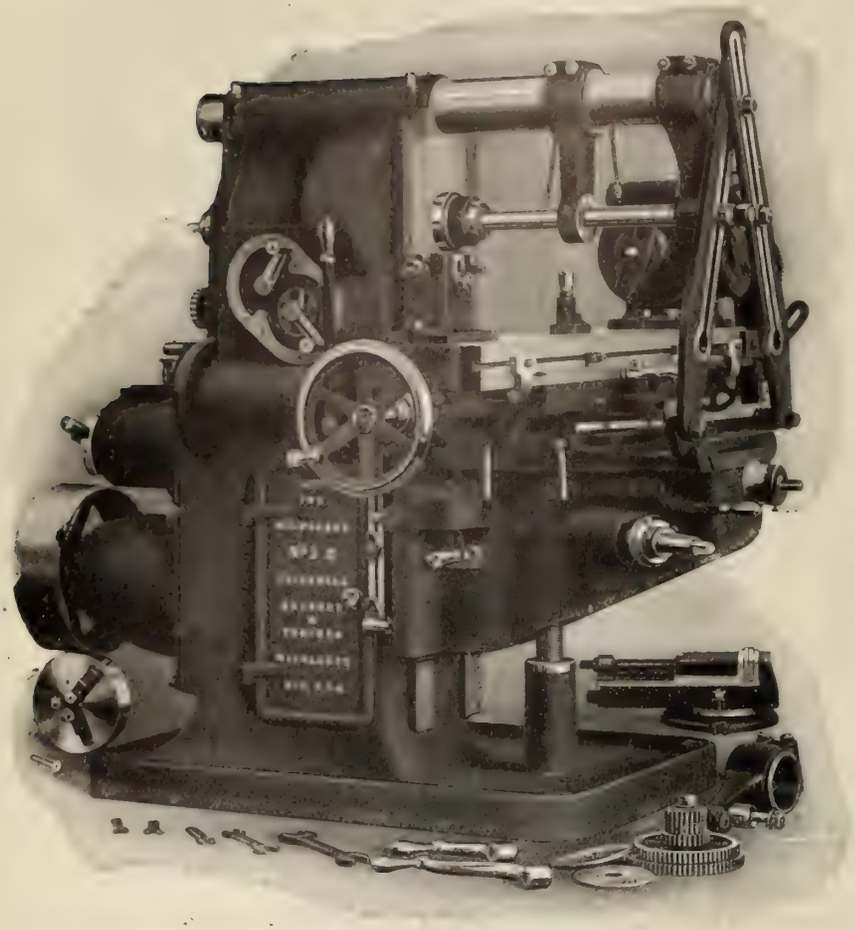
The Cincinnati Milling Machine Co., CINCINNATI, OHIO, U.S.A.

CANADIAN AGENT—H. W. Petrie, Ltd., Toronto, Montreal and Vancouver.



The No. 2 Cincinnati Cutter Grinder

Takes 12" x 36" between centres.
Has 24" automatic table feed.
Takes face mills up to 24" diameter.
Does the same great variety of work as the No. 1 Machine.
Supplied with either countershaft or direct motor drive as shown.



THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

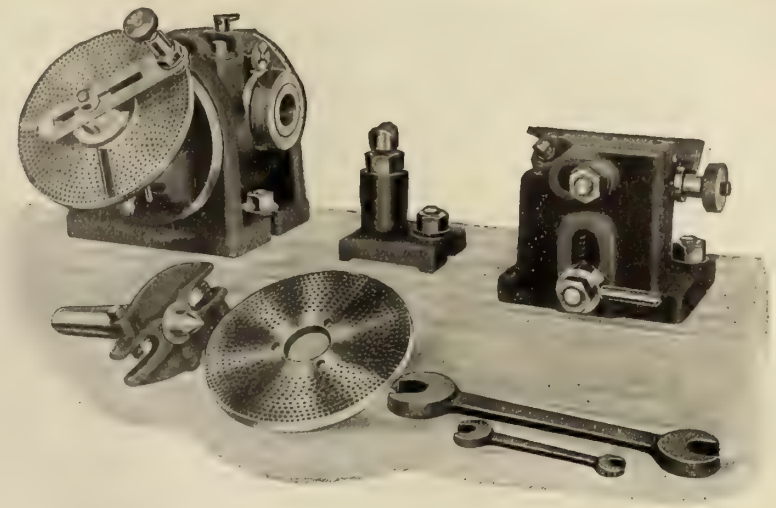
Also builders of Cylinder Planers and a full line of Draw-Cut Pillar Shapers.

KEMPSMITH

New Type Universal Dividing Head

(Furnished regularly on Kempsmith Universal Milling Machines —also Independently.)



RADICALLY NEW

The worm is so located that its point of mesh with worm wheel is at a pronounced angle from the vertical. The worm is not directly under or over the worm wheel. Consequently the worm wheel can be made exceptionally large, and yet be located strictly within the head proper, between the front and rear spindle bearings. Worm can be readily thrown out for quick indexing, and its adjustment for wear is entirely independent.

There are many other very novel and valuable features on this new head. Get the full description.

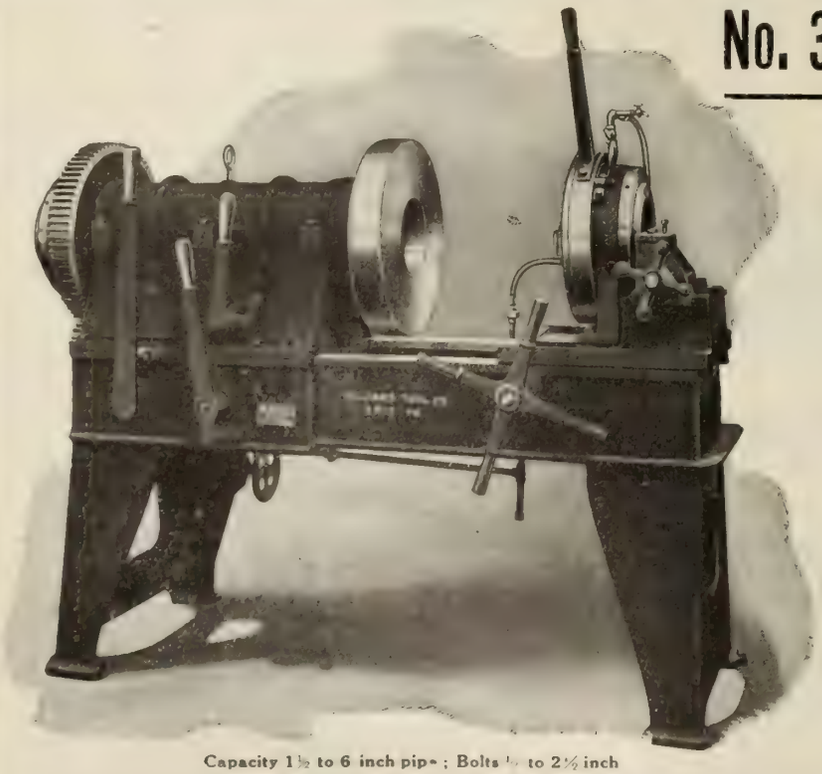
DIRT-PROOF GAS-TIGHT
BALL-BEARING
PIPE-VENTILATED
RUGGEDLY CONSTRUCTED
RELIABLE MOTOR

The compact design of our motors makes them very suitable for individual drives of all kinds. This compactness is not obtained by a sacrifice of strength or efficiency, but by good design and the use of the very best materials only. It is the result of many years' experience in the manufacture of motors and generators, and knowledge of the severe conditions machines have to work under. Whilst compact, the machines are liberally rated, and will stand up to their output and a good deal beyond it, without fear of breakdown of any kind.

No. 3 Williams Pipe Machine



Capacity 1½ to 6 inch pipe; Bolts ½ to 2½ inch

Has every device for convenience, durability and speed.

The Williams Pipe Machines are made in six sizes: ¼″ to 2″; ½″ to 3″; 1″ to 4″; 1½″ to 6″; 2″ to 8″ and 3½″ to 12″.

Designed for strength and accuracy, and unexcelled in efficiency, steady service and reasonable cost.

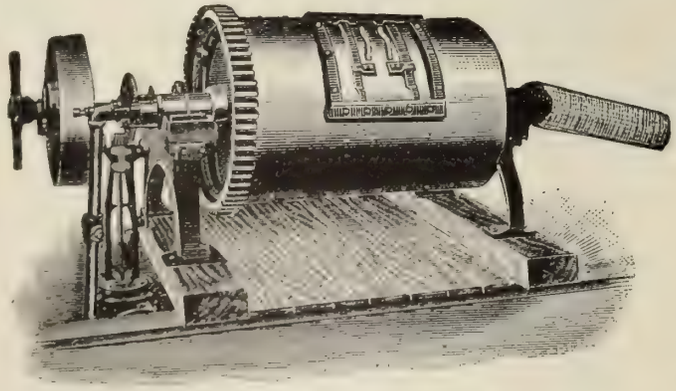
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our ware house in all current sizes, flat, squares and rounds; annealed and unannealed.

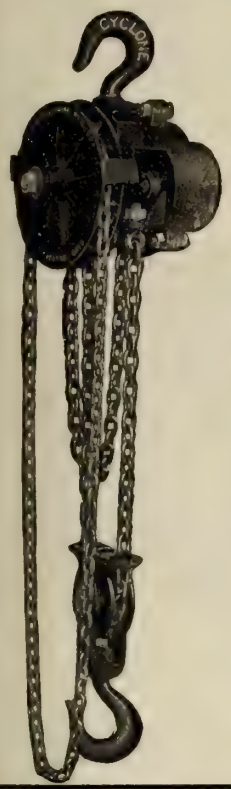
"CYCLONE" High Speed Chain Hoists



We are now sole Canadian Distributors for the CHISHOLM & MOORE MFG. CO., of Cleveland, Ohio, and are prepared to supply, in sizes of ½ to 30 tons, the best Chain Hoist made—the "CYCLONE."

The "Cyclone" action is unique. The friction loss is so slight that the "Cyclone" has been geared higher than any other hoist yet manufactured.

The one-ton "Cyclone" overhauls only 29½ feet of hand chain, with a pull of 85 pounds, to raise one ton one foot, while the average screw hoist of the best type overhauls 60 feet, with a pull of 88 pounds, to accomplish the same result.

Self-lubricating Graphite Bronze Bushings, a splendid automatic brake, and the absence of overhanging bearings to bind under load, add to the superiority of the "Cyclone" over every other hoist.

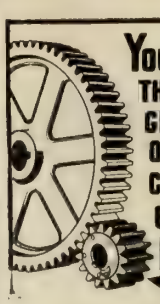
The CURTIS & CURTIS CO.
36 GARDEN ST. BRIDGEPORT, CONN.



YOU CAN'T DROWN THE NOISE OF METAL GEARS WITH BARRELS OF LUBRICANTS, BUT YOU CAN GET QUIET CUSHIONED GEAR DRIVES BY USING NEW PROCESS NOISELESS PINIONS

The lubrication of metal gears is a mighty trying problem. With high speed motor drive, for instance, oil is thrown off about as fast as it is applied. If grease is used it is pressed aside by the teeth from the very place where it is most needed. There is bound to be racket and bound to be wear, so your lubrication expense is largely waste.

The wear on metal gears meshed with New Process Pinions is next to nothing, and you get every advantage of metal to metal gearing with silence thrown in.

Send in your name for a copy of our free booklet on "Noiseless Gears." This will surprise you in showing the class of large plants that have used New Process Pinions for years.

Our Furnaces Heat Steel with the Cheapest Fuel on Earth—
SOFT, SLACK COAL

They are all fired with "American" Mechanical Stokers, which burn bituminous slack coal automatically and without smoke, and give a clear, steady, soft, non-scaling flame. You get increased production, at about one-third to one-half the operating cost of oil or hard coal. This is a fact! If you burn money to heat steel why not burn less of it, and write us at once?

The Effect of the Automobile Industry on Machine Tools

This Topic was Discussed before the National Machine Tool Builders' Association —The Automobile Industry has had a Marked Effect on Machine Design.

By Robert Pierpont.

Where we are making automobiles there is a great saving in the use of special machinery, even if used for but one season. The large output of one model helps this, as we could well afford to spend thirty thousand dollars to experiment and make the tools for a rear axle if we were making twenty thousand cars, as it would mean only $1.50 per car, and would save several times that, but on one thousand cars it would be $30 per car.

In regard to special machinery designed for special purposes, it has usually been considered by a salesman a good argument to say that the entire cost of the machine can be saved in one season's business, in comparison with the cost of doing the same operation on a standard machine. I am strongly in favor of special machines, which do pay for themselves in this way, provided they are simple and easy to operate and not liable to get out of repair.

We have two extremes of opinion in regard to special machinery. A friend of mine, who formulates the policy of a large automobile concern, keeps selling his old machinery to buy new as fast as something which he thinks is better comes out; consequently, he does not believe in very much special machinery, as he would not be able to sell it as readily as he does the standard tools. Others go to the other extreme and will buy special tools for everything, as fast as they come out, whether there is much of a saving or not. I hardly think either extreme is the better policy. It seems to me there is a large field for standard machines somewhat simplified, to be used for special purposes, these to be sold at a cheaper price in quantities, but so built that the full complement of attachments could be added at any time desired. This brings up a point which I wish to emphasize, which is "Simplicity."

Simple Machines Needed.

In Michigan we do not have all high-class mechanics, but are forced to bring in farmers' boys, and even the farmers themselves, during the winter months, and try to make machine men out of them. A great many of the machines which we have are so complicated that it takes a long time for such men to learn to operate them. With the rapid increase of manufacturing and the great demand for machinists, it is almost impossible to get enough competent men to run the machines properly. I think we need simpler machines with fewer feeds and speed changes, rather than machines more complicated and complete. In the ordinary use of machinery it is not necessary to have quick change of gears, as the majority of our men run day after day on the same piece or cut, and in getting out pieces in large numbers it is more advantageous to keep a man doing a certain piece of work, as he is apt to do better and more pieces the longer he is at it. The adjustments of the bearings should be simple and easy to understand and operate. Good foremen are getting scarce and we need machines which will require but little attention.

Referring again to the gearing of the machines, both for driving and speed changes, I notice that our machine shops are continually getting more noisy, and I think you will all agree that when we want a man to do a really nice job, we get him off in some quiet place to work. The noise of the gears running and shifting attracts the attention of the men from their work, and it takes them a long time to get used to it, especially is this true of unskilled labor. This is another reason why I would favor a more simple machine, which would also be more quiet in operation.

Still another reason why I am in favor of the special machine for doing the work faster and more accurately is in taking care of repair parts. The time is already here for some of the automobile manufacturers, and will come to all of the large producers, when they will not be able to take care of the repair parts for outstanding cars in the regular production machine shops, but will have to make special departments, where these repair parts can be produced. If we have any special machinery used in this year's produce, but not in next, we can turn this machine over to that repair department and continue to make these pieces at a cheaper cost than could be done on standard machines, which will all go to help the upkeep for the car owners.

I think a wise plan is, instead of selling old machinery, to which all the special tools and fixtures have been fitted, to turn these over to the repair or parts manufacturing department and buy more new and special machinery for equipment for the coming season's cars. I am sure you gentlemen will all agree with me in this, as the laying aside of the old machines and buying of new will be fine for the machine tool business. This, as you can see, would not be a hardship for the manufacturer of cars, if he buys the special machines and tools with the knowledge that he will more than save their cost in the season's run.

Motor-driven Machine Tools.

I imagine the question of the direct connected, or motor-driven machines, is receiving considerable attention at your factories. It has always seemed to me that special machinery, or that adapted to doing one thing, was the ideal tool for a direct-connected one, as the load will be fairly constant. It very often happens that a special tool will do so much work that it will be necessary to run it only part of the time. If motor-driven it could be shut down for the remaining part of the day without cost.

It does not seen practical to me to equip all standard machines with motors, as on a standard machine, the work varies in style, quality, and power necessary to accomplish the desired result, as at one time we might be using only one h.p. and at others 10 to 15, or whatever the capacity of the machine might be. For example, if we took a room of twenty milling machines and equipped them all with 7½ h.p. motors, the sum would be 150 h.p., whereas very likely the whole room could be run to better advantage with one 50 h.p. motor, and we would have the difference in investment between the twenty 7½ h.p. motors as against one 50 h.p.

It is a well known fact, however, that the friction of the line shaft and belts is greater than the power consumed by the required number of small motors running idle, or the amount of current used to run the motors themselves in excess of the load of the machine.

In the remodeling and moving around which we have found necessary on account of the growth of our machine departments, we have been compelled to use motor-driven machines, as they could be placed in alomst any position, and a great many times the room was not suitable for the hanging of shafting. I use the word "compelled" because I do not think anyone would lay out a machine shop for the special purpose of making automobile parts with the idea of using all motor-driven machines; or, in other words, not have a piece of shafting in the building.

However, here is another example where I would prefer a motor-driven

machine: We will suppose, in order to get out our output, we have to make twenty-five pieces of a certain kind in a day. Now, this operation of whatever kind, uses a regular or standard machine, but the tooling is special; and although it takes but $2\frac{1}{2}$ hours to do the operation on the 25 pieces, on account of the difficulty in changing over the machine and the size of the piece, it is impractical to do more than that number per day. Now, although this is a standard machine, I should wish it motor-driven, as the power used to drive the countershaft, etc., with the wear and tear on belts for the remainder of the day, would more than offset the cost of the motor.

Character of Drive.

I may be mistaken, but I have always thought that the single pulley drive came as a natural result after the motor drive. Not from necessity, but just because it was very easy to put a pulley on where the motor was connected.

There are a number of machine tools built, which, under certain conditions, can remove an enormous amount of stock, but the jobs are very few on which we can use a machine to the limit of its power. On the great majority of pieces that go to make up an automobile, if we held the piece tight enough to remove the material as fast as the machine will cut it, we would spring the piece all out of shape. If we do not spring it in holding, it will spring when we let it loose. I have very seldom seen in actual use a cone-driven machine which would not do the work as fast as the piece or fixture would allow it to be done. As the single or greared machines must necessarily cost more money and wear and tear on the whole machine is greater, I am inclined to believe that in a few years we will, most of us, be of the opinion that the single belt geared drive was not the success which we had expected.

It is not many years since the cutting tool, or steel man, came around and told us that his steel would stand more than the machine was able to do, but I have not heard that remark passed in the last two or three years, which goes to show that the machines themselves have been perfected beyond the tooling point. It is all very well for a manufacturer to say that his machine will remove so many cubic inches of stock a minute, but in actual practice that does not interest us as much as to have a machine run 365 days in a year, if need be, without repair, and do one piece after another with perfect accuracy. As you see, I am not a very strong advocate of the single pulley drive over the old cone type.

Automobiles do not seem to be getting much cheaper in price, but we are giving more horse-power for the same money. The tendency is toward larger bore and longer stroke engines, which mean larger and heavier motor parts throughout. This, of necessity, is reflected through the whole car. The requirements all along the line will be for heavier machine tools to take care of the increase in size and horse-power of the cars. We used to think that an engine with a 5-inch bore was a large car and mostly for racing purposes. In looking over a list of some of the American cars, I find there are forty-four makers of cars using engines with 5-inch bore or larger for the present, or 1910 season, in standard touring cars, and I feel sure that there will be more next year.

Milling Machines.

I think some fine milling machines are being built. They are very powerful, and have all kinds of feeds and quick-change gears for feeds, speeds, etc. Now these same machines are just like the universal milling machine, except that the table does not swing. As only a small part of the work done on a universal miller requires the moving of the swinging table, the machines are knee type and to all intents and purposes universal. As a rule, we use universal machines chiefly for tool work. The question I wish to raise is this: Do we need all of these attachments and feeds in the same machine? Why not make them optional?

Lathes.

The same thing applies to lathes. We buy lathes with all kinds of quick-change appliances, feeds, stops, etc., but do we really need them, or do we buy them because you force them on us against our will? We do, however, like the wide, heavy carriage, the large bearings and rigid tail stock. A lathe used to be a simple machine; it was one of the first, if not the first, on which we started the apprentice to work. Take a walk through almost any automobile factory and notice the character of the work the men are now doing. Notice how often they use the change gears, etc., in getting out a large quantity of work. You are getting lathes to a point where they are almost universal in scope, I do not think we want a shop full of universal machines, the greater part of the attachments on which will never be used. As it is now, it is like buying a universal grinder with all the attachments, extra spindles, etc., and putting on it work that should be done on the ordinary plain grinder. This would be the height of folly, for we would be getting no return whatever for our extra investment, and I am forced to look at some of the so-called standard machine tools which are being built at the present time in this light.

It is rather hard for us to expect the average man who cannot even read a micrometer to turn out accurate work on a complicated machine. We have been tied down to the old-established precedent that every lathe called for a large and small face-plate, steady rest, etc., but I think if we had lathes built that could be bought either with or without plain rest, compound rest, quick-change gears, or screw-cutting attachments, and still have these attachments so they could be procured and put on at any time, it would save us considerable money on our investment.

There is very little work we finish on a lathe now. No matter whether it is straight or taper, inside or outside, we invariably leave a little to grind, whether it is to be hardened or not. This makes the lathe only a roughing machine at the best, but it must be able to rough accurately and true, in order to leave a uniform amount to grind or finish.

The newer crank-shaft turning lathes have proven very satisfactory. A number of us have tried grinding from the rough, but have given it up one after another. We may start off with drop-forged cranks near enough to grind out readily, but the dies wear, and we have trouble, and eventually come back and rough turn them on the lathe. I think it will be a fine thing when we can finish them in a grinder from the rough in an entirely satisfactory manner.

Grinders.

The manufacturers of plain grinders are moving in the right direction by making their machines heavier. High-speed machinery must be heavy and stand firmly on the floor or foundation in order to be satisfactory. I do not think it pays to be saving with your iron in the designing of grinding machinery. The whole machine, bed, table, wheel carriage, etc., must be very heavy, enough so, at least, that it will not synchronize with the vibration of the spindle, or the result will be poor work. We buy these machines and put them to work and no doubt they do not get the attention they should, but we expect them to do good, accurate work, although they may not be adjusted to a fine point at all times. The same holds true in all classes of grinders, internal, as well as external, and with the large milling cutters and tools we have to grind—I think the tool and cutter grinders might be made heavier without losing any of their efficiency.

We are using water grinders in new ways more and more and find they give the cheapest finish, as well as the best and most accurate. This applies to soft parts as well as hard ones. They save quite an item in float files and emery cloth. A large part of the different

pieces that go to make up a first-class automobile have operations on them in the grinding departments at some time before they are finished and ready for the stock room. We want in the future to finish more and more from the rough casting or forging without any previous or roughing operation. This applies to round as well as flat surfaces.

Drills.

In the way of drilling and vertical boring machines, we have used, and shall continue to use, still more multiple and special tools. While we now drill ten, fifteen or twenty holes on one side of a piece, I see no reason why we should not be drilling as many more on the other side at the same time, just as we mill or turn a piece on two or three sides at the same time. These special and multiple drills make a very nice proposition for motor-drive, as the load is very even. High-speed twist drills are used by almost everyone, and all drilling and boring machines should be arranged to take care of this.

We are using the gang drill press in successive operations to good advantage, and on large and long holes are getting a very cheap production, as one man can run a number of presses in one gang or set. Strong and accurate interchangeable tools and fixtures, that would be almost, if not quite, universal in scope, for holding the pieces to be machined would be an added inducement for the purchase of the drills if they could be furnished in this way.

The engine cylinder has had more special machinery built for it than any other part of the car, but the crank case which carries it seems to have been neglected, except in the matter of multiple drills. I think there is a market for some horizontal boring and reaming machines with two or three spindles, having movable centres for boring out crank and transmission cases. On a crank case for an L motor we require two bars, and on a T motor case three bars for the crank shaft and cam shaft holes. As it is now, we buy a horizontal drill and have to equip special driving heads to run these bars and this also shortens the space on the bed of the machine. If such machines are made, I do not know of them and will say we are in the market for two or three right now.

Screw Machines.

On the automatic screw machine we want greater production with accuracy. We also want machines which require the minimum of repairs. In the hand screw machines we are looking for new and original ideas for holding and tooling the pieces for chuck work and second operation. Some of the large bar machines are going to prove to us that they can make gear blanks cheaper from the bar than from the forging. The turret machine builders have the right idea in enabling us to buy the bare machine or with as many outfits or tools as we require.

Gear Cutters.

Regarding gear cutters I do not think of anything other than what I have said in a general way. I do think, however, that someone should get up a machine or attachment for grinding rotary gear-cutters and hobbs, after they are hardened, so that they will be absolutely correct. It might make the cutter more expensive, but with the increased wear we get from high-speed steel they would be well worth the money.

Special Machinery.

As I have already told you, I am in favor of special machinery for doing one thing and that well and quickly. I will give you only two or three examples which perhaps you will not think of. We are all using square holes more or less in our transmission gears. There should be a good sale for a machine to bore out a round hole into a square one, within a reasonably close limit. This could be done either vertically or horizontally and does not seem to me to be a very difficult operation. We would be willing to run a sizing broach through if it were necessary, but when we have to broach out a long sliding gear hub made from high-grade alloy steels from the round hole, it is a long and seemingly unnecessary operation.

There are an enormous number of cotter-pin holes to be drilled in the ends of bolts and studs. I do not see why we should not put them into a hopper and have them come out all drilled automatically. The same is true of castleated nuts. I do not see why these should not be slotted by an automatic machine, as well as threaded.

Then we have the square shafts that fit in the same square holes. These should be ground with a form or master doing the flats and corners all in one operation, and in the same manner in which we are now grinding the cam shafts. After machines of this character have been perfected, I do not see why they should not be standardized and sold as such.

AUTO SECTION OF C. M. A.

The Canadian automobile manufacturers have formed a branch of the Canadian Manufacturers' Association, their object being the promotion of the automobile industry in Canada. The following executive committee was elected: T. A. Russell, R. S. McLaughlin, R. B. Hamilton, Fred Sager, Hugh T. Tudhope.

The executive will elect a chairman and a vice-chairman.

The present members are: The Ford Motor Car Co., Walkerville; Canada Cycle & Motor Co., Toronto; the McLaughlin Motor Car Co., Oshawa; the Reo Motor Car Co., St. Catharines; the Tudhope Carriage Co., Orillia; the E. M. F. Co., Walkerville; the Dominion Motors, Ltd., Walkerville; the Regal Motor Car Co., Walkerville; the Kennedy Motor Car Co., Preston.

MONTREAL BRANCH, C. M. A.

Lieut.-Col. Robert Gardner, of the manufacturing firm of Robert Gardner & Son, Limited, president of the St. Andrew's Society, has been elected to the chairmanship of the Montreal branch of the Canadian Manufacturers' Assn., for the ensuing year. Col. Gardner has for several years taken a very active part in the work of the association. He was first elected to the exceutive committee in 1901, and has sat as a member of that body continuously since 1904, taking a prominent part in its deliberations and a keen interest in all that pertained to the welfare of the Montreal branch, and the association as a whole.

RAPIDS PRINCE LAUNCHED.

The John Inglis Co., Toronto, have launched a new passenger steamer, Prince George, for the Richelieu & Ontario Navigation Co. The Rapids Prince carries twin screw triple expansion engines with cylinders 12½ inches, 20 inches, and two 22 inches diameter, by 16 inches stroke. Steam is supplied by one Scotch boiler, 14 feet 8 inches in diameter, 12 feet long, with the Howden system of forced draught and a working pressure of 170 pounds. There are six feed pumps and a vertical jet condenser. The boat is equipped with steam and hand-steering apparatus. It is lighted with electric light supplied by a Westinghouse direct connected 22 kilowatt generator of 250 volts.

CLUB FOR EMPLOYES.

The Massey-Harris Co., Toronto, intend securing and operating a clubhouse for their employes, where tea and coffee could be served; a place, it is presumed, where the men could smoke and take their ease, offering all the inducements and companionship of a hotel, with none of its drawqacks.

James D. Grant, formerly of the order department, Frost & Wood Co., Smith's Falls, has accepted a position with the P. Burns Co., Calgary. He was presented with a gold watch by the Frost & Wood office staff and foremen before leaving for the west.

Interior Dominion Bridge Works, Toronto, Showing Facilities for Handling Material.

Solving Transportation of Material in Machine Shops

The Dominion Bridge Co. have Solved the Problem in their Toronto Works by Installing Jib Cranes, Two Narrow Gauge Tracks and a Standard Gauge Track.

There are several ways in which materials may be transported from department and through a machine shop. In the accompanying illustration is shown a series of jib cranes and tracks successfully used at the works of the Dominion Bridge Co., Toronto.

The shop is longitudinal in design and the work passes progressively through from the east to the west end where it is ready to be shipped. When new stock arrives it is brought into the shop on the standard gauge track and deposited at the east end. On the left in the view shown, are the Newton cold cut-off saws where the larger shapes are cut to lengths for the work for which they are designed. The smaller shapes are cut off on the Henry Pels machine. This machine is very rapid in operation and with the aid of a jib crane the shapes are quickly cut off to length and transferred to the next machines.

The shapes are next marked, punched, assembled, riveted and painted. In passing the work along the tracks and cranes are used. On the north side it is possible to pass the work along almost the whole length of the shop. Opposite the air riveting machinery near the west end one crane has been omitted, but could be easily installed if desired or if found necessary.

On the south side opposite this point is the air riveting apparatus. An overhead trolley equipped with an air hoist is installed and by utilizing this the work could be passed along from east to west end of the shop without depositing the work on the floor.

The narrow gauge tracks are used for passing the work along, the cranes being utilized for the machinery, and marking and assembling operations. When the work is completed a car may be shunted into the shop and the finished product loaded on the cars, the jib cranes being found useful tools for loading.

This arrangement is very efficient, the cranes being at the service of the operators at any time. The trucks, which may be seen in the foreground of the illustration, are in sufficient numbers so that there is no delay waiting for material.

PROBLEMS OF THE FUTURE FOR THE ENGINEER.

In a paper on "The Apprenticeship Course and the Engineering Graduate," published in the Electric Journal for April, Chas. F. Scott, consulting engineer of the Westinghouse Electric & Mfg. Co., says in part:—

"Modern industrial life consists not merely in machinery and factories, processes and systems, but it includes the human element and brings together in a single organization and into a single community, men of all grades and types. To know these men, how they work and how they think, to understand their point of view, is an opportunity which the young engineer should not miss. The larger and more difficult industrial problems which will come up for solution during the next generation are not those of machinery, but of men. It is this relation which underlies much of the industrial, social and political unrest of the present. The coming engineer will have more and more to do with the handling and direction of men, and furthermore, his education and training, his natural relationship to industrial affairs, supplemented by a first-hand knowledge of conditions and of men, should make the engineering profession a useful instrument in working out the problems of modern life which are very largely the outcome of the new conditions which engineering itself has produced."

Semi-Annual Mechanical Engineers' Convention

Atlantic City Meeting, May 31 to June 3, 1910---Many Important Papers were Read and Discussed: "Comparison of Lathe Headstock Characteristics," "Improved Methods in Finishing Staybolts and Straight Taper Bolts for Locomotives," Etc., Etc.

At the sixty-first semi-annual convention of the American Society of Mechanical Engineers, at Atlantic City, several important papers were read. These included a paper on the stockless jarring machine, described in the February issue of Canadian Machinery. Prof. Walter Rautenstrauch, of Columbia University, gave a paper showing a comparison of lathe headstock characteristics.

Lathe Headstock Characteristics.

Many machines on the market have been redesigned to make the most efficient use of high-speed steels. These tools can be compared on many bases, but the one which the author believes the most satisfactory is that established on the basis of those characteristics of speed and torque which permit the most economical removal of shavings from a given class of material and a comparison of the speed and torque actually obtained with the standard characteristics will serve as a means for judging the efficiency of the headstock. In any machine a definite relation must exist between spindle speeds and accompanying torques that the machine may be adapted to efficient weight removal on all diameters of any material. The torque resulting from taking a cut varies directly as the diameter of the piece operated on and to keep the standard surface speed best adapted to the tools employed the spindle speed must be increased. The spindle speed varies inversely as the diameter of the work, and where it is desired to remove a maximum weight of shavings, the product of the speed and the torque should be a constant and the ideal speed-torque diagram is an equalateral hyperbola. The diagram may be used to determine the proper relations which should exist between spindle speeds and torque in a new design of lathe and also to determine the extent to which the speeds and torques of a lathe already designed conform to this standard. A number of lathes of different makers were selected and speed-torque diagrams plotted for each. An investigation of these diagrams showed that increasing the number of speeds regardless of the torque does not necessarily increase the lathe's adaptability to economical performance and that the amount by which the efficiency can be increased is not proportional to the additional speed changes provided.

In the discussion of this paper Carl G. Barth spoke of the use of slide rules in calculations regarding lathes. With reference to gears he stated that the pitch diameter d for a 60-toothed gear

$$\frac{60}{62}$$

can be made equal to S— by the Brown & Sharpe formula, allowing the outside diameter to be equal to the pitch diameter of a gear of two more teeth: 7.7 S is then the strength of the gear. Tools of proper cross section should be one-thirtieth the diameter of the swing.

A formula for the horse-power required by a lathe is often wanted; a good one he offered is one-third of the swing.

A paper was read on "Improved Methods in Finishing Staybolts and Straight and Taper Bolts for Locomotives," by C. K. Lassiter, of the American Locomotive Co., Richmond, Va.

Finishing Staybolts.

The staybolts in a boiler, more than any other part, are subjected to destructive stresses. These bolts were formerly cut to length, drilled for centres and threaded in engine lathes, but as this method was expensive, bolt cutters were substituted. The introduction of the lead screw in bolt cutters brought about a considerable improvement in pitch. The idea of concaving the bolts or reducing them in the centre below the root of the thread was conceived with the idea of providing flexibility, and for many years the diameter of the bolt was reduced in an engine lathe after it was threaded in the bolt cutter. About ten years ago an automatic machine was designed for making side stays from the bar automatically, including threading and concaving. In the drilling of staybolts, considerable trouble has been experienced with drills breaking and an automatic machine for drilling the holes before the stay is placed in the boiler has been devised, which has reduced the cost of this very considerably. The usual method of finishing straight and tapered bolts required a number of operations, but this has been changed by the use of a special vertical multiple spindle drill and a special cutter head. The latter is the essential means of producing these bolts cylindrically true to the axis, the machine being simply the means for driving and feeding the bolt. In connection with this special cutter a device has been perfected for performing the threading operation at the same time that the turning is done.

E. D. Meier, discussing this paper, emphasized that in boiler parts too good a material cannot be used.

Another paper of interest was one by H. L. Gautt on the mechanical engineer's relation to the textile industry.

Mechanical Engineer and Textile Industry.

The textile industry has been brought to a high state of perfection without the aid of the mechanical engineer, and its machinery was developed by the mechanic before the mechanical engineer became a very important factor in the industrial world. The most important field of this industry that the engineer has entered is the power department. In this industry a wider gap exists between the financial interest which controls, and the help that operate, than there is in almost any other industry. The textile schools at the present time are doing much to fill this gap by supplying men who can act as a link between the two interests. The lack of such men in the past is undoubtedly responsible for some processes, such as handling cloth in a bleachery, which could be easily standardized and done automatically, being still performed expensively and inefficiently by hand. One of the specific things which the author has in mind is the forming of the pile where the cloth is "soured." The piles are formed by hand, and for subsequent processes portions of two piles may be joined to form one. The pieces of cloth thus become mixed and must be untangled.

To do this work more efficiently and less expensively the author has developed a machine consisting of an inclined chute with upturned ends and a bottom composed of a series of freely-revolving independent rollers. The cloth is fed into the stack and is carried by its own weight to the bottom. As the fabric rises in the receiving stack, the forward end of the pile is forced upward into the other end of the machine and is taken off at the rate at which it enters the receiving stack. These machines produce a marked saving in time and also a saving in the amount of floor space required.

Line Shaft Hangers and Bearing Improvement.

This paper by Henry Hess, president of the Hess-Bright Mfg. Co., Philadelphia, has for its object the description of a special hanger, and the results obtained from tests made on it.

The Sellers type of hanger, while well adapted for use with plain bearings, was not found practicable with ball bearings, because the spherical sections outside the box for it to rock on were too flat for the large diameter of the box containing the ball bearing. After laying out a number of forms of hanger on paper, a design was finally evolved, in which the box is supported and pivoted horizontally. The body proper is of channel section and is attached by a single bolt at each end. The bearing box is a central cast supporting ring bored to fit the outer race of the ball bearing and provided with cover plates at the sides.

This arrangement retains the lubricant and also excludes foreign matter. The ball bearings are free to move endwise in the box, but are clamped fast to the shaft so that the inner race cannot rotate. Special alloy steel is employed for the construction of the balls and the races.

An interesting discussion followed, the author explaining the various points brought up. Concerning the effect due to dust in concrete buildings he explained that dust will destroy ball bearings if it gets in, but it is easy to keep it out. Ball bearings are being run on dredges where they are 40 feet under water, and the water is kept out and the lubricant in by the form of bearing used. The Thompson Meter Co. has a concrete building in which no trouble is reported from dust. In a marble works ball bearings are running without any trouble, and in textile mills they are able to operate without any trouble from lint.

The heating of ball bearings is due to mechanical work imposed by misalignment. Its effect is not very evident in ball bearings. There is but a very small rise of temperature in a ball bearing even with an exceedingly heavy overload. Ball bearings will reduce friction 60 to 90 per cent. Lubrication and drip are partly taken care of by enclosing the bearing. The space for lubricant is so large and the amount required so small in ball bearings that they will run from three to five years without replenishing of oil. It is not a question of the lasting of the lubricant, but its gumming, and, all things considered, it is advisable to look after such a bearing at least once a year. Regarding the best method of supporting bearings in concrete buildings, the author referred to practice in a German plant, where they have placed cast iron channels in the ceiling with T-slots and about 3 feet apart, running lengthwise of the building. Across these other channels can be clamped, permitting the locating of hangers anywhere.

CANADIAN STEEL COMPANIES.

"The Steel Company of Canada" is the name chosen for the large Canadian steel merger, which includes the Hamilton Iron & Steel Co.; Canada Screw Co., Hamilton; Montreal Rolling Mills, Montreal; Canada Bolt & Nut Co., with works in Brantford, Toronto, Belleville and Gananoque. The company is capitalized at $25.000,000, with headquarters in Hamilton. The provisional directors: Robert Hobson and C. S. Wilcox, of the Hamilton Steel & Iron Co.; Cyrus Birge, Canada Screw Co.; Lloyd Harris, Canada Bolt & Nut Co., and W. M. Aitken, of the Royal Securities Co., Montreal, who represents the new holders of the stock of the Montreal Rolling Mills.

Improvements to the extent of $1,500,000 will be made. The officers of the merger are: C. S. Wilcox, of the Hamilton Steel & Iron Co., president; Cyrus A. Birge, of the Canada Screw Co., and H. S. Holt, representing the Montreal Rolling Mills, are vice-presidents; and Robert Hobson, of the Hamilton Steel & Iron Co., is general manager.

The valuation at which various companies included in the Hamilton merger were taken over is given as follows:—Hamilton Steel & Iron Co., $9,300,000; Canada Screw Co., $4,000,000; Canada Bolt & Nut Co., $2,100,000; Montreal Rolling Mills Co., $7.650,000. The present capitalization of the Steel & Iron Co. is about $3,000,000, so that the holders of stock will get three shares in the merger for every one they hold in the company.

President Plummer, of the Dominion Steel & Coal Co., confirms the report that the Dominion Co. will not enter into competition with the Hamilton merger by erecting nail and screw mills. This is in return for the concessions made by the Hamilton merger in giving up the name and probably deciding not to erect a rod mill at Hamilton. The merger of the Dominion Steel & Iron Co. and Dominion Coal Co. will be known as the "Dominion Steel Corporation."

The statement that the Dominion Wire Mfg. Co., Montreal, is to be included in the Hamilton merger is officially denied by the president, W. H. Farrell. Negotiations were on but no agreement could be reached, so the company will not join the merger. There has also been some talk of the United States Steel Corporation taking over the Dominion Wire Mfg. Co., the two interests being very friendly.

The work of the additions to the works of the Lake Superior Corporation is progressing favorably. It is expected that those now under way will be completed by December, 1910.

St. Paul capitalists are about to establish a steel plant and smelter near Cowley, Alberta. Winnipeg capitalists have turned over immense coal and iron deposits near Cowley to the syndicate, and the latter has taken an option on iron deposits for $250,000. The ore is magnetite, adapted for manufacture of steel

The Western Steel Corporation, who are to establish a plant on the outskirts of Vancouver, plan to erect blast furnaces, rolling mills, bolt works and nail and screw mills. In connection with the steel works the company will lay out a townsite on ground situated close to the plant. The projected town will be patterned on general lines after the famous creation of the United States Steel Corporation at Gary, Ind.

RE-ROLLING OLD RAILS.

About four or five thousand tons of steel rails have just been re-rolled by the Provincial Steel Co., Cobourg, Ont., for the I. C. R., and at the present time from fifty to one hundred tons of rails are being turned out daily.

These rails were purchased by the Intercolonial Railway from the old Ship Railway between Fort Lawrence and Baie Verte. They were then placed in use on the I. C. R., and were afterwards torn up and sent to Cobourg to be re-rolled. The rails formerly were of the one hundred and ten pound variety, and have been reduced to eighty pounds. They were laid on the road a few years ago, and becoming somewhat worn were taken up and sent to the Provincial Steel Co., who have re-rolled them. The Provincial Steel Co. is one of the new industries in Canada, and this is the first work they have done for the Government road. The process used is called the McKenna process. Used rails are heated and then put through the rolls, thus making the rails practically new, but reduced in weight and size.

CANADIAN BOUNTIES.

An official statement of the iron and steel bounties paid by the Canadian government during the fiscal year ending March 31 last, shows total payments amounting to $1,808,533. The total pig iron production was 740,244 tons. On 547,063 tons made from Canadian ore $480,763 was paid, and on 193,181 tons made from foreign ore the bounty amounted to $93,205. The production of steel was 740,390 tons and the bounty $695,762. On wire rods $538,812 was paid for an output of 89,802 tons. The list of recipients was headed by the Dominion Iron & Steel Co.

OTTAWA MINT EQUIPMENT.

There have been several additions made to the Government Mint, Ottawa, by James Bonar, Deputy Master and A. H. W. Cleave, M.E., mechanical superintendent. The orders were placed with Francis Hyde & Co., Montreal, for equipment for use in the refinery department, and includes a battery of five King fuel oil furnaces equipped with safety valves, etc.; two rotary oil pumps fitted with special gearing, suction and discharge pipes, safety valves, etc.; one 1 h.p. a.c. motor, one 100 gal. fuel oil tank, one Sturtevant monogram blower with motor, and four burners and combustion chambers complete with firebrick.

The Patent Relation of Canada to the World

A Summary of the Articles of the International Convention for the Protection of Industrial Properties—Some of the Advantages Accruing to the Contracting States.

Realizing that a change in the conditions then extant, regarding international patent conditions, was advisable, in 1883, an invitation was extended by the Swiss Government to all the countries of the world to attend a convention at Berne, Switzerland, to discuss ways and means of making any necessary changes. This meeting gave rise to the International Convention for the Protection of Industrial Properties, the signatories of the articles then drawn up, giving themselves that name. The contracting states were Belgium, Brazil, France, Gautemala, Italy, Netherlands, Portugal, Salvador, Servia, Spain, and Switzerland, and since that time, other countries have come in, so that from a report in January, 1909, the following additional states had bound themselves to the articles of the convention: Australia, Algeria, Austria, Ceylon, Cuba, Denmark, Dominican Republic, Germany, Great Britain, Hungary, Italy, Japan, Malta, Mexico, New Zealand, Norway, Servia, Sweden, Tunis, Tobago, Trinidad, and the United States of America.

The Patent Act.

Substantially, the act is as follows:

1. The subjects of each of the states of the union shall enjoy, in the the states of the union, all the advantages that their own laws grant them, as regards patents, industrial designs or models, trade-marks and trade names. This applies likewise to a foreigner from a non-contracting state having interests in one of the states of the union. He is treated as a citizen of that state where those interests are located.

2. Any person applying for a patent, industrial design or model, or trade-mark in any one of these states shall, in all the other states of the Union, enjoy a priority of registration, of twelve months for patents, and four months for industrial designs or models and trade marks.

3. The introduction by the patentee into the country where the patent has been granted of articles manufactured in any of the others states, shall not entail forfeiture; but nevertheless, the patentee shall remain bound to work his patents in conformity with the laws of that country into which he is introducing these manufactured articles, provided the period allowable before forfeiture for non-working in that country is not under three years, commencing from the date of application in that country.

4. All goods illegally bearing a trade mark or trade name may be seized on importation into any of the contracting states, at the request of the interested party or government. If seizure is contrary to law, the goods can be prevented from importation.

5. Each of the states reserves the right to make any independent contract or special arrangement with any other state whether that state is in the Union or not, provided that the new arrangement does not contravene the convention agreement.

These foregoing five paragraphs, while by no means giving the full particulars of the articles of the convention mentioned, nor of the amendments agreed to by the convention when it met again in Brussels in 1900, they nevertheless give the essential working parts, for the balance of the report deals with the details of carrying out the ideas embodied.

In view of the simplicity of the agreement, does it not seem strange that Canada, one of the coming countries of the world, does not belong to this Convention when practically all the countries of the world, both great and small have identified themselves with the movement.

Some time ago a committee of the Canadian Manufacturers' Association was appointed to investigate the matter and they brought in a report unanimously in favor of Canada becoming a participant, but apparently the matter has been let drop with the result that no action has been taken in the matter.

There are many advantages that would accrue to Canada from being a member of that Union. If a citizen of one of the contracting states desires a patent all that is necessary for him to do is to file an application with his own home government, and if it doesn't conflict, it is granted and his patent is not only protected in his home country under the patent laws of that country, but it is also protected for the period of twelve months in every other state of the union under the same laws as his home patent.

It is a well-known fact that to protect a patent in the principal countries of the world is a very expensive undertaking, costing in the neighborhood of $600, depending on the number of countries where protection is desired. Under the laws of the union, the patentee can manufacture and market his goods for the space of twelve months and thereby find if there is to be a sale for his product, having, so to speak a "trying-out" period. If his article does not find a sufficient sale to warrant the expenditure of protecting his patent in the other countries at the end of the allotted period, he is saved the expense of having done so originally.

This allowance of twelve months' grace permits of the patentee's product becoming so established in that foreign country that in many instances a patent would be unnecessary there.

Another value of the union lies in the fact that a prospective patentee will go where he can obtain the greatest protection at the least expense. This has a tendency to take otherwise Canadian patentees across the line where the protection of the union is afforded. This is made possible by the first article cited.

These instances show that Canada would derive a benefit if she will only participate.

In 1900 Canada did apply for admision; but she was refused on the ground that her patent laws would need revising. All the principal countries of the world had laws that would conform, or were made to conform, besides the numerous smaller countries, behind whom Canada does not want to lag. Yet, while she was refused on that ground, and while the Canadian Manufacturers' Association has reported in favor of it, no movement has been instigated tending to their revisal. It would be an inestimable boom to the manufacturer, and would no doubt help to promote international trade.

MANUFACTURERS AT PT. ARTHUR

G. M. Murray, secretary of the Canadian Manufacturers' Association, has completed arrangements with the Port Arthur authorities for the entertainment of the association on Sept. 12.

They will arrive in Port Arthur at 10.30 a. m. on two trains, and will be taken to the top of the new Canadian Northern Railway Hotel, from which a panoramic view of the harbor and city will be had. Afterwards they will separate into two parties, those wishing to go over the dry docks and the lumber mills, which are to the north of the city, and those wishing to visit the blast furnace and the Canadian Northern elevator. Boarding separate trains they will be conveyed to these industries, and upon returning, at 12.30, they will be tendered a luncheon on the hill crest.

At 2.30 p.m. they will embark on the yacht "Sigma" and be taken for a trip around the harbor, after which they will again enter their trains and proceed west to the annual meeting at Vancouver at 8 o'clock.

"Beaver" Quick Changing Chucks and Collet Sets

Some Interesting Tools Manufactured by the Hamilton Tool Co.---The Collets are Designed for Rapid Interchange of Drills, Reamers, Counterbores, etc.

The accompanying illustrations show a chuck and set of collets designed for the rapid interchange of drills, reamers, counterbores, etc., with the result that they have succeeded in practically converting a single-spindle machine into a multiple spindle, as the collets and tools can be changed instantly while the machine is running at high speed. There is nothing to catch or shock the operator. These tools are made of high-grade tool steel throughout. They are simple in construction, positive in operation, and have proven great time-savers.

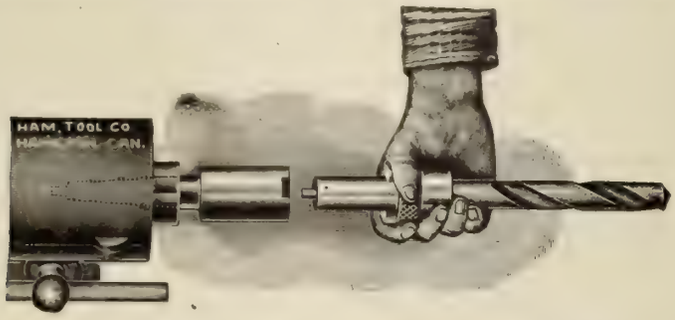

Fig. 1.—Drill Chuck and Collet, Hamilton Tool Co., Hamilton.

A self-contained device releases the collet and tool instantly, requiring neither hammer, wrench nor key to operate.

The chuck is fitted with a Morse taper shank of the required taper to fit the machine spindle and is bored so that each collet of the set will fit snugly into it.

The collets are bored to take tools having either Morse taper or straight shanks, as required. Lengthwise of the collet shank is set in, a strip of steel, which is kept in position by means of a spring. On this steel strip is a catch, which, when the collet is engaged, fits into a groove on the inner side of the chuck, thus holding the collet and tool firmly in position. The inner side of the knurled ring is so constructed that when grasped between the forefinger and thumb and pulled outward the catch is instantly released, thus freeing the collet and tool from the chuck, which still remains firmly in the spindle. A spring steel wire firmly seated in a groove around the collet prevents the knurled ring from coming off when being pulled outward to release the collet.

The sliding pin in the end of the collet is a very simple and most effective method of knocking out tools.

Fig. 2.—Drill Chuck, Hamilton Tool Co.

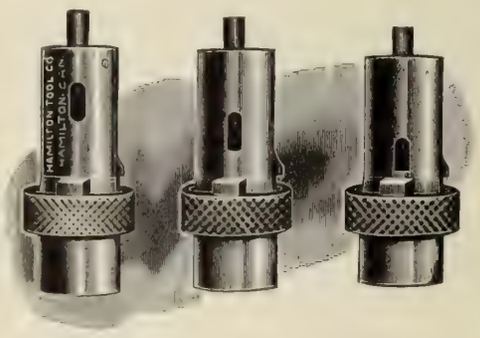

Fig. 3.—Drill Collets, Hamilton Tool Co.

To engage the collet grasp it by the knurled collar and push into the chuck.

To disengage the collet grasp it by the knurled collar and pull straight out from the chuck.

These chucks and collets are manufactured by the Hamilton Tool Co., Ltd., Hamilton, Ont.

TECHNICAL EDUCATION COMMISSION.

The following commission has been appointed by the Dominion Government: James W. Robertson, Montreal, Que., chairman; Hon. John N. Armstrong, North Sydney, N.S.; George Bryce, Winnipeg, Man.; M. Gaspard De Serres, Montreal, Que.; Gilbert M. Murray, Toronto, Ont.; David Forsyth, Berlin, Ont.; James Simpson, Toronto, Ont. Secretary and reporter to the commission, Thomas Bengough, C.S.R.

The purpose of the commission is to be that of gathering information, the information when obtained to be carefully compiled, and together with such recommendations as it may seem expedient to the commission to make, to be published in a suitable report to be at the disposal of the provinces and available for general distribution.

The commission is appointed under the statute respecting enquiries concerning public matters, and will report the results of their investigations, together with their recommendations, to the Minister of Labor.

The Commission will begin by making a tour of the Dominion from the Atlantic to the Pacific, visiting all important industrial centres and ascertaining by personal enquiry and investigation, as well as by the hearing of evidence, the needs of employers and workingmen alike as respects industrial training and technical education. Having completed this part of its work the commission will then visit the United States, the United Kingdom, Germany, France, and any other countries that may seem necessary, with a view to ascertaining the best methods by which similar needs are being met, and the work of technical education furthered in other lands. It is expected that at least a year will be required for this work.

Manitoba has also appointed a commission on technical education as follows: D. McIntyre, of Winnipeg School Board; one representative each from Brandon and Portage la Prairie school boards, and from Dauphin; one representative of the Manufacturers' Association, one from the Agricultural College, one representative each from the Brandon and Portage la Prairie Trades and Labor Councils, and about six from the Winnipeg Trades and Labor Council, and one from the Winnipeg Board of Trade.

FOUNDRYMAN'S RULE.

The Hamilton Facing Mill Co., Ltd., Hamilton, Ont., manufacturers of foundry facings and supplies, are issuing to their friends a two-foot folding steel rule, in a neat leather case, making it suitable for carrying in the vest pocket. In addition to the ordinary uses, the rule can be used for measuring the circumference of cones, patterns and castings. On release the rule at once regains its original shape. Any foundry foreman or superintendent may obtain one of these useful rules by writing the Hamilton Facing Mill Co., Ltd., on your company's letterhead.

THE EASIEST PROFITS.

By James H. Collins.

A FOUNDRY in Ohio had been so busy for two years that, despite overtime work, it was constantly behind orders from a month to six weeks. Conservative advance estimates of the business that was being done placed the volume at half a million dollars, easily, and when the next annual accounting was made the gross output exceeded that amount. Yet it was learned that the profits for twelve months had been less than twenty thousand dollars. This discrepancy was so surprising that the concern called in a firm of production engineers to make a study of the business and find out where the profits had gone. Investigation showed that most of the loss came from congestion in the moulding shop, where castings were turned out.

This foundry make a wide assortment of machine parts for other manufacturers. Its business was secured chiefly on bids. The latter were based upon rough estimates. With no accurate cost system for following each order through the plant it was necessary to use averages calculated from last year's general cost of labor, materials, and so forth. The prices at which work was secured usually afforded a fair margin of profit. But that margin was frittered away in the processes, and for lack of a cost system which would show actual expense on each job it was impossible to locate the leakage. As each job came in it was numbered and sent through the plant in the order of its number. Thus, a lot of small castings would be followed by some very heavy ones, and those in turn by a dozen miscellaneous parts intended for a certain machine, all handled together under the same job number. As a result, the molders worked on a hodge-podge of stuff, big and little being cast side by side, and there was loss through confusion.

The production engineers laid out a system by which orders for several days were classified according to size. That made it possible to work the men on about the same-sized castings each day, giving the facility that comes in handling uniform work, simplifying the handling of flasks, pouring molten metal, and so forth. This immediately relieved the congestion that had put the foundry behind its orders. Overtime work became unnecessary. Quality of output improved. Most important of all, it was possible to keep accurate cost records on each job, giving a surer basis for bidding.

For several weeks after this system was installed the engineers supervised its workings. The first definite information it yielded sent them to the management with suggestions about a certain kind of castings.

"You are losing money on them ; raise your prices."

"Oh, we wouldn't dare ask higher prices for those," was the reply. "Our competitors crowd us too closely. It would put us out of business."

"Well, then, go out of business," said the engineers. "This work will put you into bankruptcy eventually, for you are losing money on all you turn out."

Why There Were Flaws in the Castings.

Investigation in the sales department demonstrated that contracts during the past two or three years had been made below actual cost of production, a condition brought about by lack of knowledge of true costs, coupled with timidity in the sales end. By sharp tactics customers had scared salesmen into meeting purely fictitious bids alleged to have been received from competitors. When prices on these castings were eventually raised little business was lost, showing that the competition had been largely imaginary, as a good deal of competition always is. At the end of a year this foundry was turning out three-quarters of a million dollars' worth of work. The plant had not been enlarged, nor was overtime labor necessary. Yet profits under the new system had been brought up to more than a hundred thousand dollars a year.

Some months after the system was running smoothly the production engineers were called in again. The foundry's percentage of defective castings had suddenly begun to assume alarming proportions. In the finishing-rooms many flaws were revealed despite most careful inspection of work turned out in the molding department, while some of the costly machine parts sold to customers under guarantees of quality were coming back almost daily, showing failures. For two weeks the engineers studied the establishment's whole routine, yet did not find anything that seemed to be out of the ordinary. The character of work was just as good as ever —better, in fact. Inspection of raw castings was very thorough, every piece that revealed the slightest defect being set aside as soon as it left the flask.

The engineers were puzzled. Finally a young chap on their staff, lately out of college, was told to stay at this foundry until he ran the trouble down, and he made it a point not only to work with the men in various departments, but to come down an hour or so before the whistle blew in the morning. One day he asked the superintendent a question :

"Mr. Walker, why did that molder over there take some castings from this

THE EASIEST PROFITS.

James H. Collins, the well-known writer of human efficiency stories, has contributed to *The Saturday Evening Post* a series of articles on *Business Economies.* The article on *"The Easiest Profits"* is abstracted from one of his series, in which he illustrates the work of the *Production Engineer.*

Lack of knowledge of costs resulted in a foundry in Ohio *losing money.* A study of the situation resulted in *prompt deliveries* and a *profit* on the work. The story impresses this fact—manufacturers must *know* their *costs.* What managers, superintendents and foremen must have is *business information* if they are to place the factory under their charge in a position to compete in this country's and the world's markets. This information can be obtained by studying and drawing up a scheme of administration, by which all the necessary *data, costs,* etc., are brought to the *daily* attention of the *man-in-charge.*

pile before he started work and place them on that pile ?"

"Did he do that ?" asked the superintendent, surprised.

"Yes—and other men did the same thing."

The trouble was cleared up immediately. Several molders, coming in early, had adopted the trick of lifting rejected castings off piles set out to be weighed and deducted from their day's work, reducing the defective pieces charged against their wages. Those defective castings had gone into piles of work inspected and passed, and a number had been shipped to customers. This is a typical instance of the production engineer's work in simplifying routine and saving profits.

The business doctor has long been familiar to the general public as a man called in when something is obviously wrong in a factory or mercantile house. Very often his service went no further than clearing up some specific trouble. Usually his chief interest was in accounting methods, and he departed after installing a card system of bookkeeping But the production engineer takes the whole business as his province. He tests flue gases and coal, installs systems in the boiler-room and saves cost. In the engine-room he saves on lubricating oil. In the factory he tests materials, synchronizes processes, ferrets out costs, trains employes to better methods. At the executive end he takes routine work off the shoulders of the management, and at the same time gives them more facts about their business from day to day. The old-fashioned business doctor might be compared to the physician who is called in a hurry once of twice a year when some member of the family is sick, whereas the production engineer is like the Herr Doctor, common in Germany, who visits the family at least once a month, spends part of the evening chatting with its various members, and makes quiet studies that enable him to keep the family in pretty good health.

One of the best-known production engineers in this country began applying card systems to business years ago, when cards were hardly known outside of libraries. At the outset he adapted his cards chiefly to accounting. But soon he became interested in extending their usefulness. Making card-system payrolls, for instance, led naturally to recording miscellaneous data about labor and its costs on cards with different contours. That led, in turn, to gathering information about materials, processes, and so forth. By and by he woke up to the realization that the thing most needed in business is information—facts about men and management, materials and methods. Ninety per cent. of the concerns he investigated were operating on guess-work. So he began gathering business facts for others, interpreting them, carrying out improvements indicated by them. To-day he has a large organization.

In the Interior Department at Washington an inquiry or other bit of routine business was referred to so many persons, with offices so arranged in a large building, that before it was finally disposed of it had traveled, perhaps, several miles, crisscrossing back and forth in a most confusing fashion. Production engineers studied those operations exactly as though they were factory processes; platting the routes taken by business, moving some departments nearer together and cutting others out of certain routine. When they finished the detail had been amazingly simplified and shortened. This same Government department has one hundred and four district land offices scattered over the United States. The records of each office were kept in a set of twenty-one different books, weighing upward of a hundred pounds. When the production engineers finished with that detail each office kept all its records in a single loose-leaf volume, so that there were only a hundred and four books as compared with nearly twenty-two hundred. These engineers are factory experts, and after making a typical factory study of the Interior Department, treating its business largely as a product, they made suggestions by which its operating expenses will eventually be cut down not less than half a million dollars yearly.

The Stock Room.

An old pottery, established more than half a century, had hundreds of designs in finished goods stored in its warehouse. An order for one hundred dozen pieces of a certain design was received and the shipping clerks hunted it up in the warehouse. Maybe they found only half enough goods to fill the order, so it had to wait while the plant turned out the other half. At the same time, perhaps five hundred dozen extra pieces of this particular design would be made up for stock and stored in the warehouse in readiness for future orders. After several months, however, the shipping department, searching for that design again would fail to find these extra goods, and another order was delayed while the plant made still more of them. This situation was put up to production engineers as a genuine puzzle, and they solved it very simply by installing a modern record of stock which facilitated orders by making it possible to make up goods before they ran short, and which reduced the amount of stock on hand by showing the frequency of orders for all designs. One very important item of saving was that effected by discarding designs that had not been called for in years.

In locating a disappearing margin of profit in a large foundry it was found that all castings turned out were figured by weight, and bids made on that basis. Weight is no guide to cost in such products, for two different castings containing just the same quantity of metal may be of such unlike character that the labor cost of one may have actually been twice that of the other. This foundry was operating under a cost system that made it dangerous to raise the quality of its products, for its high-grade castings were being turned out below cost, and sufficient increase in the sort of patronage that should have been most desirable would have sent it into bankruptcy. The difficulty was met with a simple cost system that kept time, wage and material records on each job. In a few months the old margin of profit was not only restored, but increased, for the foundry secured more profitable contracts by being able to bid with absolute knowledge of costs, and thus had decided advantages over competitors.

These are typical accomplishments of the production engineer. Yet they are merely details. His study of a business extends to every department and function, and his conclusions are embodied in a complete report, usually a large, typewritten book with blue prints, forms and diagrams, each department having its separate chapter, with suggestions for economies. Such a report was prepared for a Government bureau at Washington. It contained so many suggestions for saving time, work and expense that the bureau chief had to ask Congress for a special appropriation to put the more important suggestions into operation. While he was waiting for his appropriation, however, he saved two hundred thousand dollars a year by carrying out some of the minor suggestions.

In another case the production engineers went through a large mill, making their report, and when it was submitted they called the president's attention to a little detail of accounting reform, the loss-and-gain account.

"Shortly you are going to be very much interested in this account," said they, and the president found it true.

Up to that time his plant had been operated wholly on information derived from an annual inventory, as is the case with many other concerns. This mill turns out several different kinds of goods. Going in the dark from one year's end to another, the president might be under the impression that he was making more money than last year, only to find that he had made less. Even if he gained in profits it was never definitely known which kinds of goods had earned the extra money, while if a loss was shown he could not certainly put his finger on the item that caused it. The year is too large a unit upon which to transact business in these times—there are only twenty or thirty of such units in the

average business man's life at most. When the production engineers gave him a loss-and-gain account he had definite knowledge of each class of goods from day to day. Reports came from every quarter of the mill, were tabulated, and he could compare a given day's output with that of any other day, not merely in quantity, but from the standpoint of labor, raw materials, time consumed in processes, and so forth. If he wanted it this information could be presented to him in such ways that he alone knew the whole story.

At the outset this system was regarded with suspicion by foremen. Those exact reports, calling for detailed statements of each minute of time, every ounce of materials and every item of completed work, seemed a sort of spy system. But when results began to come in to the president and go back to the foreman in the shape of orders and suggestions the latter became as interested in the loss-and-gain account as himself.

In the old days, after an annual inventory, if there was a gain in profits the president would, perhaps, increase each foreman's salary, going largely by the number of years Tom and John and Bill had been with the mill. If there was a loss he called them all together and gave them a lecture on the importance of economy, diligence and other abstract virtues, and sent them back to work to find the cause of trouble and correct it. They had had no means of finding it, naturally —he couldn't find it himself.

But the loss-and-gain account changed all that. It showed definitely that on this batch of goods, made last week, the cost of manufacture had been three cents per hundred higher than the cost of identically the same quantity and kind a month before. The foreman responsible for those goods could be called in and given a chance to explain matters.

"Why, Mr. Smith, that low cost last month was on account of the way our enamel worked. We never had such a fine lot of enamel. Everything seemed to run like a dollar clock. But this month we're having trouble. The last job didn't go through as smooth."

"Well, now, suppose you experiment a little with your enamel. Send down to Biggs' laboratories and get a chemical analysis. If we can get that kind of enameling right along it will mean a good deal to us in the way of contracts."

This gave the foreman something definite to work upon. Under the old inventory system there were a thousand or more ratholes down which that three cents a hundred might have disappeared and nobody have been able to locate it. But the loss-and-gain account showed precisely the rathole to be investigated, and usually the foreman succeeded in plugging it up and trapping the rat. If he set a standard of quality or economy he was held to it. But the president knew how great an advance such new standards meant, and knew who was entitled to credit. Soon there was a different spirit in that plant, because the men knew they were now working on accurate information and that credit for good work or blame for bad would fall exactly where it belonged. The engineers had planned a loss-and-gain account, but what developed when it was put into operation was a broad human principle that facilitated management from top to bottom.

The capable production engineer is far more than a systematizer.

Nine times in ten, after making his study and drawing up a scheme of administration, he stays with the latter until it is installed and running smoothly. If the new-fangled routine were all drawn up on paper and handed to Bill Jones in the boiler-room, with the statement that by following that method the company could save three per cent. of its fuel costs, Bill Jones might not think the matter important. But when there is somebody right on the job to insist that about forty dollars a week is being wasted up the chimney Bill Jones is interested.

He may also be called upon to take charge of business enterprises on behalf of creditors or heirs, to lay out large plants where capital is creating them from the ground up, to apportion different kinds of manufacturing among a number of plants following a large consolidation, to advise as to increase of capital, or find the valuation of property in disputes or settlements.

So he is more than an expert in accounting, costs, industrial chemistry, systems, or any other restricted specialty. In the course of the year he employs many such experts, and supplements their work with broad administrative experience drawn from manufacturing, trading, banking, Government business. For in dealing with production he is dealing with pretty much all industry.

SHOP SECRETS.

By John R. Godfrey.

The shop secret is a peculiar institution. Sometimes it is based on the idea that if the other fellow knew how we made our sausage stuffer, he might be a more vigorous competitor. The chances are, he is meeting our prices now, which indicates that he must be making them as cheaply as we are, so that his methods must be as good as ours, even if different. And there are nine chances out of ten that we wouldn't use his methods if we knew them, nor he ours, if he knew all about them. And the chances are that we all know all about the other fellow's way anyhow, and prefer our own.

This method of ours has cost us a lot of money to develop. Meanwhile, the other fellow has been standing still and we've been getting all the business. But have we?

Isn't he still in the ring, wearing clothes as good as ours, and didn't we see him in his auto last Saturday at the ball game? Then somebody must have told him our way, because no one else could have thought of it.

Shop secrets are largely creatures of the imagination unless in a business so small that one man can do all the work and use all the secret methods.

When a workman leaves our shop, no matter what the reason, he carries in his head some of our ideas and methods. He can't help it. Some men carry more than others, some can impart more than others, but it doesn't do to fool yourself, as some do, into believing that the average workman wouldn't know an idea if he met it face to face. Don't get the idea that all the brains of any establishment are in the office, no matter who says so. If they were, there wouldn't be nearly so many successful businesses as there are to-day.

I was in a large shop recently and saw a new material being used for a certain part of a well known machine. "Sh! not a word, we aren't advertising that. The other fellow will catch on soon enough."

Strangely enough, I saw the same thing in the other fellow's shop the next day—said they had been using it for some time. The other fellow had caught on, but I wonder which one was first.

So I've come to this conclusion. When you get a new scheme, build a new machine or do something worth while, don't try to be over modest. Talk about it; let others talk about it—and use it after it's been talked about with your name hitched on to it.

I can name several types of machines which are to-day known by the names of men who do not claim to be the inventors. These men simply saw the possibilities of these machines, built them, talked about them and made other people talk, and they bear their names as long as they are used. And many users never heard of the original makers. If they had not been so backward in proclaiming their wares, it would have been a different story.—American Machinist.

Wm. Surdam, foreman of the molding department, Frost & Wood Co., Smith's Falls, has resigned to accept a position in Auburn, N.Y. He was presented with a Masonic ring and traveling bag when leaving.

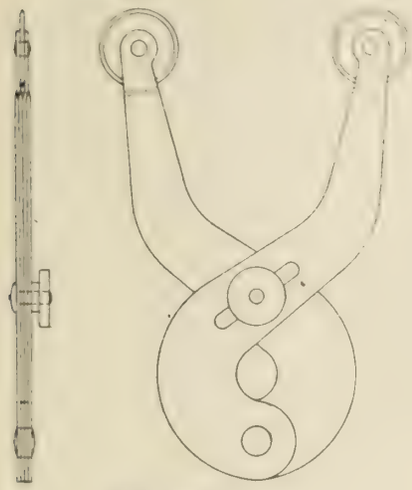
MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

BALL RACE CALIPER.

The accompanying sketch represents a very useful tool used in the shops of the Canada Cycle and Motor Co., Toronto, and is an idea developed by the superintendent.

The discs are ground circular with bevelled edges, the exact diameter of



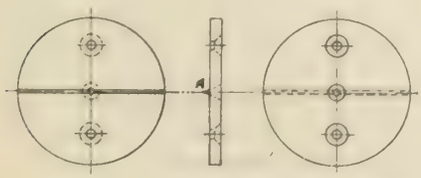
Ball Race Calipers.

the ball-races, and are formed of thin steel. The bevelled edge insures line contact, making observations easier. The body is made up of four thin sheet steel strips, riveted like ordinary calipers at one end, and clamped together in any position desired by a screw in a slot. Most of the ball race calipers in use by the company are not made as shown, but made fixed like gauges, by riveting where the adjusting screw is. The latter is a better method for multiple production of the parts. Quite a number of different sizes are carried.

CENTRE FOR TURNING PATTERNS.

In the machining of circular patterns, care is required, else the pattern will not be split exactly in the centre.

This little device is one in use by the Steven Co., Galt. It not only insures



Centre for Turning Patterns.

the work being split exactly in the centre, but also facilitates the operation.

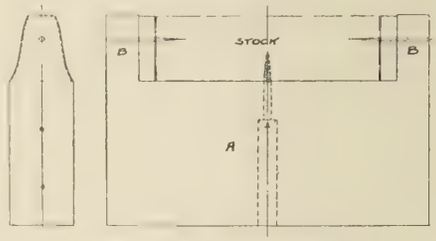
In general, it is almost exactly the same as the usual centreing piece for patterns, consisting of a flat disc, with a tapered hole for the centre, and two screw holes, securing the two halfs of the pattern. The special feature is the knife edge projection, A, which is inserted at the dividing line of the patterns, making it impossible to have the pattern unequally divided. This edge, of necessity, must be very thin in order that the patterns might be tight together. Paring the parting edge slightly at the end insures this.

JIG FOR GEAR TEETH PATTERNS.

The method of forming patterns for gear teeth by shaving down to marked lines on the end of the block of wood is a very slow process, and entails considerable work to ensure any degree of accuracy. This is especially true with bevel gears.

The Stevens Co., of Galt, have devised a very simple jig for the rapid production of patterns, which is a great improvement on the old method, both in point of quality of work, and rapidity of production.

The jig consists essentially of a block of wood A, with tooth forms BB projecting at each end. These tooth forms are made the size of the tooth de-



Jig for Gear Teeth Patterns.

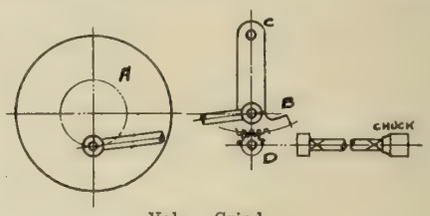
sired, plus the thickness of a piece of sand-paper, all over. The actual size of the tooth is as shown by the dotted lines an the end view. The block of wood to be worked is placed between these forms, and held in position by the woodscrew below, and the two brads at the ends. The tooth stock is first reduced roughly in the usual manner by chiselling, until it is approximately D size, and then it is sandpapered on a revolving drum. The sandpaper is just slightly wider than the stock, so that the forms at the end press against the revolving drum, while the stock is reduced the thickness of the sand-paper below the size of the forms, making the desired size of tooth.

It has been found to be a very useful jig, and is adapted to all forms, being particularly useful for bevel gears. The Stevens Co. carry a large stock of jigs for the various sizes, finding it a very economical process.

VALVE SEAT GRINDER.

This is a simple little device for grinding small valves to proper seats in a manner better than can be done by the continuously rotating method in general use. It is the method in use at S. F. Bowser & Co., Toronto, and was devised by their superintendent.

The basic principle is that a better



Valve Grinder.

seat may be obtained by an oscillating motion than is possible by the continuously rotating process before mentioned. This device provides a means for so doing, revolving the valve seat a little more than a revolution in one direction, and then reversing, making the process continuous.

Rotative motion of a drum A is converted into a short arc motion of the gear B, which oscillates on pin C. The pinion D meshes with B, thereby giving D a rotative motion. D is proportioned so that the arc travel of the pitch line of B is slightly greater than the circumference of D on its pitch line, which gives the latter an oscillating motion slightly in excess of a complete revolution each way.

The shaft containing pinion D is supported by two bearings, and on its other end it carries a chuck for holding the valve spindle of the job under operation.

Apparently the results are most satisfactory.

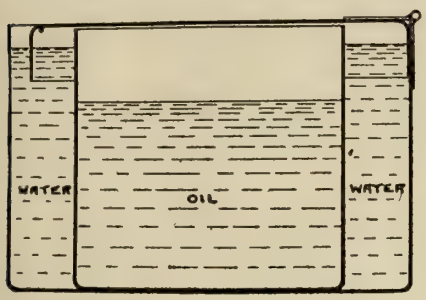
SHOP BUCKET FOR INFLAMMABLES.

The accompanying sketch shows a very useful tank for keeping inflammable substances, such as light oils, gasolene, paints, etc., where they may be readily gotten at.

It consists essentially of two light sheet iron tanks, one within the other, the outer having a cover hinged to it, which drops over the inner one. The inner vessel holds the inflammable substance, filled to any level, as desired, while the outer one is kept full of water to within a short distance of the top at all times—full enough that the

downward projecting edge of the cover is partially submerged. This forms a water seal for the inner compartment, not only protecting this latter vessel from fire, but also preventing the evaporation of the substance in a very simple manner.

In the shops of S. F. Bowser & Co., Toronto, all the dipping tanks for paint



Shop Bucket for Inflammables.

are arranged in this form, as well as similar vessels for containing the gasolene used for washing oily articles, as they come from the turrets.

This firm finds it especially useful for paints, as the dip tanks are located near the enameling ovens, where fire might readily occur. In event of the latter, the simple operation of lowering the lid would suppress the conflagration without any attendant danger.

PUNCHING MALLEABLE RINGS.

The method of producing the rivet and screw holes in malleable iron manhole rings is somewhat different at S. F. Bowser & Co., Toronto, than it is elsewhere.

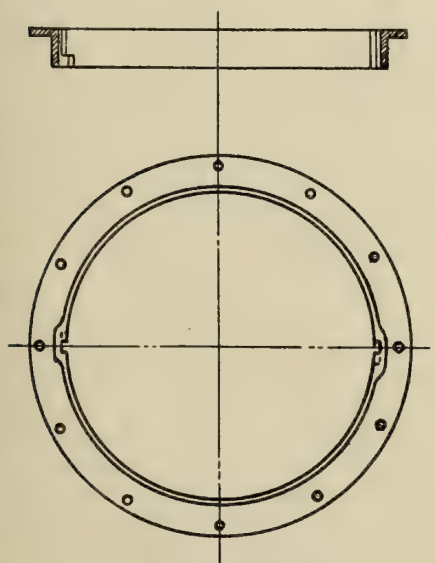


Fig. 1.—Manhole Ring.

One of their typical manhole rings for oil tanks, is shown in Fig. 1. As it is malleable iron, the usual procedure would be to drill the holes, no doubt, using a drilling jig for the purpose, the number to be produced warranting the latter. Not so in this plant, where the holes are produced in a punch press, very satisfactory results being obtained, judging from the finished holes, which are as smooth and free from burr as if drilled.

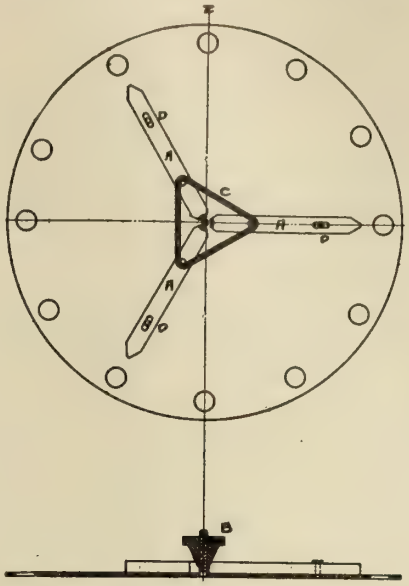

Fig. 2.—Manhole Ring Jig.

A unique punching jig, Fig. 2, enters into the process, in conjunction with the special form of die, Fig. 3, the combination making very rapid production possible.

The ring is laid on the jig (which are of different sizes to suit the different rings) and clamped there by the three projecting arms, A.A.A., which are forced out by a tapered nut, B. on a stud fastened to the body of the jig. This nut fits into correspondingly-shaped cuts in the arms. These three arms automatically centre the work in the jig. When the tapered nut is loosened, the arms are drawn back rapidly by a coiled

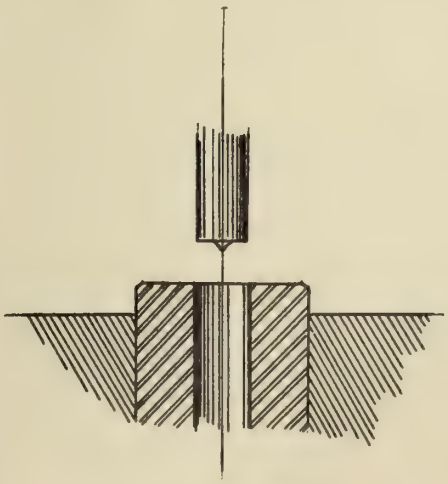

Fig. 3.—Punch and Die.

spring, C, around pins in the three arms. guided by pins in slots, D,D,D.

When punching, the jig is on the under side, the holes in the jig being placed in succession over the die, which is made slightly tapering to receive them, thereby centring each hole instantly for punching. This allows of very rapid production.

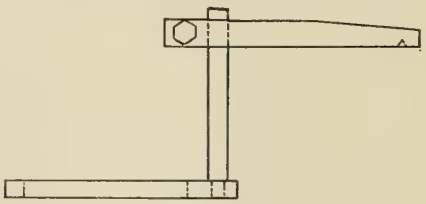
The same principle of jig and die is utilized in all punching work in these shops, for most of their work is standard, making the initial cost of such a jig a profitable investment. Some of these jigs run as large as five feet in diameter, the same die being used throughout, unless the size of the hole requires changing.

DRILL STAND.

At the John Inglis Co., Toronto, a drill stand is used in connection with an air drill and finds many varied uses. By means of it, holes can be drilled or reamed. A hand ratchet drill could also be used.

This simple but useful tool consists of a post firmly fixed in a flat piece of iron in which is a slot, so that it may be easily bolted in a convenient position for the work to de done.

The top arm is a flat piece, tapered at one end and double at the back, a

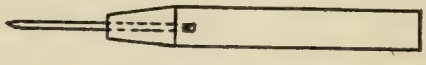


Drill Stand.

second flat piece having been welded on to the first. The two fit around the upright post, the horizontal bar being held in position by a bolt. A small drilled hole at the outer end allows the top of the drill to sit firmly in position. The idea in having the cross bar slide up and down the post is to adjust the tool to the work quickly. It can therefore be used for work outside the screw on the air drill or the hand ratchet.

DRAFTSMAN'S POINT.

A draftsman often finds it necessary to mark points on the paper by a pin point. The accompanying illustration shows a simple draftsman's needle point for such work. A piece of stock is



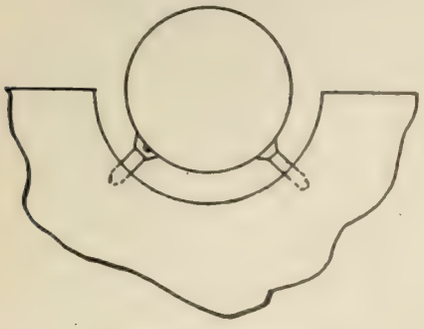
Draftman's Point.

whittled to convenient size and a needle pushed into it, the head of the needle being pushed into the stick.

This instrument can also be used to hold drawings on the drawing board when it is not necessary to use the T-square.

BABBITTING BEARINGS.

In a Toronto machine shop the method shown in the accompanying illustration for babbitting bearings has been adopted. Two little screws are used on which to rest the shaft. The



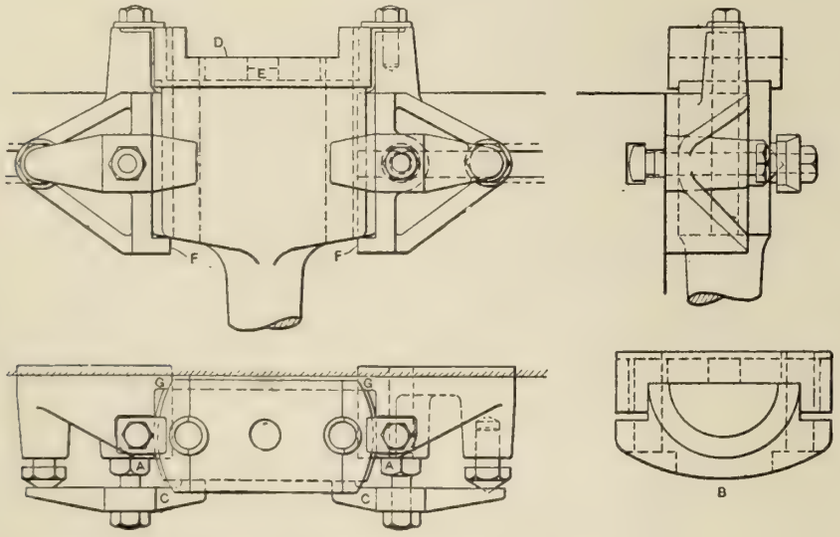
Babbitting Bearing.

holes are drilled at an angle of 90 degrees and very close to the outside of the bearing. The shafts are aligned by raising or lowering the screws. After pouring the babbitt, the screws can be removed.

DRILLING CONNECTING ROD ENDS.

A pair of special clamps for holding and aligning gas engine connecting-rods while the bolt holes are being drilled, and also the jig used for locating the drill are shown in the accompanying illustration. The end of the finished rod is held between the two clamps or special angle-plates. These clamps each have a rib or tongue on the back that fits a T-slot of the machine table. In this way they are set parallel to each other and in line with the drill spindle. By tightening the nuts A, these plates are fastened to the machine. The same bolts that hold the plates to the table are also used for tightening the clamps C. One end of these clamps rests on adjustable screws with conical casehardened heads, which may be set to different heights to correspond with work of different thicknesses. On the top of each angle-plate there is a boss in which is tapped a small stud that is used in conjunction with the clamps shown to hold the drill jig D. This jig is used for drilling the outer half of the bearing brass, as well as the connecting-rod bolt holes. A channel is planed in one side of the jig, so that it is a snug fit over the end of the rod, while on the other side it is planned out at right angles to the first side as shown. The projections thus formed on either end, fit over the bearing brass as shown at B. The jig is further located for drilling the bolt holes in the rod end, by a central hole which fits the projection E on the rod.

After the connecting-rod is turned and planed, and is ready to be drilled, it is placed between the two plates which are movable sideways. The work rests on the lugs F and the plates are fastened, as before stated, by tightening nuts A. The rod is then clamped against the faces G. The drill jig is then placed on the end of the rod and lightly clamped against it. The drilling



Special Clamps and Jig for Drilling Connecting Rod Ends.

is then done by the usual method. When drilling the holes in the outer half of the crankpin brass, with the jig in the position shown at B, the tool steel drill is cutting on one side only, through part of the hole.—Machinery.

Correspondence

EJECTOR MANUFACTURER.

Can you give me the name of the maker of ejectors to draw water with compressed air?—Ontario Subscriber.

The Penberthy Injector Co., Windsor, manufacture such an ejector. They will be pleased to send catalogue if you write them.—Editor.

CABLE TRANSMISSION.

I wish to transmit power 70 ft. to a sawmill, will you give me the name of the company who can instal a cable system to transmit about twenty-five horse power?—Quebec Subscriber.

The Dodge Mfg. Co., Toronto and Montreal, and Canadian Fairbanks, Montreal and Toronto, will give you full particulars and equipment.—Editor.

DESIGN OF BEVEL GEARS.

In the article on "The Design of Bevel Gears," by G. D. Mills, on page 38 of the April issue of Canadian Machinery, the formulae should read Cot. L (Cotangent L), instead of Co.+L, as printed.

WAX PATTERNS.

Kindly give us a formula for wax mixture in making wax patterns.—Ontario Mfgr.

For making wax patterns some use pure beeswax—2 parts of wax to one of rosin; others, ozokerite with a small quantity of Venice turpentine or kerosene to prevent it from shrinking. The two above mixed together also gives good work.

NEWALL TOLERANCE STANDARD.

The Newall Engineering Co., Blackhorse Lane, Walthamstow, London E., England, have issued a chart for gratis distribution, giving tables of allowances for the various classes of fits in millimeters. The Newall System is based on "hole basis" by which all holes are produced as near standard size as commercially possible.

Class F is a force fit and will produce shafts that will require hydraulic pressure or heating to force them into holes. Class D (driving fits) will produce shafts that will require driving in; Class P (push fits) shafts that can be pushed in but are not free enough to rotate; Class X, Y and Z are running fits. Class X is suitable for engine and other work where easy fits are required; Class Y is suitable for high speeds and good average machine work; and Z is suitable for fine tool work.

Classes A and B are tolerances in standard holes. The tolerances in each case is the difference between the high and low limits, and represents the work-levers shown and can be accomplished

CANADIAN MACHINERY AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

Vol. VI. July, 1910 No. 7

DEMONSTRATING MACHINE TOOLS.

Robert Pierpont, works manager of the Olds Motor Works, said in the course of his paper before the National Machine Tool Builders' Association at Rochester, N.Y., in which he argued for a simplification of machine tool design:

> A number of the tool builders, when they sell a machine or a number of them, send out a demonstrator or a man to instruct the manufacturer how to use it properly to obtain the best results. Some of you keep men on the road all the time, going from place to place to see that your machines are used as they should be. The point I wish to make is this: Are any of you sending your designers around to see what they can learn from the actual conditions existing in the automobile factories? If not, why not? Let them visit and talk with the heads of departments, the general foremen and superintendents of a number of the automobile factories where your machine tools are used. You will then find whether your machine is the best for the work that you can make it or not; also whether you could not make it cheaper and have it answer the purpose just as well. If you will do this you will find out more about what is required than you ever can by getting some one like myself to tell you how little he knows about machine tools.

The statement is full of suggestion. By demonstrating the machine tool, the builder of same interests the purchaser in the machine and makes a satisfied customer. On the other hand, the machinery builder gets many good ideas from the demonstrators. Co-operation between the builders and users of machine tools would be of mutual benefit, therefore. Each would profit by the assistance of the other. The "getting together" would no doubt greatly assist in the development of more efficient and economical manufacturing equipment.

WILL PRICES ADVANCE?

Many in the manufacturing trades are viewing with anxiety the passing of the various iron and steel industries into one or two large corporations working together to control the market. In the past there has been difficulty in securing prompt delivery of goods ordered, and already there are rumors of advances in wrought and bar iron, bolts, nuts, etc.

The general understanding is that mergers aim to increase profits by effecting savings in production and distribution rather than by price advancements, but when companies which have not been paying dividends are turned over to corporations capitalized at several times the capitalization of the various companies included, it is apparent that some special effort will require to be made if the shareholders in the larger corporations are to get any return on their investment.

PROTECT THE MACHINERY.

The list of accidents continues to grow in spite of campaigns to secure the protection of machinery. From Deseronto, Collingwood, Vancouver, and other points come reports of industrial accidents. The companies may not always be responsible, but in any case, the number of accidents could, no doubt, be greatly lessened by protecting the belts and machinery.

Another thing that would assist in the lessening of the number of accidents would be to have one man trained to look after belts, an engineer or mechanic who will exercise care in the performance of his duties. In many industries it is the custom to allow Tom, Dick or Harry fix the belts near his machine, and if he is not careful, or does not understand his work there is a chance of an accident.

In the month of May, 1910, there were 133 deaths through accidents among employes in Canadian industries. In addition 243 individual work people suffered serious injuries.

CANADA'S LARGE TRADE.

Final figures of revenue and expenditure for the last fiscal year, ending March 31, made public by the Department of Finance, show a record surplus of $22,092,185 in revenue over all ordinary expenditure. This exceeds by over two and one-half millions the previous high record of 1907-08, and is five millions better than the estimate given by the Finance Minister in his Budget speech of December last. The total revenue was $101,501,034, an increase of $16,500,000 over the preceding year. The total expenditure on consolidated fund account was $79,409,849, or $4,500,000 less than 1908-09. On capital account last year there was spent $34,114,994, including $19,968,064 on the construction of the National Transcontinental Railway. Out of the revenue Canada paid last year every item of ordinary and capital expenditure, exclusive of the National Transcontinental, and had over $8,500,000 still left towards the construction of the railway. Probably no other country in the world can show anything like

so satisfactory a financial statement for the year, and with the revenue for the current year increasing at the rate of $1,500,000 a month, indications point to an even greater surplus for the twelve months.

The net debt of the Dominion at the end of the fiscal year was $336,266,348, an increase during the year of $12,336, due, as has been noted to three-fifths of the year's expenditure on the National Transcontenintal Railway.

In his Budget speech Hon. Mr. Fielding conservatively estimated the total revenue at $97,500,000. The actual revenue went $4,500,000 beyond his estimate. He estimated the total expenditure on consolidated fund account at $81,000,000. It fell short of this by $500,000.

The principal items of revenue were as follows:—Customs, $60,156,133; excise, $15,253,352; post office, $7,958,547; public works, including railways, $10,114,990; miscellaneous, $8,018,009.

The principal items of expenditure on capital account were as follows:—Public works, railways, and canals, $27,571,225; militia, $1,299,970; railway subsidies, $2,048,097; bounties, $2,411,095.

The figures of Canadian trade for May show a record advance over May last year. The total trade for the month was $59,187,972, an increase of $14,276,236, or over thirty per cent., as compared with May of last year.

Imports totalled $38,821,963, an increase of over ten and one-half millions, and the largest increase on record for any one month.

Exports of domestic products totalled $18,347,432, an increase of $2,537,225. Exports of foreign products totaled $2,018,577, an increase of over one million.

For the first two months of the current fiscal year (April and May), the total trade of Canada was $105,171,866, an increase of twenty-five and a quarter millions as compared with the corresponding months of 1909.

At the present rate of increase Canada's total trade will within two years reach the billion dollar mark. For the current year indications point to a total trade of over $800,000,000.

The customs revenue for May was $5,818,490, an increase of $1,576,170, as compared with the corresponding month of last year.

The statement of the Canadian chartered banks for May reflects the continued expansion of business in the Dominion. For the first time the liabilities of the banks have passed the billion mark; the assets reached that stage about 18 months ago.

The chief comparisons of the month as compared with April, are as follows, the first figures being those for April and the second for May:—

Notes in circulation	$ 78,776,228	$ 77,194,344
Deposits on demand	246,746,180	256,651,635
Deposits after notice	521,427,172	524,680,979
Total liabilities	993,105,845	1,015,631,890
Call loans on stocks	59,621,328	58,159,050
Current loans in Canada	638,347,238	643,246,518
Total assets	1,182,850,969	1,205,001,218

CANADA'S PATENT RELATION.

Elsewhere in this issue is an article dealing with the patent relations of Canada to the rest of the world, in as far as the International Convention for the protection of industrial properties is concerned. As pointed out in that article it does appear very strange that Canada should be one of the very few powers who are not signatories of that convention. Doubtless there must be many advantages therein, or the nations interested would not be increasing to such an extent as to be leaving Canada almost isolated. From enquiries among patent solicitors, Canada does not appear to be taken very seriously as a patent country, which is exemplified by the fact that Canada never has any patents cited against her, while Great Britain, Germany, France, the United States and other principal powers have, indicating that Canadian patent records are seldom, if ever, consulted by these foreign patent offices when verifying the validity of an application. It is to be hoped that this matter will be taken up by manufacturers in general, and all interested parties so that the subject may be thrashed out. Canadian Machinery would appreciate receiving readers' views on this subject.

FALL OF WATER TANKS.

The fall of the water tank on the Herald Building, Montreal, recalls other similar accidents though fortunately not attended with such disastrous results. In the business and manufacturing quarters of our cities and towns are structures on which are perched tanks containing great quantities of water. In some cases the tanks are on separate steel supports, and in other cases they are erected above factories and business houses in which are hundreds of employes.

Inspectors in Montreal, Ottawa and Toronto are now looking carefully into the construction of tanks and supports. Their example should be followed by every city and town where tanks have been installed. In Toronto the supports must be of four times the strength really required. Sometime ago a tank fell in Toronto, but it was erected without a permit. A tank of water weighs from 50 to 250 tons, and in it is an enormous possibility of peril.

There are several things in connection with the erection and maintenance of a tank to lessen the possibility of falling. When a separate tower is erected it should be built on a concrete foundation over rock if possible, and a six to ten-foot base on "hard pan" where this is not possible.

Hoops on wooden tanks should receive special attention and all rust should be removed before painting. Particular attention should be given to tanks placed on roofs and covered with corrugated iron. The hoops corrode very rapidly between the corrugated iron and the staves, and the hoops may be found almost corroded through a few years after erection.

If a tank is left empty, the sun and rain will cause the staves to warp so that it cannot again be made water tight.

Tanks cannot last forever and careful inspection should be made each week. The life of a tank is from 12 to 30 years. They average about 15 years, but they must be painted often and kept filled with water.

A large factor of safety should be allowed for supports. If erected on brick walls, great care should be taken in this connection. A purchaser of a tank should not cut down the designer and builder of a tank to the last cent. It is very poor economy. When the tank has been installed, it is the duty of the owner to have all iron work, bolts, etc., carefully inspected at regular intervals. In this way the number of failures of water tanks and supports will be lessened.

DEVELOPMENTS IN MACHINERY

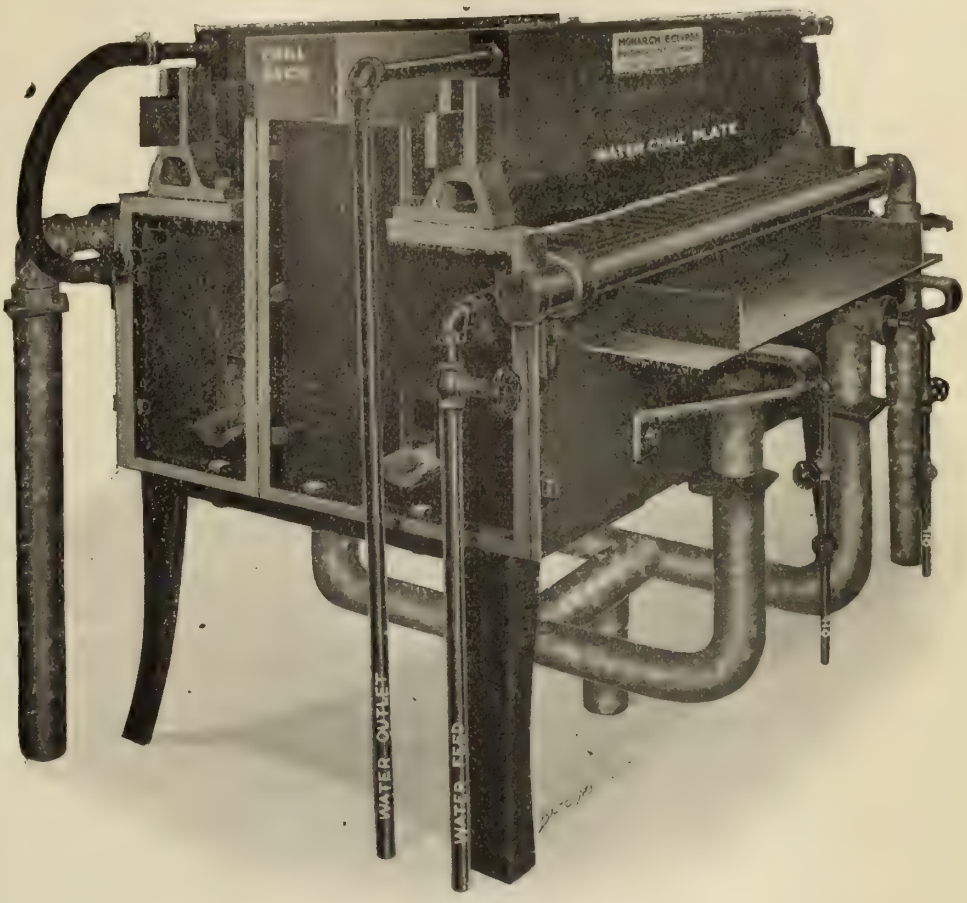
New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

ECLIPSE BOLT-HEATING FORGE.

The Monarch Engineering & Mfg. Co., 1200 American Bldg., Baltimore, Md., have placed a new bolt-heating furnace on the market, operated with oil or gas and air. The forge is of use for bolt, boiler, railroad, bridge, structural and general shop work.

The heat can be regulated in this furnace. There is also a new patented keyed fire brick. There is an arrangement of special bricks within the lower chill to prevent them from becoming disarranged. The top of the arch is so devised as to act as a retainer for the brick, forming the arch over the heating space, and at the same time acts as a protector for the operator. This top is also adjustable, making it possible to obtain any desired length of heat up to capacity of furnace. Being adjustable in either direction it is possible to heat any diameter iron desired, by simply raising or lowering this top to height required for entrance of blanks and adjusting pin to keep same in required position. Also that this top being water-chilled prolongs the life of brick used in same. The makers claim that any length of heat desired can be obtained and that blanks as short as ½-inch in length can be heated and withdrawn as rapidly as those of a longer length; this being made possible by the leveled arrangement of this top.

By the device of grooves as per lower chill, the blanks can be inserted and kept apart, thus should operator through some mishap neglect to withdraw the blanks before they become over-heated they will not stick together.

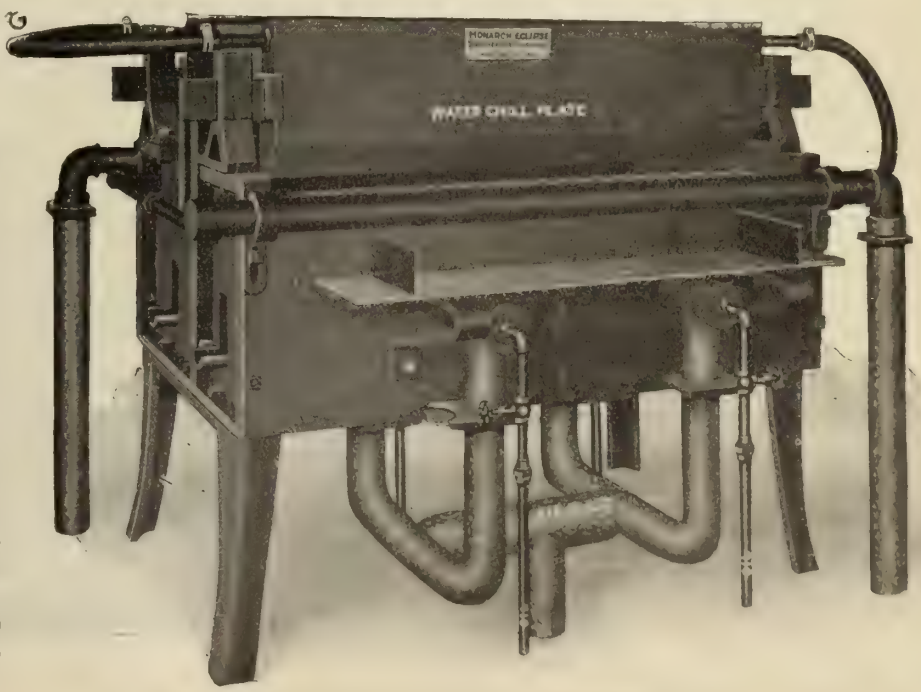


New Monarch Eclipse Bolt Heating Forge, Monarch Engineering & Mfg. Co., Baltimore Md.

MONARCH RIVET-HEATING FURNACE.

The Monarch furnace illustrated herewith is portable, and made in standard sizes. It can readily be carried around from place to place by two men. They are especially recommended for ship, bridge, boiler and general construction work, and will produce excellent results.

Where quantities of rivets are required, it is a rapid heater, bringing the same to a white heat in three minutes, under compressed air pressure of twenty pounds or higher, with a volume of fifteen cubic feet per minute; the higher the pressure, quicker the results. It can also be used in connection with the Monarch high pressure blower, which is furnished in various sizes according to number of forges in use.



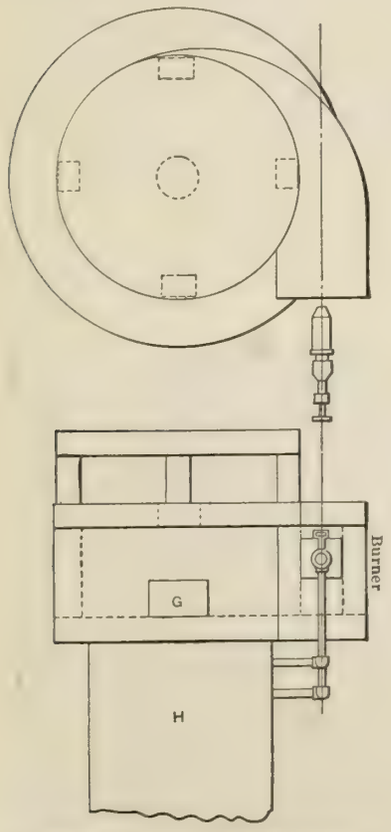
New Monarch Bolt Heating Forge, Monarch Engineering & Mfg. Co., Baltimore, Md.

The furnace carries a high, soft, uniform heat, and is always under control of operator. Rivets are always in plain sight, and readily reached. It will heat up to inch and one-half in diameter, an average 500 per hour. Amount of oil consumed is from one and one-half to two gallons per hour, according to quantity of rivets heated. It can also be used for light forging, hardening, tempering, annealing and welding.

The flame is directed into combustion chamber "A" where the oil is thoroughly ignited, it then passes into the heating chamber "B" the construction of which gives the flame its rotary motion, distributing the heat uniformly throughout the whole interior.

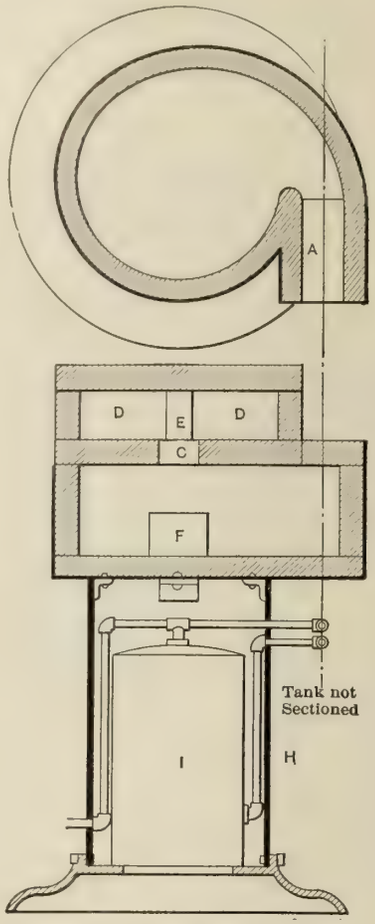
The waste heat escapes through the opening "C" and distributes itself into the open chamber "D" where the rivets may be placed prior to their being put into heating chamber "B".

The top tile is supported on the 4 piers E. The furnace has two doors F—G, front and back. The furnace is supported on a steel cylindrical sheet, which contains the fuel oil tank I and the whole on a cast iron base. The furnace top is made of steel securely welded together with angles riveted to bottom of same so that the furnace top



Burner of Monarch Rivet Furnace.

may be set on to sheet without being permanently attached to it. The supply for tank is fed through same pipe that feeds burner. The fuel consumption is of very low quantity, the burners of "Monarch" type being regulated for largest volume of air, consistent with lowest consumption of oil.



Section Monarch Rivet Furnace.

The furnace is manufactured by the Monarch Engineering & Mfg. Co., Baltimore, Md.

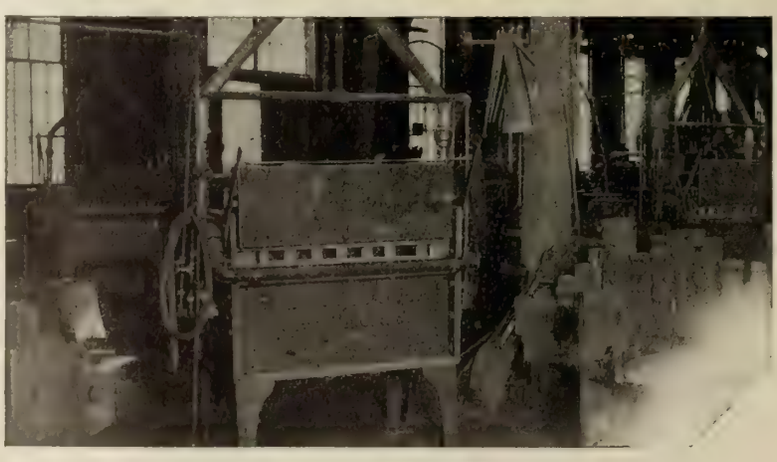
HEATING IRON AND STEEL FOR FORGING.

The use of oil as a fuel was not given very serious consideration until after the discovery of the large deposits of low-grade crude oil in the west and southwest sections of this country. Coal was expensive in Beaumont, Texas; besides, there was not room to store any great quantity of it convenient for use. The derricks were so thick on Spindle Top that there was no room there for boilers, so these were arranged on the edge of the field along each side of a road, which became known as "Boiler Avenue." Oil was burned under all these boilers. The burner consisted simply of a perforated end of gas pipe with a steam jet so arranged that the oil was sprayed against a target of fire bricks in the fire-box of the boiler. All the fireman had to do was to regulate the amount of oil occasionally by means of the check valve. The heat of the oil fire is very intense, and while this rough and ready method did not secure a very even heat distribution, yet it answered the purpose and was in every way a great improvement over the best results obtainable by hand-stoking.

Great improvements have been made in oil burners since those early days. Recently tests were made on a Kirkwood oil-burning furnace, which is made by Tate, Jones & Co., engineers and manufacturers, of Pittsburg, Pa. A description of this furnace may be of interest to the readers of Canadian Machinery.

The furnace described herein is used in heating iron and steel for forging, etc., in plants where oil is not regularly used as fuel. This firm also manufactures similar furnaces for annealing, tempering and case hardening. The burner is different from any of the other oil burners on the market in that the oil and compressed air for atomizing are controlled by one lever, the proportions being determined by tests at the factory before the furnace is shipped. Once determined, this burner is so adjusted that this ratio of air to oil is fixed and is not left to the judgment of the operator. Since the proper atomization of the oil is the vital point in the successful oil burner this arrangement is of great value and prevents any troubles.

The air for forcing the oil to the burn-



Heating Iron or Steel for Forging.

er under pressure and for atomizing and oxydizing it, is supplied by a small rotary blower, which is mounted on the floor near the furnace, and may be driven by an electric motor or other source of power.

About 60 cubic feet of air compressed to 25 pounds is used for atomizing the oil; the pressure at the burner being about 20 pounds. The portion of the air blast which furnishes the necessary oxygen for proper combustion is so regulated, by the lever just referred to, that the pressure at the burner is from two to four ounces. The regulation of this pressure varies the fire from an oxydizing flame to a strong reducing heat. This gives the operator the exact heat wanted at a moment's notice. The burner can be cleaned without disconnecting it from furnace and is nearly noiseless in its operation.

A steam jet or the regular shop compressed air supply can be used for atomizing the oil if desired. In the latter case a reducing valve is necessary to cut down the pressure to the proper amount for atomizing. This valve is supplied with the furnace if so desired.

The burner is set up under an inclined arch of fire clay at the centre of the furnace, the inclination being from the burner downward, so that the products of combustion travel down the arch, completely encircling and filling the inside of the furnace and escaping through two vents in the upper corners on the same side as the burners. This gives equal distribution of the heat through every part of the furnace.

The furnace is lined throughout with the best quality of fire brick, carefully laid, and between the fire brick and outside metal wall a thick layer of asbestos is placed. This heat insulation saves fuel and prevents the air in the neighborhood of the furnaces from becoming unpleasantly warm.

The oil for this furnace is carried in a tank attached to the side, the tank being filled from a barrel when necessary by a small rotary hand pump. For plants having an oil fuel supply the tank is not necessary.

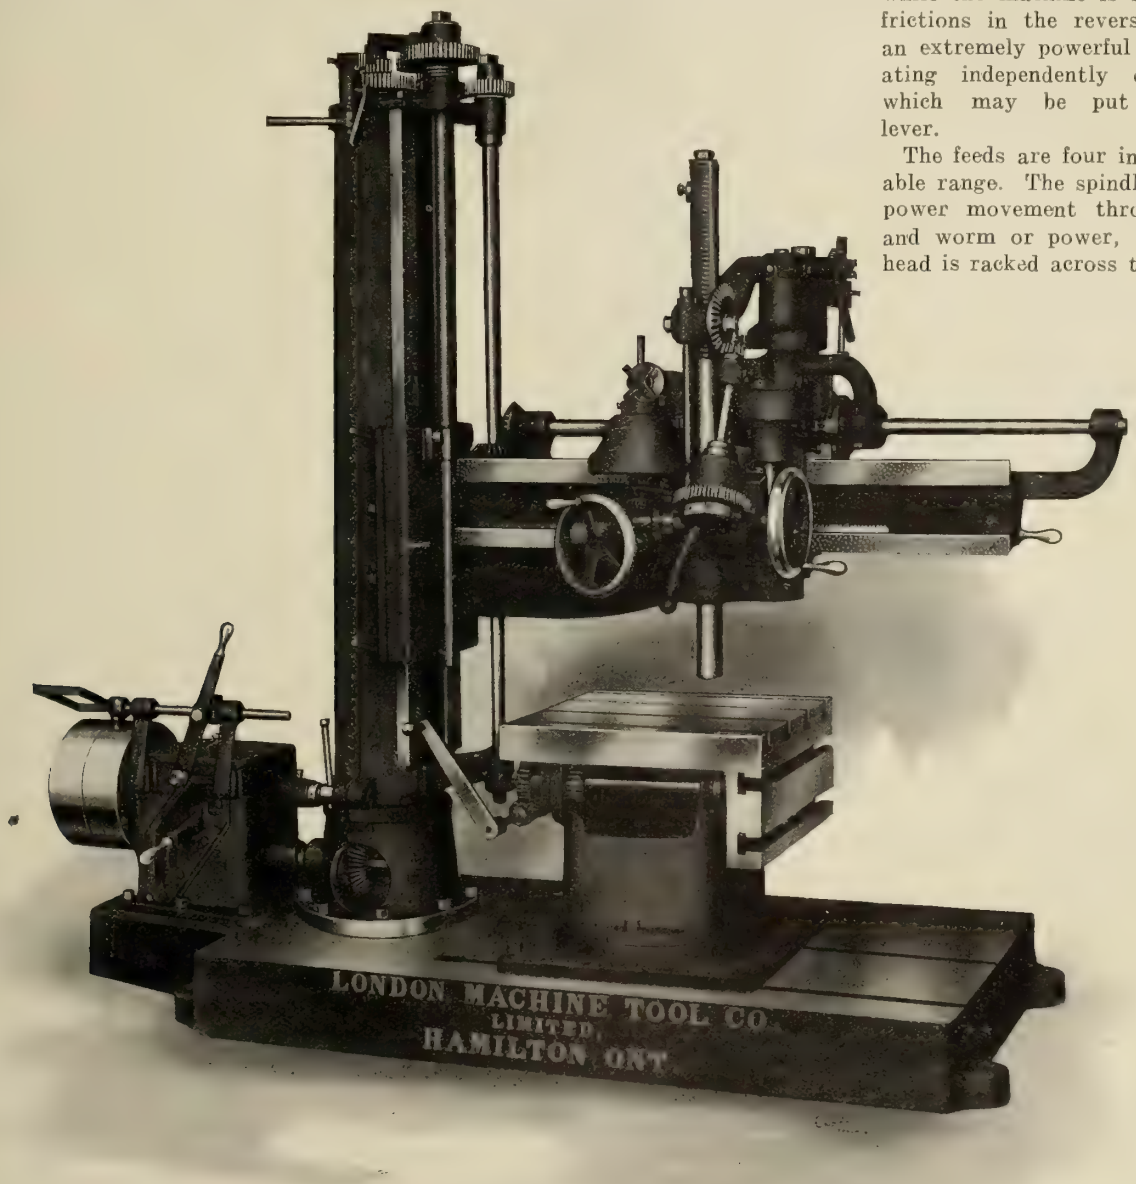
RADIAL DRILL.

Herewith is illustrated a new style of radial drill, which has been placed on the market by the London Machine Tool Company, Limited, Hamilton.

The features of construction in this machine are the bottom drive to the spindle, the back gears and reversing gears on the head, and square face to column. As will be noticed from the illustration, the spindle is driven on its lower end. The power is therefore applied at the nearest point to drill, and the pressure on the driving key is reduced to a minimum, making a feed drive very easy.

The back gears are placed on the head, and are of the positive automobile type, back gear being thrown in while the machine is in operation. The frictions in the reversing gear are of an extremely powerful band type, operating independently of any pressure which may be put on the reversing lever.

The feeds are four in number, of suitable range. The spindle has quick hand power movement through hand wheel and worm or power, as desired. The head is racked across the arm by means



New Radial Drill, London Machine Tool Co., Hamilton.

of hand wheel conveniently located. All handles are so located as to make all operations most convenient for the operator. Outer column is provided with a square face, which insures accurate alignment. The outer column revolves in an inner column at its top and bottom surfaces, and revolves on ball bearings with suitable clamping mechanism.

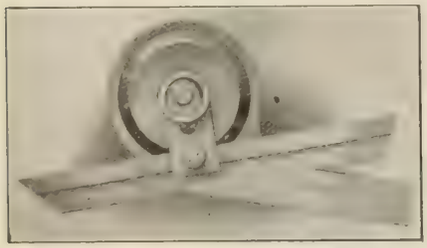
On the positive gear box shown in the illustration, all gears are of steel, of positive type, making it impossible to get out of order. The machine is also furnished with cone drive, if desired.

The machine is made with plain or swivel table, swivel table being shown in illustration. This latter table makes the drill entirely universal in its operation. The success of this line of radials has prompted the London Machine Tool Co. to re-design their whole line of radial drills, using the bottom drive.

IMPROVED BEVEL PROTRACTOR.

The Improved Bevel Protractor, shown in the cut herewith, was recently put on the market by the Brown & Sharpe Mfg. Co., of Providence, and is an accurate and inexpensive tool for laying out or establishing angles. Not only is it useful to draftsmen, but it is also of great service to mechanics.

In design the tool is very simple and is very similar to the Improved Universal Bevel Protractor, made by the same company. The main point of difference between the two tools is the fact that there is no vernier on the Bevel Protractor and so the measurements cannot be made to such a degree of fineness.



Brown & Sharpe Improved Bevel Protractor.

To facilitate use of the tool one side of the protractor is flat and this allows the tool to be laid flat on the paper or work, a decided advantage that users of the protractor will appreciate.

The dial is graduated in degrees and these graduations extend over an arc of 180 deg., reading from zero to 90 deg. from each extremity of the arc. Especial care is taken with these graduations to have them accurate.

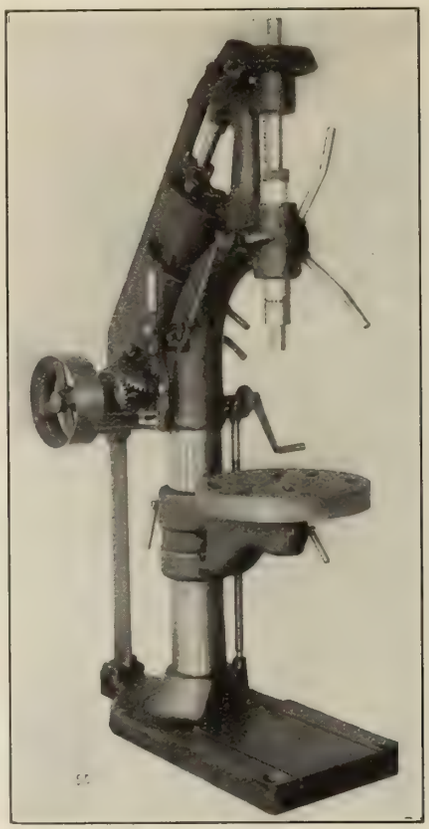
The large central stud upon which the dial of the protractor turns is hardened in order to eliminate as much wear as possible. When the protractor is set and the nut tightened it clamps the dial rigidly in position so that there is no danger of slip.

The blade of the protractor is free to move backward and forward for its entire length independently of the dial and this adapts it unusually well for work where other protractors cannot be used. It is clamped independently of the dial and is rigidly held in place.

Great care has been taken in cutting the grooves, etc., so that there is very little chance for dust to accumulate and cause inaccuracies in the measurements.

BARNES TAPPING MACHINE.

While the general design of the new Barnes all-geared automatic reversing tapping machine is the same as the standard all-geared drill, a single pulley is used for driving and for reversing. The friction clutch gears give reverse speed of 1¾ to 1 and these gears are on the driving end of the machine—not on the spindle—a strong point in favor of this machine.



New Tapping Machine, Barnes Drill Co., Rockford, Ill.

It has automatic reversing mechanism, as shown, useful particularly for depth tapping. It can be set so that the instant tap reaches depth desired, spindle will automatically reverse, backing out at double speed. It can be set so as to trip automatically (or by hand) stopping the spindle instantly instead of reversing same.

The small hand trip lever shown is always ready for instant use if desired to reverse or stop spindle at any point in the operation. It has four direct-geared speeds and four back-geared speeds, making eight changes of geared speeds available on this machine. It is built in 20-inch and 24-inch sizes. The 20-inch machine drives a 1¼-inch U. S. standard tap 125 r.p.m. in cast iron without back gears. When back gears are in, it drives a 1½-inch U. S. standard tap 50 r.p.m. in cast iron. The 24-inch all-geared drill will handle up to 2-inch U. S. standard tap.

With postive power feeds added to these machines, they can be used advantageously for both drilling and tapping. They are manufactured by the Barnes Drill Co., 602 South Main Street, Rockford, Ill.

FREE COLLEGE COURSE.

College educational work by the Canadian railways has hitherto to a large extent concerned itself with training of sons of employees, so as to fit them for future positions in the service. In this connection a circular has just been issued by Charles M. Hays, president of the Grand Trunk, announcing the terms of competition for three free scholarships at McGill. These scholarships each cover four years' tuition in the Faculty of Applied Sciences of McGill University, and are offered, subject to competitive examinations, to apprentices and other employees of the company under twenty-one years of age, and to minor sons of employees.

The competitive examinations, which will be the regular entrance matricu'ation examination provided for in the Annual Calendar of the University, were held at the University, Montreal, and at other centres, beginning June 13, 1910. The three candidates making the highest average and complying with the requirements of admission will be awarded the scholarships and have the option of taking a course in any department of the Faculty of Applied Science. Scholarships will be renewed from year to year, to cover a period not exceeding four years, if at the close of each session, the holders thereof are entitled, under the rules, to full standing in the next higher year.

In consideration of the free scholarships, students will be required to enter the service of the company as student apprentices, and serve during vacation period while in attendance at the University, and at the option of the company, for two years after completing the college course. Successful candidates will, before entering the University, be required to execute the company's regular form of student apprentice contract, copies of which can be obtained upon application to R. S. Logan, assistant to president, Montreal.

Large Successful Foundrymen's Convention at Detroit

Resume of Association Papers—Exhibits of Foundry Machinery Were Large and Interesting — Pittsburg is the Convention City for 1911.

The Foundrymen's Convention at Detroit marked another milestone in the successful gatherings of the allied foundry associations,—the American Foundrymen's Association, the American Brass Founders' Association, the Foundry & Manufacturers' Supply Association and the Associated Foundry Foremen. The meetings for the reading of papers and their discussion, and the transaction of business, were held in the Michigan State Building at the State Fair Grounds. The exhibit of foundry equipment and supplies filled the Administration, Main and Horticultural Buildings, while the overflow was housed in a large tent.

A feature that occasioned many favorable remarks was the fact that Canadians in larger numbers than ever took the opportunity to visit the exhibit, see machinery in operation and obtain literature on the latest and best equipment for foundries, whether brass, grey iron or steel. A partial list of the Canadians present is given. As a large number did not register, however, it was impossible to obtain a complete list.

Monday, June 6.

The formal opening of the fifteenth annual convention took place at Hotel Pontchartrain, Monday night, the occasion being marked by a banquet tendered to the officers of the A.F.A., the A.B.F.A., the F. & M.S.A., the A.F.F. and representatives of the technical press.

Dr. Frank T. F. Stevenson made an address of welcome, followed by Arthur S. Waterfall, the president of the A.F.A. Mr. Waterfall is general superintendent of the Russel Wheel & Foundry Co. Joseph T. Speer, Pittsburg, spoke on the national organization. Dr. Richard Moldenke spoke on the foundrymen's questions.

The A.B.F.A. was represented by their vice-president N. K. Patch, of the Lumen Bearing Co., Toronto. Other speakers were Eugene Smith, Chicago, president of the A.F.F.; J. J. Wilson, vice-president of the Detroit foundrymen's association; L. L. Anthes, of the Anthes Foundry, Toronto, and F. B. Stevens, Detroit.

Tuesday, June 7.

The first business session opened at ten o'clock in the Michigan State Building, Arthur T. Waterfall occupying the chair. This was a joint session of the four associations. The visitors to Detroit were welcomed by Mayor Bretmeyer and President Larned, of the Board of Commerce.

JOSEPH T. SPEER, PITTSBURG.
President A. F. A.

The welcome was followed by the presidential addresses of A. T. Waterfall, of the A.F.A. and Wm. R. Webster, of the A.B.F.A., W. M. Corse, secretary-treasurer of the A.B.F.A. and Dr. R. Moldenke, of the A.F.A. In his address Mr. Waterfall gave the membership of the association as 753, but intimated it would probably reach 850 before the close of the convention.

Secretary Corse, of the A.B.F.A., hit a popular chord when, in his report, he recommended that miners, chemists and foundrymen standardize their stock terms, the present terminology for the same article in the various trades causing great confusion.

MAJOR JOSEPH T. SPEER.

Major Joseph T. Speer, the president of the American Foundrymen's Association, is the head of the Pittsburg Valve Foundry and Construction Co. This company is an amalgamation in 1899 of Atwood & McCaffery; Shook, Anderson Mfg. Co.; Pittsburg Valve and Machine Co.; pipe fitting department of Wilson & Snyder, and the foundry department of Alexander Speer & Sons. Major Speer served his apprenticeship as a pattern maker with his father, Alexander Speer. Afterwards he devoted himself to the foundry end of the business. He became manager of Alexander Speer & Sons in 1897, and in 1901 succeeded to the presidency of the Pittsburg Valve Foundry & Construction Co., which position he now occupies.

The session closed with a talk by Steelman Stevenson, Detroit, on acetylene-oxygen repairs in the foundry. In connection with this he gave an exhibition of the art of cutting and welding, etc., practically applied.

Fluxes.

In the afternoon separate sessions were held. The A.B.F.A. met at 2 o'clock, the session opening with a paper on "Fluxes as applied to the Brass Foundry," by Erwin S. Sperry, Bridgeport, Conn. Fluxes, he said, must be used with discretion, and different ones are suitable for different metals and different alloys.

For aluminum, chloride of zinc has proved a very efficient flux, This is due to a reaction wherein a chloride of aluminum is formed and free metallic zinc alloys with the aluminum. The dross becomes fine and granular and is readily skimmed off.

For nickel, a flux consisting of three parts of lime and one part of fluor spar is used. Fluor spar alone becomes very fluid when melted and rapidly attacks a crucible. The lime used in connection with the fluor spar increases the melting point of the flux so that the crucible is not readily attacked.

For copper practically every known chemical has been tried as a flux. The selection of the proper flux depends upon the alloy to be made. Sound copper castings may be made with a flux of potassium ferro-cyanide, but the various dioxidizers, such as silicon copper, magnesium, phosphorus, etc., produce equally good and better results. Common salt is very efficient used as a flux for melting copper for producing brass or bronze. It reduces any copper oxide that may be formed during the melting.

As a flux for brass common salt is very efficacious. It is the only flux used for brass for rolling purposes.

For German silver, equally good results are obtained in the manufacture of this alloy with or without the use of a flux. Sodium nitrate with black oxide of manganese constitutes a flux used by one of the largest manufacturers of this product. The use of metallic manganese alone has also shown excellent results.

For washings, grindings, etc., a flux must be used to reclaim the metallic content. Plaster of Paris is very good for use in melting brass, bronze, or composition washings. It is cheap, has no action on the crucible, it melts readily and forms a thin slag.

A covering of charcoal should be used in melting all metals enumerated above,

as it supplies a reducing atmosphere and prevents oxidation.

Charles R. Stevenson, of Miller, Franklin & Stevenson, Business Economists, New York, followed with a paper on "Brass Foundry Costs and Statistics." He pointed out the advantage of accurate scientific methods over the "rule of thumb" way of doing business. A cost system was outlined and will appear in full in an early issue.

In the afternoon session of the A. F. A., Benj. D. Fuller, Cleveland, read a paper on "Foundry Efficiency." The questions considered were excess of weight on castings due to careless ramming, weak flasks, weak boards, loss in machinery through jigs not fitting the larger castings, etc. Molders can be kept tab upon by having a daily record showing percentage of good castings by weight. By a card giving this information a foreman can tell a man's comparative value.

Personal Equation in Accidents.

The second paper was on "Personal Equations in Accidents," by Thos. D. West, Cleveland. In his paper Mr. West states that from his experience as an employe and employer and his investigations along the line of accidents, their cause and remedies, he is certain that any unbiased and thorough investigations will show that the great majority of accidents is the result of carelessness chargeable directly to the individual, his lack of obedience to instructions, error in judgment and neglect of duty. An authority on railroad accidents, James O'Fagan, says that 85 p.c. of the fatalities that occur on railroads can be directly traced to the negligence of employes. What holds good in one industry, so far as accidents are concerned, is often applicable to all others.

DR. RICHARD MOLDENKE.
Secretary American Foundrymen's Association.

To advance a doctrine that the majority of accidents in a trade are incident to it, and neither the employe or employer is at fault, is a step likely to have serious results, for it takes away the sense of personal responsibility from the operative, and makes him heedless regarding the effect of his actions upon the safety of others.

N. K. B. PATCH, TORONTO.
President, A.B.F.A.

The employer should help to prevent accidents by supplying safety devices. Prevention of accidents by the removal of the factors that tend to cause them should be the watchword. An honest effort by both employe and employer to remedy individual faults, the doing of which will cut down 80 p.c. of the accidents in the shops.

Mr. West's paper was followed by an illustrated talk on oxy-acetylene welding and cutting by Henry Cane, Springfield. Among the illustrations shown was one where cylinders were welded together making a six-cylinder for an automobile.

Evening Smoker.

Tuesday evening a smoker was given by the Detroit Foundrymen's Association to the visiting members of the allied associations in the Light Guard Armory. A most enjoyable time was spent, a feature of the evening being the presentation to each visitor of a stein suitably inscribed.

Wednesday, June 8.

An address was given before the A. B. F. A. on Brass Foundry Practice, by Jesse L. Jones, Pittsburg, which was followed by a paper by J. W. Richards, South Bethlehem, on "Electric Power Required to Melt Brass, Bronze, etc." Mr. Richards pointed out that in dealing with metals of a low melting point it was cheaper to use coke or oil, but that in handling metals of a high melting point electricity could be used to advantage as an adjunct to coke or oil. In this connection he described the process used at a furnace in South Bethlehem for melting steel. He said that coke was used until the mass was partly melted and then electrodes were lowered and the current applied to the metal until the required degree of heat was obtained.

A report of the committee on "Chemical Standards for Iron Castings," was given by Dr. J. J. Porter. A collection of analyses of iron castings was presented in tabulated form. The information giving the composition of iron for various castings. This was followed by a paper on "Physics of Cast Iron," by H. M. Lane, Cleveland.

Visiting Plants.

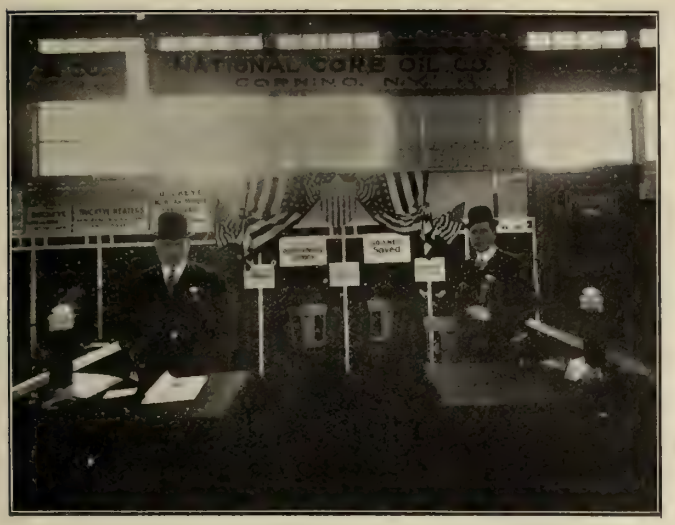
Much time was spent visiting Detroit's industries. Every manufacturer threw open the doors of his plant and a visiting bureau furnished credentials and guides so that as many plants as possible might be visited.

Wednesday afternoon the visitors took a trip down the river on the steamer Columbia. On the down trip a number of the excursionists stopped at the Semet-Solvay Coke Oven Plant, and a number at the Detroit Iron & Steel Co. to inspect the blast furnace. The remainder visited the Livingston Channel and inspected the government work. In the evening there was a second excursion, this time on Lake St. Clair.

W. M. CORSE, BUFFALO.
Secretary A.B.F.A.

Thursday, June 9.

At the Thursday morning session of the A.B.F.A., Dr. F. T. F. Stephenson



National Core Oil Co., Buffalo, N. Y.

Robeson Process Co., Au Sable Forks, N. Y.

Brown Specialty Machinery Co., Chicago.
Buckeye Products Co., Cincinnati, O.

Henry E. Pridmore, Chicago, Ill.

Northern Engineering Wks., Detroit, Mich.

S. Obermayer Co., Cincinnati, Ohio.

read an interesting article on the value of the association to its members in which he pointed out that a member does not perform his full duty by simply joining the association. "We have fine examples of those who are doing their duty," he said, "in the men who have devoted their lives to the brass industry and who take the time to give us the benefit of their knowledge. We owe them a debt and it can be best paid by contributing the value of our knowledge and experience to the rest." Dr. J. J. Porter, Cincinnati, gave a talk on "Co-operative Courses in Metallurgy."

At the morning session of the A. F. A. Wilfred Lewis read a paper on "The Shockless Jarring Machine," which brought forth much discussion. A full description of the shockless jarring machine was given in the February issue. Other papers were "Rejected Castings in Steel Foundries," by S. D. L. Emerson, New York; "Reward—Premium—or Bonus," by W. J. Power, New York; "Report of Committee on Industrial Education," by P. Kreuzpointer, Altoona, Pa.; "Foundry Transportation Methods," by David Gaehr, and "Overhead Transportation in Foundry," by A. W. Moyer.

In his paper Mr. Emerson pointed out that efficiency was becoming to mean the elimination of waste. He maintained that records should be kept

WILFRED LEWIS,

Tabor Mfg. Co., Philadelphia, Vice-Pres., F. & M. S. A.

and tabulated as to cause, location, number of castings, as to each molder or floor gang, with percentage of loss for each working day, or shift and statements made to these responsible for the foundry work within a few hours after the pour, if possible before starting the next day's work. By getting at the cause through a good system it is possible to reduce the losses.

In the paper on "Reward—Premium—or Bonus," Mr. Power stated that the practical results of a co-operative effort between employer and employe, the

GEORGE RAYNOR,

Carborundum Co., Niagara Falls, N. Y., President F. & M. S. Association.

former paving the road well for the latter, should be at least a net gain in cost to the former of 28 p.c., and an increment in earnings of 20 p.c. to the latter.

Thursday Afternoon.

"Modern Foundry Practice" was a paper presented at the A.B.F.A. session by Chas. T. Boogg, Mansfield. This was an interesting article which brings out the principles underlying all progress and calls attention to those principles that are operating in the brass foundry to-day, as a means to better methods and better quality.

H. M. Lane, Cleveland gave some interesting facts in connection with a series of experiments to determine the use of magnesium in deoxidizing aluminum alloys. Mr. Lane's paper on the various types of electric furnace was also well received.

Hugh McPhee then gave a paper on a new method for mounting patterns of uneven parting for use on molding machines in which the inventor claims combination of small labor in pattern making, and cheapness in using patterns not adaptable to ordinary match plate work. The method consists in making master pattern, and from this enough white metal patterns to fill flask. This completes the work of the pattern maker. Molds are then rammed up, patterns drawn, and metal poured into each impression separately flush with the parting line, in both cope and nowel. These patterns are then mounted on iron frames which fit flasks by means of a composition. This method of mounting is also adaptable to bench work.

C. P. Karr then read a paper on "Analysis of Lead in Alloys." The article discusses the various methods that have been successfully used in the assay of lead in non-ferrous alloys. The subject is classified according to the various methods now in vogue. It refers to the gravimetric method in which lead is precipitated from its nitrate solutions by sulphuric acid and also by treatment with a molybdate solution. Comparisons are made of these two methods.

A.B.F.A. Officers.

At this session was held the annual election of officers which resulted as follows:

President, N. K. B. Patch, Toronto; Secretary-treasurer, W. M. Corse, Buffalo; Vice-Presidents, Thos. Evans, Philadelphia; J. C. Sharpe, Chattanooga; W. L. Abate, New York; W. H. Carpenter, Bristol; Richard Augenbraun, Standford; L. M. Olson, Mansfield; John Wolff, Chicago; J. N. Gamble, Kewanee, Ill.; and Richard R. Mitchell, Montreal.

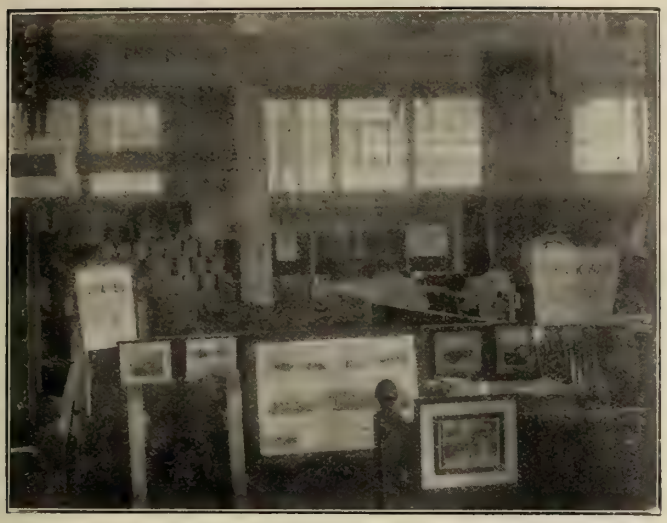
Foundry Foremen Officers.

The following officers were elected for the coming year: President, Robert B. Thomas, foreman of Buffalo Pitts Co., Buffalo.

C. E. HOYT, CHICAGO.

Secretary F. & M. S. Assoc.

Mr. Hoyt was elected secretary-treasurer until a new executive board shall select a secretary. There will be a new method of control consisting of an executive board appointed by the



Browning Engineering Wks., Cleveland, O.

The Adams Co., Dubuque, Iowa.

Joseph Dixon Crucible Co., Jersey City, N. J.

Osborn Mfg. Co., Cleveland, O.

Frederic B. Stevens, Detroit, Mich.

Calumet Engineering Wks., Harvey, Ill.

president, to perform the work of the Foundry Foremen's Association. The executive will act as vice-presidents this year.

A.F.A. Thursday Afternoon.

A number of papers were read. Dr. Richard Moldenke giving suggested specifications for foundry coke. Dr. Moldenke proposed that coke be bought according to its property to melt iron and specifications were given to govern buying, reference being made to sampling, base analysis, moisture, volatile matter, fixed carbon, ash, sulphur, and shatter test.

Thursday Evening Banquet.

A banquet was tendered to the officers of the allied associations Thursday evening, by the Founders' and Manufacturers' Supply Association, at Hotel Cadilac. F. B. Stevens acted as toast master and called upon several prominent foundrymen for addresses.

The feature of the banquet was the awarding of the prizes for the best exhibits which were displayed at the State Fair Grounds during the exhibition week. The prizes were presented by "The Foundry," for the best still exhibit and the best moving exhibit.

The committee making the awards was composed of Major Joseph Speer, Arthur T. Waterfall, H. A. Carpenter, and Stanley B. Flag.

The Solway Process Co., Detroit, re-

HARRY D. GATES,

Thos. W. Pangborn Co., New York, Vice-Pres. F. & M. S. Association.

presenting the firm of Baird & West, took the honors in the still exhibit contest, while the Tabor Mfg. Co., Philadelphia, won the prize for the best moving exhibit. Other companies obtaining honorable mention were :Arcade Mfg. Co., Carborundum Co., Roger Brown Co., Detroit Foundry Supply Co., Mumford Molding Machine Co., Berkshire Mfg. Co., "Castings," Osborne Mfg. Co., and the Robeson Process Co.

Friday, June 10.

The following nominating committee brought in a report of new officers :

ROBERT B. THOMPSON,

Buffalo Pitts Co., Buffalo. President Associated Foundry Foremen.

W. H. M. McFadden, Pittsburg ; J. J. Wilson, Detroit ; Alfred E. Howell, Nashville ; H. A. Carpenter, Pittsburg and L. L. Anthes, Toronto.

The report which was adopted nominated the following officers for the coming year :

President, Major Joseph T. Speer, Pittsburg Valve, Foundry & Construction Co.

Vice-Pres., No. 1 Dist., F. B. Farnsworth, McLagon Foundry Co., New Haven.

2nd—Walter Wood, R. D. Wood & Co., Camden, N.J.

3rd—W. A. Bole, Westinghouse Co., Pittsburg.

4th—Wm. Gilbert, Buckeye Foundry Co., Cincinnati.

5th—J. J. Wilson, General Motors Co., Detroit.

6th—T. W. Sheriff, Sheriff Mfg. Co., Milwaukee.

7th—Alfred E. Howell, Phillips & Buttorf Mfg. Co., Nashville.

8th—A. N. W. Clare, Clare Stove Co., Preston, Ont.

Sec.-Treas.—Dr. Richard Moldenke, Watchung, N.J.

Founders' and Manufacturers' Association.

The annual meeting of the Founders' and Manufacturers' Association was held in Hotel Cadillac, Friday evening. A committee was elected to consider the advisability of incorporating.

The following officers were elected :

President—Geo. R. Raynor, Carborundum Co., Niagara Falls.

1st Vice-Pres.—Wilfred Lewis, Tabor Mfg. Co., Philadelphia.

2nd Vice-Pres.—E. D. Froman, S. Obermoyer Co., Pittsburg.

3rd Vice-Pres.—T. S. Hammond, Whiting Foundry Equip. Co., Harvey.

4th Vice-Pres.—Harry D. Gates, Thos. W. Pangborn Co., New York.

Trustees (for three years)—F. N. Perkins, H. M. Bougher, E. H. Stedman.

Secretary—C. E. Hoyt, Lewis Institute, Chicago.

Treasurer—H. S. McCormick, Pittsburg.

Trustees—F. N. Perkins, Arcade Mfg. Co., Freeport, Ill.; H. M. Bougher, J.

T. S. HAMMOND,

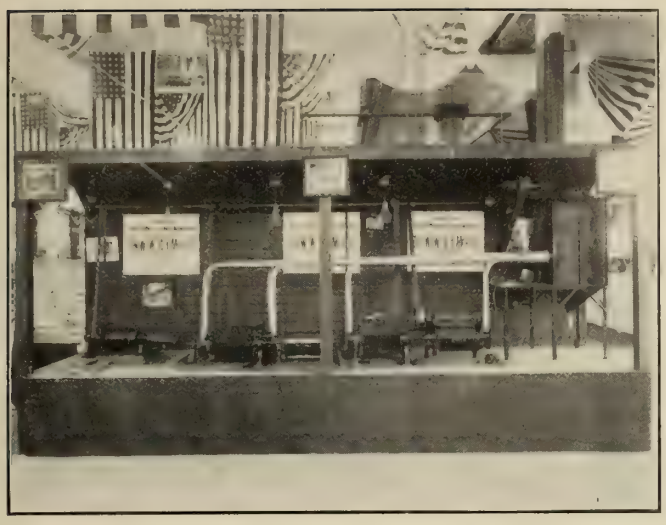
Whiting Foundry Equipment Co., Vice-Pres. F. & M. S. Association.

W. Paxson Co., Philadelphia ; E. H. Steedman, Curtis Mfg. Co., St. Louis, Mo.

The nominating committee's report was presented by the chairman, E. A. Pridmore, Chicago. The other members of the committee were E. H. Mumford,

ROBERT B. THOMSON.

Robert B. Thompson, the president elect of Associated Foundry Foremen, is a Canadian by birth, being a native of Halifax, N. S. He has been connected with several large concerns in the eastern States. For several years he has been connected with the Buffalo Pitts Co., Buffalo, which is his present address.

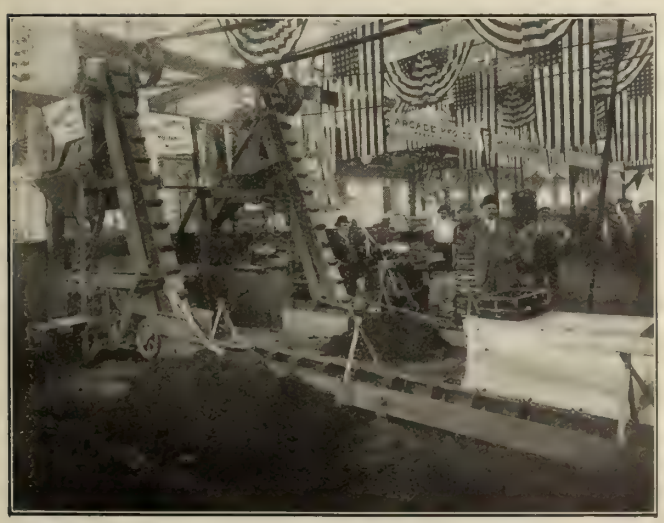


W. W. Sly Mfg. Co., Cleveland, O.

J. W. Paxson Co., Philadelphia.

T. J. Peterson Co., Chicago.

Berkshire Mfg. Co., Cleveland, O.



Arcade Mfg. Co., Freeport, Ill.

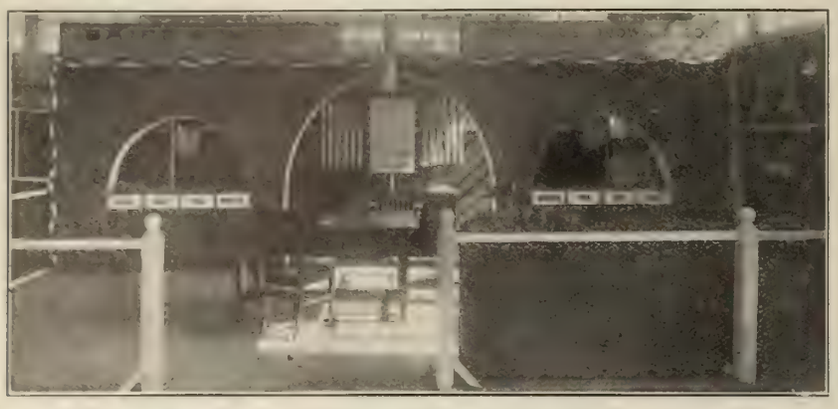
Cutler-Hammer Mfg. Co., Milwaukee, Wis.

Martin L. Heyl, W. C. Sly and John C. Pangborn.

Canadians Present.

There were a great number of Canadians present, but as all did not register the following list is not complete :

M. Chapman, Ontario Wind Engine and Pump Co., Toronto ; Geo. Childs, James Stewart Mfg. Co., Woodstock ; J. H. Ainsborough, Toronto ; J. Anderson, J. Fleury Sons, Aurora ; L. L. Anthes, Anthes Foundry, Toronto ; J. C. Armer, Toronto ; Hugh Lamont, Toronto Testing Laboratories, Toronto ; F. E. Laner, Warden, King Ltd., Montreal ; J. Linklater, International Harvester Co., Hamilton ; S. R. Logan, Waterous Engine Works, Brantford ; J. E. Long, McKinnon Dash & Metal Co., St. Catharines ; D. O. McKinnon, Toronto ; Geo. Merckling, McKinnon Dash Metal Co., St. Catharines ; L. A. Mills, Western Foundry Co., Wingham ; R. R. Mitchell, Robt. Mitchell Co., Montreal ; J. K. Moffat, Moffat Stove Co., Weston ; J. Morin, M. Moody & Sons Co., Terrebonne ; J. F. Nellis, Chas. C. Kawin Co., Toronto ; A. E. Smith, Montreal ; E. Stanley, Ontario Wind Engine & Pump Co., Toronto ; T. C. Stewart, Jas. Stewart Mfg. Co., Woodstock ; A. G. Storie and F. Storie, Ontario Malleable Iron Co., Oshawa ; A. H. Tallman, Tallman Brass & Metal Co., Hamilton ; J. M. Taylor, jr., Taylor-Forbes Co., Guelph; S. Terrell, Raymond Mfg. Co., Guelph ; H. V. Tyrrell, Canadian Machinery, Toronto ; W. D. Varey, Western Foundry Co., Wingham; M. J. Walsh, Canadian Car & Foundry Co., Montreal ; Fred Washburn, Taylor-Forbes Co., Guelph ; G. H. Weaver, Dominion Foundry Supply Co., Montreal ; Frank White and Arthur W. White, Geo. White & Sons Co., London ; Robert Wilson, Hamilton ; Joseph Wright, Dominion Radiator Co., Toronto ; J. H. Fryer, Galt Malleable Iron Co., Galt ; F. S. Ferguson, Canada Iron & Furnace Co., Montreal ; Wm. Findlay, Findlay Bros., Carleton Place ; E. B. Fleury, Hamilton Facing Mills Co., Hamilton ; B. Geery, American Wheel Co. and Advance Thresher Co., Toronto ; A. W. Given, Taylor-Forbes Co., Guelph ; H. L. Gulline, Warden King Ltd., Montreal ; W. J. Harris, Canada Metal Co., Toronto ; G. C. Keith, editor Canadian Machinery, Toronto ; G. Parry, National Iron Works, Toronto ; Mr. McDonald, Industrial Commissioner, Guelph ; and A. Knight, of Canadian Northern Ry., Winnipeg.



Baird & West, Detroit, and Picands, Brown & Co., Winner of Foundry Loving Cup.

A. N. W. Clare, Clare Bros., Preston ; A. E. Earsman, Earsman Bros., Toronto ; P. A. Drummond, American Wheel Co. and Advance Thresher Co., Toronto ; Geo. A. Drysdale, International Harvester Co., Hamilton ; J. J. Cunningham, Western Foundry Co., Wingham ; Thomas Davidson, Cockshutt Plow Co., Brantford ; G. G. Noble, Dominion Radiator Co., Toronto ; A. M. P. Irvine, Parker Foundry Co., Montreal ; Thos. Jenkins, Dodge Mfg. Co., Toronto ; Wm. K. Kennedy, the Wm. Kennedy Co., Owen Sound ; H. O. Kerr and R. Kerr, Kerr Engine Co., Walkerville ; F. W. King, McClary Mfg. Co., London ; A. Oliver, Sheldon's, Galt ; F. Painter, Standard Sanitary Mfg. Co., Toronto ; A. Park, Park Bros., Chatham ; N. K. B. Patch, Lumen Bearing Co., Toronto ; J. H. Phillips, Pease Foundry Co., Toronto ; W. F. Ralph, Canadian Machinery, Toronto ; C. Rehder, Bowmanville Foundry Co., Bowmanville ; W. G. Rogers, Erie Iron Works, St. Thomas ; J. M. Ryan, Montreal Steel Works, Montreal ; R. Savill, Taylor-Forbes Co., Guelph ; J. G. Scully, Raymond Co., Guelph ; Mr. Nunan, Raymond Mfg. Co., Guelph; H. Hertfelder, Dodge Mfg. Co., Toronto ; A. P. Hilton, Taylor-Forbes Co., Guelph ; A. R. Hocken, Taylor Forbes Co., Guelph ; R. J. Hopper, Pratt, Litchworth Co., Brantford ; Thos. Hopkins, Welch Stove Co., Guelph; Edward Hutchinson, Cockshutt Plow Co., Brantford ; F. S. Campbell, Taylor-Forbes Co., Brantford ; John M. Carrol, Hamilton ; T. J. Best, Warden King Ltd., Montreal ; F. Ben Bennett, D. Maxwell & Sons, St. Marys ;

Entertainment for Ladies.

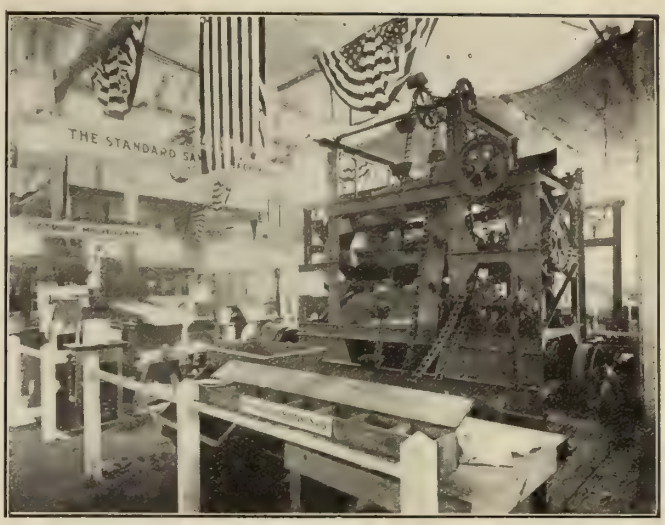
During the convention many ladies attended the sessions of the A.F.A. and A.B.F.A., listening to the papers and discussion. The visitors to the exhibition included a large number of ladies who showed their interest in the machinery and equipment on exhibition. The ladies were not forgotten at any time, and while the gentlemen were enjoying the smoker Tuesday night, the ladies were entertained at a theatre party.

Tabor Mfg. Co., Philadelphia, Winner of Foundry Loving Cup.

Parlor H at Hotel Pontchartrain was reserved for ladies by the Detroit Committee. Members of the Ladies' Committee were in attendance at all times to give information and assist the visiting ladies.

On Wednesday afternoon the ladies joined with the gentlemen in the excur-

Cleveland Wire Spring Co., Cleveland, O.



Standard Sand Machine Co., Cleveland.

Mumford Molding Mch. Co., New York,
Q. M. S. Co., Plainfield.

Jonathan Bartley Crucible Co., Trenton, N. J.,
Central Foundry Supply Co., Columbus, O.

Carborundum Co., Niagara Falls, N. Y.

Monarch Engineering & Mfg. Co., Baltimore, Md.

sions on the Detroit River and Lake St. Clair.

On Thursday afternoon the ladies saw Detroit by automobile. After seeing many places of interest they were tendered a luncheon at the Yacht Club on Belle Isle.

Convention Committees.

The Detroit committee who had charge of arrangements were Dr. Frank T. F. Stephenson, Detroit Saw & Brazing Works, general chairman; A. Preston Henry, Standard Pattern Works, secretary; Frederic B. Stevens, chairman finance committee; J. J. Wilson, Cadillac Motor Car Co., plant visitation; J. B. Keightley, Great Lakes Engineering Co., reception; W. P. Putman, Detroit Testing Laboratory, technical papers; De La Motte Henry, Buhl Malleable Co., ladies; E. J. Woodison, Detroit Foundry Supply Co., entertainment; and Oliver Phelps, M. A. Hanna & Co., chairman boat ride committee. The excellent arrangements in connection with the convention meetings, exhibition and entertainment were due to the plans made and carried out by these gentlemen. Representatives from the Pittsburg Foundrymen's Association were on the ground, both during the convention and for months previous, observing the methods used in Detroit. This fact is a compliment to the excellent methods adopted by the Detroit Foundrymen.

THE EXHIBITS.

ANTHONY CO., 45 WEST 34th ST., NEW YORK.—Liquid fuel engineers, showed in operation oil burners for high and low pressure, pit crucible furnaces and tilting furnaces. J. M. Neill demonstrated the melting of brass with the Anthony furnace. N. W. Anthony and A. R. Anthony were also on the ground. In the oil furnace the flow of oil to the spindle is regulated by the oil valve as it passes through a very small hole in the plug at the end of the spindle. The oil is then caught up by a current of air completely surrounding this plug and caused to enter the furnace in a finely divided spray. Pressure is 2½ to 3 oz. and a temperature of 2650 deg F. is obtained. The furnace is lined with ¼ in. asbestos and firebrick.

ARCADE MFG. Co., FREEPORT—Had a large exhibit in the main building. Edgar H. Morgan, Chas. Morgan, F. N. Perkins, W. C. Norcross, R. M. Burton, G. D. Wolfley, August Christen and Reeve Burton were on hand. Several machines were in operation including the Arcade Automatic Molding Machine, Modern Molding Machines, Arcade squeezers, Norcross jolting machines,, Buck roll-over match plate and sand conveyors. There was also a demonstration of pattern plates. A Northern crane was used in connection with the exhibit.

AMERICAN BLOWER CO., DETROIT.—The special feature of the exhibit was a 24 inch ball, kept in the air by 1 58 in. pressure blower direct connected to a 40 h.p. motor, delivering air at an angle of 45 deg. A small blower with motor was also shown in the exhibit. In addition were Sirocco heating and ventilating system, Sirocco ventilating propellors and isolated power plant engine with dynamo direct connected to engine. R. T. Coe, M. L. Diver, B. E. La Follette, A. N. Kelley, and W. A. Fletcher were in attendance.

BOYER PATTERN PLATE & MFG. CO., CLEVELAND.—Represented by John T. Boyer, G. Knock and Chas. W. Brown their combination roll-over and squeezer molding machine. The entire mold is made in one operation when work of snap flask size is being produced.

BERKSHIRE MFG. CO., CLEVELAND.—Showed power riddles, flasks, automatic molding machines, etc. During the exhibition Berkshire hand machines were operated. This machine is intended for use where the output of different castings is limited and can be used on any style of patterns.

BROWN SPECIALTY MACHINERY CO., CHICAGO.—Showed their Hammer core machine which makes round, oval, octagon, slab and irregular cores up to three inches and square cores up to two inches. E. A. Rich, Jr., was in charge of the demonstration of the work that can be done with this core machine.

JONATHAN BARTLEY CRUCIBLE CO., TRENTON.—Lewis H. Lawton and S. H. Dougherty pointed out the merits of the crucibles, retorts, stoppers and other graphite specials, that were exhibited.

A. BUCH'S SONS CO., ELIZABETHTOWN, PA.—Made molds on the two Buch's jar and squeezer molding machines. They also showed patented aluminum snap flasks, method of mounting patterns for molding machine use, special cast iron flasks for gravity molding machine, etc. R. S. Buch and P. J. Potter had charge of the exhibit.

BROWNING ENGINEERING CO., CLEVELAND—A miniature magnet in operation illustrating the work that may accomplished with a Browning magnet. Literature on locomotive cranes, automatic grab buckets and hoisting and conveying material, was distributed. Photographs illustrated these several machines. H. E. Green was in charge of the booth.

BUCKEYE PRODUCTS CO., CINCINNATI.—Showed samples of parting compounds, brass flux, and foundry specialties. They were represented by Chas. J. Gochringer and E. H. Leisl.

BURROUGHS' ADDING MACHINE CO., DETROIT.—Adding and listing machines were shown, their uses and operation being demonstrated by F. H. Dodge and F. S. Wheeler. Their usefulness in connection with cost systems was also demonstrated.

S. BIRKENSTEIN & SONS, CHICAGO.—Had ingots of copper brass and babbit. They were represented by E. E. Berliner, J. B. Neiman and Harry Birkenstein.

CALUMET ENGINEERING WORKS, HARVEY—Had on exhibit tumblers, ladles, trolley system and a cupola model showing construction. H. W. Schulze, J. T. Krieger and C. A. Dugan were in attendance.

CHICAGO PNEUMATIC TOOL CO., CHICAGO—Had an air compressor in operation furnishing power. Also shown were pneumatic hammers, sand rammers, drills, grinders, etc. They were represented by J. F. Duntley, F. E. Lawson, R. P. James, W. C. Walker and G. W. Parker.

CARBORUNDUM CO., NIAGARA FALLS—Carborundum aloxite wheels, rubbing bricks, sharpening stones, emery cloth and paper, were shown as well as crystals of carborundum. Wheels were operated on two grinding machines. G. R. Rayner, C. D. Sargent, F. B. Jacobs, H. A. Eaton and O. C. Dobson attended.

CENTRAL FOUNDRY SUPPLY CO., COLUMBUS—Offered to supply free 250 lbs. Bull Run talc. Acme parting and Bull Run red facing are two of their specialties.

CLEVELAND WIRE SPRING CO., CLEVELAND, OHIO—Had on exhibit steel shop and foundry barrels, sprue boxes, steel tote boxes, core trays, coiled wire springs and wire forms. J. W. Campbell was in charge.

CASTINGS, CLEVELAND—Published by the Gardner Printing Co. The booth was in charge of H. M. Lane and R. I. Clegg, editors, and G. H. Gardner, president, S. R. Lewis, S. G. Krake and Chas. G. Kissinger. On exhibit was a pig of Zug iron weighing 135 lbs. and also the exact amount of limestone, coke, ore, etc., to make the pig. There was also shown the equivalent amount of S., FeS., pig., P., Si., C in its composition and the amount of slag left from making such a bar. On exhibit was a cast iron tablet 3' x 5' with an address to President Lincoln in raised letters. It was made by the Moline Scale Co. Moline and glutine was used in making. Various other castings in grey iron and brass were shown including grey iron (rubber iron), fancy brass castings made by Yale & Towne, Cleveland, and castings of National Cash Register Co.'s cash register, sides with the original plaster of paris pattern.

CUTLER-HAMMER CLUTCH CO., MILWAUKEE—Mr. Ludwig demonstrated the Cutler-Hammer magnet and its control by means of one erected in the book and placed in commission there.

CRECENT MACHINE CO., LEETONIA, OHIO—Manufacturers of woodworking machinery showed the Crecent safety head for joiners. C. G. Wilderson was in charge of booth.

CANADIAN MACHINERY, TORONTO—Represented by H. V. Tyrrell, W. F. Ralph and G. C. Keith.

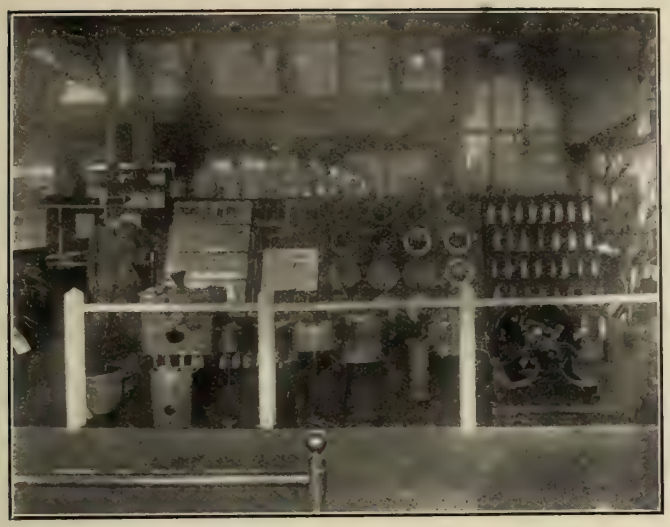
DETROIT FOUNDRY SUPPLY CO., DETROIT—Were represented by Edward J. Woodison, W. Bruce Howard, Wm. H. Chase, Wm. H. Fitzpatrick, Wm. W. Murray, Jas. C. Dissette and Chas. D. Yahne. Their exhibit included a core oven, oil burners, plating dynamos, buffing wheels, plates, chemicals, roll-over molding machine, shovels, crucibles, new eccentric adjustable clamps, aluminum snap flasks, blow torches, etc. A number of Wetmore patent glue heaters were shown. The heater may be equipped with a thermostatic valve which turns off the flow of gas as soon as the glue reaches the desired temperature and thereafter keeps the glue at the proper temperature.

WM. DEMMLER & BROS., KEWANEE, ILL.—Demonstrations were made of the Hewlett core machine which makes seven boxes per minute with one or more cores in each box. The sand is introduced into core box by compressed air at 75 lbs. pressure for oil sand mixtures and 100 lbs. pressure for ordinary sand mixtures. The Kewanee molding machine was also shown. H. L. Demmler had charge of the exhibit.

JOSEPH DIXON CRUCIBLE CO., JERSEY CITY—They had on exhibit crucibles for both brass and steel melting, special shapes and formulae for various purposes, phosphorizors, stirrers, skimmers. Motor brushes and other graphite products were shown. The booth was a centre of interest, the crowd being entertained by the "Wiggle-Wagglegraph." It contained a magic mirror which made it impossible to draw a square with diagonals correctly. Dixon pencils were also distributed as well as a recent publication "Crucibles, their care and use." The purpose of the book is to uniform the user of crucibles as to their nature and chatacteristics, and give him suggestions as to their care and handling, which, if followed, will add to their efficiency and greatly prolong their period of usefulness. They were represented by Dudley A. Johnson, W. B. Allen, F. R. Brandon, L. Hoasis, F. Krug, John A. Cordit, L. M. Chase, C. D. McIntosh and Geo. Neighbor, John A. Cordit, manager of the Buffalo office, has charge of the Canadian territory.

DETROIT HOIST & MACHINE CO., DETROIT—Had compressed air hoisting machinery on exhibition. A model in operation showed the principle of the hoist. J. C. Fleming, and F. B. Fleming were the representatives.

DETROIT TESTING LABORATORY, DETROIT—They carry on the business of consulting foundrymen, metallurgists, chemists, etc. Associated with them in Canada is the Toronto Testing Laboratory, 18 Saturday Night Building. Representatives were W. P. Putman, J. D. Stoddard and Hugh Lamont.



Detroit Foundry Supply Co., Detroit.

Detroit Foundry Supply Co., Detroit, Mich.

J. D. Smith Foundry Supply Co., Cleveland.

Thos. W. Pangborn Co., New York City.

Castings, Cleveland ; Detroit Testing Laboratory. Detroit.

Falls Rivet & Mch. Co., Cuyahoga Falls.

STANLEY DOGGETT, NEW YORK—Representatives were W. S. Rupert, Wm. Busser and Stanley Doggett. They distributed samples of Doggett parting compound and literature on the various foundry specialties such as manganese dioxide, facings, etc.

FOUNDRY SPECIALTY CO., CINCINNATI—Represented by F. W. Weissman demonstrated the Graf roll-over match plate device, hingeless snap flask and skeleton snap weight or clamp. Their specialty is "Tartive" and "Fluxine."

FEDERAL FOUNDRY SUPPLY CO., CLEVELAND—Showed samples of facings, core binder, etc. They were represented by W. J. Adams, Ralph Ditty and W. R. Beers.

FALLS RIVET AND MACHINE CO., CUYAHOGA FALLS, OHIO.—The following Wadsworth machines were on exhibit at this booth; three improved stock, No. 1, ½ to 3" improved core machine; No. 2 ¾ to 7" improved hand power core machine; No. 3 improved power core machine, improved sand mixing and compounding machine; No. 1 and 2 core cutting off and coning machine, improved core oven; all steel stock core racks; standard core prints in cabinets, and a group of Wadsworth vertical jar-ramming core-forming machines making standard and chambered cores. This exhibit, which was in charge of Geo. H. Wadsworth and Geo. White, was shown under a structural iron frame making the line shaft and countershaft all self-contained, while the machinery was all running it was entirely separated from the building and was in operation every day during the convention.

FOUNDRY NEWS, NEW YORK—Albert Spies, Chas. E. Cornell, Jr.

GUTHRIE & HOWE, CINCINNATI—Polar flaming arc lamps made in Berlin, Germany, designed for both direct and alternation current were shown by P. H. Guthrie and C. G. Howe.

GOLDSCHMIDT THERMIT CO., NEW YORK—Have also a branch in Toronto. The method of making repairs with thermit was illustrated. Photographs showed many repairs made by this process of welding, patterns, expensive castings of all kinds, etc. They were represented by Henry S. Mann and J. G. McCarty.

HERMAN PNEUMATIC MACHINE CO., PITTSBURG—Had on exhibit Herman jarring molding machines, jarring molding machines with roll-over and pattern drawing device, jarring and stripping plate machine, combination jarring and squeezer machine. Demonstrations of mobing were given. A Northern crane was erected and used in connection with the molding. In attendance were Martin L. Heyl, Chas. Herman, H. T. Frauenheim and John J. Lawlor.

HOWLEY DOWN DRAFT FURNACE CO., CHICAGO—Showed ladle heaters, Schwartz metal melting furnace for all metals in operation and the Hawley oil crucible furnace also in operation. H. J. Stow was in charge of the exhibit.

HANCK MFG. Co., NEW YORK—The three sizes of portable oil burners were shown also burners for lighting cupolas, ladle heaters, skin drying burners, torches, forges for annealing, brazing, pipe bending, heating rivets, etc. They were represented by A. B. Link, A. H. Stein, Willis C. Squire, and F. G. Squire. E. Stanley of the Ontario Wind Engine & Pump Co., Toronto, Canadian representative, was also in attendance.

HANNA ENGINEERING WORKS, CHICAGO—Had in operation screen shakers, revolving dumping riddles, mold dryers, riveters, and Rathbone multiple molding machine. They were represented by Wm. L. Laib and James T. Lee.

HILL & GRIFFITH CO., CINCINNATI—Deal in foundry facings, core and parting compounds, patent tamping head molders' shovels, bellows, brushes, etc. They were represented by John Hill, J. M. Glass, and M. Z. Fox.

HICKMAN, WILLIAMS & CO.—This company had only an office. Their plants are at Louisville, Chicago, Cincinnati, Pittsburg, St. Louis, New York, Philadelphia, Boston and Birmingham. They manufacture pig iron, coke, steel, ferro-manganese, ferro-phosphorus, ferro-silican and silico-speigel. They were represented at the convention by H. E. Pierce, E. P. Hettiger, H. Black, John U. Byrd, T. C. Ward, F. S. Fears, J. B. Holloway, S. E. Frazee, Richmond Nicholas, R. B. Miller, T. L. Powell, T. A. Arthur, R. W. Kellow, W. L. Hoffman, B. P. Williams, Day Williams, John Daker, jr., L. E. Paton, C. A. Reed, and L. H. Miller.

INGERSOLL-RAND CO., NEW YORK—Exhibited compressed air appliances applicable to foundry work consisting of motor-driven air compressor, pneumatic sand rammers, pneumatic chipping hammers, hoists, etc. W. H. Armstrong, W. A. Armstrong, Jas. Moran and James L. Kelly were in attendance.

E. KILLING'S MOLDING MACHINE WKS., DAVENPORT, IOWA—Had on exhibit the Killing foot-jarring rockover machinery, universal jarring machine and a No. 1 Killing auto squeezer duplex. The squeezer closes the mold automatically and also sifts sand, squeezes cope and drag, vibrates the pattern, clamps the flask, lifts cope, drops drag and closes the finished mold automatically.

T. P. KELLY & CO., NEW YORK—Had an office in the main building. They deal in foundry supplies.

KROESCHELL BROS. CO., CHICAGO—Had on exhibit Kroeschell-Schwartz gyrating flame crucible furnaces, tilting or stationary type, oil or gas fuel. Mr. Schwartz represented the company.

J. S. McCORMICK, PITTSBURG—Had a model power ramming machine, Deane pneumatic sand mixer, Blake wire streightener, 20th century molding machine and a continuous sand mixer. The two last were in operation. The sand mixer has a capacity of ten to fifteen tons per hour. The company was represented by J. S. McCormick, T. E. Malone and S. R. Costley.

MICHIGAN SMELTING & REFINING CO., DETROIT—Showed gates of castings, and finished castings made by companies using M. S. & R. Co. metal. Representatives were Joseph Stillman, Albert J. Hall, T. R. McNamee, S. R. Ginsburg and H. Levitt.

MONARCH ENGINEERING & MFG. CO., BALTIMORE, MD.—The Monarch rivet heater, Steele-Harvey crucible tilting brass melting furnaces were shown. The crucible is not removed from the furnace in pouring the metal. Monarch "Acme" portable core oven was also shown and a Monarch "Eclipse" bolt heating forge, water jacketed, operated by oil, gas or air. In attendance were David R. Steele, M. W. Woodburn, James H. Fowler H. D. Harvey and Jas. J. Allen. This exhibit was in the tent, the furnaces being in operation each day during the week.

MUMFORD MOLDING MACHINE CO., NEW YORK—Had in operation squeezer with vibrator and match plate, high trunnion squeezer with vibrator and match plate, power ramming plate pattern, power ramming machine with starting power pattern draft, plain jolt ramming machine operated in connection with hoist for rolling molds and sand pattern guide for match plates. Mr. Mumford was in attendance.

BENJ. MIDDLEDITCH, DETROIT—Showed a power sprue cutter the wearing parts of which are made of tool steel. Cutters are of tool steel 1½" x ⅝" and cut a piece equivalent to ¾" square common yellow brass. A polishing machine was shown and a tilting tumbling barrel for tumbling brass and bronze castings. In the latter machine bushings are renewable, and outer end of shaft carrying pulleys and gear is supported with a heavy bracket keeping small gear in proper mesh with large gear. Brass founders' bevel flasks completed the exhibit. The representatives were Benj. Middlehitch, P. De Vines and S. Laffrey.

MILLERS' PRODUCTS CO., CHICAGO—Had samples of Black Diamond Bore Compound and several grades of foundry flour. C. B. Spaulding was in charge.

METAL DROSS ECONOMY CO., BRISTOL, CONN.—Metal dross extractor was shown. The skimming tank consists of a cast iron box 20 x 22 ins., covered with a steel top. The dross from the crucible is skimmed into this tank which is kept full of water. The separator consists of wire screens. Tests show that this machine has saved a great amount of metal where tried out. They were represented by A. L. Hoasis and W. H. Carpenter.

METAL INDUSTRY, NEW YORK—Represented by Palmer H. Langdon, L. J. Krom, T. A. Trumbour, E. B. Fritz and F. J. Huntley.

NORTHERN ENGINEERING WORKS, DETROIT—In the centre of the exhibit was a cupola set on a turntable to show the ease of operation of the turntable. On the top of the turntable and beneath the cupola was a mirror so that the interior of the cupola was easily seen. Probably the most interesting feature of the exhibit which included a great number of foundry supplies and equipment was a model of a crane trolley in operation. This was complete with motor, the gears were enclosed and all the features of the Northern crane were included in the model. The representatives were W. G. Chesebrough, Walter Robinson, W. S. Reid, W. H. Standart and Geo. A. True.

NATIONAL CORE OIL CO., BUFFALO, N. Y.—Deal in high grade core compounds and foundry specialties. C. H. Cotton, P. L. Crandall.

OSBORN MFG. CO., CLEVELAND—Molding machines, etc., were shown in operation including rock-over drop-draft molding machine, adjustable flask stripping moulding machine and rock-over jolt and plain jolt molding machines. In the jolt machines the length of stroke and hardness of blow to be struck are always in control of the operator. Representatives were H. R. Atwater, F. D. Jacobs, E. T. Doddridge, J. H. Galloway and J. C. Boynton.

S. Obermayer Co., Chicago—Were in the booth with the Whiting Foundry Equipment Co. They were represented by S. T. Johnston, F. H. Dodge, F. J. Brunner, O. J. Peterson, J. E. Evans, C. M. Barker, W. M. Fitzpatrick, E. D. Frohman, H. F. Frohman and G. H. Kersting.

OLIVER MACHINERY CO., GRAND RAPIDS—Showed a great number of wood working machines such as pattern makers' planers, jointers, band saws, circular saws, Sanders' wood trimmers, lathes, borers, grinders, etc. Of greatest interest was the Wadkin milling machine in which milling is applied to the making of patterns. J. W. Oliver, A. N. Spencer, J. P. Schmidt and W. Y. Mentzer represented the company.

J. W. PAXSON CO., PHILADELPHIA—Manufacture cupolas, ladles, etc. On exhibit in operation was a rock-over pattern-drawing molding machine. This Barker type is for large and small patterns and patterns on plates or match boards may be used. The representatives were H. M. Bougher, Geo. Moore, A. W. Moyer, I. F. Kromer, W. Scott Thomas, W. T. Nicholson, and W. Baetty.

T. J. PETERSON CO., CHICAGO—Showed cores made by a number of engine manufacturers for gas engine cylinders using their core oil. They were represented by Jas. Kerr, H. S. Peterson, J. Purvis, A. B. Elwes.

HENRY E. PRIDMORE, CHICAGO—Exhibited at the Foundrymen's Convention, Detroit, thirteen years ago, being the only exhibitor at that time of molding machines. There were on exhibit small square stand stripping plate machine and patterns, large square heavy double shaft stripping plate machine and patterns, stove plate rock-over machine and patterns, rock-over drop machine fitted with automobile patterns, power ramming rock-over drop machine and patterns, machine were operated during the convention. Edward A. Pridmore, R. E. Turnbull, D. F. Eagan and W. W. Miller were in charge.

THOMAS W. PANGBORN CO., NEW YORK—Had on exhibition their modern high pressure sand blast systems. In addition they had sand separators equipped for either belt or air drive. Representatives were John C. Pangborn, Harry

D. Gates, Jesse J. Bowen, Willis S. Doane, Alfred L. Holmes, Foster J. Hull and Raymond F. Smith.

PENTON PUBLISHING CO., CLEVELAND—Publishers of Foundry and Iron Trade Review had a booth furnished with easy chairs for visitors and decorated with palms, etc. The two loving cups presented by them to the Exhibitors' Association were on exhibit. These were presented to the companies having the best exhibits. They were represented by John A. Penton, A. O. Backert, C. Vickers, W. A. Ten Winkel, R. E. Donsmore, D. C. Warren, W. B. Robinson, J. C. Eppens and F. J. Ryan.

PARKER BROS. CO., DETROIT.—They are the selling agents for the Ohio Sand Co., Conneant, Ohio, the Ayres Mineral Co., Zanesville, O., L. K. Brown, Zanesville, and the Interstate Sand Co., Zanesville, all miners and shippers of all grades of molding sands. In attendance were E. M. Ayres, L. K. Brown, U. E. Kanavel, E. R. Wilson, F. E. Gordon, Arthur S. Barrows and W. R. Thompson.

Q. M. S. CO., PLAINFIELD—Had on exhibit cylindrical air hoists, hand power traveling cranes, I beam trolley and I steel foundry saw. R. H. Post and F. R. Phillips attended.

ROBINSON AUTOMATIC MACHINE CO., DETROIT—Showed automatic machines for metal polishing.

ROCKWELL FURNACE CO., NEW YORK—Showed photographs and blue prints of oil, coal and gas furnaces, and burning appliances. W. S. Quigley and A. L. Stevens explained the features of these appliances, etc.

ROGERS, BROWN & CO., CINCINNATI—Besides Cincinnati there are offices at New York, Chicago, Buffalo, Pittsburg, Cleveland, Boston, St. Louis, Birmingham and Philadelphia. They manufacture pig iron and coke. Their exhibit showed several grades of pig iron with numerous unusual castings made from pig iron. Henry B. B. Yergason was in charge of the exhibit. In the background of the exhibit was a large sign of colored lights, the lights representing the furnaces and coke districts in which the company is interested and from which are obtained the different grades.

ROBESON PROCESS CO., AU SABLE FORKS, N. Y.—Both the head office and main works are at Au Sable but there is also a plant at Covington, Va., manufacturing gluterin core binder. Recently its manufacture was begun at Grand Mere, P.Q., and Francis Hyde, Montreal, were appointed Canadian agents. Small trees surrounded their booth, illustrative of the Glutrin trade mark.

SAND MIXING MACHINE CO., NEW YORK—Showed in operation a machine for cutting molding sand and for mixing core sands and facing sands. V. E. Minich, John Bradley and B. F. Doup were in charge.

J. D. SMITH FOUNDRY SUPPLY CO., CLEVELAND—Showed natural draft furnaces, aluminum melting furnace, rolling drawer coke oven, sprue cutter, water tumbler, grinder, sand blast installation and three different styles of molding machines. Representing the company were P. G. Smith, J. S. Smith, M. S. Finley, Jos. Harrison and F. A. Coleman.

FREDERIC B. STEVENS, DETROIT—The exhibit was of interest and attracted much attention on account of the "Dummy" operating the Stearns molding machine. There was also shown a sand blast machine complete, a Noble's electromagnetic separator, Spanish felt wheels, cotton buffs, etc., and a Noble magnetic separator. Those in attendance at the booth were Frederic B. Stevens, J. M. Moyers, W. J. Cluff, A. T. Wagner, J. Hughes, H. Kringner and Geo. B. Bell. Mr. Bruce, of the Bruce Foundry Supply Co., Toronto, the Canadian agent of Frederic B. Stevens, was a visitor to the convention and made this booth his headquarters. Among the souvenirs given by F. B. Stevens were the elephant and the donkey "barometer."

STANDARD SAND & MACHINE CO., CLEVELAND—Showed a Standard combined rolling and blending machine in operation. All of the material entering the drum receives eighteen uniform rollings in passing through the machine. H. E. Boughton, J. A. Boughton and T. J. Morgan are the representatives.

WM. SELLERS & CO., INC., PHILADELPHIA—A centrifugal sand mixing machine was in continuous operation during the convention. A drill grinding machine was also shown. Edward L. Holljes was in charge demonstrating the sand mixing machines, machines driven from overhead pulley and with motor drive being shown.

W. W. SLY MFG. CO., CLEVELAND, OHIO—This exhibit attracted considerable attention on account of the novel exhibit of cleaning mills cinder mills, etc. These were complete in every detail and showed to advantage the good features of the cleaning mills. Photographs of other machines were also shown. W. W. Sly and W. C. Sly, were at the convention and assisted by H. R. Morse and D. A. Livensparger, took much pleasure in demonstrating the salient features of the equipment they had on exhibition.

STERLING WHEELBARROW CO., MILWAUKEE—Had special rolled steel flasks on exhibition, these being demonstrated by I. R. Smith and H. G. Mindrum.

SOLVAY PROCESS CO., DETROIT—This coke is made by the Solvay process at Detroit, Chicago and Milwaukee. The selling agents are Baird & West, Detroit and Picards, Brown & Co., Chicago and Milwaukee. They were represented by G. A. T. Long, J. A. Golligan, B. T. Bacon, Edward R. Stoughton. The booth was artistically decorated with palms and flags with a background wall of Solvay coke.

TABOR MFG. CO., PHILADELPHIA—Received the cup for having, in the opinion of the committee the best exhibit in motion. Standard squeezing machines both power and hand, were shown in operation. The shockless jarring machines received a great deal of attention. These were described in the February issue. It is essentially a sand-packing machine capable of ramming any mold in short time. John T. Ramsden, C. W. Coleman, J. H. Coleman, C. H. Ellis and Wilfred Lewis were in attendance.

UNITED STATES GRAPHITE CO., SAGINAW, MICH.—Made their room a rest room. Their specialties is plumbago foundry facings. In attendance were H. C. Woodruff, Frank B. Godard, J. G. Drought and R. A. Corrigan. These gentlemen supplied the visiting ladies with carnations.

WHITEHEAD BROS. CO., NEW YORK—Had an office in the main building, deal in foundry supplies.

J. B. WISE, WATERTOWN—Showed in operation the "M.R.V." brass melting tilting crucible furnace, permanent crucible, using coke as fuel.

WALTER McLEOD & CO., CINCINNATI, OHIO—Buckeye and blast machines both pressure and suction types, compressed air sprayers, babbitt and lead portable melting furnaces, oil burners for cupola lighting, skin drying molds, brazing, etc., were shown. They were represented by the Obermayer Co.

WHITING FOUNDRY EQUIPMENT CO., HARVEY, ILL.—Had a large centre stand to which were attached frames containing photographs of the various foundry plants they have installed and equipment they manufacture. These include cupolas, tumblers, ladles, elevators, air hoists, sand sifters, brass furnaces, turntables, trucks, core ovens, electric traveling cranes, etc. They were represented by C. A. Hardy, P. A. Dratz, R. H. Bourne, F. A. Rundle, Crad Hughes, T. S. Hammond and W. Mayor. The Dominion Foundry Supply Co., Montreal and Toronto are Canadian agents and Mr. Weaver, of this company was in attendance at the convention.

HERE IS A SPLENDID

Sensitive Column Drill

For drilling holes up to 5/16 of an inch it gives remarkable satisfaction. The spindle has two speeds and is driven by a 1" flat belt. It is relieved of all belt strain, is counterbalanced and provided with means for taking up wear. As the column is graduated by a vertical line its full length, the centre of the table may be set in line with the spindle at any point of vertical adjustment. A cup centre is furnished with each machine as a substitute for the table in centreing small work. *Write for Circular and Price.*

pattern storage, three storey building, 50' x 40'; foundry, 215' x 70'; engine gang structural shop, 192' x 50'; blacksmith shop, 154' x 70'; iron storage building, 128' x 100'; shear shop, 100' x 32'; transformer station, 14' x 12'; cupola house, 52' x 32'. Besides twelve new structures, either separate buildings or additions, three large new warehouses will be erected at Brandon, Saskatoon and Calgary. The large warehouse at Regina will also be added to, making in all practically sixteen new buildings to be put up this year by the Cockshutt concern.

BRIDGEBURG.—The Norcross Marble Co., and Monitor Harrow Co., are looking for sights here.

GUELPH.—The Chapman Double Ball Bearing Co., Toronto, were given an order from the Taylor Forbes Co., for the fitting of their entire plant with double ball bearings.

HESPELER, ONT.—The Chapman Double Ball Bearing Co., Toronto, are equipping the balance of the R. Forbes Co. plant with double ball bearings. About four years ago one department was equipped and gave good service.

NELSON, B.C.—The Nelson Iron Works, has taken over the business and stock of the Rossland Engineering Works, Rossland B.C., and will succeed that company as British Columbia agents for the Sullivan Machinery Co., Chicago.

OSHAWA.—Fittings, Limited, have purchased the adjoining property and will extend. Their annual pay roll is now over one million dollars.

OSHAWA.—The McLaughlin Carriage Co., have let the contract for a 300 ft. extension to their automobile department. Geo. McLaughlin reports that they require 2,500 h.p. at once and in a short time more will be needed. They have bought 43 acres near their present property.

PORT ARTHUR.—Recognizing the increase in shipping at the head of the Great Lakes, the Western Dry Dock & Shipbuilding Co. now have under construction a $1,250,000 dry dock and shipbuilding plant. This will be capable of handling the largest boats at present on the lakes, and the keels for two 600-foot freighters are expected to be laid as soon as the plant is far enough advanced for same.

This work will entail a large amount of machinery, as there will be a complete boiler shop, rolling and punching shops, pattern shop and foundry. It will employ at least 500 hands when in complete operation. At the present moment about 200 men are on the ground on the construction work.

TORONTO.—It is announced that the head offices of the Ontario Iron and Steel Co. and the Page-Hersey Tube Works will be moved from here to Welland and will be located along with the factories at that place. A fine brick office is being erected.

WINDSOR.—The council has voted to sell the Regal Motor Co., Detroit, sufficient ground now owned by the municipality to enable a good-sized factory to be erected, with provision for future growth.

WINDSOR.—The Paterson Automobile Co., of Flint, Mich, has purchased ground in Windsor, and will establish a Canadian branch. The buildings now on the property will be remodeled at once, and work started under the supervision of T. G. Ferris.

Industrial Notes.

BRANTFORD.—Austen Bros., who have been carrying on a pattern-making business, are forming the Austen Bros. Stove Co., to manufacture a new stove patented by them.

BRANTFORD.—The Brantford Emery Wheel Co., are extending their lines by taking up the manufacture of vitrified emery wheels as well as the silicate wheel they have been manufacturing for some time.

Ker & Goodwin
Brantford, Canada

chine Works here, with a capital stock of $59,000. They will carry on a general engineering, foundry and machine business.

AMHERST, N. S.—Fire gutted the works of the Malleable Iron Co. The building is brick and is 200 feet long by 60 feet wide. In the past six months the works have been fully occupied, employing one hundred men, making the malleable castings for the car works at Amherst and in Montreal.

BRANTFORD.—Brantford Scale Co., Ltd., is applying for a $40,000 charter to manufacture scales. M. Herod, of Herod & Co., is the promoter.

CHATHAM.—The Anhut Motor Car Co., Detroit and Chatham, will in July commence the manufacture at their branch here, of cars for next year's Canadian trade.

GRIMSBY.—The Hall Zryd Foundry Co. will build a new foundry, if the town grants them the loan they ask for.

HAMILTON.—The National Fireproofing Co., of Canada, will locate in Canada, with headquarters at this place, where 125 acres of land have been secured, on which a plant will be erected to cost $1,000,000.

HAMILTON.—The International Harvester Co. of America and the Oliver Chilled Plow Co. of Canada, both Hamilton firms, have completed an arrangement whereby the International will handle the entire sale of the Oliver company.

HAMILTON.—The following local companies will either build or make additions to their plants and factories at that place: The International Harvester Co., additions, $500,000; E. T. Wright Co., $11,000; Canadian Westinghouse Co., $35,000; Sawyer-Massey Co., $11,000; Chipman-Holton Co., $8,000; Princess Underwear Co., $3,000.

LONDON.—Wortman & Ward's had a $30,000 fire. The destroyed shops will be rebuilt at once.

LONDON.—The Labatt Mfg. Co., have taken up brass molding, the organisation for which is now progressing.

MONTREAL.—Plans have been filed at Ottawa, by F. Orr Lewis, president of Lewis Bros., Montreal, Canadian agents of Vickers, Sons & Maxim, for a $2,500,000 shipbuilding and ship repairing plant to be built by this English firm in Montreal. It will be located on the shore of the St. Lawrence, near Longue Pointe, and will include a floating dry dock, three large berths for the repairing and building of steel vessels, machine shops and plant capable of doing the heaviest construction work.

MORRISBURG.—The Morrisburg Tack Mfg. Co. have now a new board of directors, composed of Andrew Broder, H. H. Bradfield, W. H. McGannon, William Eager and C. B. Russell. Those retiring from the board were George N. Hickey, J. H. Mullin and Irwin Hilliard. At a meeting of the directors William Eager was elected president, H. H. Bradfield, secretary, C. B. Russell, managing director.

NEW GLASGOW.—Two new buildings costing $100,000 will be erected at this place by the Nova Scotia Steel Co., in the near future. It is expected that the company will install machinery for the turning out of products other than those now manufactured.

NEW WESTMINSTER.—It is stated that large car building shops will be established on this coast by the C.N.R. and that the site will likely be opposite the mills of the Fraser River Lumber Co.

NORTH SYDNEY, N. S.—The machine shops and forge of R. Musgrave & Sons were destroyed by fire. Loss, about $20,000.

OSHAWA.—The McLaughlin Carriage Co., contemplate a large addition to their works to cope with the tremendous demands for the McLaughlin-Buick automobiles.

PETERBORO.—A new machine shop will be erected at the Canadian General Electric Works, estimated cost about $100,000.

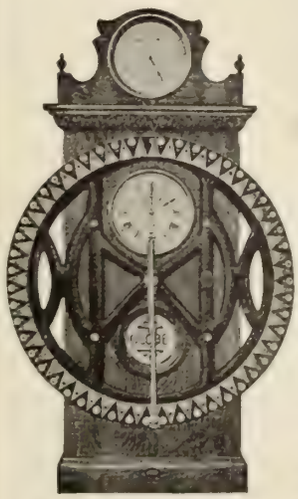
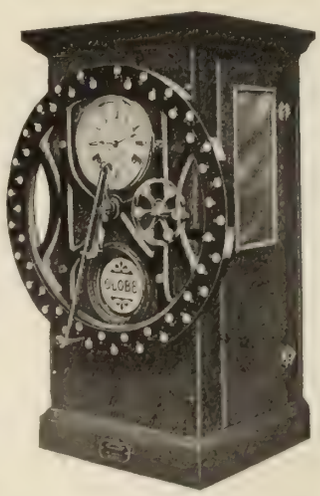
"GLOBE" TIME RECORDERS



are made in Canada by expert mechanics. They are accurate, simple in construction, strong, and of good chaste appearance. They will record with absolute accuracy the arrival and departure of your employees (TO THE MINUTE), making you pay for what you get and no more. All lates and short time marked in red, regular time in green. The small cut at the top illustrates the WEEKLY MODEL, an entirely automatic recorder requiring no attention whatever during the week, as all changes, etc., occur automatically (DONE BY CLOCK WORK). The DAILY MODEL is shown in the cut at the bottom. This recorder is being used mostly in large shops, etc., where a large number of hands are employed. With the "GLOBE" TIME RECORDERS only one operation is required as against five with most others.

Inspection may be made through the glass sides of the case, but tampering with records is impossible, no danger of having soiled, torn or lost records when same are unfavorable, as is the case with all CARD CLOCKS. We are now manufacturing over 224 DIFFERENT TIME RECORDING CLOCKS, and are in a position to meet the requirements of any business. Write us about your needs and let us suggest what will best meet with your requirements. WE SOLICIT YOUR ENQUIRY.



W. A. WOOD, Manufacturer

Head Office and Factory: 40 St. George St., Montreal

Branch Offices:
19 Bleury St., Montreal 65-67 Victoria St., Toronto

REDCLIFFE, ALTA.—N. H. Bolton, of Minneapolis, will build a foundry and machine shop here.

SAULT STE. MARIE.—The entire plant of the Northern Foundry and Machine Co., comprising the machine shop, foundry, and moulding department, was destroyed by fire. It was the largest of the independent industries in the city, employing from 25 to 50 hands. The loss is about $30,000, mostly covered by insurance.

SASKATOON.—The Saskatoon Machine and Foundry Co., made their first blast early in June. Everything in the line of cast iron will be made. Brass molding will also be carried on extensively.

PETERBORO.—The Peterboro Lock Co. are making a large addition to their factory and the equipment is also being added to by several new presses. The offices have been remodelled and many new designs of locks are being added to the company's output.

ST. CATHARINES.—The Russell Machine Co., which was burnt out by a recent fire, has rebuilt. Since the fire their business has increased considerably. They intend taking up the manufacture of special appliances in the near future.

ST. CATHARINES.—The St. Catharines Brass Works which suffered a complete loss by fire recently have rebuilt their plant.

ST. CATHARINES.—The John Deer Plow Co. contemplate locating their Canadian branch at this place.

STRATFORD.—The plant of the Ontario Brass and Copper Co., which has been doing business at 491 King St. West, Toronto, has been purchased by the Crown Electric Co., of this city, and will be removed here as soon as the local factory is ready.

VANCOUVER.—The machine shop owned by Twohey & Turpin was totally destroyed by fire on June 16.

WELLAND.—The head offices of the Ontario Iron and Steel Co., and the Page-Hersey Tube Works, are to be moved from Toronto to Welland, where the factories are now located. A new brick office building is under erection for the office staff of twenty who will go to Welland.

WELLAND.—The Electro-Steel Co., will build a plant here.

WINNIPEG.—Permits were issued to the Canadian Pacific Railway Company for new car shops at $65,000.

WINNIPEG.—The McClary Mfg. Co. have purchased additional property to the extent of 100 feet to 150 feet at the rear of their warehouse on which a temporary storage shed will be erected at once. The company intend building a large warehouse in connection with the present building in the course of a few years.

Municipal Enterprises.

LA TUQUE, QUE.—The council here will call for tenders for the construction of a waterworks system. Estimated cost, $300,000.

NEW WESTMINSTER.—Tenders will be received here for the laying of about 14 miles of 25-inch riveted steel water mains and about 7,780 feet of 12-inch and 7,500 feet of 13-inch lap-welded pipe.

POINT GREY, B. C.—The council are considering projects for an appropriation of $500,000 to cover the cost of reservoir and site and the laying of mains. A by-law for $250,000 will also be introduced for sewerage works.

TORONTO.—Chipman & Power, of this city, have been engaged as designing and superintending engineers in connection with the proposed waterworks and sewerage systems at Dauphin, Man.

ST. JOHN, N. B.—City Engineer Murdoch, has estimated the cost of a new incinerator plant from $50,000 to $100,000.

WELLAND.—The Water Commissioners have recommended to council the submitting of a by-law to raise for waterworks improvements $60,000.

Electrical Notes.

BROCKVILLE.—In accordance with the by-law recently passed by the ratepayers providing for an expenditure of $50,000 for improvements and extensions to the light and power plant, the commissioners have awarded tenders for two new steam engines and electrical equipment. Lawrie & Lamb, Montreal, were awarded the contract for the steam engines, and Kilmer, Pullen & Burnham, Toronto, will supply the electric equipment.

CALGARY.—Plans are being prepared for a power plant to cost $80,000.

CALGARY.—The ratepayers carried the $70,000 electric light plant extension by-law.

CARGILL, ONT.—The power house was burned early in June.

CALGARY.—Tenders will be received until July 12 for one 750 B.H.P. engine, 300 r.p.m., with condensor; also one 600 k.w.d.c. 600 volt generator switchboard, etc. H. E. Gillis city clerk.

DAUPHIN, MAN.—The $11,000 by-law for electric light purposes was carried.

FARNHAM.—The ratepayers have approved of a by-law to raise $100,000 for the erection of a dam and for general power development work.

FORT FRANCES, ONT.—The Minnesota & Ontario Power Co. have been granted a right by the Dominion Government to export 3,500 horsepower, or half of the total now developed.

MONTREAL.—The General Electric Co., of Sweden, have been awarded the contract for electrical equipment required for the Jacobs Building sub-station of the Dominion Light, Heat & Power Co. One 150 h.p. motor generator set and one 350 k.w. engine type generator will be installed.

MONTREAL.—The Canadian Westinghouse Co. have secured the contract from the Quebec Railway, Light, Heat & Power Co. for this season's transformer requirements. Also for 25,000 volt lightning arresters, disconnecting switches and choke coils.

INGERSOLL.—Two by-laws were carried, one to raise $39,800 to acquire the plant of the Ingersoll Power & Light Co. and the other to raise $15,000 to make improvements and extensions to plant.

MONCTON, N.B.—The agreement prepared by the city council with the Street Railway Electric & Gas Co. for the leasing of the city lighting plant for thirty-nine years was endorsed by the ratepayers.

PETERBORO.—The Peterboro Light & Power Co. will erect a power house at Auburn to cost about $150,000.

POINT GREY, B.C.—The B.C.E.R. agrees to supply this municipality with light for ten years. Five hundred electric lights will be installed.

PORT ARTHUR.—The by-law for $10,000 for extension of the electric lighting system was carried.

SASKATOON.—The Saskatchewan Power Co. will build a generating plant 12 miles below this city at an estimated cost of $1,000,000.

STAVE LAKE, B.C.—The Western Canada Power Co. have a large gang of men employed on the construction of the power plant and lines leading to it.

TORONTO.—The Electric Light Co. have made the following proposal to the city, in the utilization by the city of Hydro-Electric power: The city shall have the joint use of the company's poles and conduits at a rental that will meet the interest, maintenance and depreciation of the poles and conduits. The city may take over the lighting of the streets and civic property irrespective of any contract with the company. The city and company are to supply each other with electric energy in case of emergency at a rate to be agreed upon.

WINDSOR.—The citizens by a vote of 622 to 620 decided to allow the Electric Distributing Co. franchise.

Borden-Canadian Co.

Richmond St. East, Toronto, Ont.

I. Fenton, insurance manager, are applying for incorporation as the Wilson Box Co., to carry on the manufacture of wooden boxes, barrels, etc., in Milford, St. John county. The capital stock of the company is $50,000.

SOUTH MAITLAND, N.S.—The mills of the Anthony Lumber Co. were destroyed by fire last month. Total loss, $90,000.

TORONTO.—Scholey Bros., lumber and planing, was gutted by fire early in June.

General Manufacturing News.

ALBERNI, B. C.—The Barclay Sound Cedar Co. will build a large timber mill at this place.

CHATHAM.—Wm. Gray & Sons have purchased the property latterly occupied by the Modern Malleable Range Co. The Gray company will carry on the manufacture of automobile bodies and tops in the new premises.

LONDON.—The London Concrete Machinery Co. will enlarge their plant.

LONDON.—A factory to manufacture automobile bodies and assemble the parts is under consideration by Fred. Mitchell, who has a garage here.

MONTREAL.—The Holland Varnish Co. are erecting a factory here to cost $20,000.

MONTREAL.—The Kingsbury Footwear Co. will erect a factory double the proportion of their present plant.

MONTREAL.—The merger of five large rubber companies is announced—the Walpole Rubber Company, of Granby, Quebec, the Massachusetts Chemical Co., the Walpole Shoe Supply Works, and the Walpole Varnish Works, Walpole, and the Valveless Inner Tube Co., of New York.

NEW WESTMINSTER.—The National Paper Mills, of Vancouver, purpose erecting a plant near here for the manufacture of pulp and paper.

OWEN SOUND.—A syndicate of English capitalists will construct a million dollar shipbuilding and repair plant and two dry docks at this place.

OTTAWA.—The National Bag and Paper Co. will build a factory here capable of turning out 1,000,000 paper bags daily. Work on the new factory will be started at once.

PARIS, ONT.—Tate Bros., have secured the contract for the big $50,000 extension to the Penman mills at this place.

PORT COLBORNE.—David Dick & Sons, of Welland, have the contract lor building the International Cork Factory to be erected here. Cost about $40,000.

VANCOUVER.—A permit has been issued for the erection of the plant for the Pacific Pressed Brick Co., at a cost of $70,000.

VICTORIA.—The Warswick Asphalt Pavement Co. will erect a plant at this place, to cost $40,000.

VANCOUVER.—The Stegar Silica Brick Co. will build a large plant here.

VANCOUVER.—Col. W. B. Dickey will build a $70,000 brick plant here.

WELLAND.—The Canadian New Way Motor Co. will locate here. This company is a branch of the New Way Motor Co., of Lansing, Mich. It will manufacture air-cooled gas and gasolene engines, and will employ one hundred men.

Canadian Plant for Michigan Stamping Company.

Articles of incorporation have been filed for a new company to be known as the Dominion Stamping Co., with an authorized capital of $100,000 of which $60,000 has been paid in.

It is the intention of the company to purchase a large tract in Walkerville, Ont., and erect a substantial brick factory building in which they intend to manufacture general automobile stampings, including hoods, tanks, fenders, etc., also a large line of stove parts as well as cater to general stamping and machine work.

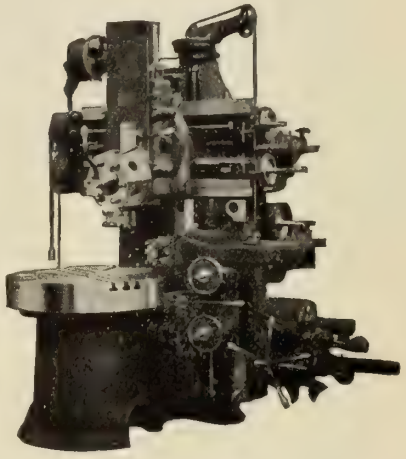
The principal stock holders are :—Henry P. Cope, John H. French, Geo. S. French, Fred.

A Constant-Speed Drive

A fundamental underlying principle of a constant-speed drive and the mechanically obtained speed changes incident thereto is convenience.

Any machine so designed as to entail the absolute stoppage of the driving pulley, as well as the machine in order to change speeds by the shifting of a tumbler gear or engagement of a positive clutch does not in any way meet the requirements of the case.

Friction back gears are, comparatively, an advantage, but the quick change so obtained is too great. Quick speed changes should have but a slight increment from one to another, in order that the surface speed of the work may be readily and properly accommodated to the capacity of the cutting tool.



A perfect constant-speed drive is one of the many features incorporated in the VERTICAL TURRET LATHE which tend to make it such a remarkable machine for rapid production of absolutely perfect work.

This feature is only one of the many incorporated in the VERTICAL TURRET LATHE which is fully illustrated in catalog C-15, which is free for the asking.

The Bullard MachineTool Co.
Bridgeport, Conn., U.S.A.

J. Armstrong, Peter B. Luyster, Milton T. Watson, Robert Houghton and Walter F. Tant, all of Detroit; Benj. W. Valet, of Ironwood, Mich.; and Chas. J. Albert Montreuil, of Walkerville.

Reid Co., St. John's, Newfoundland.

The Reid Co., St. Johns, Newfoundland, are planning to erect a commodious and up to date foundry and machine shop in connection with their dry docks and works. The new building will be fitted with the most modern machine tools and machine shop foundry equipment.

Up to the present the company have not been making their own castings but they intend going extensively into that line and build engines and cars for their railroad. The Reid drydock is 640 feet long and here the company's fleet is kept in repair. Reid steamships ply along the Labrador and Newfoundland coast and they have also a line running to Sidney, N.S.—D.W.

G. T. R. Order Equipment.

In addition to the 1,000 steel frame box cars, 500 automobile cars and 10 passenger engines, the G.T.R. has placed orders for $2,000,000 worth of equipment. Included in the new order, are 15 Richmond freight engines, 25 mogul locomotives, 1,000 hopper bottom coal cars and 500 steel frame freight cars. The order for cars, has been placed with the Canada Car Co., Montreal, Sillker Car Co., Halifax, and G.T.R. shops, Point St. Charles.

Machine Tools for C. N. R.

The Canadian Northern Railway, Winnipeg, are in the market for a list of tools as follows:

One 6-foot radial drill.
Three 30-inch upright drill presses.
One 250-ton 42-inch car wheel hydraulic press.
One 24-inch by 12-foot double back geared engine lathe.
One 30-inch by 14-foot double back geared engine lathe.
One 30-inch turret head vertical boring mill.
Three 10-inch screw cutting bolt lathes.
One Rockover grate molding machine.
One power hack saw.
Three emery wheel stands.
One oil flanging furnace for handling boiler plates.
One 14-inch upright slotting machine.
One 18-inch brass finishers' lathe.
One 42-inch car wheel boring machine.
One 36-inch by 36-inch by 10-foot double head iron planer.
One punch and shears.
One 800 pound steam hammer.
One 1-inch to 4-inch pipe threading machine.
One set of plate rolls.
One 24-inch by 12-foot engine lathe.
One 24-inch upright iron shaper.
One 24-inch by 36-inch by 14-foot gas engine lathe.

BROWNING CRANES BUCKETS MAGNETS SHOVELS, Etc.

At a large manufacturing plant of any kind, one of these machines can be used with profit for handling coal and other loose material, and or doing all necessary lifting and hauling in the yard.

Let us send you Bulletin with full information.

From Editor to Readers

WE wish to take the readers of Canadian Machinery into our confidence, and we want to be taken into your confidence so that Canadian Machinery may be of most use to you. We want you to "get the habit" of writing us for information, giving criticisms and suggestions, etc. If you desire the address of the manufacturer of any class of machine shop or foundry equipment, we will supply you with the information if you mail us a card containing your request.

Canadian Machinery is now located in its new building on University Ave. The work of moving was a big affair but the five large presses are now working to their full capacity turning out the thousands of MacLean technical and trade newspapers mailed each week. The new building is completely equipped with new composing room furniture, bindery machinery, and there have been additions to the press room equipment to take care of the large growing circulation of our papers.

Canadian Machinery has shared in that growth. The four new circulation men who started on May 1 have sent in new subscribers and with the large circulation staff at work we are covering thoroughly every province in Canada.

West Indies and Newfoundland Circulation

Readers of Canadian Machinery, including regular subscribers and advertisers, will be pleased to know of the success the special representative of the MacLean Publishing Co., David Williams, has been having in the West Indies and Newfoundland. Each week in the West Indies excellent reports were sent in. For several months he travelled through Trinidad, British Guinea, Cuba, Bahamas, Jamaica, etc. His last week's report before leaving for Newfoundland contained thirty-three subscribers obtained in Kingston, Jamaica, for Canadian Machinery.

Mr. Williams has just arrived in Newfoundland but already he is at work, he having sent in twenty during the first week and a half's stay on the island.

Canadian Circulation

We are covering Canada just as thoroughly. Besides covering Western Canada by our regular western circulation staff, we have sent M. Moyer from the Toronto office to assist in covering the western provinces. Mr. Moyer will remain in the west some months.

Editorial Pages

To keep our readers posted we have made an addition to the editorial staff. We will therefore be better able than ever to keep in close touch with machinery development, machine shop practice and business management. The following are a few subjects which will be treated in early issues: Developments in British Machinery and Machine Shop Practice; A Drafting Room System.

Several up-to-date cost systems now in practical operation, cheap power.

Descriptions of several apprenticeship systems, technical schools, etc.

Methods and devices used in railroad shops, automobile shops, agricultural shops, engine and boiler shops, etc.

We have these on hand and our staff is hard at work. We mean to give you a big return for your investment. You can assist us by sending in the subscriptions of your friends who are interested in reading a good mechanical journal.

¶ **Remember**—That Canadian Machinery will keep you posted on all subjects relating to Machine Shop and Foundry Practice. The development in machine tools and the evolution of the machine shop can only be kept pace with by perusing each month your technical paper.

Thor AIR TOOLS

ARE SUPREME

MECHANICALLY AND ECONOMICALLY.

They are easily superior to all others in power, durability, ease of handlin economy of air consumption and general efficiency. THOR TOOLS are simple in construction; they run without vibration, and little attention and repairs are necessary. ADOPTED AS THE STANDARD IN THE PRINCIPAL PLANTS THROUGHOUT THE WORLD.

SENT ON THIRTY DAYS' TRIAL—express charges paid both ways if unsatisfactory. WRITE FOR DESCRIPTIVE MATTER.

Made in 50 different sizes, covering every possible Air Tool requirement.

STRETCHING THINGS

I am mighty careful not to stretch the facts in these publicity efforts.

You see, I base all my statements from information received from practical foundrymen, who know the subject.

I have reports from more than fifty progressive Foundrymen who say my KING KORE KOMPOUND is a new era in economy, in investment of money, in time-saving and in saving of castings. If there is now any one whose detail differs from the majority, I make it to fit his case.

It's the same way with GENUINE EAST INDIA PLUMBAGO, the only Lead any foundryman can afford to use.

With the Core Compound goes STEVENS' CARBON BLACKING, the ideal core-wash; there is no trouble, when making hollow castings, with this combination.

I manufaoture FOUNDRY FACINGS, FOUNDRY SUPPLIES, BUFFING COMPOSITIONS and PLATERS' SUPPLIES.

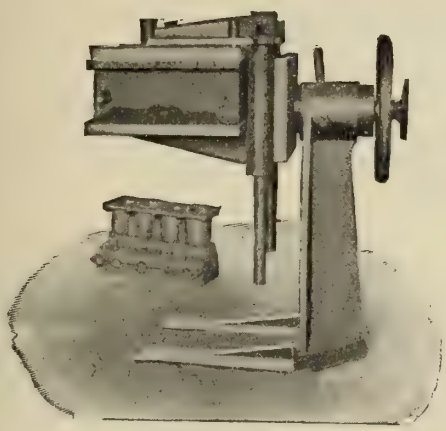
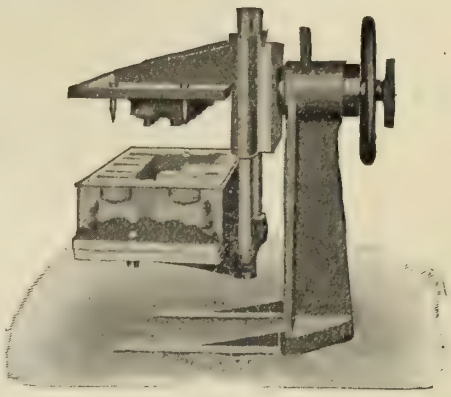
Grimes Roll-Over Molding Machine



No. 1

This is a simple, standard machine, requiring small floor space.

It is perfectly balanced, requiring no counter-balancing mechanism as centre of gravity is centre of rotation.



No. 2

By means of small hand wheel shown in cut, one man can turn largest flask smoothly and without jerk.

Pattern is drawn by absolutely straight gravity drop.

This machine is adjustable for deep flasks and can readily take care of flask 24 in. x 36 in. and 4 to 12 in. in depth, with maximum pattern draft of 12 in.

Positive adjustable pins at four corners of clamping device, Fig 2, compensates for unevenness of floor boards.

PRICE, f.o.b. cars Windsor, $125.00

HIGH GRADE CASTINGS are not made with low grade materials. Think this over over when you see a poorly finished casting in your cleaning room, and remember if you please if you wish to place the pattern in the high grade class our No. 48 Plumbago will do it, also that the saving in cleaning room expense would pay for three times the necessary No. 48 Plumbago to have made it high grade.

Another vital point is that you have a core wash which will peel clean and not run before the metal. Try our Eureka Blacking, the best core wash on the market.

THE "KING" FUEL OIL FURNACE

This space has heretofore been used to give you our opinion of the merits of our furnaces. Now we will, from time to time, print extracts of letters of recommendation received from some of our customers, and no doubt this will help to convince the skeptical.

March 22nd, 1910.

Messrs. Francis Hyde & Co.,
Montreal, Que.

Dear Sirs:—

We have discussed very freely the question of heating steel with oil as fuel, with your Mr. Jacobs.

At the present time, our cost for heating with oil is entirely too high—so high, in fact, that, if we cannot get it lowered, we will have to change back to the coal burning furnace. However, we think that your burners are showing the best results of any of the three which we are using, and we made the following proposition to your Mr. Jacobs, viz.—

We will purchase two (2) burners from you, you agreeing that, if we can not get them to give us a fuel cost of $1.10 per ton, we will have the privilege of returning them to you, we paying the freight both ways, but if your burners will give us the heating at this cost, we cannot see any reason why we would not install them in our oil heating furnaces.

On receipt of this letter kindly let us hear from you as soon as possible, as this matter is very important to us at the present time.

This letter was received from a manufacturing concern, which controls its own coal mines, therefore the recommendation is all the stronger.

You will notice that mention is made of three other burners which were tested at the same time. You know that, with the exception of our own, there are none manufactured in Canada, therefore they were the pick of the appliances manufactured in the United States.

Needless to say we supplied the burners and same were paid for the early part of May, and in previous advice received, we were told that the cost of heating was considerably less than they had anticipated.

P.S.—We also Manufacture Foundry Equipment and Supplies and Request Your Enquiries.

Francis Hyde & Company

Montreal, Que.

OIL DRILLS

as made by the

Morse Twist Drill & Machine Co.

New Bedford, Mass., U.S.A.

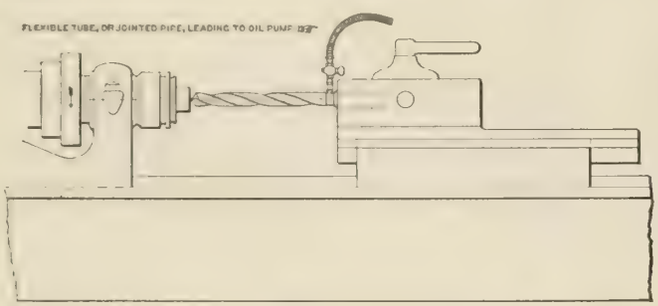
This method of conveying lubricants to the point of a drill or cutting tool was exhibited by the Morse Twist Drill & Machine Company at the World's Fair at Chicago in 1893, the drills then exhibited being duplicates of some made during the two previous years. The "American Machinist" and "Iron Age" in the year 1893 illustrated and explained this style of tool.

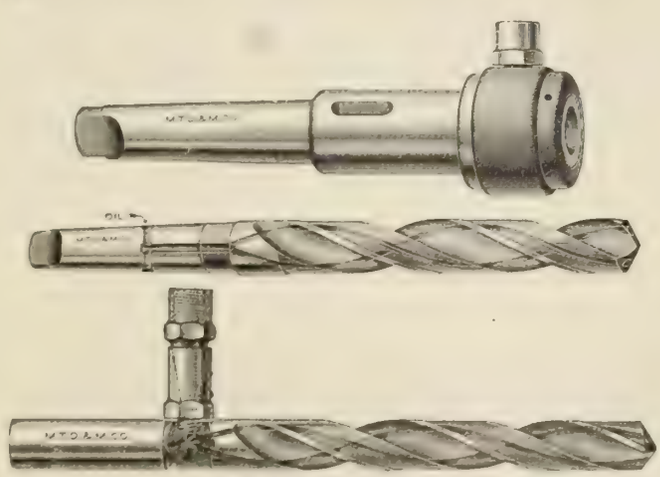
Various devices have been used to convey the lubricant to the points, the early methods providing for an inserted tube. The latest improvements, however, provide holes through the solid metal, drills of this style being made SOLELY by this Company under patents owned by it. All oil drills 2½ inches and smaller in diameter have holes through the solid metal, while with sizes larger than 2½ inches it has been found advisable to continue the use of the inserted copper tube.

INFORMATION AS TO USE OF DRILLS

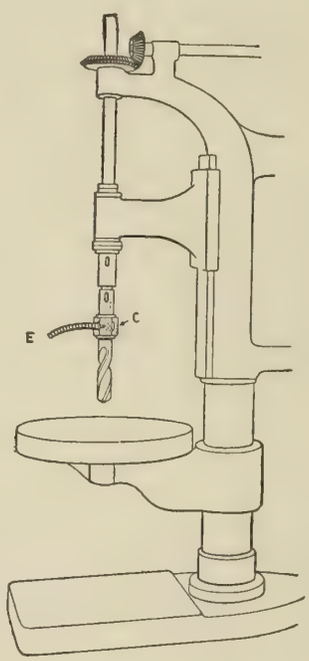
WITH HOLES FOR LUBRICANTS.

Cut, showing a Drill with Oil Holes as used in a Turret Lathe. The Drills are furnished with Straight or Taper Shanks, as desired.



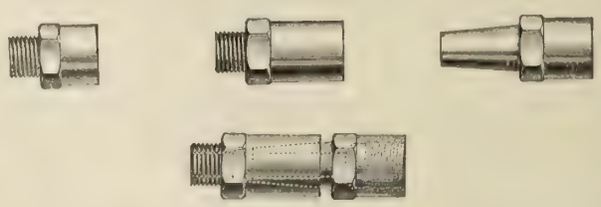


This style of drill, 15/32 and smaller, are furnished with one oil hole only. They can be furnished with two if ordered, but at customer's risk.



Cut, showing method of supplying a Drill with Oil, the Drill revolving.

A flexible tube *E* conveys oil from the oil pump to chuck *C*, which admits of passage of oil to the point of the Drill.



CUPS FOR USE IN OIL DRILLS.

Our goods are handled by Rice Lewis & Son, Limited, Toronto. Aikenhead Hardware Co., Limited, Toronto. Frothingham & Workman, Montreal. Mechanics Supply Co., Quebec.

What are your *Twisted off Tangs* costing you

An important Shop economy

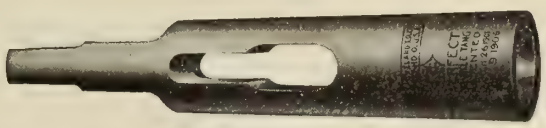
The drill expense is one of the biggest items of tool expense that the machine shop has to bear. Go around through your shop and count up the number of drills with their tangs twisted off. The rest of the drill is just as good as new, but that lost tang makes it *useless*.

You ask the foreman why he doesn't do something with these. He will answer that the shop has been so busy that they had not had the time to fuss with them.

Is this Economy?

The "Perfect" Double Tang Sleeve

PAT. MARCH 1901, OCT. 1906.



Is a *simple* and *inexpensive* means of putting these drills back into commission. Simply grind on a new tang below the old one and set it to work. The combination is fifty per cent. stronger than the original drive.

Don't look for trouble

by using tools of inferior make! First class mechanics recommend and use

BUTTERFIELD

Taps, Dies and Reamers

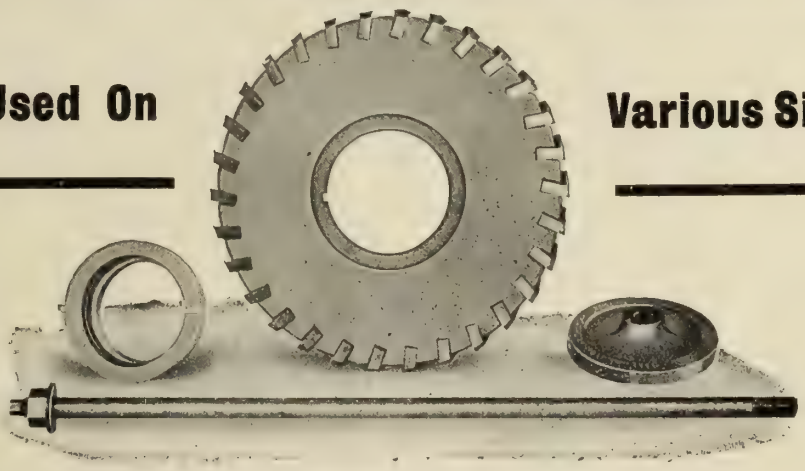
because they are honestly made, perfectly tested and tempered, well finished and accurate.

Send for catalogue.

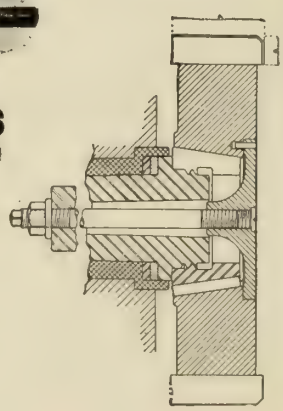
BUTTERFIELD & CO.
ROCK ISLAND,
QUEBEC

They Can Be Used On **Various Sized Spindles**

They Economize Time



They Economize Expense



B & S Inserted Tooth Face Milling Cutters

Because the cutters can be used interchangeably on machines of different sized spindles, they save time and expense that would be incurred waiting for special cutters to be made to fit different machines.

Special sleeves that fit the hole in the cutter, but with different internal diameters, make possible this interchangeability.

SEND FOR NEW CIRCULAR, JUST ISSUED.

THE RAILROAD CITY OF THE PROVINCE

¶ Can offer manufacturers who contemplate the establishment of manufacturing industries unexcelled railroad facilities. The systems reach every part of the American continent. ¶ We can give you cheap Hydro-Electric power, light, etc. ¶ We have a good lake port at our door and within one hundred miles of the coal regions of Pennsylvania. ¶ We have good roads, schools, waterworks, gas, electric street cars, etc., and we are situated in the midst of the finest farming, fruit and dairying district in Canada. ¶ Get in touch with us and we will meet you fairly.

They Cut Fastest and Best

They Wear True and Last Longest

New Sectional Emery Wheel

is the first grinding wheel to be made in Canada containing alternate sections of emery and corundum. The great advantage of this construction for a large class of work has been very amply demonstrated.

In grinding large work a soft wheel loses its shape too quickly, causing inaccurate work; if the wheel is hard enough to hold its diameter it glazes and clatters the work; but our new Sectional Wheel, having alternate sections of emery and corundum, prevents both uneven wear and the possibility of the wheel glazing.

With this wheel you never need to use an emery dresser. It can be used on any grinding machinery. Same price as ordinary emery wheels.

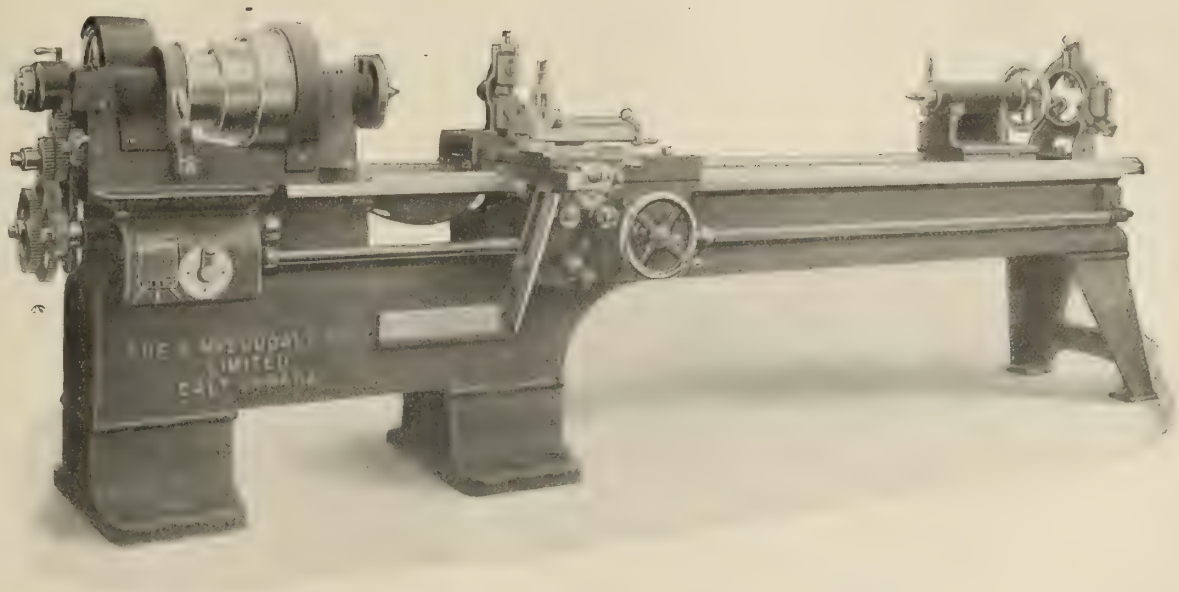
MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe-Screwing Machines



GAP LATHES—16, 18, 20, 24," in any length of Bed.

A Gap Lathe for a Jobbing Shop is an almost absolute necessary Machine Tool.

The improvements embodied in our Lathes made for absolute solidity and steadiness of cut.

The Brace under Carriage allows Gap diameters to be turned at High Speeds with resultant work as good as can be done on an Engine Lathe of large swing.

Double Back Gears give a range of Spindle Speeds which are all found useful.

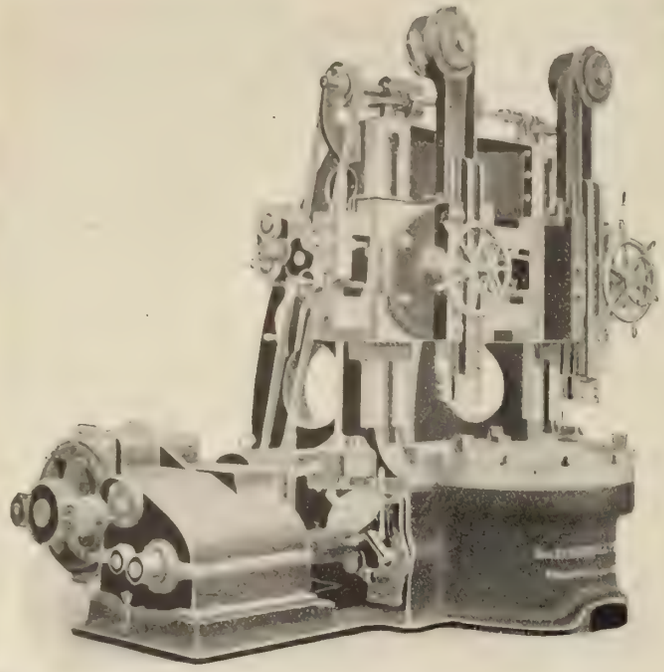
Our extra large belt surfaces, combined with specially heavy spindles, ensure highest efficiency both in quantity and quality of work

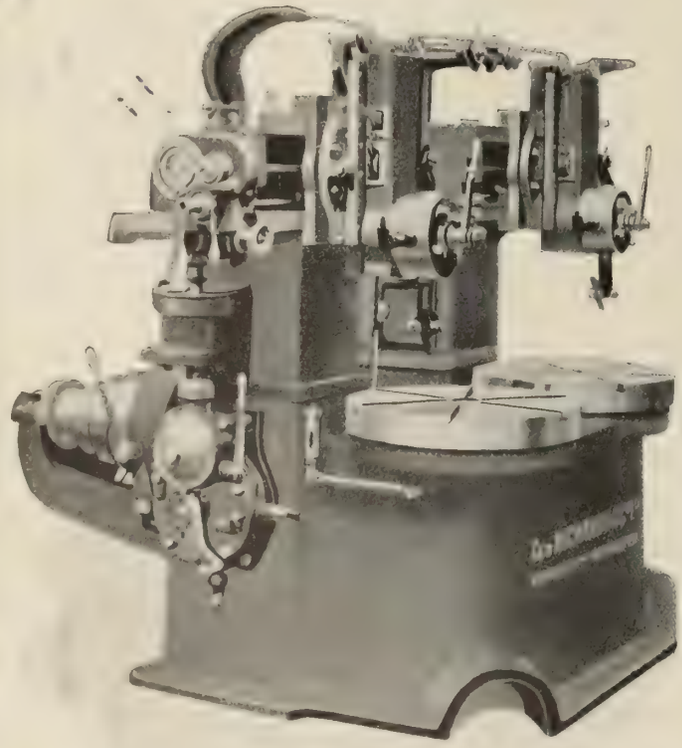
We invite the closest scrutiny of materials, workmanship and finish, and have adapted Highest Quality as standard from which we will not deviate.

Particulars, yours for the asking.

The R. McDougall Co., Limited

The Canadian Fairbanks Co., Sales Agents. GALT, CANADA





Vertical Boring Mills

Manufactured by George Richards & Co. Broadheath, Manchester, England

48" Boring and Turning Mill. Special Heavy Type.

In this machine every part is of massive proportions and the mill has been specially designed for Boring and Turning steel tyres or for dealing with other classes of work from which a large amount of stock in hard material has to be removed in one cut. Net weight of machine about 12 tons. Estimates for machines of this type but of other sizes will be submitted on application.

Duplex Turret Head Boring and Turning Machine

These machines consist of two single turret head boring and turning machines made right and left hand, with the bed cast in one piece. Made in three sizes to admit 14," 26" and 30" respectively. Complete and illustrated catalogues describing these machines will be sent on application.

In addition to the above we carry Horizontal Boring and Turning Mills, Planers, Slotters, Nut and Bolt Making Machinery, Cutting-off Machines, Drilling Machines, High Speed Cold Saws, Engine Lathes, Turret Lathes, Brass Finishers' Lathes and special machinery of every description.

We also carry Velos High Speed Steel and Twist Drills and Special Steel for All Purposes, Pneumatic Tools, Chain Hoists, Woodworking Machinery, etc.

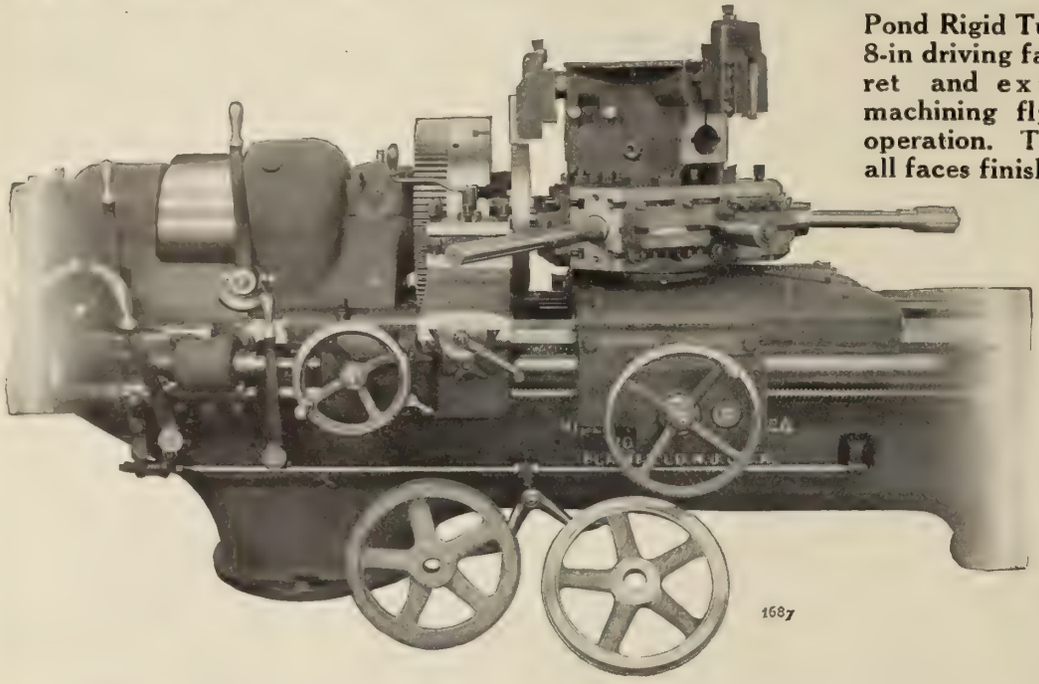
THE IDEAL MACHINE

For Rapid, Heavy Manufacturing

The Pond Rigid Turret Lathe

The Heavy Turret Lathe with Automatic Turret Control



Pond Rigid Turret Lathe with 8-in driving face, showing turret and extension turret machining fly-wheel in one operation. Time 20 minutes, all faces finished.

Particularly adapted for getting out heavy, accurate and interchangeable work in cast iron or steel, either from the chuck or from the bar, at the minimum of time and labor.

The fact that the turret is controlled by power makes possible exceptionally rapid manipulation without overtaxing the operator. It takes the heaviest burden off his shoulders—gives him an opportunity to operate the machine at its maximum capacity—an opportunity to show his record skill day after day without taking the gumption out of him. Relieves him from all unnecessary exertions and promotes good feeling—an all necessary element in time of rush orders.

The Pond Rigid can machine heavier and larger work and with greater accuracy than is generally known to be possible in a turret lathe.

Very efficient on single cylinder gas engines, electric motor frames, fly wheels, gear blanks, globe valves, and similar work.

Takes heavy chuck work up to 28 in. and bar work up to 6 in. in diameter.

Write for the new catalog, the "Pond Rigid." It illustrates numerous economic operations.

Style E - 6 Spindle Drill

LEVER FEED

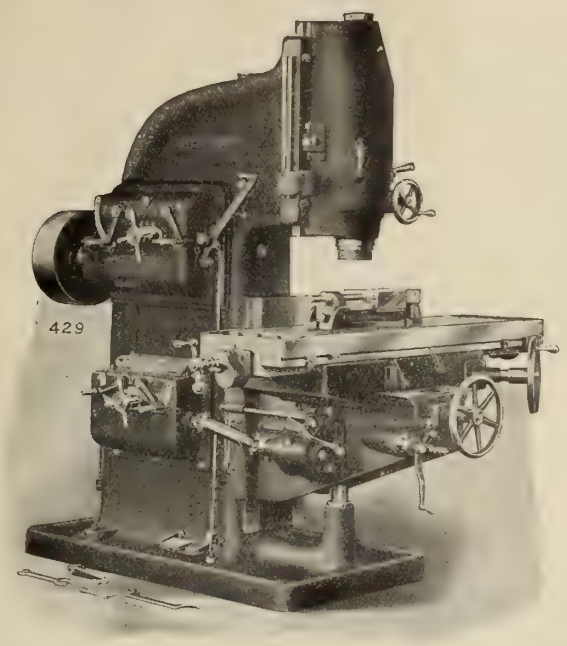
This machine will DRILL up to ¾ in. holes. We furnish power feed, automatic stop and quick return on one or more spindles as required. The style E drilling and tapping machine is adapted to this machine. Style F is the same machine with all power feed. We are offering you the greatest money-making proposition in sensitive drilling and tapping that has ever been presented. Write for information and learn the advantages to be obtained by knowing how.

You cannot afford to miss the opportunity. DRILLING—TAPPING—LEVER FEED—POWER FEED all arranged on one machine to fit your particular case. Do not believe everything that you read but INVESTIGATE.

H. G. BARR, Worcester, Mass., U. S. A.

WILLIAMS & WILSON, Montreal
A. R. WILLIAMS MACHINERY CO., Toronto

High Power Vertical Cincinnati Millers



are made in 3 sizes—28", 34" and 42" table travel, and of 5 h.p., 7½ h.p. and 10 h.p., respectively.

FOUR STYLES of drive, all interchangeable; Torsional vibration eliminated; locked tumbler; treadle for quick speed changing; direct reading feed and speed index; quick pitch feed screws; single plunger trip; feed levers control reverse and always indicate which way the table will move; sight feed oilers. **THE SPINDLE HEAD** is made in large proportions—see illustration; head can be securely bolted to the column when doing heavy milling. **THE DRIVE** is always through the main gear close to the lower bearing. **THE SPINDLE BEARINGS** are always the maximum distance apart.

Because of all these new features these machines have greater cutting capacity than other Verticals of equivalent size.

Ask us for our High Power Miller Catalog,

The Cincinnati Milling Machine Co.

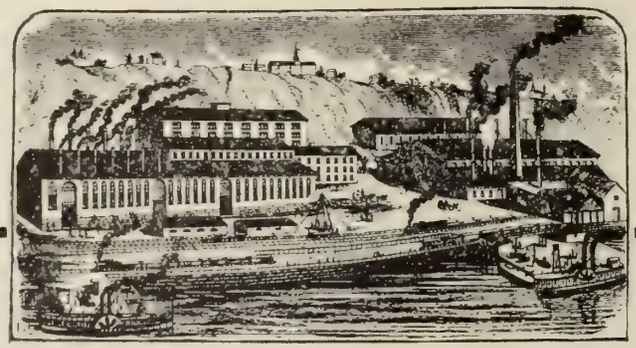
MARINE ENGINAS and PUMPS. SHOE MACHINERY A Specialty



BRASS and IRON CASTINGS. BOILERS and REPAIRS.

That we have exceptional facilities at our disposal for the manufacture of all kinds of Machinery —in addition to our business as Brass and Iron Founders, General Contractors and Shoe Machinery Engineers—has been amply proved this year. In the short space of five months, we built and installed all the Engines and Boilers of the new sister steamers "Levis" and "Lauzon," whose trial trips were a complete success. We make a specialty of all kinds of Marine Engine Work, and shall be glad to quote for first-rate products only.

SHOE MACHINERY. Manufacturers of "Non-Royalty" Machines, Metallic and Goodyear, "Fortuna" Skivers, and "Climax" Presses, Sand-papering, Lasting and Loose Studding Machines.

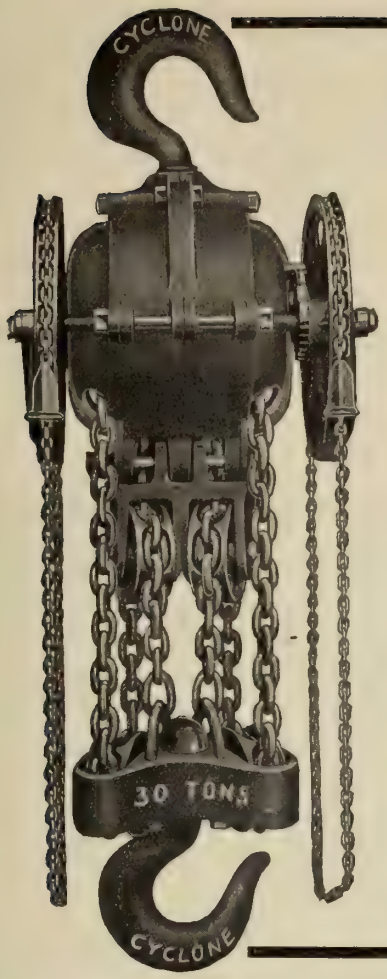
Wire of every description for Slugger and Standard Screw Machines.

The Canadian General & Shoe Machinery Company, Ltd.

ENREST CARON, Managing Director

LEVIS, Quebec

The advertiser would like to know where you saw his advertisement—tell him.



This 30 Ton "CYCLONE"
High Speed Chain Hoist

has but 6 load chains where other hoists of equal or less capacity need 12 and even 24. That is because the CYCLONE eccentric gear is so efficient that with a total pull of only 95 pounds on each hand chain, the full 30 tons can be lifted with only the two pairs of idler sheaves.

This means less dead weight of chain, less friction and quicker hoisting.

There are no overhanging bearings in the CYCLONE, so that even under the full load the frame will not spring and bind the working parts.

The CYCLONE is made in 14 sizes, from ½ to 30 tons capacity. No other hoist is quite so good.

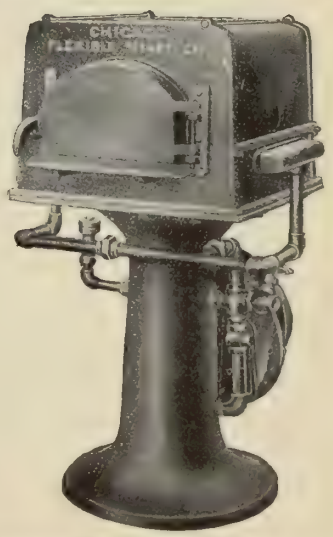
A First Class Oven Furnace

THE STEWART NO. 2 Muffle and Oven Furnace produces results



Its great adaptability makes it the ideal furnace for use in shops where there is a variety of work to be treated.

Very great care has been taken in the designing and construction of this furnace and it is unquestionably the most economically operated furnace of its kind.

SMOOTH-ON

TRADE MARK—REG. U. S. PAT. OFF.

Pump Repaired with Smooth-On Iron Cement No. 1 six years ago, and still in use.

Write for circular showing how work was done.

SMOOTH-ON IRON CEMENT No. 1

is prepared in powdered form—for use mix with water. It is unequalled for stopping leaks of Steam, Water, Fire or Oil, because it becomes metallic iron that has the same expansion and contraction as iron, thus keeping tight at all temperatures. Engineers and Foundrymen use it where a smooth surface and metal-like hardness are desired.

SOLD IN BLUE LABEL CANS

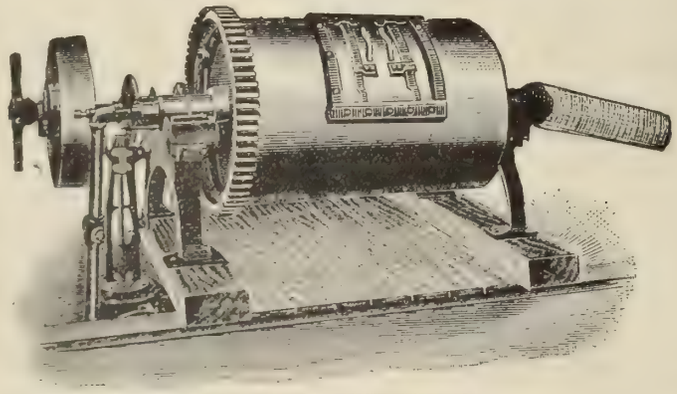
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our ware house in all current sizes, flat, squares and rounds; annealed and unannealed.

Automatic Forging Drop 3,000-lb. Hammer

FOR THE **FORGE SHOP**

Automatic Board Lift Drop Hammers
Hot Trimming Presses with Side Shear

The endurance and effectiveness of Automatic Drops depend in no small degree on a proper ratio between the weight of the base and the weight of the hammer. The additional cost with all parts made of proper proportions is more than compensated for by the larger quantity and better quality of the finished product, and by the comparative freedom from breakdowns obtained from their use.

The hammers are made of steel forgings. The bases are cast in a single piece.

Line of Eleven Patterns with Hammers from 200 lbs. to 3,000 lbs. Trimming Presses of Various Designs.

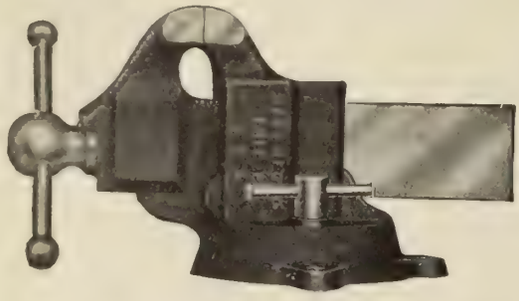
MACHINISTS' SOLID JAW VISE
Swivel Base Type

Hollands Vises and Tools

have been recognized as standard quality for twenty years, and are used exclusively in many of the leading Industrial and Railway Shops in Canada and the United States.

Hollands Manufacturing Co. - Erie, Pa.



STANDS USE OR ABUSE

In the first place, the design was developed by deliberate breaking tests so that we are able to get plenty of metal at the points where it is needed most. Then, too, we give an amount of care and detailed attention to the manufacture of these Vises which would make them cost a lot more money if we did not make them in such large quantities and under specialized methods. Every part is made to limit gauges, and as a general rule these limits provide for variations of not over .001".

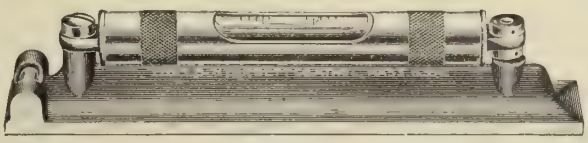
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH

Improved Levels for Testing Shafting, Etc.



In addition to the regular parallel vial, the bases have a cross level which enables one to place or hold the base on a shaft level in its cross section, not canted sidewise; for the shape of a level glass is such that, though true as adjusted on a flat surface, it will not be reliable when canted sidewise. Hence the value of the cross level, not only to test the truth of shafting, but other surfaces which tend to throw the level base into a canting position.

The base of this level has our improved concave running through the length of its base, leaving a flat margin each side, which improves its seat for flat work, while forming an absolutely true and reliable seat for shafting, etc., and it is better than a V groove. Made in 6, 8, 12 and 18 in. sizes, with plain vials and with plain and graduated vials.

Send for Free Catalogue, No. 173, of Fine Mechanical Tools

Goodhue Belts Prevent Shutdowns

BECAUSE

They STRETCH LESS by 15% to 25% than any other leather belts on this market.

This also means that you don't have to pay for belting you can't use, which is represented in the short lengths taken out every time slack is taken up.

These are two points important to a belt buyer and you should consider them when in the market.

Ask us to prove these points to you and if your dealer doesn't stock our belts write us for prices.

Cleveland Technical School

By J. A. Webster, B.S.*

IN the erection of the new Technical High School, and in the working out of a co-related curriculum, technic supplemented with the academic, Cleveland has set the pace so to speak, and many of the other larger cities are making haste and falling into line.

The Cleveland Technical High School is unlike any technical or manual training school, institute, or college in the country. The technical work is made the more prominent feature and this is supplemented or co-related with the academic in such a way that the latter is made to strengthen and assist the technical. Mechanical drawing and mathematics are expressed in practical applications by constructing tools and articles in the machine shop or pattern-making department; freehand drawing finds expression in its forms, designs, and outlines in the pottery, printing, millinery or dressmaking departments; applied chemistry experiments in food adulterations, etc., lends interest and instruction in the departments of cooking. Thus it will be seen how the hand and head are educated, one in sympathy and harmony with the other.

New York City has a boy's technical school, the Stuyvesant, and means have been appropriated for a girls' school, to be known as the Washington Irving. Newark, N.J., is erecting two technical schools, each costing $600,000. Chicago is planning to build three or more; Buffalo, N.Y., has decided to spend $600,000 for a technical school, and Cincinnati has appropriated a like amount for similar purposes. Grand Rapids, Mich., will build a $250,000 technical school, while St. Louis has just erected a $500,000 building, and St. Paul is soon to have a fine new public edifice for this line of education.

Scarcely a day passes that the board of education, or Principal Jas. F. Barker of the Cleveland Technical High School, does not receive inquiries as to the course of study or the educational requirements of this new high school, and many national educators and committees from schools, colleges, and boards of education have visited the school during the past three months. At least 25,000 persons have passed through the rooms and shops, and this number is being rapidly increased daily.

The United States has been a little tardy in accepting this natural means of imparting knowledge. We find that England, France and Germany lead all other nations in providing a technical education for citizenship. For a score or more years Germany has taught manual training in her public schools, and to-day Japan has over 1,600 schools, public and private, which furnish a technical education to her citizens, although she has to send to the United States for much of the machinery used in her schools.

During the past quarter of a century the public schools of the United States, and, in fact, nearly all of the schools and colleges of the country, have offered instruction that was really helpful in a practical sense to only about ten per cent. of those who most needed it.

There are in the academic positions, professors, teachers, lawyers, doctors, ministers, etc., about ten per cent. of the working population in our civilization. This leaves ninety per cent. laborers, who either had to go without a practical education or had to prepare themselves with the same kind of an education offered the professions. Again we find about four per cent. of our active population employed in the professional and official life, leaving ninety-six per cent. employed in industry and commerce, yet the education of the past has been conserved to the larger benefit of the four per cent.

Broad Education.

In this practical age we have outgrown the antiquated notion that education is only of the head, for the head, and by the head, just as a few decades ago it was discovered that something more than the three r's was needed to round out one's education. We have been tardy in learing that there must be an end to this fatal lack of direction in education. In combining the three h's, head, heart and hand, we are going to discover the manly man in the lad and the worthy woman in the lass.

There is no greater tragedy than the wilful or ignorant wasting of the youth. With all our twentieth century education, with our pomp of material progress and intellectual refinement, we have only learned the first lesson of how to save the child into usefulness, happiness and refinement.

In a technical education all are taught the rudiments of language, arithmetic, geography, science, writing and history. In connection with this academic training such boys and girls who wish to learn some special work into which in-

* Department of Printing, Cleveland Technical School.

ciation and aptitude directs, or through the direction of wise parents, are given ample opportunity by competent instructors, with the use of the latest applied machinery and instruments available.

Mind and hand are alternately called into activity in a way that relieves much

Running a Milling Machine at Cleveland Technical School.

of the fatigue and strain of ordinary school work, while at the same time the work of each supplements and mutually illustrates and strengthens the other. What is learned in the recitation room is applied in the shop or laboratory; theories are put into practice, ideas are wrought into tangible form, and labor in turn, when shown in its relations to human thought and history and art, becomes transformed into a most noble and fascinating thing.

This combination of the academic and technic does not mean the gross materialism of education. It means rather the union of the real with the ideal, and that all the varied human likes and loves shall have their natural expression. Professors and scholars will not be exterminated because we educate and train carpenters, nor philosophers become extinct because we teach men to become skilled mechanics. With better machinists, and more efficient carpenters will dawn a new optimism to philosophy and a truer basis to scholasticism, and we will have learned and acknowledged the fundamental truth of civilization, that the first duty of a useful citizen is to earn an honest living.

A glance at a few statistics taken in Cleveland and throughout the State of Ohio (and these statistics compared to other states and large cities, will be found conservative) show the lack of our educational system during the past, as well as illustrates the present needs of a newer and larger curriculum.

At present there are 128,013 children of school age in Cleveland. Of these 90,673 are under sixteen years of age, and 41,206 not in any school. Most of these are over sixteen years of age.

In 1906 2,447 children dropped out of school between the sixth and eighth grades. In 1908 3,144 dropped out, and in 1907 2,925 dropped out. Thus 8,916 children dropped out of school at this critical age in the last three years into unskilled labor.

In round numbers there are 30,000 children in Cleveland between the ages of sixteen and twenty-one who are earning their living without any special preparation and there are at least 10,000 children between the ages of fourteen and sixteen who are helping to earn a living without an education of any special preparation.

Out of the 460 factories written in Ohio, but 61 have some sort of apprenticeship for its employes, and only one turns out machinists to fill a great and growing want. The wave of popular thought that is spreading over the whole nation shows that a change in our system of education is demanded and that our boards of education are meeting this demand. Cleveland has been foremost, and through her progressive board of education and an able corps of instructors is fast working out a text of technic and academic instruction that will appeal to the needs of the day.

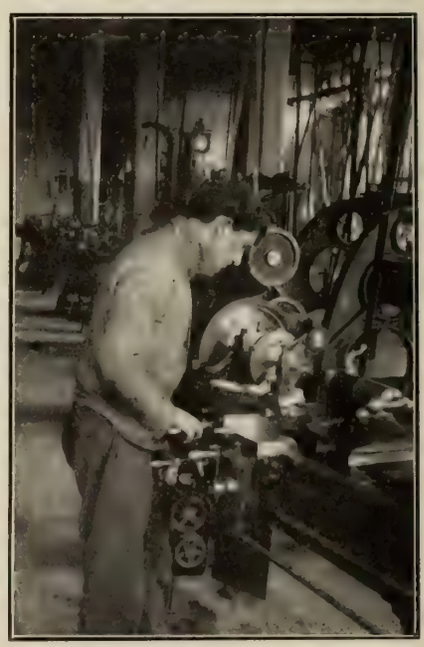
Cleveland Technical School.

The Cleveland Technical High School owes its origin to the board of education of 1906. In his inaugural address at that time, the president, Mr. Samuel Orth, said: "Industrial education as carried out by the manual training department of the high schools was wholly inadequate; that this manual training was entirely secondary; and that though it aimed at adaptness, it was not of such a nature as fitted for an occupation." An educational commission reported favorably to the establishment of a manual training high school in September, the same year, and on March 5, 1906, the board unanimously adopted a resolution authorizing the issue of bonds for the purpose of erecting such a school.

Active operation began on the building August 30, 1907, and the school was opened for enrollment of pupils and the organization of classes October 6, 1908, and one week later, regular class work began in all departments, with an attendance of over seven hundred pupils. Of this number only forty-seven came from other high schools in the city, thus verifying the prediction that the school would create its own field in a high school population whose want had hitherto been unmet.

The style of the building is English Gothic. It is a dark reddish brown superstructure with terra cotta trimming, and rests upon a heavy stone water table which gives an effect of strength and massiveness well calculated to offset the usual amount of wall space sacrificed to ample lighting. Upon entering the building from the main entrance there is a large reception room at the right, while at the left are the offices. Directly opposite the entrance across the main corridor, which connects the north and south wings, is the spacious auditorium, with a seating capacity of nearly fourteen hundred. The lecture rooms and laboratories for physics and chemistry are at each end of the main building. In the north wing the entire area is devoted to a lunch room, with large kitchen and serving rooms. The main dining room for pupils seats about 300, and a smaller room for teachers accommodates about 25, where noon-day lunch is served at nominal cost.

The entire south wing basement, as well as the first floor, is occupied by the shops. The pottery department is well equipped with potter's wheels, lathes for turning models, a slip house and a glass room set, kilns, cabinets, etc. Adjacent to this is the forge shop, with provisions for a blacksmith class of 36. The forges have down draft and the



Running a Lathe at Cleveland Technical School.

entire equipment is thoroughly modern. The next room is the machine shop with heavy machines suitable for the very best of trade instruction. At the end of the corridor is a foundry with a cupola for the melting of iron, a brass furnace, suitable core ovens, etc. At

the extreme rear of the building the heating and power plant is installed. This furnishes heat, ventilation, electric light and power and has a capacity of over four hundred horse-power.

On the first floor of the main building at the front corners are two large

Pattern Making, Cleveland Technical School.

rooms, with seating capacity of two hundred and fifty reserved as study halls, one for boys and one for girls. In the wing above the shops are five wood-working shops, including joinery, turning, cabinet-making and pattern-making shops and a room for re-sawing and storing stock. In addition to the usual hand tools in these rooms, suitable wood-working machinery has been installed to meet the requirements of modern methods of manufacture. Opposite the entrance to this corridor is a drafting room for the preparation of designs for school problems. There is also a room for varnishing and finishing woodwork.

The second floor is devoted to recitation rooms, the school library and mechanical drawing rooms.

The third floor, north wing, is entirely devoted to the girls' departments. Here are located the kitchen for instruction in cooking, the dining rooms for lessons in table service, and the laundry. Rooms for instruction in plain sewing, dressmaking and millinery are situated in the corner of the building. Additional mechanical drawing and freehand drawing, applied art and recitation rooms, a clubroom for school organizations and a rest room occupy the remaining floor space.

The fourth floor is occupied by additional rooms of the department of applied arts and by the printing department.

Objects in View.

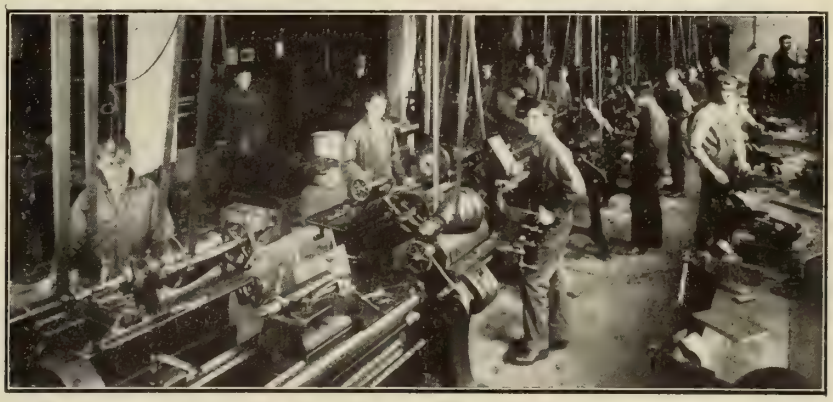
The Cleveland Technical High School has two immediate ends in view: (1) To prepare youths of both sexes for a definite vocation and for efficient industrial citizenship. (2) To help men and women already engaged in a vocation to better their condition by increasing their technical knowledge and skill.

In most classes the nature of the studies and the purposes in view are so different as to demand a separation of the boys and girls. There is, therefore, organized within the one building a boys' school and a girls' school.

The daily session consists of nine periods of 45 minutes each, beginning at 8.25 and ending at 3.25. Ordinarily each student is expected to carry three academic and two technical or laboratory subjects.

The school is in session the year round. The year is divided into four quarters of twelve weeks each, with one vacation week between the quarters.

The subject of mechanical drawing is taught as the language through which the student learns to give graphic expression to ideas which he learns to work out later in material forms in shop and work rooms. It is the one medium through which craftsmen are able to record, clarify, and perfect such ideas as may come to them. The problems not only bring into use the various instruments in the student's equipment, but also represent some definite object to be made later in his course in joinery, wood-turning, forging or pattern-making.



Machine Shop, Cleveland Technical School.

As mechanical drawing is made the medium of expression in the shop, so is freehand drawing in the department of applied arts. Nature forms are studied and sketched in the flat, in detail and in color. Then they apply in constructive work, as in borders for garments, draperies, naperies, and in embroideries, in the decoration and making of utensils and articles of household and personal use from various materials and fabrics.

The course of domestic art includes plain sewing, the making of outfits for use in the departments of domestic science and domestic art, undergarments, shirt waist suits, simple summer dresses and millinery. Principles of handwork in the way of rolled edges, setting of lace, handrun tucks and elementary embroidery are introduced and applied to underwear. Original designs made by the pupils are used for this work, and in the decoration of the table linen for the dining rooms of the domestic science department.

The purposes of the work in the domestic science department is threefold: (1) To teach all subjects pertaining to the care and duties of the home. (2) To teach all theory relating to the above subject as applied science, that girls may acquire intellectual development as well as practical skill. (3) To teach institutional cooking and kitchen management as trade subjects, that students may be prepared for catering as a vocation. The lunch room in connection with the school affords excellent opportunity for girls desiring to specialize in institutional cooking. After having learned the fundamental principles the student may go into the kitchen or the lunch room and prepare foods in larger quantities.

Shop work is intended to be educative and creative as well as technically constructive. From elements and principles taught in the mechanical drawing and shop classes each pupil makes his own designs, which he executes from working drawings. Free scope is given to his

inventive talent in the making of his designs. When the design is decided upon, he is held to strict accuracy and workmanship in its execution.

Specialization.

If after a time a pupil shows peculiar adaptability in any given direction, specialization along this line will be permitted in order that on graduation a pupil may be better fitted for his life work. The choice of a vocation is forced upon our youth at an early age, and if a proper choice can then be made it is a great advantage. After completing two preliminary years in wood and iron working and in mechanical drawing, he may then devote a major part of his last two years to the particular branch along which his ambitions lie.

A course of practical printing is offered as a fourth-year elective. This is utilized in printing official blanks, school catalogues, the school paper, and announcements of the school. Much of the instruction in the various courses of technical work is of so special a character that no suitable text book is yet available. The printing office is therefore brought into frequent requisition for supplying printed copies of the instructor's notes, diagrams and explanatory text to the students.

A periodical, edited and managed by students of the English department is published as the official organ of the school. This is illustrated by students of the drawing departments.

One of the most important missions which this school can fulfill is the betterment of people already engaged in some vocation.

The abolishment of the apprenticeship system in the sub-division of manufacturing processes has made it practically impossible for mechanics to secure any general training which will increase their efficiency and hence their earning power in their present position or enable them to fit themselves for a better position. This school offers trade courses during the evening to men and women who are already employes during the day. The entire equipment used during the day is available for the evening classes.

Instruction is offered in carpentry, cabinet-making, pattern-making, foundry practice, tool forging, sheet metal work, machine shop practice, trade mechanics, applied mechanical, architectural and machine drawing. Complete courses in plain and hand sewing, machine sewing, spring and fall millinery, cooking, freehand drawing, charcoal and water color rendering, clay modeling, bookbindery, printing, leather work and art metal work and designing as applied to the crafts.

MANUFACTURERS AND UNIVERSITIES.

The following suggests a plan whereby Canadian manufacturers may receive a great benefit from Universities.

Prof. Robert Kennedy Duncan, Professor of Industrial Chemistry in the University of Kansas, has announced that three important discoveries have been made by research students in his department. Various manufacturing concerns in the United States have endowed fifteen scholarships, thus furnishing the funds necessary for the experimenting. The companies which give the scholarships have the privilege of indicating the line in which they wish the research work to be done, and are protected by patents for the exclusive right of sale or manufacture of any products or processes resulting from the experiments. The fifteen scholarships have already resulted in three remarkable discoveries, and Prof. Duncan states that a number of other students now engaged in experimental work will undoubtedly accomplish important things.

The most important of the discoveries made probably is in the manufacture of casein. E. L. Tague, a fellow in industrial chemistry, has perfected a process of manufacturing this product from buttermilk, something chemists have been unable to accomplish heretofore.

Buttermilk has always been a waste product. Millions of gallons thrown away by creameries can now be turned into a practical benefit for use in the manufacture of casein, which is extensively used in the sizing of paper by paper mills. It is also used in manufacturing brushes, combs, billiard balls, and many other articles.

Archie Weith and Frank Brock are two other students in the same department who have made discoveries scarcely less important. After working a year and a half these young men have found a way to make an enamel for steel-containing tanks that has the same coefficient of expansion as the steel itself. By the use of their process of manufacture an enamel is obtained that will not crack under conditions of extreme heat or cold. The enamel is also resistant, will flow over the steel properly in the enamelling process, and is resistant to acids. It can be used as a lining for steel tanks and towers in various kinds of industrial occupations.

Two years ago the National Bakers' Association granted a fellowship paying $500 a year to Henry Krohman to carry on experiments in search of some means of making salt-rising bread uniform in quality.

The efforts of Mr. Krohman also have proven entirely successful. He has discovered a way to isolate the microbe which causes the bread to rise. This means that bakers will be enabled to supply bread of a better quality and lower in price to consumers all over the country.

Prof. Duncan, head of the department of industrial chemistry, is a Canadian, a native of Brantford, and a graduate of the University of Toronto. He is himself the discoverer of a number of industrial processes.

TECHNICAL EDUCATION COMMISSION'S TOUR.

The itinerary of the Technical Education Commission has been completed. The first sittings were held at Halifax, N.S., on July 18, 19 and 20, and others in the Maritime Provinces will be held as follows: Lunenburg, July 22; Liverpool and Yarmouth, 23; Digby, 25; Middleton, 26; Kentville and Wolfville, 27; Windsor, 28; Truro, 29; Sydney and district, August 1, 2 and 3; New Glasgow, 5; Pictou, 6; Charlottetown, 7 and 8; Summerside, 10; Amherst, 12; Shediac, 14; Moncton, 15 and 16; Sussex and Hampton, 17; St. John, 18 and 19; Fredericton, 22; Woodstock, 24.

The commission will then go to the Toronto Exhibition.

The Quebec and Ontario dates are: Quebec, Sept, 13 to 15; Three Rivers, 16; Sorel, 17; St. Hyacinthe, 18; Sherbrooke, 20; Montreal and Valleyfield, 21 to 28; Ottawa and Hull, Sept. 29 to Oct. 3; Lachute, 4; Smith's Falls, 5; Cornwall, 6; Brockville, 7; Kingston, 11; Belleville, 12; Peterboro, 13 and 14; Toronto, 17 to 20; Barrie and Orillia, 21; Hamilton, 24 to 26; St. Catharines, 27; Niagara Falls, 28; Brantford and Paris, Oct. 31 and Nov. 1; Galt, Nov. 2; Berlin and Waterloo, 3 and 4; Guelph, 5 and 7; Stratford, 8; Woodstock, 9; London, 10 and 11; St. Thomas, 14; Chatham, 15; Windsor and Walkerville, 16.

The commission will then go west and stay there till the end of January. On the way back St. Louis, Chicago and Milwaukee will be visited. The commission early in February will go to the eastern United States and then sail for Europe.

In one factory a regular doctor spends eight hours a day at the plant. He has an office completely equipped for immediate relief in any kind of accident.

Invoices for miscellaneous supplies as they come in, are checked with department requisitions for those supplies, entered under department headings in a single loose-leaf book and paid by check on the 26th of each month by the treasurer of a steel-casting company. He saves clerical work and forms.

Tempering Carbon Steel Gears by "Local" Hardening

A Description of Equipment Necessary and the Various Operations in the Process—This is Known in Sheffield as "Local" Hardening.

By FRANK WALKER.

In tempering gearing it must be clearly borne in mind that only the teeth require to be hardened, the other parts of the wheel or rack must be kept normal, or better still, be slightly annealed.

The hardness of the teeth must be absolutely uniform and must be accompanied by the highest elastic limit obtainable, while cracking or shelling must be entirely avoided.

Perfection can only be attained by a thoroughly efficient equipment, operated by an equally efficient staff, and the strictest attention to details. There must be no "near enough" about it, "absolute in everything" must be the watchword. If it is found that a certain grade of steel gives the best results when dipped at, say, 1,525 deg. Fah. the greatest care must be taken to always attain this heat—no more and no less.

The Equipment.

I propose first to describe the equipment necessary and then proceed with a description of the operation:—the sizes of the various items being, of course, dependent on those of the articles to be treated; and they should be grouped as closely as convenient on a level, unobtructed, standing.

The best furnace for the work in question is, undoubtedly, the oil-heated oven type, it is self-contained, cheaply operated, and capable of maintaining the highest temperature required under perfect control. It should be provided with a reliable pyrometer as the old method of judging temperatures by color is not to be depended upon. The furnace door should open vertically and should have in its centre a sight-hole fitted with a fire-brick plug.

Experience in this class of work has shown that the cooling medium which gives the best results at one operation is good animal oil—preferably whale—at a temperature of not less than 390 deg. Fah. It should be contained in a wrought-iron tank having a water-jacket extending all around and under the bottom through which cold water must be circulated and the temperature of the oil should not be allowed to rise over 450 deg. Fah. The tank should be sunk in the ground so that its top should project not more than 18 inches above the standing, and should be protected when not in use by a removable cover.

For convenience in charging and drawing expeditiously—and it must be remembered that careful haste must be observed in every movement, "Festina lente" is the motto for a tempering plant—it is best to have a small crane erected so as to command the furnace and dipping tank, one of the simplest will suffice, a swinging jib with a runner carrying a set of quick motion chain blocks.

Between the furnace and the dipping tank, and in the crane-path, a substantial platform must be provided, the same height from the standing as the fore-plate or sill of the furnace door, and having underneath it a bin to contain good foundry loam sand.

By the side of the oil tank, placed out of the way, but easily accessible have another bin holding common road sand, for use in case the oil should catch fire, a small blaze always occurs when an article is dipped, but this can be easily checked by agitating the surface of the oil with a rake or paddle, but if the flame gets out of control smother at once with sand.

Charging Lever.

An important tool which will be required is the charging lever, or "peel"; this should be practically the same in form as that used in charging ingots into a reheating furnace, but should be suspended by an eye riveted through it to avoid slipping or canting.

A set of charging plates must also be provided of various diameters, these can be made from old boiler plate ½ in. or ⅝ in. thick, they will require renewing occasionally as they crack and buckle with the heat.

Have a good supply of lifting tackle, eye-bolts and plates, single, double and triple-legged "ring-and-hook" chains, etc., and see that each one is as light as compatible with the work it has to do.

Great orderliness must prevail, "a place for everything and everything in its place," for remember a red-hot wheel will not hold its heat while operators are stumbling about on a littered standing.

The whole plant should be enclosed in a well-ventilated building with the roof not too low.

Before proceeding to describe the operation, it is necessary to state that no hard and fast rule can be lad down for temperatures, carbon steels vary to such an extent that though an analysis may give approximately the best heats for tempering purposes, it is imperative to make a series of careful experiments with test pieces to determine exactly the requisite temperature to give the best results and also to determine the fusing point—this is very important, and an exact record should be kept of each experiment and filed for reference.

Description of Process.

To insure success in the process of hardening, every movement must be carefully thought out and every emergency provided for. Provision must first be made for lifting the wheel when heated to convey it to the dipping tank, in the case of small wheels and pinions this may be done by means of an eye-bolt through the hole in the hub, with a plate underneath; with larger wheels it is better to drill three holes in the web, and use three eye-bolts and a "three-leg" ring and hook chain, these holes can be tapped and plugged after the wheel is finished.

Gearing must always be dipped so that the teeth enter the tank uniformly, that is to say, a wheel must be dipped on its flat and not on its edge: bevel wheels must be heated apex upwards and dipped base upwards and provision must be made for turning them over when heated, this is best done with a pair of tongs such as are used by forge-men for handling small billets.

Having fixed the eye-bolts securely in their required positions, take a charging plate a few inches larger in diameter than the wheel and place it on the platform or "making-up table" letting it lie evenly on three or more low stands—half bricks will do—so that the charging peel can be slid underneath it. On this plate place a layer of loam sand two or three inches deep. In the case of a bevel wheel the sand must be deep enough to prevent the eye-bolts from touching the charging plate. Take the wheel to be hardened and press it down on the sand bed, ramming underneath till the sand is packed to the contour of the wheel and well pressed down to the lower edge of the teeth, using a small trowel for this purpose. Bevel off the sand from the lower edge of the teeth to the edge of the charging-plate, then protect the upper surface of the wheel in a similar manner, bringing the sand well up to the edges of the teeth. It is best to use a small firmer for this. It will be seen by this method that only those parts of the

wheel which require to be hardened, namely, the teeth, are exposed to the heat.

The made up wheel or "Pie" is now ready for charging into the heating furnace, which should in the meanwhile, have been raised to and maintained at the exact heat required. The "pie" must be charged by means of the peel and crane, bringing it right up to the fire-plate before raising the furnace door in order to prevent as much as possible the loss of heat. It should be placed in the furnace on stands—small cast iron tripods do very well for this—so that the teeth stand evenly in the heat-zone, and also to allow the peel to be withdrawn and reinserted without disturbance. If the furnace door is not a good fit it is advisable to lute it with a little fire-clay.

The pie must be heated as rapidly as possible and by careful and accurate readings of the pyrometer and frequent inspections through the sight-hole it is possible to determine the exact moment when the requisite heat has been imparted to the teeth, it must then be drawn quickly, placed on the making-up table, the wheel stripped and cleaned of sand, and plunged evenly and steadily into the oil. The chains used for dipping should be sufficiently long to allow the wheel to be suspended by a bar across the edges of the tank and hang mid-way in the depth of the oil.

Two important points must be observed in furnacing. Always draw the pie on a rising heat and do not allow it to "soak" as this is detrimental to successful tempering.

The wheel should be allowed to remain in the oil until its temperature has been reduced to that of the bath, then withdrawn and hung over the surface to drain and then allowed to cool down to atmospheric temperature.

If proper care and attention have been taken it will be found that the teeth will be hard enough to resist a file and elastic enough to stand hammering, while the body of the wheel will have been slightly annealled, the hardness of the teeth graduating back into the softer rim.

In large wheels a certain amount of warping will take place, but they can be brought back to shape by resetting under a hydraulic press or drawing them down by plates and bolts on the plateau of a planer, and it is advisable to leave a finishing cut to be taken off the hub faces, and bore after this is done.

Resetting is best done at a temperature of 225 deg. Fah. Racks may be treated in the same way—they should be heated teeth upwards and dipped teeth downwards.

The burnt oil may be removed from the faces of the hardened articles by washing with gasoline.

MACHINERY MERGER.

The Canada Machinery Company, Limited, was incorporated under the Canada Companies Act on July 5, 1910, and has acquired the business and undertakings of the following companies :

1. MacGregor, Gourlay & Co., Ltd., Galt, Ont.

2. John Ballantine & Co., Limited, Preston, Ont.

3. Hespeler Machinery Co., Limited, Hespeler, Ont.

And the Woodworking Machinery Departments of :

1. Goldie & McCulloch Co., Limited, Galt, Ont.

2. Sussex Manufacturing Co., Limited, Sussex, N.B.

The companies controlled constitute practically all the concerns in Canada manufacturing the lighter grades of woodworking machinery and tools. They also constitute a large percentage of the manufacturing capacity of iron working tools in Canada.

The intention of the company is to perfect the organization of the different factories upon a uniform basis, thereby eliminating the excessive duplication of special machinery, etc., which has taken place in the past.

The reproductive value of the plants, as determined by the Canadian American Appraisal Company is $1,027,973.33, over two and a half times the present bond issue of the company. The bonds are being issued under a deed of trust and mortgage by the company to the Montreal Trust Company, of Montreal, and are secured by a fixed and specific first mortgage and charge upon all present and future real and immovable property of the company.

The total amount of bonds to be issued is limited to $1,000,000, and can only be issued up to 66 2-3 per cent. of the appraised value of the affixed assets. Of this sum $400,000 has been issued and is now being issued. The remaining $600,000 can only be issued to an amount equal to 66 2-3 per cent. of expenditures on capital account subsequent to August 1st, 1910.

On or before the 1st of August, 1914, and annually thereafter, a cash sinking fund of 2 per cent. of all bonds outstanding is to be paid to the Trustees, and used to purchase and retire these bonds at not exceeding 110 per cent. and accrued interest, or to call bonds at that price if not so purchasable. All bonds so purchased shall be the property of the trustee, and the coupons shall be collected by the trustee and carried at the credit of the sinking fund.

It is estimated that the net earnings of the company for the ensuing year, based on present output, will be $120,000, showing the bond interest earned five times over. These earnings will be materially increased during the following years. The auditors' reports of the various factories have not as yet been completed, but the audit of one of the principal companies shows average net earnings for the years 1900 to 1910 of far more than the amount required to pay the interest on the entire issue of $400,000 bonds. Mr. George D. Forbes, the President of the company, in a report, says the benefits to be accrued from the consolidation may be summarized as follows :

Increased efficiency, resulting in economy by specializing the output at the different factories and by eliminating the unnecessary duplication both in output and patterns.

Savings to be effected in the purchase of raw material and in administration.

Economies in selling, distributing, manufacturing, and transportation charges.

The consolidation is being effected just at a time when the industry is showing tremendous development, and the new company, by placing the different factories on a uniform basis will be in a position to take full advantage of it.

The directors are as follows : Geo. D. Forbes, Esq., president ; President, R. Forbes Co., Ltd., Hespeler, and Taylor Forbes Co., Ltd., Guelph. R. O. McCulloch, Esq., vice-president, Goldie & McCulloch, Co., Ltd., Galt ; R. MacGregor, Sr., Esq., vice-president, president MacGregor, Gourlay Co., Ltd., Galt, Ont ; S. H. White, Esq., vice-president, president Sussex Mfg. Co. Ltd., Sussex, N.B., and New Brunswick Telephone Co., Ltd.; Thos. H. Watson, Esq., Toronto, Ont., vice-pres. and Gen. Mgr. Canada Bolt & Nut Co., Ltd.; Alex. G. Gourlay, Esq., Galt, Ont., MacGregor, Gourlay Co., Ltd.; Garnet P. Grant, Esq., Montreal, Pres. Dominion Canners, Ltd, vice-Pres. Canada Bolt and Nut Co., Ltd.; Harry Cockshutt, Esq., Man. Dir. Cockshutt Plow Co., Ltd., Brantford, Ont.

The manager of a woodworking mill on going over his cost sheets discovered that increases in the cost of the item of "blown fuses" matched the decreased output from a certain group of electrically-driven machinery. His cost system suggested the addition of a special protective device—an automatic circuit breaker.

Mechanical Features of the Cummer Asphalt Plant

A Machine which Exemplifies what Can be Done by the Designer where Space is Limited---General Description of the Arrangement of the Parts.

An unusual piece of machinery has just been completed at the works of the John Inglis Co., Toronto. It is an asphalt plant built from designs furnished by the Cummer Co., Cleveland, for a Winnipeg paving contractor.

From a mechanical viewpoint, it presents many interesting features, notably the compactness, and economical ultization of all available space, at the same time not neglecting utility and ease of operation.

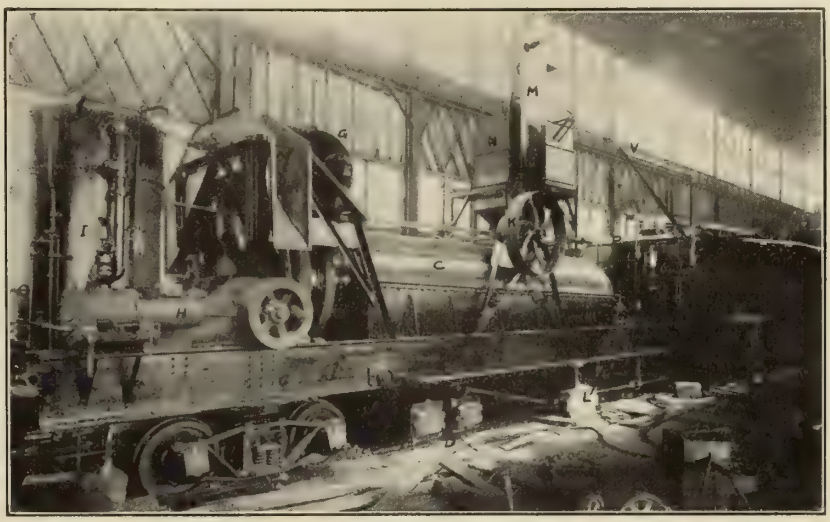
As shown from the cuts, the plant is portable, operating from any convient side-track, adjacent to the work. Two 24 in.—100 No. 1 beams, 65 feet long, each tied by a 3¼-in. truss rod, form the frame structure of the outfit. This frame is carried on two trucks, of one hundred tons capacity each, situated 51 feet centres, necessitating the heavy ties just mentioned. It is necessary to place the trucks this distance apart, for part of the structure extends down through the frame quite close to the rails. The total weight of the machine above the trucks is 140,000 pounds, nearly unidistributed throughout the length of the frame.

A bucket chain in the chutes AA raises sand, and drops it through the chute B into a slowly rotating drum under the corrugated casing C. This drum, which slopes slightly toward the far end, to cause the sand to travel in that direction, has a fire place built beneath it, which is fed through the fire-doors D. Combustion is promoted, and all moisture in the sand drawn off through a pipe F, by the blower G on top of the drum casing. The arrangement is such that the hottest blast strikes the driest sand. The drum revolves on the rollers E at the near end, and in a special adjustable trunnion at the far end.

A 50 h.p. engine, H, completely encased to be grit proof, supplied the necessary power for all purposes. Steam is generated in a 70 h.p. vertical, enclosed fire-box boiler I.

That power might be transmitted at right angles to rotate the drum without the use of large bevel gears, a Hindley worm gear at J is used. This makes a small compact arrangement, which is completely encased in an oil box. This secondary shaft carries a pinion, which engages the gear on the large drum. Power is also transmitted to the pulley K on a central shaft which in turn drives the blower by a belt, and the mixer and elevator, referred to later.

The sand after its passage through the revolving drum, falls into the transverse passage L, and thence into the bottom of the vertical elevator M, which



Cummer Portable Asphalt Plant.

Cummer Portable Asphalt Plant

Cummer Portable Asphalt Plant

carries it by a bucket conveyor to the storage tank N, where it can be released as desired through a gate O.

The asphalt end of the machine consists of three tanks P, Q, R, with a furnace under each.

Q and R are open to the atmosphere by loose hinged doors in the top through which they are fed, while the tank P is air tight, and capable of withstanding a slight pressure. It is the final tank taking its supply in liquid form from either Q or R. To fill P, a vacuum is created therein, by the Westinghouse air pump shown, which draws the liquid into P. At the proper moment, the suction valve can be closed and pressure created in P by the pump, forcing the liquid out into the mixing chamber, the amount of discharge being regulated by a valve.

The mixing chamber S, is open and consists of a cast iron shell in which are two sets of intermeshing paddles. These thoroughly mix the two substances—sand and asphalt. The mixer is driven from the previously mentioned central shaft through the gears T and U. The elevator is driven from the same source. A valve beneath the mixing chamber discharges the mixture into a wagon beneath.

All the outlying superstructure may be readily removed for transportation making the shipping dimensions 65 ft. long, 10 ft. 2 in. wide, and 14 ft. 2 in. high. All these removable parts are made in small sections to facilitate field erection. The small jib crane V, assists.

As a mechanical contrivance, it forms a remarkably compact arrangement, and shows what can be done by the designer where space is limited.

METAL DRAWING IN CANADA.

By Geo. Koff.

The development of the art of drawing and stamping metal has been exceedingly rapid of late. The press builders have kept pace with the fast increasing knowledge of the physical properties of the various metals, especially as to their flow. New steels have entered into the progress of art, not only in the product itself, but also in the tools used in its working. One after another, obstacles have been overcome which have hitherto been considered insurmountable. The press designers are turning out machines to do work which had been supposed to be impossible for accomplishment. Precision work, involving the manufacturing of parts in which the limit of variations is a small fraction of a thousandth of an inch, is now being carried on commercially quite as a matter of course, with an enormous saving of time and money as compared with what had been practically hand work, and at the same time with a greater uniformity of product. In automatic press work, marvels of manufacturing have been developed recently. An instance of drawn metal is the manufacture of very long slender tubes of various metals, closed at one end.

The field of pressed metal has been enlarging ever since its beginning, which has not many years ago, but lately the growth seems to have been given a new impetus, doubtless because the knowledge of the various elements that enter into the art has been more nearly perfected. The efforts of research by many experts have been brought to fulfillment, furnishing more exact data as to details of the properties of metal, with important results in the design of the machines and tools with which it is worked. Beneath all, is the basis of the experience of many practical men. The pressed metal people have always held that their branch of industry was only at the threshold of its usefulness, and this would seem to be a better grounded prophesy to-day than ever before, because its foundation in fact is the more apparent.

The first drawn work was done to supply a demand for seamless parts to replace castings, which were too heavy and cumbersome for convenience or appearance. Ferrules for various purposes, stove knobs and a few other specialties were produced and sold at a great margin of profit, because at even high prices as compared with their cost the expense to the purchaser was little if any more than under old methods, and the drawn metal was greatly superior for the purpose. From the small beginning the business progressed rapidly. The possibilities of its application were seen, and as time went on many manufacturers entered the field. Finally general manufacturing companies established departments for the manufacture of metal parts of their products, or the cans and metal boxes, in which to pack them.

With competition came the spur to better and cheaper methods of production, and in this the press builders have played the most important part. The development has included greater power, greater speed of production, greater precision, automatic feeds, combinations of processes in one machine and special machines of wonderful ingenuity, with principles of design conforming to the knowledge gained by the experience of the pressed steel manufacturers and the investigations of their experts, and by the manufacturers of the metals which are used as tools and as raw materials for manufacture. The adaptation of the products has been so broad as to be revolutionary. There are few articles in which metal plays a part to which the press does not contribute its share, as a rule improving the quality and lessening the cost. Other branches of mechanics have entered into the work, especially important being the new welding processes, notably the electric and the oxy-acetylene, both of which produce results previously impossible, and consequently adding their important functions in developing the field.

There are instances of manufacturers or those who would be manufacturers who have abandoned ideas because the special machinery people in the past have been unable to give them the equipment with which to manufacture cheaply by automatic processes. To-day these machines could be furnished in many cases. Manufacturing has been simplified by the reductions of the number of operations necessary to accomplish a certain work, which constitutes a very great development in pressed metal working. The manufacturer who is equipped with the most modern tools can compete successfully at a satisfactory profit, for what to him is a sufficient price, would be below cost to a competitor less well equipped. Figuring is frequently very close indeed in this line, and as in many other branches of business, first-class machinery is necessary if money is to be made. First-class machinery is particularly noticable in the manufactories in Canada.

WESTERN DRY DOCK CO.

A large order for machine tools has just been put through at the King Edward Hotel, Toronto, for the Western Dry Docks Co., of Port Arthur, through their agents, Messrs. Fenn, Rankine & Wallace. The order was well distributed among the different manufacturers, as follows:

John Bertram & Sons, Dundas—

1 large plate shear.
1 bending roll.
1 angle shear.
1 lathe.
1 drill.

London Machine Tool Co., Hamilton—

5 60-in. punches.
2 48-in. shears.
1 large planer.
1 lathe.

Canadian Westinghouse Co., Hamilton—

Electrical equipment.

John Inglis Co., Toronto—

Pumping machinery.

Orders for electric cranes were placed through Rudel, Yeates, representing Pawling & Harnischfeger, Milwaukee.

Other smaller contracts were let through different local firms.

Notes on Some British Manufacturing Processes

Pneumatic Plant for Small Tools, Aeroplane Propeller Blades, and the Goff Patent General Wheelwright are Here Fully Described.

By Herbert A. Carter.

Herewith are descriptions of a number of interesting British processes which will, no doubt, be of interest to readers of Canadian Machinery.

Pneumatic Plant for Small Tools.

The pressure of a gas may be raised by simply heating it. The increase in pressure enables the gas to do more work by a given volume charge, hence the advantage of heating compressed air is at once apparent. On compressing air in practice its pressure at once rises, and this by increasing the back pressure increases the work that must be done to effect a given compression. Were there no temperature rise the work done during compression would be less. In practice it is impossible to secure perfectly isothermal compression, though this is approached by repeatedly cooling the air between the various compressor stages. It is also impossible to retain the compressed air that heat so acquired by compression. If the compressed air be used straight from the cylinder without re-heating, none of that part of the work done in compressing it which went to overcome what may be termed "the temperature back pressure" can be recovered. If, however, the air be reheated by passage through the fuel-heated stacks of metal tubes to, or above, the temperature at which it was fed into the storage cylinder, the source of inefficiency is entirely removed, and owing to the heat supplied being used about five times as efficiently as if used in steam-raising a surprising over-all efficiency of power transmission may be realized. So great is this cooling in many practical ways as to result in the copious formation of hoar frost, on and around the exhaust pipes and ports. Compressed air on expanding is cooled by the inverse action of that by which it was heated in compression. The formation of hoar frost just referred to is advantageous in many ill-ventilated mines and tunnels, but in general it is convenient to avoid such an excessively cold exhaust by re-heating the air before use in the air motor. The latter result, if re-heating, however, is a minor one, the gain in thermic dynamic efficiency being the argument in favor of such treatment. Perfectly adiabatic, or isothermal working being both unattainable in practice, it is unusual in modern compressed air establishments, to approach isothermal compression as nearly as possible by the use of multi-stage compressors with inter-coolers to store the compressed air in, storage cylinders of suitable capacity and strength, fitted with relief cocks and to re-heat the air just before it passes into the compressed air engine, and even during its utilization in the latter, by the use of hot jackets, or preferably, multi-stage engines with inner-heaters, which are stacks of steam or fuel-heated pipes.

Aeroplane Propeller Blades.

So far as the theory of the propeller is concerned, one made from solid wood would be equally as good as one built up, but when made from solid wood the blade is short-grained and consequently very weak. Unless for a small model a propeller should always be built up. Glue is the substance generally used for sticking the pieces together. When finished the whole should be well varnished to keep the damp out. The following is Sir Hiram Maxim's method. He built them up in the usual way, and when finished they are varnished over on both sides with hot glue. When dry, they are carefully sandpapered, then covered with strong, smooth Irish linen, which is glued on. When this is dry they receive another coat of glue, are again smoothed with sandpaper, and finally they are painted with zinc white in the ordinary way and varnished. The following pitches are taken from practice, and will be a guide. They vary in different machines of the same make:

	Dia. H.M.	Pitch H.M.
Curtis	6.0	6.0
Voison	7.6	4.7
Wright	8.3	9.6

The pitch ratio, which is $\frac{\text{Pitch}}{\text{Dia.}}$ varies from 0.4 to 1.2 in practice, between these limits, the higher pitch ratio the greater the efficiency.

The Goff Patent Wheelwright.

This is a new machine which is being made by an Oldham, Lanc., firm for hand, foot or steam power, driving, and they claim that it is the best wheelwright in the world. Its price brings it within the reach of even the smallest users. It is the best and most satisfactory wheelwright ever invented, and for those wheel makers, van, and wagon builders, and wheelwrights, workshops in which there is not sufficient work to warrant a costly plant of separate machines proves itself to be an ideal time and money-saver. It must not be confused with light, inferior wheelwrights, so many of which are offered under the term "General Wheelwright," and which are far from being a success. Both the hand-power and steam-power machines are massively built, and are of the very best class of workmanship and material. The main frame is of heavy section casting, all fitting parts perfectly planned, and bedded. The bed is cast on one piece, accurately planned to carry the heavy head and tail stocks. The steel spindle runs in long phosphor-bronze bearings, the end thrust being taken up by an adjustable case-hardened steel rim. The various attachments are easily and quickly set up for performing their operations, the tools and attachments named below can be supplied in addition to that for mortising hubs.

Apparatus for Turning Hubs.

A countershaft is necessary with No. 1 steam power machine. The same firm makes an improved draw-spoke trimming and mitreing machine, with or without stand. In every cabinet-making and other wood-working shop there is ample use for one or more of these machines, and their adoption results in great saving in men's time. In mitreing, jointing and trimming hard or soft woods, at any angle, the work done is perfectly smooth and most satisfactory, making altogether unnecessary any further work for a first-class glue joint.

The main frame carrying the slides is heavily constructed, the table has a mitreing scale, adjustable mitreing fence and strong clamps for holding the timber in position. The knife slide is operated by means of a lever, rack and quadrant. The working of the machine is simple. It can be supplied by bolting it to a wooden bench or complete with stand.

ITEMS FROM "FACTORY."

Illuminating gas and compressed air are used to fire coke in one foundry cupola, instead of a wood fire.

Men work in pairs in one foundry. One more skilled gradually trains the other to the job until both can pair off as instructors.

Metal patterns made of an alloy, one-half tin and one-half zinc, have been found easier to finish than iron. They wear well and sand doesn't stick to the surfaces.

Each molder in one brass foundry has a numbered furnace. Bins of the same number hold the metal for each day weighed out in a metal room. The weight of the metal is charged against the bin number. After the heat, the weight of the castings, gates and so on is balanced against the original weight and the losses so accounted for.

ROUTING SYSTEM.

By M. E. P.

A large Canadian plant, employing several hundred men, and turning out many machines every year, has made use of the system hereunder described, for keeping track and following up articles from the time the order is placed until the part reaches the store-room. From the latter place the article is sent to the erecting floor, and then shipped, another following-up system being used.

When the plans have gone through the engineering department, a card like No. 1 is sent to both the pattern shop and the man who has charge of the castings as they come from the foundry preparatory to being machined. This pair of cards is made for one piece of each lot, a separate pair of cards for each part of the finished machine.

On the card, as it leaves the office is the following information: Symbol (which is the serial number of the part), name of the part, number of pieces ordered in the lot, the lot number, date, drawing number, and routing. The latter is given in the "Dept." column, the office knowing what machinery operations will be necessary. In the example given on the card, R is the roughing department, or as the casting leaves the foundry; P, the planer department, and S, the stock room; the whole indicating that in the planer department all the work will be done. In case any latne work is necessary an L is placed either between R and P, or between P and S, as deemed best, the part going from one department to the other in the order indicated.

The card that goes to the pattern shop is kept until the pattern is made, and then tacked to the pattern, and the whole sent to the foundry, where the tag is destroyed, no longer being necessary. The other card is kept by the intermediate man between foundry and machine shop, and should all the pieces in one lot come through in a batch, the line opposite R is filled in at "Pes. Del." with the full number of the order, with the date. The attached coupon on the right is filled in to correspond. However, it frequently so happens that the lot

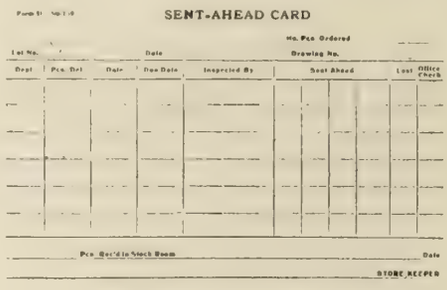


Fig. 3.—Routing System.

is broken when coming through, in which case card No. 2, a "Sent-ahead" card, is used.

Consider the example shown where three pieces were ordered. In the first batch only two came through. The casting man fills out a "Sent-ahead," as shown, giving 2 as the pieces delivered, and sends it with the casting. In all other respects the card corresponds to the original. When the remaining casting arrives, card No. 1 is filled in, as shown, one being given as delivered, while the two previously sent are recorded in the "Sent-ahead" column. This is sent with the casting to the machine shop, the two slips giving the casting man his clearance. The O.K.'d stubb ends are sent by P to the office, where the card originated, informing them that the pieces have gone thus far, giving the office a record of the progress of the work.

After the machining, a similar process is gone through when sending to the stock-room, a "Sent-ahead" card being used when all the parts are not finished at one time. In both cases, line P is filled and the store-keeper signs when the card is returned to the office, giving them the final record.

In case of anything occuring to a casting along the route, such as breakage, loss, etc., card No. 3 is used, which, when properly filled in for the missing part or parts, is sent to the office, where an order like No. 1 for the necessary parts, is sent over the route again.

SCALES THAT COUNT.

In the Canada Cycle & Motor Works, Toronto, is a platform scales so adjusted that a certain weight on the end of the balance arm will balance a certain multiple times its weight on the platform of the scales. A number of pieces are put on the platform and enough are put in a pan on the end of the arm to make a perfect balance. The number in the pan is then counted. This number multiplied by the multiple gives the count of the pieces on the platform.

Iron shutters protect one oil house from fire. All the shutters are connected by a special system of levers and cranks so that they can be closed simultaneously by turning one crank inside the oil house.

Economic Handling of the Factory Output, Shipping, Etc.

The Canadian Fairbanks have Erected a New Warehouse in Toronto with Some Excellent Features for Taking Care of Factory Output.

There has just been completed on Bloor Street West, Toronto, for the use of The Fairbanks-Morse Canadian Manufacturing Co., a modern warehouse for taking care of the rapidly increasing business this firm is handling. The business of this company has grown so fast that a separate warehouse was found absolutely necessary for storing the goods so that orders might be promptly filled from stock.

Five years ago the Fairbanks-Morse Canadian Manufacturing Co. Ltd. was established to manufacture the lines made in the U. S. by Fairbanks-Morse & Co., of Chicago. This consisted mainly of industrial gas engines, and gasoline engines for farm power, but later on a large field for marine engines developed in Canada and this line was taken up also.

Other lines as steam, gasoline and power pumps, hand and motor railroad cars, hangers, bearings, railroad standpipes, Wissen stamps, etc., are now manufactured. Approximately 300 men are employed. Further enlargements in the near future are contemplated which will increase the output of the machine shop 75 per cent. and double the foundry capacity. In addition a brass foundry is being installed.

These extensions are being added to accommodate the manufacture of gas tractors for all the various kind of fuels, which business offers a very promising future.

The power plant will be increased by the addition of another 150 h.p. producer Fairbanks-Morse gas outfit, two of which are already in operation, bringing the total horse-power developed up to 450 h.p.

The Canadian Fairbanks Co. handle exclusively the output of this factory through their offices at Montreal, Toronto, St. John, New Brunswick, Winnipeg, Calgary, and Vancouver.

Description of Warehouse.

The building in question is 80 ft. wide by 135 ft. long, and it consists of four storeys and a basement, and has been especially designed for handling all classes of machinery that this company build and, therefore, there are several features in connection with same which are somewhat out of the ordinary.

The building is built in what is known as "slow-burning" or "mill construction." The walls are built of brick and cement mortar with heavy timber posts and timber and steel beams with floors 6-inch thick; the ground floor being designed to carry a load of 250 lbs. to the square foot and the other floor 150 lbs. per square foot. The basement has a concrete floor finished over waterproofing material. The upper floors are finished with hardwood.

At the east side there is a shipping platform about 70 ft. long and 12 ft. wide, which is covered with a canopy and this platform is elevated above the level of the ground to the height of an express waggon, and from this platform local shipments of less than car loads lots of the lighter goods will be despatched. On the west side of the building there is a car dock long enough to take in two standard railway freight cars, the track being depressed so that the car floors are level with the ground floor of the warehouse. On the same side of the building as the car dock, on the opposite end is a waggon dock approximately 21 ft. deep by 14 ft. wide with a 10 ft. door opening from same on to Bloor Street.

Over the railway dock and waggon dock referred to is located a crane runway with a ten ton electric traveling crane, Niles make, which is capable of lifting material off the ground floor of the warehouse and placing it on flat cars or on to the floor of heavy express waggons. This crane can also be used for loading materials which have to be shipped by rail on to flat cars. Adjoining the railway car dock is an industrial railway dock arranged so that material may be brought from the works where it is fabricated on a narrow gauge railway and brought into the warehouse; the industrial railway trucks being arranged so as to be level with the ground floor of the warehouse.

There is also located at the south end of the building an electric-driven elevator of 6,000 lbs. capacity for taking material up and down between the upper floors and the shipping floor of the warehouse. This elevator is enclosed in brick walls with skylight overhead, and operates between the basement and top floor; and adjoining the elevator shaft is a staircase which is also enclosed in brick walls in accordance with the requirements of the underwriters, and which would form in case of fire a safe escape for anyone

Construction of Fairbanks-Morse New Warehouse.

Track, Crane, Raised Platform, are Economical Features.

who might happen to be on the upper floor of the building at the time.

The front portion of the ground floor of the building has been reserved for the general offices of the works, and has been laid out with a fireproof vault adjoining same together with lavatories, private and general office, the interior of the office is finished in chestnut stains, dark brown finish and the walls, for a height of about 7 feet, are panelled in this material above which is plaster on the walls and over the ceilings, which surface are tinted in soft tones.

New Warehouse of Fairbanks-Morse, Toronto.

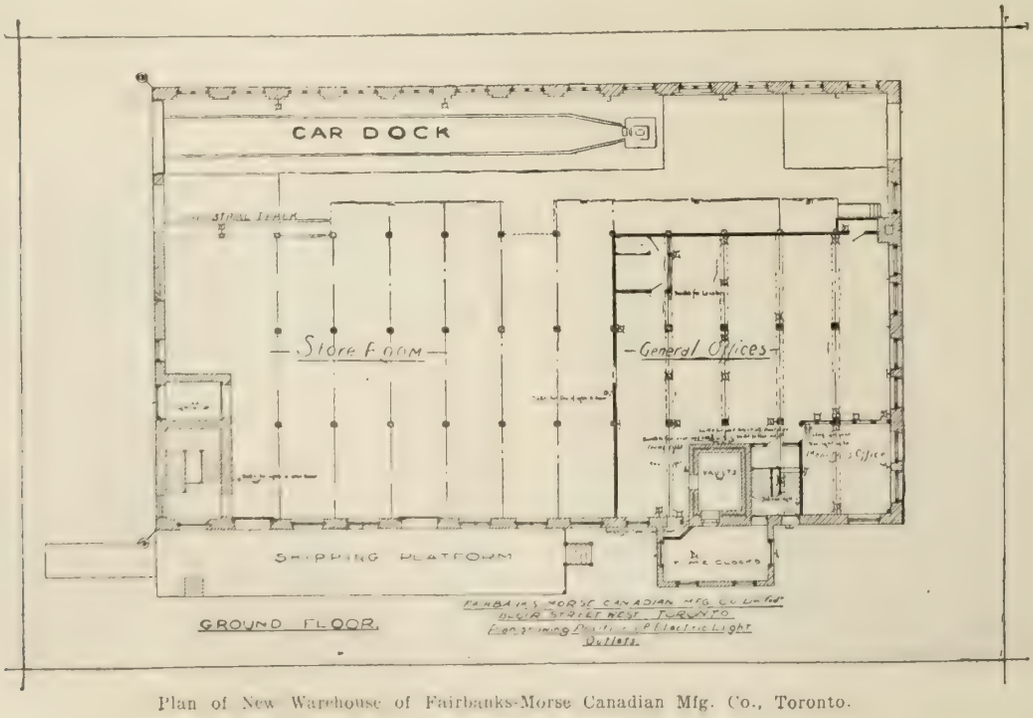
Timekeepers' Offices.

Adjoining the building on the east side is a small one storey building known as the "clock room," in which are located the time-clocks for the works; and all employes are obliged to pass through this room and punch the clock on entering and leaving the works. The floor of this "clock room" is within 6 ft. of the general grade of the ground around the building and it is therefore a simple matter for workmen arriving on bicycles to wheel same through the room, pass the clocks and out the door at the opposite end which leads to the works. The office of the timekeeper is located on the ground floor of the warehouse, in the office portion, and a small bay window has been provided overlooking the "Clock Room," from where the timekeeper can observe what is going on in this room.

This warehouse has been designed with a view to future extention to the south, and when extended, the stair-tower, over which is located at an elevation of 20 ft. above the roof a 25,000 gallon underwriters' sprinkler tank will be in the centre of the building. The building is equipped with Standard Automatic Sprinkler together with fire-hose at each floor and at roof for fighting small fires.

The floor of the upper storys of the warehouse have been built with a crown in the centre of the building and slope towards the walls, through which there are located on each side, in every alternate bay, cast iron scuppers with openings about 4 inches square and covered with cast iron hinged caps on the outside so as to allow any water which gets on the floor from the sprinklers to escape outside the building where no damage may be caused, such as might happen if the water had to find its way down from floor to floor and encounter merchandise on the way which would be more or less spoilt.

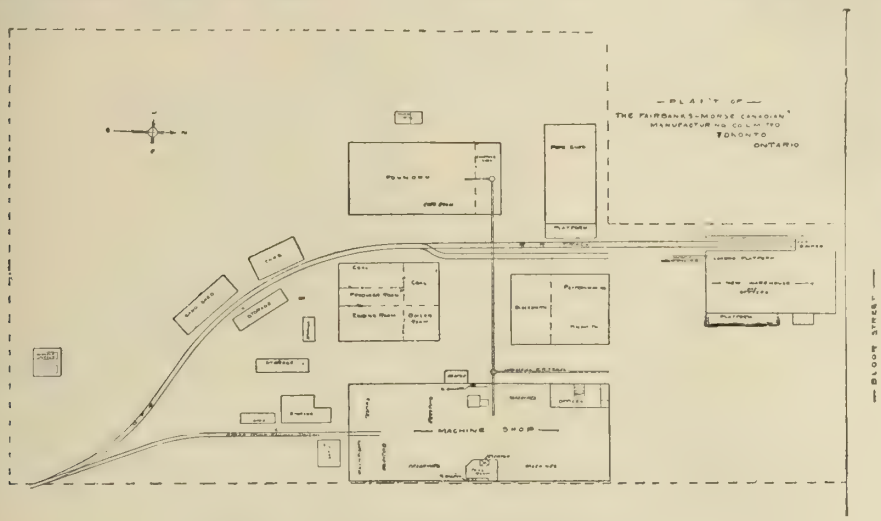
The cuts accompanying this article



Plan of New Warehouse of Fairbanks-Morse Canadian Mfg. Co., Toronto.

show the general appearance of the Fairbanks-Morse Canadian Mfg. Co.'s plant and new building, which was designed by T. Pringle & Son, Limited, engineers and architects, of Montreal, who make a specialty of industrial work, and was constructed by C. E. Deakin, general contractor.

The whole work was carried out under the supervision of the designers, the work being started in November, 1909, and completed a few days ago.



Layout of the Fairbanks-Morse Toronto Plant.

WORKSHOP PRACTICE IN UNITED STATES AND CANADA.

Recently, E. Theo. Crosier, of Newcastle-on-Tyne, Eng., made a tour of a number of United States and Canadian industries. His impressions were given before the Newcastle Y.M.C.A.. He pointed a number of comparisons between British and American methods:

1. Every workman washes himself and changes his clothes before he leaves the factory. I noticed navvies in the street taking off overalls at buzzer time.

2. Time recorders are used almost universally.

3. Employees are expected to attend to as many machines as is possible.

4. A great deal of work is done from jigs. All machines are higher speed.

5. The employer in walking through the works does not hesitate to speak to any workman, should be happen to be known to him.

I went through a very large drop forging factory with the vice-president of the company, who exchanged greetings with almost every other man he saw. I have never seen this done in this country (England).

6. The American loses no time. A well-known story has been adapted to illustrate this.

"A foreman entered the shop one Monday morning and found a workman wasting time, 'Say young feller' he said, 'I guess this won't do. Here's Monday morning, to-morrer's Tuesday and the next day's Wednesday, there's half the week gone and no work done. Yew'll have to git a hustle on if yer want ter keep yer darned job.'"

Making Milling Cutters.

He gave a description of the manufacture of milling cutters by the Union Twist Drill Co., Athol, in which English steel is used.

In the making of milling cutters a piece of steel must be removed to allow the cutter to be secured to mandril or arbor. This steel is cut out instead of being drilled out thus saving a piece of steel which can be utilized for making small cutters or saws. When a man gets a tool from the tool room he leaves a round check (1" x 1-32") bearing his number, this is put in the storing place of that particular tool until it is returned. By this means if a tool is missing one man, and one only, in the whole works is responsible.

In the twist drill department I noticed about half a dozen lads working 13 machines each. They took little looking after it is true, being automatic, but it is one big step towards cheap production. One room in this factory was particularly interesting, it contained the form tools for the making of cutters. There were stored here 11,000 of these tools, the average value of which was $5. The man in attendance showed me one tool which cost $40 to make (exclusive of the cost of steel), it was a screw cutting tool 168 threads over a length of 4", or 42 threads per inch.

CONICAL MILL.

The accompanying photo, Fig. 1, is of a Hardinge Conical Mill, a recent adaptation of the old stamp mill for the crushing of the more valuable mineral ores.

It consists of a conical, boiler-steel drum, which revolves about 30 r.p.m. and in which cast iron balls from 2 to 4 inches in diameter, tumble about pulverizing the ore, which when in its final state passes out with a current of circulating water.

From the mechanical standpoint the end bearings of both mill and drive-shaft and the ore-feeding device, are of interest.

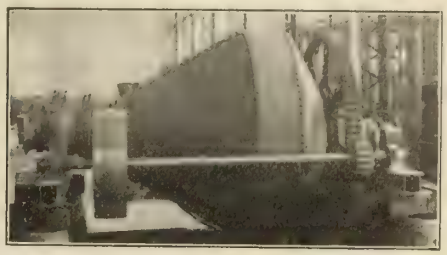


Fig. 1.—Hardinge Conical Mill.

As both sets of bearings are of the same type only one is shown in Fig. 2. The bearing and bearing stand form a ball and socket joint, permitting a deviation of the mill from the horizontal position which is necessary when operating, without interfering with the vertical position of the bearing stands.

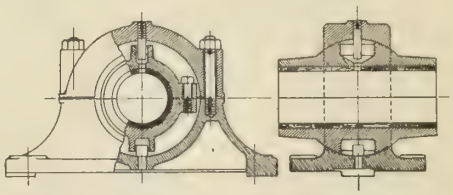

Fig. 2.—Bearing for Hardinge Conic l Mill.

The slight slope of the drum is required to pass out the treated ore by gravity after pulverizing.

The ore to be crushed is in the form of small lumps. These are picked up by the scoop shown in Fig. 3. This dips into the ore box each revolution, feeding the ore into the mill, through the hollow trunnion shaft. The noteworthy feature is the inner lip on the scoop, which prevents the ore from tumbling out when the revolution has been nearly completed.

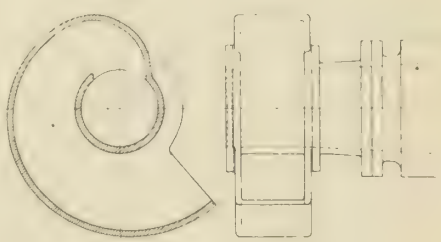

Fig. 3.—Pick-up Scoop for Hardinge Conical Mill

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

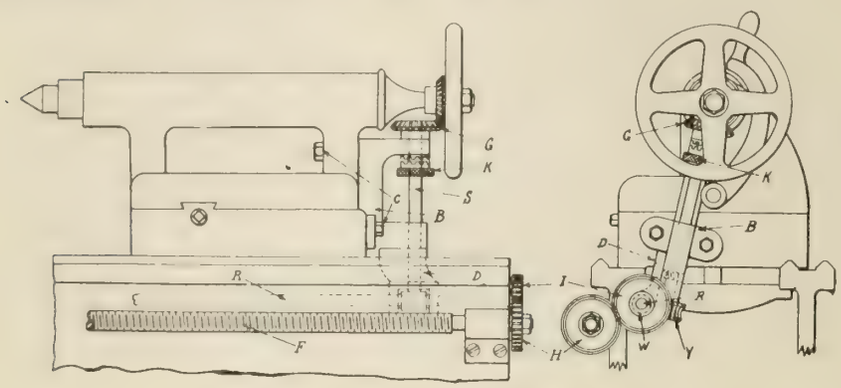
POWER FEED FOR TAIL STOCK DRILLING.

By J. H. R., Hamilton.

The accompanying sketch shows a device attached to tail-stock of a lathe where considerable drilling is required. The bracket B is secured to the tail-stock in the desired position. The small bracket D being secured to B to carry the worm W.

The shaft R is revolved from feed shaft F by the two gears H and I at the end of the lathe. On shaft R slides the worm W which revolves the worm wheel Y and shaft S. Motion is transmitted to the tail-stock spindle screw by an upward thrust of the knurled clutch nut K.

The feed shaft F is geared in the usual manner so as to transmit the desired feed to the tail-stock spindle.



Power Feed for Tail Stock Drilling.

SPACER FOR PUNCH PRESS.

Geo. R. Ward.

The steel sole of the shoe made by the Steel Shoe Co., Toronto, has an upward projecting rim which is riveted by small cleats to the vamp or upper. These rivets are spaced about ½ in. apart, the holes being punched.

Formerly, these holes, when being punched, were spaced by eye, as no degree of accuracy was essential; but this process proved to be poor, as it was impossible to keep the spacing in any way uniform.

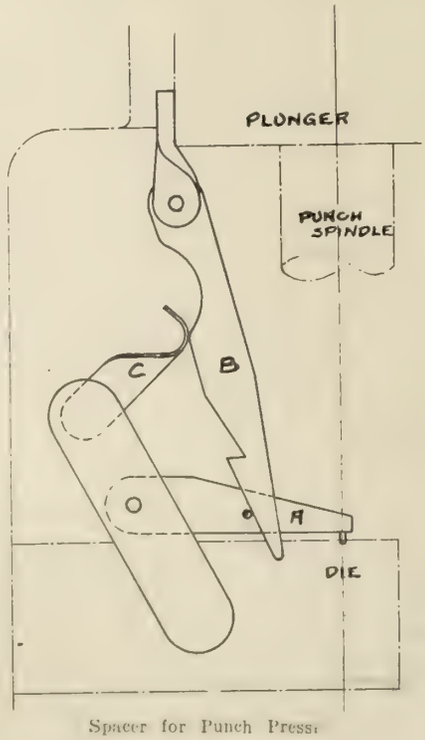
The little device for the punch press shown in the cut was devised to overcome this difficulty. The arm A, which has a small pin in the line of rivets to engage with the rivet holes, is free to swing about its inner end. The arm B, which is freely attached to the punch press plunger, has a vertical motion with the latter. At the bottom of its stroke the cut-out in the side of B engages with a projecting pin in A, and on the upward stroke, A is drawn up, releasing the pin which engages one of the rivet holes, allowing the operator to move the article along.

About half way through the up-stroke, a projection of B strikes the stationary arm C, shoving B away, and allowing A to drop into the next rivet hole, holding it in that position during the punching operation.

Any spacing may be obtained by changing A to make the desired distance between the die and the rivet hole pin in A.

The operation is extremely rapid, no stop being required between punches. This latter feature is insured by the arm A dropping about half way on the up-stroke, giving the operator time to adjust the article without shutting down.

This method ought to be applicable to other kinds of uniform line punching where extreme accuracy is not required.



Spacer for Punch Press.

HOLDING WORK WITH MAGNET.

At the Canada Cycle & Motor Co., Toronto, a grinding machine with a magnetic clutch is used to hold small parts during the grinding operation. In the manufacture of an automobile there are many small pieces that cannot be held conveniently in any other way. The pieces are held on a flat surface and hardened parts are accurately finished. It is also well adapted for finishing bright and true surfaces on small parts.

DRESSING GRINDING WHEELS.*

The difference between glazing and loading of a grinding wheel is not always clearly understood.

A loaded wheel is one whose face has particles of the metal being ground adhering to it—one in which the openings or pores of the wheel face have been filled up with metal, leaving no room for clearance. It is not necessary that all of the pores or openings between the cutting particles on the face of a wheel be filled up or loaded to prevent the wheel from cutting. The presence of a number of these pieces of metal on the face of a wheel prevents the wheel from cutting into the work and the loaded places will, of course, create heat.

A glazed wheel is one whose cutting particles have become dull or worn down even with the bond, the bond being so hard that it does not wear away fast enough to allow spaces between the cutting particles, or the cutting particles to escape when dulled. In a glazed wheel, the cutting particles and the bond at the extreme surface of the wheel are of the same radius.

It will be noted that in many places the space between the cutting particles is filled with bond and the corresponding spaces in the wheel on the left are open and will give room for clearance. Continued work with a wheel that glazes increases the smoothness of the wheel face and decreases the cutting.

A wheel will not load unless the bond is too hard or it is run at a speed very much too slow. The factors that cause loading are, therefore, hard bond and

* Prepared by the Norton Co., Worcester, Mass., manufacturers of alundum grinding wheels.

slow speed. Loading may indicate that the wheel is too hard or that it is running too slow, or both.

The factors that cause glazing are hard bond and high speed. Glazing may indicate that the wheel is too hard for the work, or it may be running too fast. A wheel of the right grain and grade may glaze if run too fast, or a wheel run at the right speed may glaze if it is too hard for the work. In short, a wheel loads when it is too hard or when it runs too slow, and a wheel glazes when it is too hard or runs too fast.

One remedy for loading is to increase the speed. A remedy for glazing is to decrease the speed. If the speeds are right, use a softer wheel in either case.

Loading and glazing make excessive dressing necessary, and excessive dressing wears wheels faster than grinding. Were it possible to obtain an ideal wheel for each kind of work, theoretically dressing would not be necessary as the face of the wheel would automatically sharpen itself.

Whenever the work is of such a nature as to cause the wheel to run out of true, frequent dressing will save the wheel rather than waste it. For example, a wheel that ran out 1-32 of an inch after one hour's grinding ran out ⅛ of an inch after two hours' grinding. Had it been dressed after the first hour and again after the second hour, the amount wasted by dressing would have been 1-16 of an inch, whereas after the wheel ran two hours it was necessary to dress off ⅛ of an inch or twice as much.

Wheels should be kept in perfect running condition in order to give good results and a wheel should never be used until the operator is sure the wheel runs true.

We can never grind perfect work with an imperfect wheel, and the more perfect and smooth the wheel is the more perfect and smooth will the work be, particularly when making the light finishing cuts.

Dressers should always be kept handy for wheels for off-hand grinding but for truing wheels on plain, cylindrical and universal grinding machines, cutter and reamer grinders, etc., a diamond is necessary for good results.

Dressing is not trueing, but sharpening the wheel, and a dresser should never be used on wheels that grind round work on centres. When trueing a wheel for round grinding, the diamond should be held in a rigid tool post on the table of the machine. You cannot do good work with a wheel that has been trued "by hand." When a dresser is used, it should be moved in a straight line across the face of the wheel, with the heel of the dresser resting firmly against the edge of the work rest.

It may be well to state here that dressing is sharpening the wheel, and trueing means to perfect the wheel—make a perfect cylinder of it, which is absolutely necessary if it is intended to grind a perfect cylinder with it.

PLANING A CONCAVE FACE CASTING.

By J. E. Hailstone.

The accompanying sketches illustrate a planing operation which, while perhaps not new to many readers, will, I have no doubt, prove interesting to some.

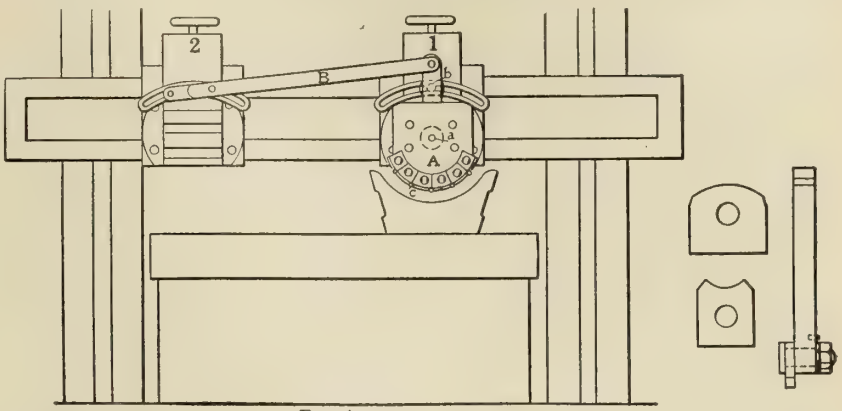


Fig. 1

Planer Rig and Tools for Planing Casting With Concave Face. Fig. 2.

The casting to be planned may be seen on the table, Fig. 1. There were about two dozen of these castings, and they were machined all over, and buffed to a mirror-like polish on the curved surface.

All castings were faced on the base first, on the large slab miller. A special planer tool holder was made, having recesses for five tools, as shown at A, the arm projecting about 12 inches from the body giving considerable leverage and allowing the head to be kept fairly tight. The clamping studs of head No. 1 were replaced by stud b in the centre, giving the maximum swing desired for the finishing tool. A small hole was drilled immediately opposite the centre pin of the tool block (not the head) for locating the tool holders. The holder was clamped by the four bolts. By using the centre pin of the tool block it was possible to regulate the depth of cut without altering the radius.

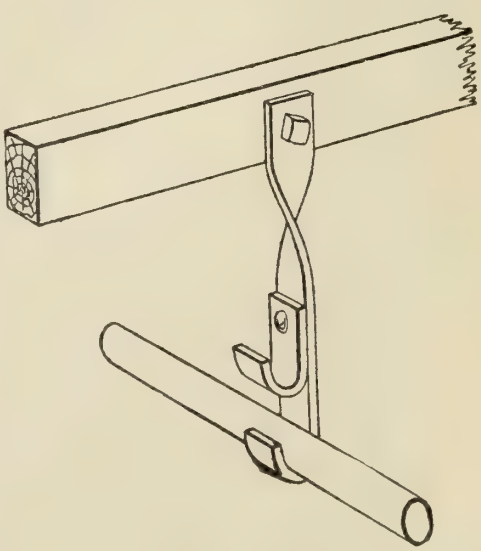
Head No. 1, after being set central, was clamped to the cross rail and a small stop was placed at one end, the bar B connecting the two heads. As head No. 2 was moved, head No. 1 rotated about the centre a on a radius equal to that of the casting. The tools were ground to the standard shape, and by using the locating pin a in the holder the points were touched on the emery wheel to give the corect radius.

There being fine tools, it did not take long to machine the large concave surface. The smaller curves were roughed by a single tool in the holder and finished with a broad-nosed tool. The stop being set on one side, the head could be moved away to finish the smaller radius and returned to a central position again without any bother. The stop was then changed to the opposite side of the head for the other small radius.

A special holder, Fig. 2, was made for finishing. The finishing tools for the smaller radius was ground to slightly larger radius than desired, to reduce the cut without interfering with the true form very much, and for the larger radius it was slightly smaller. The speed of the platen was reduced, and we obtained a very smooth finish. The stop was again used for finishing, with the head always in central position.—American Machinist.

SIMPLE PIPE HANGER.

The hanger shown in the sketch consists of two or more small hangers, riveted together in such a manner as to form hooks at the required distance from



Simple Pipe Hanger.

each other, says an exchange. The hangers are made of wrought iron, about ½-inch thick and 2 inches wide. The iron can be heated first and bent around a pipe of the same diameter as that which is to be used. This will prevent the pipe from vibrating after it is hung. If the pipes are to run in opposite directions, or to the beams above them, the iron

can be heated and twisted to the right angle. The upper end is drilled to receive a ½-inch lag screw, by which the hanger is fastened to the beam.

H.P. OF CAST IRON GEARS.

F = breadth, or face of tooth in inches.
T = thickness of tooth at pitch line, in inches.
V = velocity at pitch line in feet per minute.

(1) Horse power of spur gears = $\frac{F \times T^2 \times V}{L \times 53}$

(2) Horse power of bevel gears = $\frac{F \times T^2 \times V}{L \times 77}$

(3) Horse power of mitre gears = $\frac{F \times T^2 \times V}{L \times 82}$

H=Horsepower. D=Diameter of shaft. R=Revolutions per minute.

L=length of tooth, from root to point, in inches.

C=constant.

HP = horse power transmitted with a safety of seven; ultimate tensile strength 25,000 lbs. per square inch.

In formulae 2 and 3 for bevel and mitre gears the factors T and L express the pitch at large end of tooth.

For bevel and mitre, thickness and length of teeth have been computed at centre of face. With a view, however, of facilitating calculation, the proportions of factors T and L in formulae (2) and (3) have been taken at large end of tooth, thus giving same dimensions as for spur gears; hence the spur gear formulae has been utilized, with the exception of the constant, which has been determined by averaging the proportions of the teeth of bevel and mitre gears having the largest and smallest number of teeth in general use. The resultant horse power is consequently less than in the case of spur gears of like pitch.

For mortise wheels and pinions use thickness of pinion tooth. If different factor of safety is desired, multiply above result by 7 and divide by factor of safety desired.

The Hill Clutch Co., Cleveland, recommend the following speeds in feet per minute as the maximum at which, under favorable conditions, it is safe to run toothed gears.

	Ft. per Min.
Molded cast iron gears	1,500
Helical cast iron gears	2,000
Mortise cast iron gears	2,000
Molded cast steel gears	2,200
Helical cast steel gears	2,500
Machine cut cast iron gears	2,500
Machine cut cast steel gears	3,000

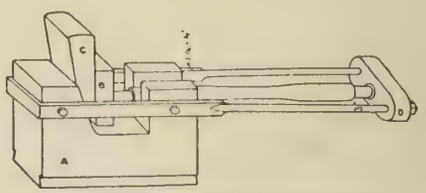
Although the above are conservative limits for safety, it is generally necessary to keep the speed much lower to avoid excessive noise and wear.

The two accompanying tables giving the horse power of head shafts and the horse power of line shafts were also prepared by the Hill Clutch Co.

UPSETTING AXLE COLLARS.

By John Treacy.

Enclosed is a blue print of die for upsetting collars on axles as used at the Dale street shops of the Great Northern Railway. The die block A is of cast iron and is keyed into the die block of steam hammer; the block B is recessed to the size of the collar required, the backstop D also being recessed to receive collar. The operation is as follows:



Device for Upsetting Collars on Axles.

The axles are first drawn a little each side of centre to permit of wheel fit being turned to required length; after this is done they are then taken up, heated on end for 3 or 4 ins., swung in crane from fire to hammer, and lowered into position, the block B being put in place backed by the wedge C. A few blows of the steam hammer

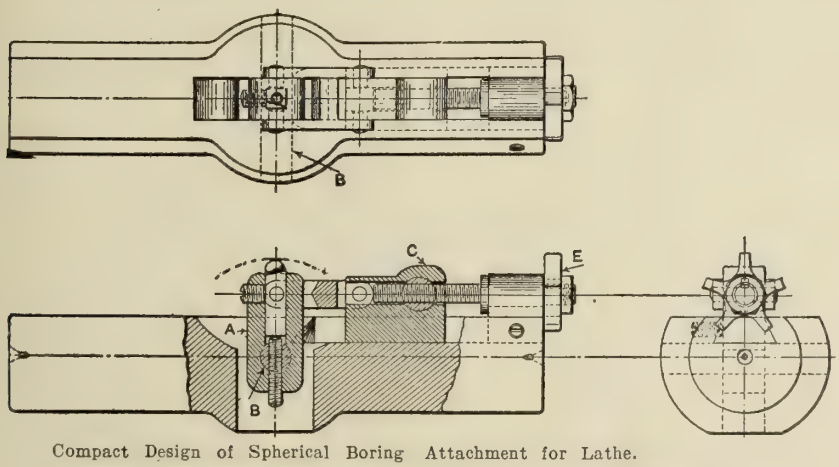
driving the wedge to place completes the operation.

Many hundreds of axles have been scrapped yearly by the different railroads after they have worn at the journal below the limit, when by upsetting a new collar on them, and using them for smaller capacity cars, their life is doubled. It was no doubt considered that the old method of upsetting collars on worn axles by the ram was too slow and laborious and did not pay, hence their relegation to the scrap heap. This die does the work quickly, and eliminates the hard labor needed for the ram, making it in every sense an economical method, as it doubles the length of service of axles so treated.

SPHERICAL BORING ATTACHMENT.

By G. R. Richards.

The design of spherical boring attachment illustrated herewith, is in use in one of the largest automobile concerns in the country. This attachment is used on the lathe in connection with a fixture that is fastened to the carriage for holding the work. It is held between the lathe centers and is driven by a dog. The boring tool is clamped in a tool-holder A that is attached to a pin B, which is free to turn in the bar. The upper end of the tool-holder is connected with a slide C by two links. Through this slide the feed-screw of the tool passes. As the bar revolves, the star-wheel E is actuated by a dog which is clamped to the tailstock spindle, thus giving the tool a circular movement about the axis of the pin B, as indicated by the dotted line. This movement combined with the regular rotary movement of the tool produces the spherical surface.—Machinery.

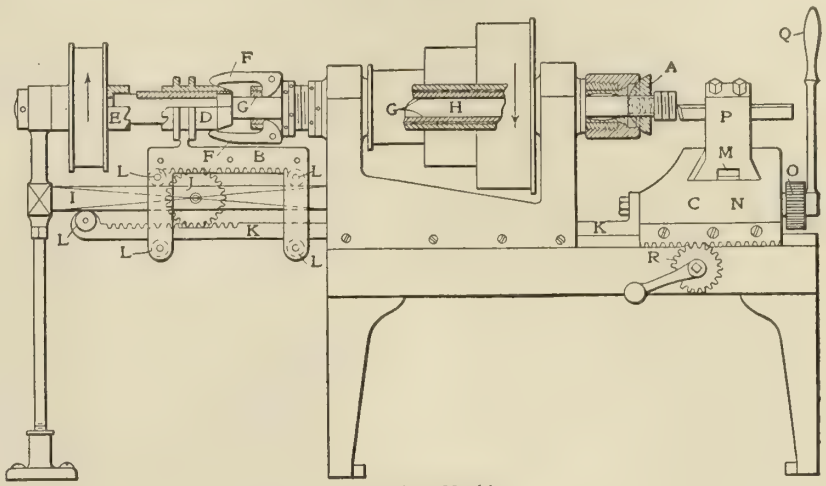


Compact Design of Spherical Boring Attachment for Lathe.

NUT FACING MACHINE.

The features about this machine are the half-ball collar A, on which the nut seats without forcing the thread in the nut out of parallel with the thread on the arbor and the clutch B, operated by the tool carriage without any extra lever. As the carriage is moved to the right after a nut is faced, it opens the spring chuck, pushes the sleeve D against the loose pulley E, revolving in the opposite direction, causes a sudden reverse and loosens the nut.

A contrary result is obtained by moving the carriage to the left, the sleeve D coming in contact with the fingers F, pulls back the sleeve G and closes the chuck on to spindle H, carrying the nut to be faced. I is a flat beam slotted to admit the gear J, which is set in motion by the rack K passing through cone carrier and attached to the carriage C. L L L L L are rollers to avoid friction on the beam I and rack K. M is a rack fastened to the bottom of the tool post. It is operated by a gear N, not shown. O is a gear meshing with another one which is fastened to the shaft carrying gear N, which moves tool post P back and forth. —American Machinist.



Nut Facing Machine.

Steam, water, gas, electric conduits and other piping is distinguished in one plant by a system of colors. High pressure steam lines white, low pressure heating lines aluminum bronze, exhaust lines grey, heating returns aluminum bronze, house supplies maroon, water supplies red, drains pink, drips black.

Correspondence

Readers of Canadian Machinery are invited to contribute to the Correspondence Department with comments on either general articles or those under department heads such as "Methods and Devices," etc., also with replies to the problems presented by readers. All acceptable material will be paid for.—Editor.

Mortising Teeth in Cast Iron Centre.

A number of readers of Canadian Machinery are no doubt familiar with the old mortise-tooth gearing so much in vogue in British mill work of the past generation—hardwood teeth mortised and dowelled into a tough cast iron centre. Is it not possible to adopt this method mechanically and commercially to modern requirements?—to construct a gear wheel having a low carbon mild or alloy steel centre fitted in the same manner with high carbon teeth, hardened, fitted and ground with mathematical accuracy.

Modern machine-shop tools and methods make this principle of construction quite possible, and, though the cost of production would necessarily be high, the advantages for high-class work would be very great, for I think that by these means a scientifically perfect gear could be produced.

Comments from readers of Canadian Machinery would be appreciated.—Subscriber.

Automobile Parts.

If you have a list of Canadian manufactures of automobile parts, will you kindly let us have same as we will soon be in the market to make purchases.—Ontario Manufacturer.

If Canadian manufacturers of automobile parts will write us telling what parts they make with particulars we will forward the information to the inquirer.—Editor.

Filing Papers.

Having read with some interest in several articles in technical and trade papers on the subject of "Ready Reference" to the different articles therein, I would like to bring to your notice an idea which would I think help to a great extent the keeping in touch with articles appearing in past issues of the technical and trade papers.

If a loose sheet or page were inserted in each copy of a paper, containing the heading or title of each important article therin, the subscriber on receipt of his paper each month or week, extracts the sheet and places it on file.

If a reader is in need of information on any subject you can in a few minutes, by glancing through the file, see if such information or anything touching on the matter has been published in the said paper even if it is several years back. A reader can, therefore, if the papers have been carefully placed find it in a few minutes.

The enclosed draft will give you an idea of the loose sheet, the blank space for "Remarks" to be used by each individual reader as becomes his needs.—J. H. R.

FIRST AID TO INJURED.

Considerable attention is being paid by the Canadian Pacific management to the work of the St. John Ambulance "First Aid" movement within the company, and it is the intention of the company to support this by giving every facility and inducement to the men on their passenger trains to learn what they should do in case of accident. The co-operation of the company with the St. John Ambulance people is a good deal more than passive, and orders have been issued, advising train employes that they are expected to take lectures on this subject and make themselves efficient in "First Aid work," not only for the benefit of passengers, but for their own good. In following up this movement it is announced that emergency medical outfits will be supplied as fast as conductors show themselves possessed of the necessary knowledge to handle them.

In this connection the following circular has been issued by Mr. J. W. Leonard, general manager of eastern lines:—

"It is the intention of the company in connection with St. John Ambulance "First Aid" lectures to supplement the knowledge that Canadian Pacific employes will obtain by furnishing an emergency medical outfit to vans as soon as conductors have passed examination showing that they are capable of rendering first aid, and these outfits will be supplied as certificates are issued to conductors.

Passenger train crews are expected to take lectures and make themselves efficient, and emergency outfits will, as now, be carried in all sleeping cars. If no sleeping car is on the train the medical outfit will form part of the conductor's equipment.

Detailed instructions as to the handling of the boxes will be issued later.

It is the wish of the company that trainmen take an interest in this work, not only for the benefit of passengers, but for the benefit of employes generally.

Information as to the holding of classes will be bulletined from time to time at divisional points by the Canadian Pacific Railway Centre of the St. John Ambulance Association.

PERSONAL.

Fred W. Evans, manager of the machinery department of the Canadian Fairbanks Co., Montreal, was married recently to Miss Edna Hurd, of Toronto.

Thomas Reed has succeeded the late Frederick E. C. Baldwin, as sales manager of the Walpole Rubber Co. Mr. Reed's headquarters are in the Eastern Townships Bank Bldg., Montreal.

William S. Leslie, president of the firm of A. C. Leslie & Co., and Miss Margaret Wilson, daughter of the late James R. Wilson, of Sanquhar, Scotland, were married on June 15th. The ceremony was conducted in St. Helen's Church, Sanquhar, by the Rev. J. Richmond Wood, assisted by the Rev J. Scott, of Toronto.

$10 For An Idea

For the "Business Management" department of Canadian Machinery.

We want ideas for this department—ideas of practical, labor-saving, cost-reducing value. We will pay at regular rates for each idea accepted, and in addition will pay $10 for the best idea submitted during the next five months—that is, until Sept. 30, 1910.

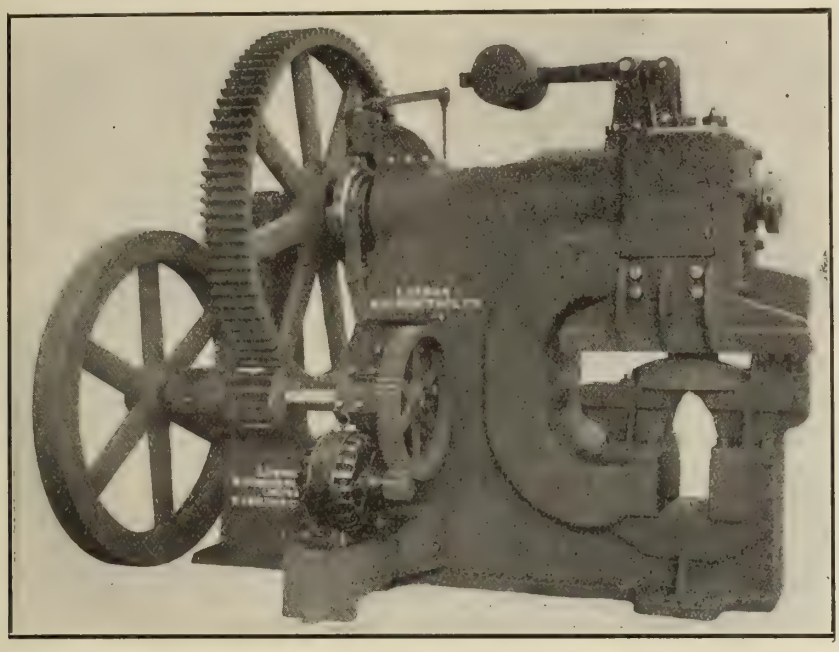
Address all communications to the Editor of Canadian Machinery, 143-149 University Ave., Toronto, Ont.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

COPING AND PUNCHING MACHINE

This machine, the latest punching machine of large capacity, placed on the market by the London Machine Tool Co., Hamilton, is designed for the rapid punching, coping and shearing of I beams and other structural shapes, and is capable of punching four 1¼-in. holes. The main dimensions are as follows: Distance from centre of plunger to back of throat, 25 in.; maximum distance from outside of horn of plunger to the throat, 46½ in.; maximum distance from plunger to base when stroke is up with blocks removed, 28¾ in.; main gear has 96 teeth, 2½-in. pitch, and 9-in. face; pinion has 14 teeth, and the fly-wheel is 5 ft. 6 in. in diameter. When arranged for electric drive, as shown, a 10 h.p. constant speed motor is required, or if belt drive, 30x6-in. pulleys.



Coping and Punching Machine, London Machine Tool Co., Hamilton.

The frame is of close-grained iron, designed with a high factor of safety, the metal arranged in box section. A 10-in. forged steel shaft, running in bronze bearings, transmits power to the punch, which has a 2-in. stroke. The outer end of the shaft is provided with a support to take the strain, obviating bending in the cam portion of the shaft.

The pintle is of cast steel, bronze-bushed, and working in a hardened steel knuckle. Taper jibs of bronze are provided for the steel plunger to take up the wear. The main gear is of large diameter, coarse pitch and wide face, with a shrouded pinion, necessitated by the heavy strains.

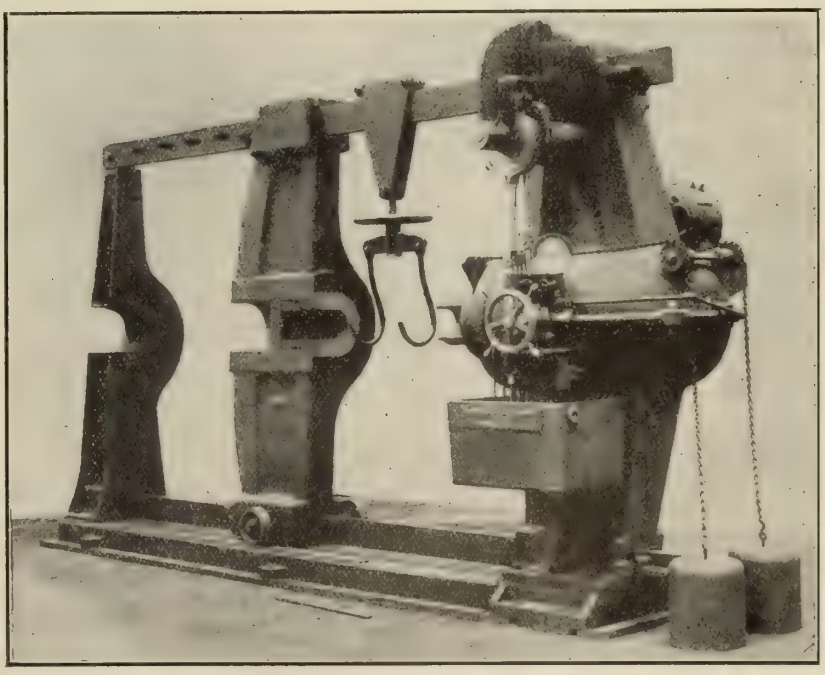
The machine is of a very powerful type, and several have been in operation in different works, giving good service.

The total weight is 36,000 lbs.

HYDROSTATIC WHEEL PRESS.

Herewith is illustrated a new design of locomotive hydrostatic wheel press of convertible type, recently placed on the market by the John Bertram & Sons Co., Dundas, Ont. The design is such as to permit of building the machine in stock lots, and where an order is received for a machine of the inclined type to facilitate the handling of wheels and axles directly into the machine by the regular overhead shop cranes, the tension bars may be so located that they do not interfere with crane tackle. Other users prefer the vertical position that they may handle axles with the carrying hooks provided with the machine, and the bars can be placed to meet their views without any alteration to the machine. This is a benefit to the user as well as builder, for this change can be made at any time, either before or after instalation in the shop. This and other features are fully covered by patents.

The triple plunger pump has separate control for each plunger, so all or each may be brought into action as required. Great speed of ram is thereby obtained and all the delivery pipes being of large diameter, the return of ram by balance weights is rapid. Drive can be changed from motor to belt, parallel or at right-angles, after the machine is completed. Suitable blocks are furnished for car as well as for locomotive wheels.

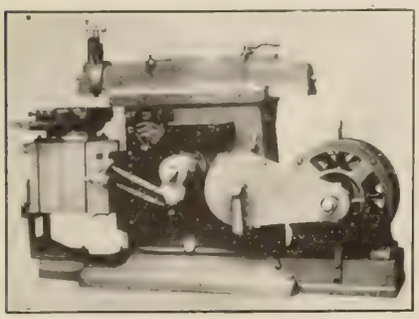


Hydrostatic Wheel Press, John Bertram & Sons Co., Dundas.

MOTOR-DRIVEN SHAPER.

The motor shown connected to the 24-in. back-geared crank shaper in the illustration has a speed range of from 450 to 1,350 r.p.m. By means of the face-plate controller, located on the side of the

shaper, the workman can regulate the speed to suit the requirements of his work. A large number of operating speeds, limited only by the number of field resistance steps on the controller, are thereby available, and the correct speed for most efficient operation on each piece of work is easily and quickly obtained. On each position of the controller, the speed of the motor is practically constant for all rated loads. This characteristic is of great importance in machine tool service, as it reduces tool breakage to a minimum. The controller



Motor Driven Shaper, Queen City Machine Tool Co.

handle is within easy reach of the operator, who can make any speed adjustment or stop the shaper instantly while standing at the rail.

The use of a silent chain as a method of connecting the motor to the shaper eliminates belt slippage and provides a positive driving power. The chain runs very smoothly and without perceptible vibration. The motor is supported on a sub-base cast integral with the base of the shaper. The equipment is compact and takes up little floor space.

This shaper is made by the Queen City Machine Tool Company, and is driven by a Westinghouse type "SA" 5½ h.p. motor, with auxiliary commutating poles.

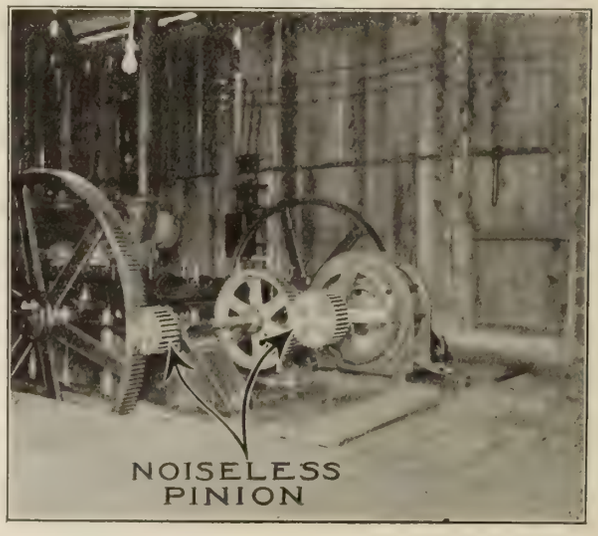
RAWHIDE PINIONS ON GEAR DRIVES.

Rawhide pinions are usually considered merely as a means of stopping noise on medium and high speed drives and by far the largest percentage of them are used for that purpose. It is a matter of engineering experience, however, that rawhide is quite beneficial on gear drives where there is vibration from irregular load, etc.

This is well illustrated in the instance of the 1,750 gallon quintuplex pump in the power plant of the Parral Power & Reduction Co., Parral, Chihuahua, Mexico. This pump as shown in the illustration is geared through double reduction to an induction motor and furnishes the circulating water for the condenser.

Originally this pump was driven entirely by cut steel pinions and cast iron gears. The pump was of so light a pattern that there was considerable spring in both shaft and frame. The result was constant annoyance from broken gear teeth and in addition to gear renewals, there was quite an expense due to the power loss of running the engines non-condensing while pump repairs were being made. The chief engineer had about decided to abandon the pump and replace it with another of different design when someone suggested the use of rawhide pinions. Accordingly, four New Process Pinions made by The New Process Raw Hide Co., of Syracuse, N.Y., were substituted for the four steel pinions. Two of these are shown in the photograph, one on the motor and the other meshing with the big gear at the left. The other two are on the other side of the motor and placed symmetrically to those shown. These rawhide pinions were put into service over two years ago and there has not been a moment's trouble with the gearing since. In fact the pump has been out of service only long enough to repack the plungers and replace the rubber valves.

Rawhide where properly cured and machined makes up into a gear or pinion that is much the same as metal, except that it has no metallic ring and is more elastic. This elasticity is highly

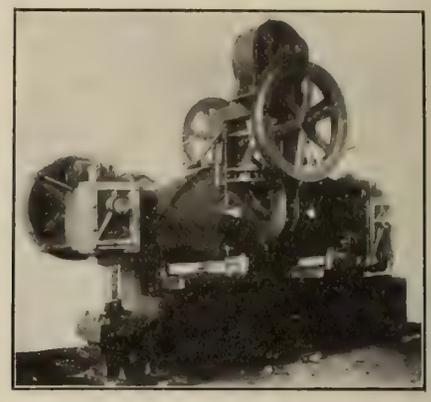


Pump Motor Drive Using Rawhide Pinions Made by New Process Raw Hide Co., Syracuse.

advantageous on motor and other drives in that it absorbs the shock as large gear teeth come into contact and as cutting tools come into cutting contact, and it cushions the irregularity of load due to the reciprocating movement of parts in machine tools or geared power plant apparatus.

UNIVERSAL CHANNEL SHEARS.

The accompanying illustration shows a motor driven universal shear for squaring and mitring channels, angles and plates, used in structural steel work. This machine was built especially for the marine department of the Maryland Steel Co., Sparrows Point, Maryland,



Punch and Shears—Covington Machine Co.

but would be found very useful in any iron works where steel forms must be cut for construction work.

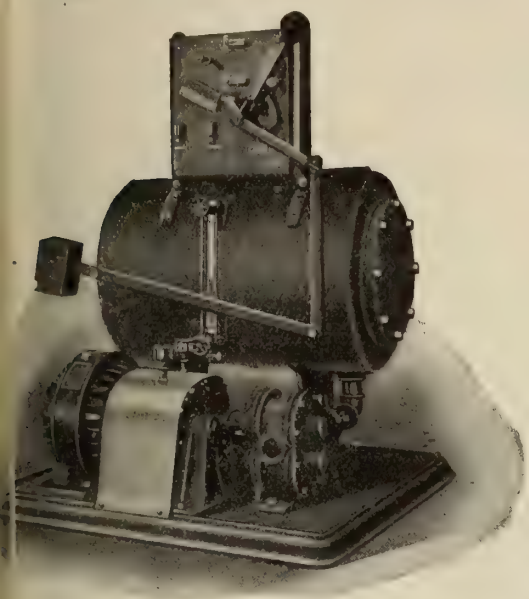
This machine has a coping attachment at one end, a plate shear at the other and two intermediate 45-degree angle shears. The coping attachment can also be used as a punch.

It is built by the Covington Machine Co., of Covington, Va., and is equipped with a 25 h.p. type S direct current motor manufactured by the Westinghouse Electric and Manufacturing Co., Pittsburg, Pa.

MOTOR DRIVEN PUMP.

The accompanying cut illustrates an automatic feed pump and receiver, equipped with motor driven rotary pump,

built by the Smart-Turner Machine Co., Limited, Hamilton. These outfits are specially designed for returning water of condensation to boilers, in plants where the boiler pressure is in the neighborhood of one or two pounds per square inch. The same receiver, with regulating device, etc., may be used in conjunction with either of their Centrifugal, Triplex or Duplex Power Pumps.



Smart-Turner Motor Driven Pump.

NEW PIPE THREADING MACHINE.

The motor driven pipe threading machine shown by the accompanying picture is one of several recently installed by the Stoever Foundry and Manufacturing Co., Myerstown, Pa., at the pipe mill of the Spang-Chalfant Co., Sharpsburg, Pa. The capacity of the machine is from 4 to 12 inches inclusive. The installation is of especial interest in that the pipe threader is the fastest machine for threading or cutting pipe on the market. It is threading pipe at the rate of 28 feet per minute; a very fast speed for a tool of this size.

Stoever Pipe Threading Machine Equipped with Westinghouse Motor.

The machine is driven by a Westinghouse type, "HS" squirrel cage induction mill motor, which has the rugged construction and the general reliability required for such service. The normal rating of the motor is 10 horsepower and the full load speed is 875 r.p.m. on a three phase, 25 cycle, 200 volt circuit. Squirrel cage induction motors of suitable design are especially appropriate for this class of service, since the speed is constant and there are no sliding contacts. The motor shown has the distinction of being the first squirrel cage induction motor designed especially for heavy mill service; the only wearing parts are the bearings, which are very large, rigid and self oiling, and capable of maximum service. The motor is started by means of a Westinghouse auto-starter.

UNIVERSAL RADIAL DRILL.

The machine shown in the accompanying illustration is a new full universal triple-geared radial drill recently brought out by the American Tool Works Co., Cincinnati. This machine is an entirely new development in the field of radial drills built in 4, 5, 6 and 7-in. arms lengths.

The design of the arm of this new universal radial has eliminated many weaknesses. It is made in the form of upper and lower tube sections which are bound together in the back by a double wall of metal and further reinforced by heavy transverse ribbing. On the front wall "ways" are formed for carrying the unusually wide and rigid saddle, which is firmly locked at any point along the arm by means of a powerful clamping device. This, in addition, binds together the double arm sections and saddle into a very compact unit, thus affording unparalleled strength for resisting all strains. Arm is clamped to column by two binder levers, obviating loose wrenches, and is raised and lowered rapidly by a double thread coarse pitch screw, hung on ball bearings, and controlled by a convenient lever, marked ears indicating the proper direction to throw lever for raising or lowering. This lever cannot be operated until slightly raised from its bearing, thus guarding against accident through unintentional movement while the arm is clamped to column. Arm is rotated in a complete circle by worm engaging worm wheel cut in the periphery of the arm flange. This movement, in connection with the swivelling head, permits drilling and tapping at any angle radiating from the centre of a sphere and is firmly clamped, as set, by four large binder bolts. Arm is graduated in degrees on its periphery, readings being taken at a fixed pointer.

The head is of very compact design and is equipped with powerful steel triple gears. It may be swivelled through a complete circle by means of a hand wheel and worm which engages a worm wheel fixed to the head. This feature is of special value in setting the spindle for angular drilling. The worm holds the swivelling head in any position and eliminate all possibility of accident, through the head swinging around of its own weight, when the clamping bolts are loosened. The hand wheel affords quicker motion than the use of a wrench. Graduation on head show, at a fixed pointer, the angle as set, and three binder bolts are provided for securely clamping the head at any angle. Head is moved rapidly along the arm by means of multiple gearing and rack, through the same hand wheel that swivels the head, by simply engaging the clutch shown. A binder is supplied which permits of readily locking the head at any point along the arm.

A feature of merit is found in the power-transmitting elements between the arm shaft and the spindle. The saddle shaft, which forms part of this connection, is offset to one side of the spindle and is mounted in two long bearings, one of which is integral with the saddle and the other with the swivelling head. Power is transmitted from the saddle shaft, through mitre gears, to a shaft in the front head, from which the spindle is driven through spur gears. This construction eliminates the cramping, consequent loss of power and rapid wear.

The spindle has 24 changes of speed, with speed box drive, or cone pulley drive with double friction countershaft, advancing in geometrical progression, ranging from 19 to 314 r.p.m., all immediately available by means of two levers, without stopping the machine. The wide range of speeds obtainable, together with the enormous power and unusual rigidity, render this drill equally efficient when using either the ordinary carbon or high speed twist drills, and particularly fits it for a wide range of tapping requirements. A speed plate, fixed to the arm girdle, shows at a glance how to obtain suitable speeds for the work being operated upon. Spindle is provided with both hand and power feeds also with quick advance and return.

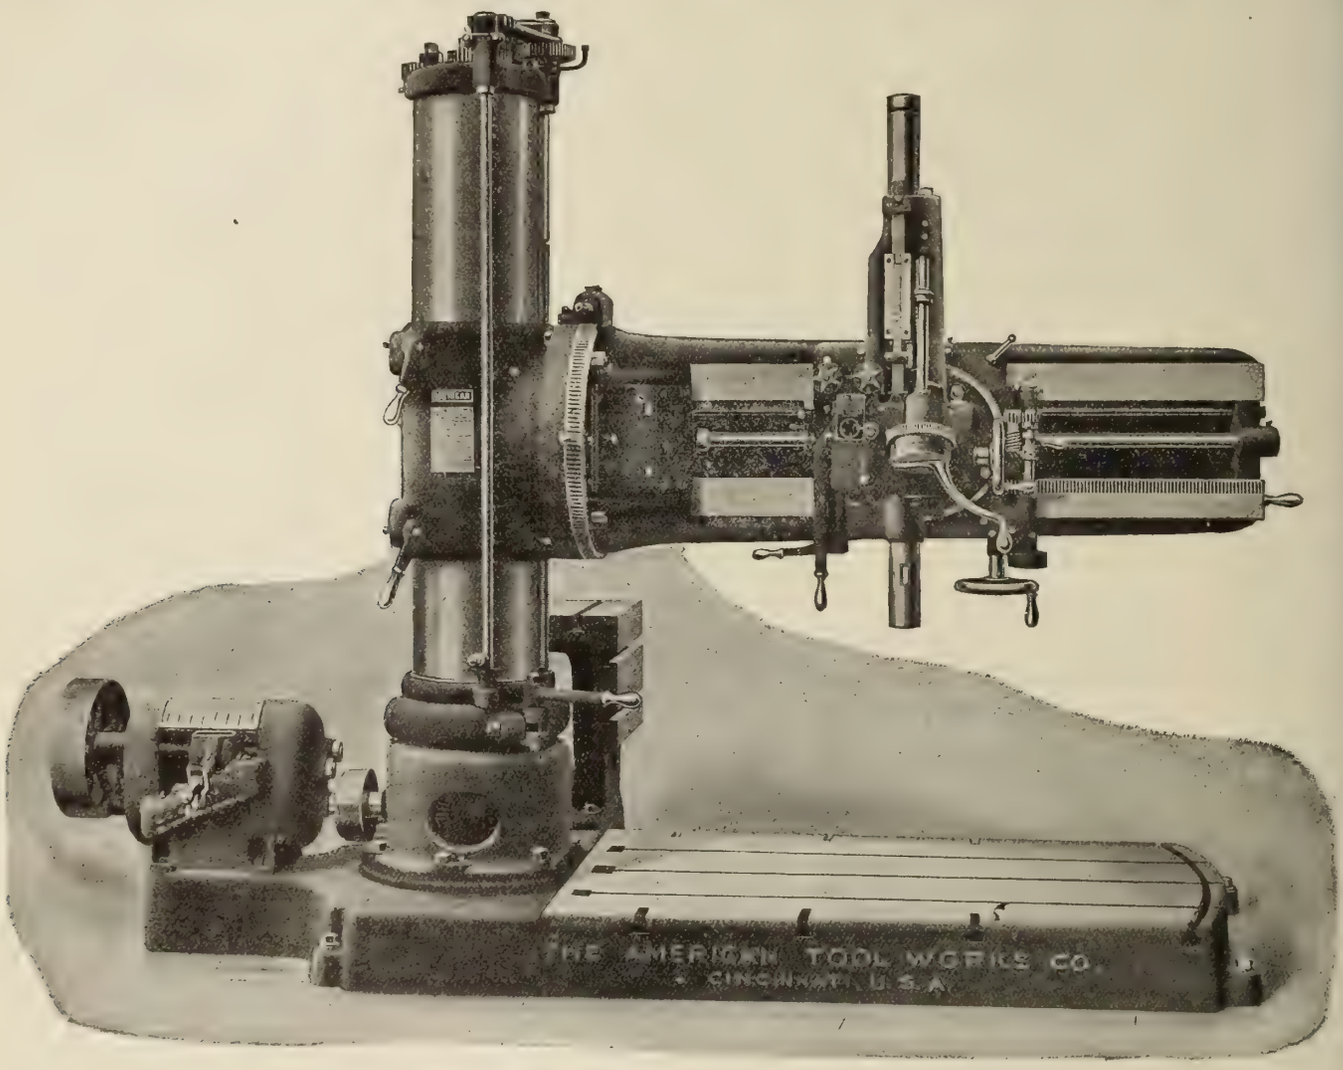
Triple gears are made of steel, are of powerful design and provide one direct and two reduced speeds, through the medium of spur gears and positive clutches. They are operated from the front of the head saddle by a convenient lever, without stopping the machine. Triple gears are mounted on the back of the saddle and are fully enclosed by the upper walls of the arm, thus permitting the universal arm to be rotated through a complete circle with no possibility of any overhanging mechanism interfering with the work being machined. This is a distinct feature on this drill.

Feeding mechanism is located on the head and provides eight distinct rates of positive geared feed, covering a care-

fully chosen range in geometrical progression from .006-in. to .060 in. per rev. of spindle. This mechanism is controlled by two dials, on the face of which the respective feeds are plainly indicated. Any one of the feeds is instantly obtained by merely turning the dial until the desired feed comes opposite a fixed pointer. The rate of feed being used is plainly indicated at all times and reference to index plates is unnecessary. The feed train is engaged and disengaged at the worm wheel through a friction trols the quick advance and return of clutch and lever, which lever also conthe spindle. This feed friction is so designed as to permit the machine being crowded to the limit of its capacity without unduly straining the feed works.

The tapping mechanism operates through our patented double band friction clutches, which afford considerable more frictional power than any other type of friction of similar size. The lever for operating this mechanism is placed on the front of saddle and controls the starting, stopping and reversing of the spindle. Owing to the fact that the tapping attachment is located between the speed box and triple gears, the frictions, already very powerful, receive the benefit of the triple gear ratio and have comparatively light duty to perform, thus making possible unusually heavy tapping without undue strain, and permitting taps to be withdrawn at an accelerated speed. The great power of the frictions require but a light adjustment, and the lever operating same is consequently thrown in and out of engagement with very slight amount of effort.

The speed box is of the cone and tumbler type and provides eight changes of speed, each one of which is instantly available by the mere shifting of the tumbler lever. All gears in box are made of steel and are of very coarse pitch and wide face. The gears in speed box are of the Brown & Sharpe "20 degree involute pointed tooth system."



Radial Drill, The American Tool Works Co., Cincinnati.

CANADA'S LEAD BOUNTIES.

The Dominion government bounty for the production of lead ore from Canadian mines, delivered at Canadian smelters for treatment during the fiscal year ended March 31, 1910, operated as follows :

There was a total production of 45,-167,515 pounds, and the bounty, $15 per ton, amounted to $310,542. The bodnty paid for the fiscal year 1909 was $307,432, indicating a production of 42,533,387 pounds of ore. The Canadian lead production is chiefly from the Kootenay mines in British Columbia, and a few years ago was shipped almost entirely to the smelters in the United States. The bounty system has resulted in the ore being smelted in Canada and, to a large extent, used in this country in the manufacture of white lead and other products. The bounty is paid upon a sliding scale, based upon the price of lead in London. It is 75 cents per 100 pounds until the price in London exceeds £14 10s. ($70.56) per ton. Should the price on the London market reach £18 ($87.60) the Canadian bounty would cease altogether. But this is not likely to happen. The London quotation on July 1 was $61.10.

POWER AT 25 CYCLES vs. 60 CYCLES

By C. L. Gulley, B.A.Sc.

The conditions that to-day exist in the central station business in the City of Toronto, are not new to the electrical profession, as they are being experienced or discussed in every city of any size in Canada and the United States. The electrical world has seen advances in the last few years that at first seemed incredible, and at which people still wonder. Among these advances is one which is attracting the attention of the citizens of Toronto, possibly more than any other; the writer has reference to the enormous strides taken in the development of the transmission line. The reason for this is directly due to the degree of perfection to which the insulation problem has been worked. Not many years ago 110,000 volts was considered by electrical engineers as impracticable, owing to the difficulties experienced in obtaining an insulating material, which would stand up under such a strain. However, these difficulties have been met and overcome, and to-day, as a result, we have entering the City of Toronto, a transmission line, which will work under a pressure of 110,000 volts.

Power, in electrical units, is the product of volts and amperes; so that, within limits, for a definite amount of power transmitted the higher the voltage the smaller will be the current, which means the line loss will be smaller as the line loss, which mainly consists of copper loss, depends upon the amount of current flowing. Thus, any means of lessening the current is immediately substituted, and as can be seen from the above statement the only way to do this is by increasing the voltage under which the line is being worked. Also, as the current is decreased the cross-section of transmitting copper can be decreased, which means a very considerable saving in the line copper. Also as the copper is decreased, the weight of the line is decreased, causing a decrease in the size, strength and number of the towers. On the other hand, as the voltage is increased (i.e. decreasing the current for a definite amount of power transmitted), the cost of insulating the line increases very rapidly. Thus, as we evade one source of expense to the first cost of the line we encounter the other. However, for any large amount of power transmitted on a low voltage line, the line loss as well as the cost of the copper and towers necessary would be enormous, and would more than balance the increased cost of insulating the high voltage line.

The 25 cycle problem, which is being worked out in Toronto is one which depends directly upon the transmission line, as power can be transmitted more cheaply, i.e., with less line loss, at 25 cycle per second, than at 60 cycle per second. Anything that will lessen line loss without materially affecting line cost is at once grasped.

Line loss depends upon the resistance and the inductive reactance of copper wire, and the charging and leakage current. The last two depend upon the voltage of transmission.

From the table of physical and electrical constants of copper wire for Matthiessen standard wire at 60 degrees Fahrenheit for transmission line calculations, as found in the Standard Handbook for electrical engineers, we find a very considerable difference in the charging current and inductive reactance, when calculated for 25 and 60 cycles.

Table of Physical and Electrical Constants for Copper Wire.

Frequency in cycles per sec.	Size of wire, B. and S.	Interaxial distance in inches.	Resistance per mile of one wire in ohms.	Inductive resistance per mile of one wire in ohms.	Charging current in amperes per mile per 100 volts between wire & neutral.
	No.				
25	0000	72	.2540	.3033	.00243
60	0000	72	.2540	.7278	.00584

The writer has chosen the constants affected by the frequency, and in each case it is found that the line loss will be decreased by transmitting at 25 cycles instead of 60. The resistance of the copper wire and the leakage current are unaffected, but the inductive reactance and the charging current are each decreased 58 per cent.

Before the days of the long transmission lines, alternating current was practically standardized at 60 cycles per second. However, now that the citizens of Toronto are being supplied with power from Niagara Falls at 25 cycles per second, it means that the central station man must either install special motor generator sets to change the frequency or arrange to have the 60 cycle apparatus removed and replaced by similar 25 cycle machines. In the case where there are a great many consumers already using current at 60 cycles per second it is a better proposition for the central station man to install his frequency changes and to stand the increased loss in the changing of the current, and in distributing to his customers, but where the consumers are comparatively few and scattered over large areas it is better for him to have the system changed as a few customers can be changed with very little trouble for the customers or for him. On this account we find the Toronto Electric Light Company changing its current in the outskirts of Toronto, where industrial power-using establishments are scattered.

One great drawback to 25 cycle current is that it will not operate satisfactorily an arc lamp. Where an arc must be used, as in a moving picture theatre in which place a most intense light is necessary, it means the installation of a motor generator set or better, a mercury rectifier set. A mercury rectifier set is preferable for it works at an efficiency of 93 per cent. and 97 per cent. against an efficiency of 70 per cent. to 80 per cent. for the motor generator set. The upkeep of such a rectifier, however, is against it, as there is an expenditure of $30 to $40 per annum for bulbs, the life of a bulb being 800 to 1,200 hours, whereas, with a motor generator set, neglecting burn-outs, etc., there is no direct outlay.

For incandescent lighting the two currents are interchangeable. Upon observing minutely a lamp burning on 25 cycle current one can detect a flickering, which is absent in a lamp burning on 60 cycle current. This flickering is generally considered to be so slight as to be harmless to the eye.

Motors designed for 25 cycles do as good work as those designed for 60 cycles, the former, however, being more expensive, owing to the fact that more iron and copper are necessary. The no-load speeds obtainable with 25 cycle motors are 1,500, 750, 500, 375, etc., r.p.m., while those with 60 cycle motors are 3,600, 1800 1,200, 900, etc., r.p.m., downwards. Thus, we see in the case where a direct connected motor generat-

or is essential or where there is a direct connected tool, the highest permissable speed with 25 cycles is 1,500 r.p.m., which may or may not fill the requirements. Where connection is made by means of belt and pulleys any difficulties of this nature can be eliminated by varying the sizes of the pulleys.

Then to sum up:—power alternating at the rate of 25 cycles per second, is much more cheaply transmitted and distributed than power alternating at 60 cycles per second; to distribute at 25 cycles per second eliminates the use of frequency changer sets in the central stations; and with the exception of arc lamps one operates electrical appliances as well as the other.

The Machinery and Equipment of a Steel Suction Dredge

An Account of the Dredge under Construction in Toronto at the Polson Iron Works, for the Great Lakes Dredging Company, Port Arthur.

The large suction dredge built at the Polson Iron Works, Toronto for the Great Lakes Dredging Company, Port Arthur, is completed. The contract was divided between the Polson Iron Works and the Bucyrus Co., South Milwaukee, Wis., the former company doing the greater portion of the work.

The vessel, Fig. 1, is of steel construction throughout. In length, it is 125 feet, with a 40 ft. beam, and the main hull is 9 feet deep, will draw, when completed, about 5 ft. 6 in. of water. This main hull has been divided into two longitudinal, and three transverse, water tight bulk heads, making 12 water tight compartments. This precaution has been taken to prevent sinking of vessel in case of accident to shell, as two, or three compartments might be filled and the dredge still remain afloat.

The main deck house is 96 ft. long by 32 ft. wide, and is 9 ft. in height. In this and the main hold, are all the power mechanisms of the boat. On the forward part of the roof of this main deck house (not completed when photograph was taken), is the operating cabin, behind which is a steel house 40 ft. x 22 ft., for the living quarters of the crew.

Cutter Head.

The cutter head is a single open hearth steel casting, 5 ft. 10 in. in diameter by 4 ft. 8 in. long, and consists of eight extra heavy blades, radially set from a hub at the end and running back spirally to a 3 in. by 8½ in. back ring to which they are cast. This cutter head is mounted on a forged steel shaft, rough turned between bearings.

The cutter shaft is driven through three sets of gears by a 10 x 14 horizontal, double reversing steam engine, in the hold of the dredge.

The suction ladder shown in Fig 1 at A is 57 ft. long and 16 ft. wide at the inner end, tapering to the cutter head, and is of exceptionally heavy design consisting essentially of two heavy plate girders strongly cross-braced. The ladder is supported at its inner end by two trunnion bearings, one of which is hollow, and forms the suction pipe connection to the pumps. These trunnion bearings have removable caps, so that the ladder may be completely removed without disturbing the rest of the machinery. The ladder is suspended from a structural steel jib which in turn is suspended from a structural steel A-frame (the latter shown at B, Fig. 1), both of which are pin-connected to the deck. The hoisting tackle consists of a continuous rope with two leads to the drum, thereby equalizing the strains on the sides of the block. The lower block is so arranged that it is always out of the water, even in the ladder's lowest position.

Suction and Discharge.

The inboard suction and discharge pipes consist of 20 in. diameter, lap-welded, steel pipe, ½ in. thick, connected to the pump by steel casting reducers. To insure safety from sinking in case the discharge pipe should become ruptured, the latter is jacketted. All elbows in both suction and discharge pipes are open hearth steel castings, and are provided with man-holes for the ready removal of obstructions such as stones and stumps.

The centrifugal pump, Fig. 2, which is unlined, has a 78 inch diameter runner. Both suction and discharge orifices are the same in size, 22 inches in diameter. The casing is a single open hearth nickel-chrome steel casting, with the maximum thickness in the region of the greatest wear, and it is braced by radial ribs extending around the shell from the suction head flange to the similar flange on the back. As these ribs increase the thickness of the shell available for wear, the life of the casing is increased. The front and back heads, which are also unlined, are steel castings. The back head has brackets cast on to be attached to the base to which the pump shaft bearings are attached. The runner is a single

Fig. 1.—The Dredge Shuniah Before Launching, Polson Iron Works, Toronto.

steel casting of shrouded type with five curved arms. The pump shaft is made in two parts to facilitate the removal of the runner from the casing when so desired. These shaft parts are connected by large clamp couplings. The section of the shaft next to the engine has three integral thrust collars with adjustable thrust bearings of the horseshoe type.

Fig. 3.—Launching New Dredge at Polson Iron Works, Toronto.

Engine and Pumps.

The pump is directly connected through this shaft to a vertical triple expansion marine type, non-reversing engine, Fig. 2, with cylinders 15 in., 22 in. and 36 in. in diameter and an 18 in. stroke, capable of running 200 r.p.m., and of developing 700 i.h.p. at that speed with 190 lbs. steam. This engine was supplied by the Marine Iron Works, Chicago.

A 500 h.p. National Feed Water Heater supplies the boiler with water through two 7½x5x6 Blake Duplex feed pumps, working against a boiler pressure of 200 lbs. The Polson surface condenser used consists of a shell 36 inches diameter and 10 feet long, with brass tube sheets and tubes, presenting a total cooling surface of 1,200 sq. ft. A 14x16x18x18 Blake combined circulating and air pump meets the requirements of this condenser.

The electric light equipment consists of a 15 k.w. Sturtevant turbo generator set, with the necessary switchboard and connections. This supplies 180 16-c.p. lights, as well as a 14 in. search light mounted on the operating cabin.

The steam piping throughout is of solid drawn steel with cast steel flanges shrunk on. All other small pipe connections are of the usual wrought iron type with malleable fittings. All valves up to 2 in. are of brass, while those above 2 in. are cast iron with brass seats.

Winch Machinery.

The winch machinery consists of five drums operated from a double 8x10 steam engine. Two of these drums are for swinging lines, two for spud lines, and one for raising and lowering the ladder. These are so arranged that any drum can be removed without disturbing the rest of the machinery. The spuds are lifted by two parts of rope, enabling them to be rapidly manipulated when stepping ahead. They are circular in sections and are held in steel casting guides with hinged caps to facilitate shipping and unshipping. The steel casting spud points are especially designed to penetrate stiff material.

A 500 h.p. Heine water tube boiler, carrying 200 lbs. pressure, supplies the necessary steam. The boiler is similar to that used in stationary practice, except that it is encased in steel and is supported by heavy channel girders and columns. There are two drums 42 in. diameter and 23 ft. 6 in. long, and 278 3½ in. tubes, 18 ft. long. The 7 ft. x 7 ft. grate is fed by a Murphy automatic stoker, and is supplied with forced draft from a Surtevant No. 7 multivane fan.

The controlling arrangement is well arranged, for all the winch drum brakes and clutches, and the various engine valves, are all controlled from the cabin in the bow of the dredge, by compressed air supplied from an 11 in. Westinghouse air compressor.

Similar dredges have excavated successfully cemented gravel, hard pan, shale, and boulders as large as would pass the pump passages, without injury to the machinery. The average output in fair digging has been 250,000 yards per month. Recently one of these machines excavated 24,600 yards in 20 hours, or at the rate of 1,230 yards per hour.

Fig. 3 shows the dredge being launched. The overhead crane shows one of the features made use of by the Polson Iron Works in the handling of their large jobs. This crane runs the length of their erection yard, so can take care of the work for several vessels while under erection. Large shear legs, not shown in view, handle the material after the vessel is launched.

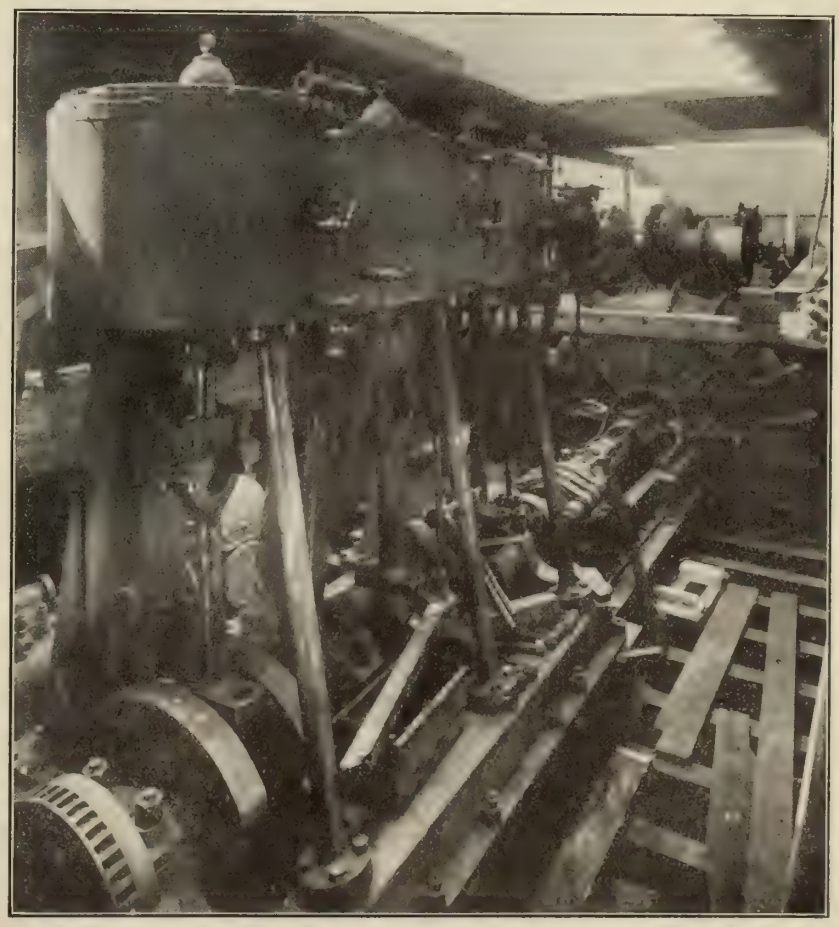

Fig. 2.—Machinery Equipment of the New Dredge Built at Polson Iron Works Toronto.

Vol. VI. August, 1910 No. 8

ABOUT CATALOGUES.

Recently we received a letter from a subscriber in British Columbia regarding catalogues. He refers to certain manufacturers advertising in trade and technical publications that their catalogue will be sent forward if the request is written on the company's letter head.

The correspondent writes: "I find from experience that it is the working engineer who wants the information about the articles and how to operate them. Sometimes the catalogue is mailed inside the box with the article and is destroyed by grease and nails."

Catalogues should be widely distributed and both engineer and company supplied with a copy. Our correspondent in his letter writes: "The firms who print advertisements and catalogues and lock them up in the safe will find it mighty hard to get their wares to leave the warehouse. I am pleased to know there are some firms who agree with me and send engineers, the men who use the apparatus, particulars of their wares.

"I know several firms who send traveling mechanics around to those establishments where their goods are used, to see that the mechanics and foremen understand them. They see that the apparatus works properly, give instructions, catalogues, etc."

Our correspondent in attempting to hit one nail on the head has struck two nails squarely on their heads. The companies wish to get in touch with the mechanic and the mechanic wishes to procure literature in regard to machinery. For the informations of the manufacturer with the catalogues we could read him the parable of the sower. Suffice it to say, however, that if the catalogues and information is not distributed, he will be the loser.

Then, again, there are mechanics who do not avail themselves of the opportunity to procure information about apparatus on the market. In addition to reading carefully his technical paper, he should send for the catalogues that are procurable. A great number of companies, we are glad to say, will willingly send catalogues on request and mechanics can become well informed on the various power rquipments on the market.

CANADA'S GROWING TRADE.

The total trade of Canada for June was $66,000,000, an increase of $10,354,623 over June of 1909. For the first quarter of the present fiscal year the total trade has been $171,173,690, a comparative increase of $36,606,000, or over 25 per cent.

Imports for June totalled $39,705,237, an increase of $8,363,675 over June of last year. For the three months imports totalled $109,384,187, an increase of $27,281,997. Exports of domestic products for the quarter totalled $57,648,937, an increase of $8,321,933.

The principal increase in exports was in agricultural products, which show a betterment of nearly six millions, as compared with the corresponding period of last year. The customs revenue for June was $5,866,906, and for the three months, $16,568,411, increases of $1,004,647 and $3,675,352 respectively.

SIGNS ON FACTORIES.

There are many ways of advertising a business, one important way being a sign in a prominent place on a manufacturing plant. This method is especially valuable if near a railroad or waterway. This method should be followed to acquaint the traveling public with the name and nature of the business.

Some large manufacturers neglect this form of advertising and they are often losers on that account. A traveler on a railroad is often prompted to ask what industry is located in certain buildings along the railroad. If there were a large sign, his question would be answered at once.

Then a conspicuous sign is a time-saver. A traveller or a customer visits a new place to select new equipment. There are a number of plants and he loses valuable time finding the one he wishes to visit. If he has only a short time between trains, every minute is valuable.

Then there is another viewpoint, the ethical courtesy. Be sure, Mr. Manufacturer, you will some day, if you haven't already done so, appreciate the courtesy of other manufacturers erecting an artistic sign in a prominent place. A sign is a good investment, which gives an air of prosperity to a plant and in addition is an excellent advertisement to the traveling public.

SECURING GREATER EFFICIENCY.

Black stained woodwork and furniture with dull terra-cotta red wall surfaces, the secretary of one company selected as the color scheme for a factory office, lighted on north and south sides by what practically amounts to glass walls, so great is the window area. The color combination is unique but the results are excellent. There is no reflected glare from the furniture.

All stock articles for which there is much demand are placed near the counters in one stockroom, to save time in filling orders. Those for which there is only occasional call are placed in the rear and away from doors. This, one manager finds, saves a lot of unnecessary handling.

25 CYCLE vs. 60 CYCLE.

Elsewhere in this issue is an article on "Power at 25 cycle versus 60 cycle in Toronto." This article treats on a subject that is of considerable interest at present due to most of the Western Ontario municipalities taking Hydro-Electric power from the Commission, all of which is transmitted at 25 cycle. The conditions prevailing in Toronto being necessarily much the same as elsewhere, the article is of general interest.

Mr. Gulley is in a position to be quite conversant with the conditions as they prevail, being in charge of part of the change-over from the 60 to 25 cycle in Toronto, so that what he states may be looked upon as authoritative.

As mentioned in this article, it is only profitable to change-over where the power users are scattered, as otherwise the cost of the change would be prohibitive, the saving where the transmission distance is short not warranting the extra expenditure of replacing the machine. For that reason, in Toronto, change-overs are only being made east of the Don, and in Parkdale, as in these districts, the industries are scattered. Similar changes have been made in other Western Ontario cities, the power companies changing over, and thereby compelling the power users to change their equipment to suit.

Mr. Gulley shows conclusively that it is much to the advantage of the operating companies to transmit at the lower frequencies, the figures he cites proving his statements.

This article will prove of interest to the majority of our readers, for it does not appear to be generally understood why this general change-over is being made.

LET US AVOID HYPROCRISY.

The extra-provincial tax of British Columbia is a menace to inter-provincial trade. There is no doubt about it, and no one denies it.

It is a sort of McKinley Act levied against the other provinces composing the Dominion.

But while this is true, do not let us who live and do business outside British Columbia play the hypocrite. These British Columbians may be sinners greater than we are in this one respect, but none of us can lay claim to being altogether free from narrow provincial legislative sins of the type which has been placed upon the statute book of British Columbia.

Several of the provinces have rather drastic laws on their statute books in regard to extra-provincial companies. In Ontario, for example, the penalty for non-registration is the same as in British Columbia, namely, $50 a day for the company and $20 a day for the agent or representative. And then some that have not extra-provincial taxes, permit municipalities to levy taxes upon commercial travelers, which is even a more irksome form of taxation.

Wherein the British Columbia Act chiefly differs from similar Acts on the statute books of Ontario, Quebec and Manitoba is in its enforcement. British Columbia seems determined to strictly enforce the law; the other provinces that possess a similar law are in the main unconcerned about its enforcement. The Vancouver Board of Trade has failed to induce the Attorney-General to suspend the operations of the Act for even six months.

The enforcement of the law will certainly interfere with trade relations between British Columbia and the other provinces.

But the tax of $25 to $250, according to the capital stock of the company, is not the worst feature of the legislation. It is its narrow provincialism that is most to be deprecated.

It is nationalism, not provincialism, which should be the aim of every Canadian to develop.

A law which, according to the Attorney-General's own word, declares it to be illegal for a person in British Columbia to order goods from a non-registered company located outside the province, certainly does not savor of nationalism.

Before, however, the business men of eastern Canada seriously undertake the modification of the objectionable British Columbia Act, would it not be well for them to begin at home? Their laws, in practice, may not be as aggressive as that in British Columbia, but they are on the statute book, and as long as they are thereon they can scarcely, with clear consciences, undertake the regeneration of their fellow sinners in the Pacific Province.

BAN ON THE SECRET REBATER.

The secret rebater is becoming more and more unpopular, and it begins to look as if Canadian salesmen were to be divided into two great moral classes—the secret rebater and the honest salesman who depends upon his ability.

The man who stoops so low as to offer a rebate in order to cover up his lack of salesmanship does not deserve the support or glad hand of his fellow traveler. His competition is most unfair; not only that, it is criminal in the eyes of the law.

Recent cases have come to our observation where travelers have declined to recognize their confreres on the street because the latter have been guilty of an offence of the criminal code in respect to secret rebates.

Under ordinary circumstances their action in keeping aloof from their competitors should be discouraged. But in the case at hand are they not justified to a certain extent in ostracising them?

The secret rebater is rapidly becoming unpopular, and rightly so. Business should be done on honest principles —a salesman should rely on his salesmanship ability, the standard of his goods, and the reliability of his house, and not on rebates contrary to the criminal, as well as to the moral law.

A large machine tool company used large quantities of cutting and threading oil in their screw machine and turret lathe departments, buying in barrel and carload lots. It was suggested that they could save money by purchasing their oil in tank car lots and compounding it themselves. A series of tests was conducted with varying proportions of different oil, different prices, and so on. The result showed to their satisfaction where by so doing an oil equal in quality to what they had been using could be had at such a reduction in price as to result in a saving of from six thousand to seven thousand per year.

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

FOUNDRY EFFICIENCY.*

By Benj. D. Fuller, Cleveland, O.

The question of raising the efficiency of the shop is ever a live one, be it the machine, pattern, smith, boiler shop or foundry. Hence, I feel it will not be trespassing upon the time of this body to ask you to devote a few minutes to the consideration of methods which have been tried and, so far, proven successful.

First, consider the question of excess weight on castings due to careless ramming, weak flasks and loose bars, weak boards, soft pit walls, etc. What does it mean? Not only a poor casting, but an expensive one in many ways. If it be a small casting, say one properly weighing 5 lbs., the order calling for the delivery of 1,000 daily, and you produce one thousand castings which, due to some negligence, average 5½ lbs., then the day's work shows 500 lbs. excess weight at .008 per lb., equals $4 per day for the one pattern, iron cost only. Now while the foundry will probably receive credit for the extra weight, it means a loss, however, to the company, who charge a certain figure for the finished equipment.

Another loss is in machinery, as jigs will not fit properly, etc., and when your foundries are in one city, and your machine shops in another, there is the extra freight charge from foundry to factory, and again the extra freight charge when shipping the finished equipment. If the casting is a heavy one, such as an engine or generator bed, armature, spider, field frame, etc., something weighing 15 to 40 tons, the case is more marked, a variance of 1,000 lbs. or more in two castings from the same pattern is not extraordinary. This, when your freight shipments are thousands of tons monthly, means much.

Now awaken a live interest in this question in your foremen, and the result is not only a saving in dollars and cents, but the satisfaction of noting a marked improvement in the quality of output. In our case a card record of shipments by pattern number is kept, upon which card weights are recorded as separate shipments are made. When gains or losses show, the case is tabulated in a monthly report, which is totaled at the close of the month, each foreman's department being segregated.

Many disagreeable surprises are in store for any one compiling such a report, but when the foremen are gathered to discuss the question, and marked cases are brought to their attention, it "sinks in," with the result that, as in our case, it shows a decided total gain.

Following up this matter has also emphasized the advantage of the molding machine, as invariably the transfer from hand to machine molding shows a decided gain in quality, as well as reduction in weight. This may not appeal to the man who sells his castings by weight, but it will appeal to his customer from both standpoints.

A striving to improve a record among the foremen, must needs awaken an ambition among the men, and nothing is better for the shop than to get the men interested in a sort of contest of this kind.

Another method being employed, and which promises well, is an efficiency record, whereby a report is tabulated daily showing the amount cast in pounds by each man, the amount good and amount bad. The per cent. of scrap made in each department, or bay, in a given period, usually from one pay to another, and whether a man is over or under the average of his bay for this period.

A foreman's record is determined by the average of all the men working under him. This individual record is kept by card index, so that any man may be shown up at any time. No bluff as to "how good you have been" can be carried out in the face of this record. And on the other hand, the deserving can be singled out. This card record is of considerable value when men ask for advance in rate from time to time. By a glance it is easy to determine a man's comparative value. For instance, if a man's record shows that he has made more scrap than the average of his department, you would not waste much time in argument with him.

Copies handed to each foreman of a daily tabulated report showing the number of castings made from each pattern, and the number which were defective, in a parallel column for comparison, will also "help some."

The coremaker is also kept tab upon, and opportunities afforded the ambitious, as well as means used to stir ambition among the men and boys. Here is a method of handling the yard labor, such as loading and unloading cars, piling and transporting stock, iron, scrap, coal, sand, limestone, clay, etc. If you have kept a record whereby each operation has been segregated as to cost, it is an easy matter to strike an average as to the cost of the whole, using as a base the average cost per ton to you at present, or the best figure you have recorded. Offer a good man in charge of the whole yard force a premium for every fraction of a penny per ton he can beat this record price. Do the same with the cupola operator as to the costs which enter into his work, charging coke, iron scrap, ladle and cupola care, etc., etc. The same with the man responsible for the cleaning and chipping of the castings, and you may be surprised at the results.

Do not make a move which will weaken the men's confidence in your fairness, and in the words of the immortal Abe Lincoln, "There may be other things which your special case requires to make you happy, but, my friends, these, I reckon, will give you a good lift."

FOUNDRY ECONOMIES.

By K. Campbell.

In a recent issue reference was made to a number of saving in the factory of the National Cash Register Co., Toronto, by which resulted in $11,400 being saved annually. The attention of the superintendent has also been given to the foundry department where a number of savings have been made.

After the brass castings came from the foundry and the gates were removed, they were brushed and afterwards dipped in an acid solution, in order to thoroughly cleanse them before they were machined. It was suggested that by using a heavier brush, the castings could be so thoroughly cleaned that the dipping process would be unnecessary. This suggestion has been tried out and works satisfactorily. As a result $565 per annum will be saved.

Another big saving was made in the foundry by subdividing the work so that the high priced molders do nothing but mold, while the clamping of molds and other similar work is done by cheaper men.

The increase of work made it necessary to get more floor space in the foundry. This was done by substituting for the coke drying stoves, gas heated stoves which take up one quarter floor space, and also by eliminating the smoking process without hurting quality of castings and thus doing away with several smoke boxes.

The Molding Machine in the Machine Tool Foundry

Actual Examples of What is Being Done in this Field of Development—Product Improved and Cost Reduced—An Assistance to the Skilled Molder.

By John Edgar.

The high quality of castings that are now required by machine tool manufacturers has forced the foundrymen to pay particular attention to the finish of the molds in order to meet these requirements. When one takes into consideration the complexity of the modern ma-

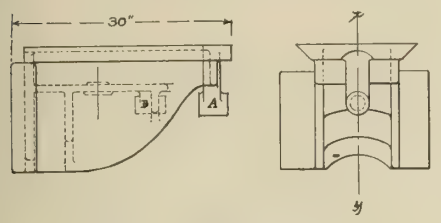

Fig. 1.—Drawing ol Knee.

chine tool with its gear boxes and box-sections, we may credit the foundry with real progress in being able under these conditions to cope so successfully with their problem.

In the March, 1909, issue of Canadian Machinery we described the method of molding pulleys on the molding machine; and in this issue some more representative examples of machine tool work will be shown.

As was mentioned in the above article the greatest drawback to the production of first-class castings was the tearing of the molds in drawing the patterns. Not only in the finished product do these torn molds show up badly, they also appear to considerable disadvantage in the cost of the castings. As the use of the molding machine eliminates

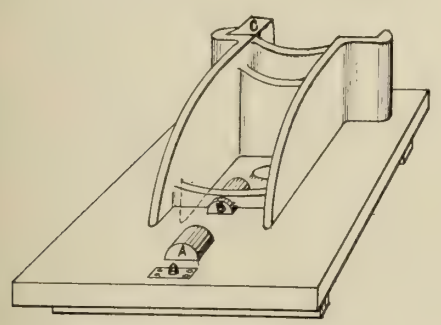

Fig. 2.—Cope Pattern Board.

these 'tears' it has a double advantage either one of which would offset any disadvantage that one may find.

One type of machine used on this class of work employs stripper plates to prevent the tearing of the molds. These stripper plates are made to conform to the shape of the pattern at the parting and the pattern is drawn back into the former position, ready to receive another flask. During the drawing and just before it is commenced the frame is struck a few sharp blows with a rawhide hammer to free the pattern from the sand. Air vibrators are also used for this purpose, and where air is available are preferable.

This type of machine is very expensive to fit up and is only available when one pattern is to be worked continually. But in machine tool work where castings are desired in limited quantities the hand ramming roll over type of machine in which the ordinary split pattern is used is the most useful.

The reason the hand ramming feature is more desirable than the power squeezer type is due to the fact that the many pockets formed by the irregular shape of many machine tool patterns makes it difficult to obtain an evenly rammed mold. In this type of machine we have the desirable features of both hand and machine molding combined.

This is the style of machine that was used in molding the pulleys, described in

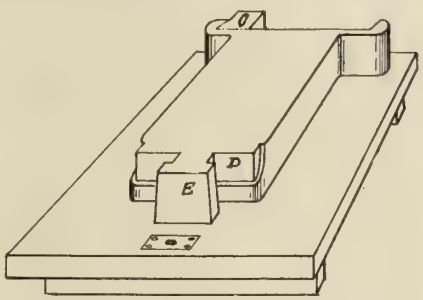

Fig. 3.—Check Pattern Board.

the March number. The operation is as follows: The pattern is attached to the board that is fastened to the roll over the frame of the machine. By means of guides the frame has a straight line drawing action, operated either by hand or air or hydraulic power. The pattern board is clamped to the rollover frame of the machine in a position such that the pattern faces upward. The flask is then set upon the board to which it is held by fixed dowels. Sand is rammed into the flask around the pattern, as in ordinary molding, the molder striking it off flush with the top of the flask. Then a bottom board is clamped to the top of the flask and pattern board so that they are held firmly during the rolling over operation, which is next in order. When the frame has been rolled over into the oposite position the clamps are removed and the frame, carrying the pattern board with it, is raised vertically until the pattern is free from the sand. At this point the frame is rolled through them when drawn from the sand. The plate prevents any sand clinging to the pattern.

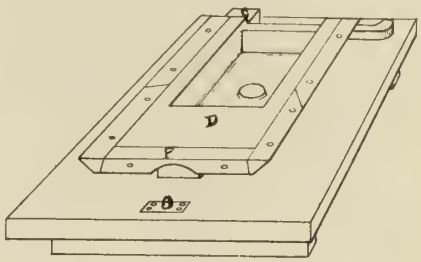

Fig. 4.—Nowel Pattern Board.

As examples of what has been done on these machines, in the way of medium heavy work, illustrations are taken of two castings that have been successfully molded on the molding machine at a great saving in time, with a considerable advantage in the matter of the appearance of the product.

Open Type Knee.

The first example is an open type knee shown in Fig. 1. This pattern was originally molded in a two part flask. In adapting it to the molding machine, a three-part mold had to be used on account of the limit in the range of the machine. The partings were made, one horizontally through the centre of the bosses A and B, on the outside, and in the inside between the boss B and the back of knee, the parting was made at the shelf. This pattern was attached to

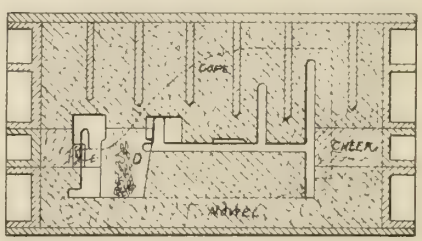

Fig. 5.—Setup of Mold for Knee.

the board along the outside parting line and the deeper parting inside was cut into the board as shown in Fig. 2 which is a perspective view of the pattern and board. The angle in the slide at the back is cored out, the print showing at c.

That part of the knee above the centre of the bosses A and B and up

to within a couple of inches of the top. where the other parting was made is shown in the view in Fig. 3. In drawing this pattern from the mold the inner boss on A and the outer one on B would interfere unless they were made loose. Loose pieces are features that must be avoided in machine molding, if possible, and in order to do so in this case a core is inserted between the two bosses, running to the board, and one is also placed

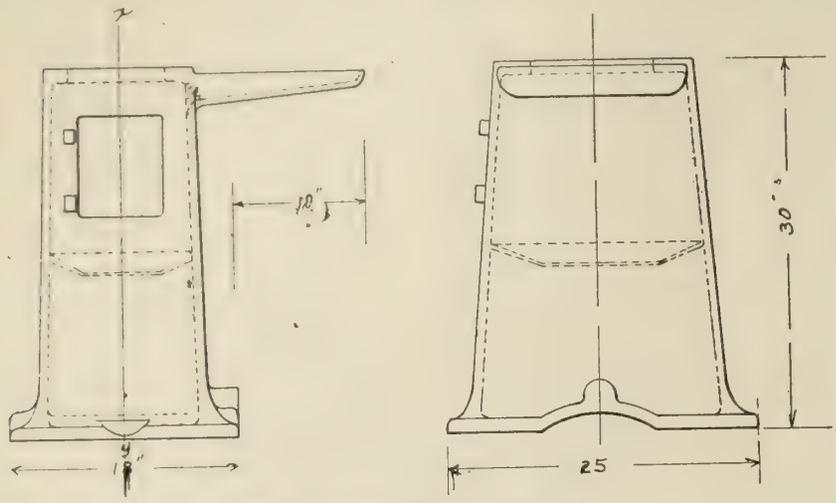

Fig. 6.—Drawing of Cabinet Leg.

under the outer boss of A for the same purpose. These cores are shown in Fig. 3 at D and E. The core D is run to the middle of the outside walls of the knee in order to preserve the rounded edge.

The rest of the mold is made up of that portion of the knee above the second parting, and the pattern and board are shown in Fig. 4. In this pattern the core D runs up flush with the top of the slide. The angles or dovetails, and also the front ledge F, are made loose, it being considered better to avoid cores that come in contact with surfaces to be planed because the tendency is to chill the iron and cause a hard gritty scale which acts injuriously on the tools. These loose pieces are held in place while ramming the sand around them by draw pins or dowels, which are removed before drawing the pattern. In order to mold the top of the shelf the board is cut out to the proper depth and the boss placed in position.

Fig. 5 shows how the three parts, match up to form the mold. The mold is poured with the face of the top slide downward, as this ensures a good clean surface free from sponginess and dirt. The dirt generally rises in the mold and any surfaces that are horizontally placed and facing downward catch it as it rises with the iron. Pouring heads and risers are not shown in this sketch as they are of the ordinary design and, as each foundryman has a way of arranging them to suit his own ideas and experience, it is not necessary to go into the details of the mold in that direction.

Much of the success in machine molding depends primarily on the pattern and unless care is taken with the draft it cannot be drawn freely from the mold. In machine molding the pattern is confined to a straight line motion vertically and cannot be shifted laterally to favor any irregularities in draft. In fact where it is possible the draft must be of a greater degree than that used in hand molded patterns. Patterns are not as a rule given sufficient draft for easy molding and this lack of sufficient draft is the cause of much of the tearing and the waste of valuable time mending the molds, as a result.

Not only should every surface of the pattern be made with a good draft, but the core prints, where they are to be drawn from the sand and where they fit into one another should be provided with a good angle of bevel. The making of cores with right angular sides causes a great deal of trouble to the core setter, who is forced to file the cores to make them fit. Pattern makers do not seem to be able to compprehend the fact that cores are made of sand and are liable to variations. A core that has to be filed to get it into the space intended for it cannot very well be expected to match up with the rest of the mold and must necessarily result in a jog at the parting.

Referring again to Fig. 1, it may be well to mention the manner in which the larger sizes of these knees were fitted for the machine. In these sizes it was impossible to part them, so as to mold as has been described, which description refers to the smaller sizes. This was due to the limited range of the machines which was for a 12" draw. So they split on the X Y centre line and molded sideways; the inside of the knee being taken in a dry sand core.

Molding Machine Leg.

Fig. 6 shows another job of molding that caused considerable trouble when made by hand. This is a machine leg with an oil reservoir inside, and a drip pan as shown. As first constructed this pattern was made to be molded upside down, the inside being cored out with a dry sand core. The depth of this mold and the effect of the core caused the casting to be very badly distorted and the walls came very much thicker than the pattern intended.

A new pattern was eventually made split on the vertical X Y axis and better results were obtained. This pattern was fitted to the pattern boards of the molding machine, as shown in Figs. 7 and 8. Fig. 7 shows the plain side of the pattern, while Fig. 8 shows the side with the projecting drip pan. This pan was the cause of some apprehension when the job was first tackled, but some little thought on the problem resulted in making the pan loose, as originally molded, which made it necessary to draw it by hand after the main part attached to the board had been drawn off. By this method it was possible to use a machine of smaller range and worked out successfully in practice. A, which is the main core, was supported in the mold on chaplets, at the bottom, as shown in Fig. 9. The core B in the pan is wired to the flask to hold it in position.

This job taxed the machine to its full capacity and the pattern could not be drawn wholly from the sand by the straight-line action of the machine, but recourse had to be made to the rolling over action as well in drawing the pattern. As the rolling over occurs at a fairly good radius from the pivot, and the pivot is so located on the machines used that the rolling over is practically equivalent to a straight draw for a couple of inches or so. By taking this into consideration a good job was event-

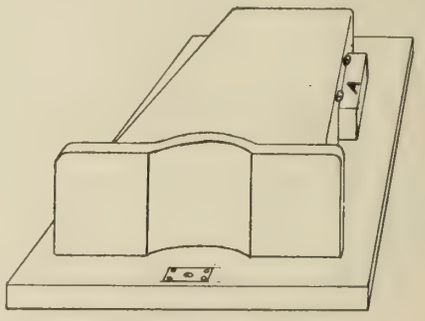

Fig. 7.—Cope Pattern Board.

ually made of an otherwise difficult one. The castings resulting—after the usual amount of experimenting—were of the highest order and were beauties compared to the hand molded product.

These two examples are only averages in the great variety that can be handled on the molding machine of the roll over type.

Many foundry masters look upon the molding machine only as a means of sub-

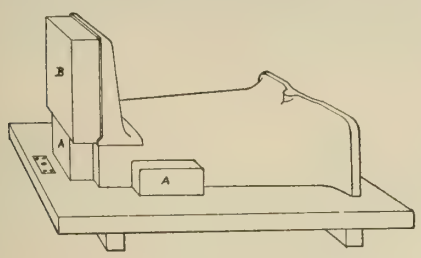

Fig. 8.—Nowel Pattern Board for Leg.

stituting cheap for skilled labor. Such a view of the matter is obviously short-sighted, for while cheap labor can be employed to a greater extent in connection with machine molding it cannot replace skilled labor exclusively. On the other hand the molder is liable also to look upon the matter short-sightedly, and to regard it as a means that will eventually deprive him of a job. Such is not the case. That a molder skilled in making the molds in the ordinary way by hand, can prove a success on the machine is only an impossibility to those that regard the advent of labor saving machinery in the old fashioned narrow manner.

The examples shown above were all handled by unskilled hands, that is, by laborers, who after a few weeks train-

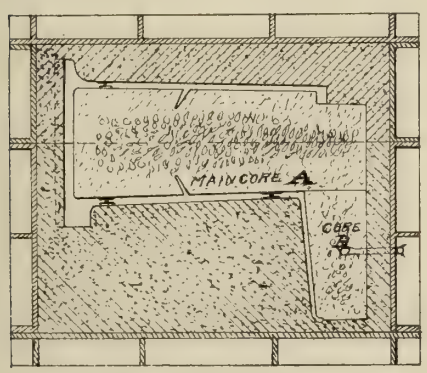

Fig. 9.—Setup of Mold for Cabinet Leg.

ing in the use of the tamper or rammer were turning out very creditable work. Their introduction into the foundry of this particular shop was forced upon the management, as even the use of the machines themselves was by trouble with the molders. Their introduction was a revelation in the possible reduction of cost and time in the production of high grade castings. To be sure, there was a great deal of loss from bad molding and the percentage was larger than seemed necessary, but after things settled down, and the excitement of breaking in a new crew and the rush from the call for castings from the machine shop was eased up—for all this occurred during the great business boom of two years ago—the percentage of bad castings was gradually reduced so that the foundry could show, not only a great saving in both time and labor cost, but a comparatively large order for castings could be turned out in a short time. In fact the foundry—as business became nearer normal—was soon running ahead.

What results could be obtained from the combination of the molder's skill and the good points of the machine can only be surmised, but, it is evident that they must be combined in this line in the very near future.

UNITED STATES AND CANADIAN FOUNDRIES.

A census of the foundry industry of the United States and Canada made by The Foundry shows a total of 6,594 foundries on April 1, 1910, against 6,366 in 1908, a net increase of 228. A similar census in 1906 showed 6,108, so that the net increase in four years is 486. In compiling the figures each plant was regarded as a unit, though there might be several departments. Counting each foundry department as a unit—there being many cases where gray iron and brass foundries are operated by one company, sometimes with a connected malleable or steel foundry—the total for the United States and Canada is 9,158. The total number of foundries producing gray iron castings is 5,157, as compared with 5,105 in 1908 and 4,956 in 1906. The plants melting non-ferrous metals exclusively, including brass, bronze, aluminum, etc., number 1,240, against 1096 in 1908, an increase of 144. Brass foundries operated as departments of works number 2,318, making the total number of brass foundry operations 3,558. The number of foundries making castings into which aluminum enters is found to be 1,679. The increase in malleable and steel foundries is noteworthy. The total number of malleable castings plants is now 178, of which 168 are in the United States. The total for the United States and Canada in 1908 was 153. The number of steel foundries is 265, against 211 two years ago.

HAD TO READ MACLEAN PAPERS.

J. E. Brown, manager of the wholesale department of Revillon Bros., Ltd., Edmonton, Alberta, paid a compliment to the MacLean newspapers recently, saying that they were amongst the brightest publications of the kind that came to his desk.

"I am a great believer in trade and technical newspapers," said Mr. Brown. "Previous to my coming to Canada, I was manager of a large mercantile house in the United States. We subscribed to some 35 of the best trade newspapers of America. I read them religiously myself and I had a system whereby the whole staff did the same, a regular circulating library. Each employe was expected to read and initial each paper in turn. If I found a member of the staff neglecting this duty he was called into my office and remonstrated with. I considered those who read these newspapers made the best men and I wanted my staff to get all the education they could out of them. The best talent in the country contribute to good technical and trade newspapers and time is well spent in reading articles calculated to sharpen a man's instincts and keep him posted."

Machines last longer in one manager's factory cared for by two men who were responsible for repairs.

The color of the order card in one brass foundry indicates the grade of metal to be used in casting small parts.

A master molding machine is kept as sample in the pattern room of one factory, and all repairs on the molding machines are made in accordance with it.

Factory forms in one plant are padded at the printers. This saves much waste. By buying large quantities the extra cost of padding is negligible.

The manager of a plant consisting of several mills, has the superintendent of one plant visit the other. This man makes a report of what he sees that in his opinion might be changed to advantage. And the manager gets the advantage of a fresh point of view on the work.

A new factory telephone system, made up of nine telephones, installed at a total cost of two hundred and seventy-nine dollars, in a three-storey factory, during the first year saved enough time in the different departments to repay the company for installing the instruments.

A very successful lacquer and one easily prepared for covering brass is made by dissolving 17½ ounces of good brown shellac in one gallon of the best 95 degree alcohol, wood alcohol will not do. The brass should be clean, dry and heated when the lacquer is applied. The brass should not be so hot the lacquer will run off it. The lacquer should be cold and 3 or 4 coats applied with soft brush.—Factory.

The Large Foundry of the Aluminum Castings Co., Detroit.

Features of the World's Largest Aluminum Foundry

Layout is Arranged on the Unit System, there being Ten Units, Five of which are in Operation, Large Windows, Electric Cranes, Molding Machines, etc.

The automobile industry is responsible, to a great extent, for rapid developments in machine tools and foundry equipments.

Detroit is rapidly forging ahead as a leading foundry centre. It is now a great automobile centre. To keep pace with the growing automobile trade the Aluminum Castings Co., Detroit, have under erection the largest aluminum foundry in the world.

The foundry consists of ten units, five of which are now in service, and contains many valuable modern features. The layout of the foundry is unique, in that it is arranged on the unit system, each unit being practically a detached foundry, provided with its own core room and melting departments.

The entire plant is in charge of a superintendent, to whom the foremen of the various units are responsible. This system permits the classification of work, the light and heavy, large and small castings being each made in separate units. By this division of work the men become more efficient, and operation costs are curtailed.

During periods of limited demand the unit plan of operation permits the shutting down of any number of departments, thereby eliminating a large portion of the expense entailed in operating a large foundry on a limited output.

The entire plant, ten units, is 600x 264 feet, and each unit is 60 feet wide. The melting furnaces are located in two lean-tos, 20 feet wide and 80 feet long, which are divided from each unit by a brick wall, making each melting department approximately 40 feet long. Extending through the centre of each foundry is an industrial track which leads to a wide passageway running the length of the plant, and at right angles to the foundries and the core departments. A narrow gage track is laid through the centre of this passage, which communicates with the tracks in each of the units. This industrial railway system affords excellent transportation facilities throughout the plant, and is used for delivering sand, flasks and patterns to the various foundries, and for the shipment of the castings from these units to the cleaning department. The passage way also serves to separate the core rooms from the foundry units.

Grinding and Shipping Department.—The grinding and shipping departments are located in unit No. 1, and in the core room end are the pattern and machine shops.

The chipping is all done on one side of the shop, the pneumatic shippers taking their air from an overhead line extending the length of the building. On the opposite side is a band saw.

For cutting off gates, two motor-driven grinders are provided.

The castings, after the removal of the cores, are delivered to the department on cars operating over the industrial track system previously described.

Aluminum will be cast in the ten units, and in the additional sections to be added later the three Detroit brass foundries operated by the company will finally be consolidated.

The sand-preparing plant for the entire foundry is located in a basement extending partially under unit No. 1, the mixing machinery being located in the basement underneath the pattern shop. A chute, covered with a grating, leads from the chipping department to the sand-preparing plant, and castings reaching the shipping department without the cores removed will be shaken out over the grating. The sand receiving track parallels the core room side of the foundry and the sand is unloaded from cars into chutes leading into the basement.

Core Department.—The core ovens are oil-fired and the fuel cost averages only from 7 to 10 cents per night for each oven. The white appearance of the cores is due to the core wash used, with which all of the cores are sprayed in place of coating them with plumbago. This gives the cored surface of the castings a very smooth finish, which is essential.

Melting Department.—The melting departments for each foundry are located in lean-tos on the end of the plant, opposite the core room. They are equipped with oil-fired, aluminum melting furnaces, and in addition, crucible melting furnaces are installed in each.

The air is delivered to the furnaces from an over-head main from the blower plant. The aluminum furnaces are simple in construction, being made of steel plate lined with fire brick. The cover handles are pivoted in the centre, which permits the covers to be swung aside when ladling out the metal or charging. Each melting unit is provided with a metal storage locker, entirely enclosed with heavy wire netting, to which the melter only has access. This arrangement permits of keeping an accurate record of the metal used in each foundry unit.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

OTTAWA.—The Department of Agriculture have awarded the contract for the building of a quarantine steamer for the Immigration Department to the Kingston Shipbuilding Co. The steamer will be located at Grosse Island and will cost $60,000.

WINNIPEG.—The National Transcontinental Railway Commission have awarded a number of important contracts for the workshops here. The Morgan Engineering Co., of Alliance, Ohio, secures the contract for one 140 ton electric traveling crane; Mussens, Ltd., Montreal, were awarded contracts for eleven electric (Booth) cranes; George Anderson & Co., Montreal, one five ton grey iron foundry crane, five hand power traveling cranes and 15 (Gib.) cranes, Whiting Foundry Equipment Co., Harvey, Ill., 20 (Gib) cranes and twenty foundry equipment cranes.

QUEBEC.—The Carnac-Marquis Glue Co., of this city, are making some important changes in their already well equipped factory. They are located at St. Malo and have decided to introduce electricity for their whole establishment, that is for operating purposes. The power will be supplied by the Quebec Railway Light & Power Co., and the machines by the Canadian Westinghouse Co.

ST LAMBERT, QUE.—The Monarch Electric Co. will build a manufacturing plant here providing the town council will grant exemption from taxes and also free water for twenty-one years.

WINDSOR.—The promoters of the Windsor steam laundry have abandoned their original plans and instead will start a shirt factory. The company will erect a $40,000 plant here. Between 25 and 50 persons will be employed.

NEW TORONTO.—The Dominion Abrasive Co., being a combination of Canadian and American interests, have purchased two acres here on which is a solid brick factory from F. H. Ross & Co. They are manufacturing emery wheels.

ST. JOHN.—The Board of Trade Council, at a meeting held last month, discussed the application of James Pender, to the City Council for a fixed rate of taxation for his nail manufacturing plant for the next ten years, and heartily endorsed the idea. The treasury board of the council is to meet this week to consider the request, and it is generally believed that it will be granted. Mr. Pender in speaking of his plans, said that if the city will grant his request, he will double the capacity of his present factory. This would involve an initial expenditure of about $50,000 or $75,000, and would necessitate the employment of a large number of additional hands. He has definitely decided that he will not go west, as he had expected, but will stay in St. John, and devote all his energies to the promotion of trade with the Canadian West, and the far away portions of the empire.

ST. JOHN.—The contract for the erection of the new building for the New Brunswick Telephone Co., has been awarded to B. Mooney & Sons, of this city. The contract price is about $22,000, and the building is to be ready March 1.

ST. JOHN.—Stanley E. Elkin, of the Maritime Nail Works, is one of those applying for incorporation as the Motor Car and Equipment Co., with a capital stock of $24,000. They have begun the building of a garage, on Princess Street, and will carry on a general automobile business.

ST. LAMBERT, QUE.—The Parker Foundry Co. have purchased a large tract of land here and will erect a new foundry in the near future.

FARNHAM, QUE.—The Dominion Vault and Safe Co., will locate here, and will employ from 100 to 400 men.

VANCOUVER.—The machinists of this city went out on strike on July 5, to enforce their demands for an eight-hour day and a minimum wage of 45 cents an hour. Their demand is in line with those of other coast cities, and some 600 machinists are affected between here and San Francisco, where the conditions demanded here exist. About 140 men are out in Vancouver, and the shops affected are the Mainland Iron Works, B.C. Marine Railways, Vancouver Engineering Works, Ross & Howard, Letson & Burpee, Terminal Iron Works, Pacific Ironworks. At New Westminster the men at the Schaake Machine Works are out to the number of 45, and their action affects about a hundred men in the works, part of the plant being shut down. They demand a reduction of working hours from 50 hours to 48 hours per week, starting at 7.30 a.m. and working until 5 o'clock, with an hour for lunch, for five days, and working from 7.30 o'clock to 1 o'clock on Saturday.

KAMLOOPS, B.C.—The contract for the new C.P.R. machine shop and roundhouse here has been awarded to McDermott and Co., Winnipeg. C.P.R. supply the steel. Estimated cost, $250,000.

FORT WILLIAM.—Contracts for the erection of Grand Trunk Pacific roundhouse and machine shops on the Mission have been awarded to the Carter, Halls, Aldinger Co., to cost, $100,000.

Robert Hobson, general manager of the Steel Company of Canada is authority for the statement that a majority of the stock of the Dominion Wire Mfg. Co., Montreal, had been acquired by the merger.

TORONTO.—Jules Motor Car Co., has been incorporated and will manufacture automobiles in Toronto.

WINNIPEG.—The Petrie Mfg. Co. will build a warehouse here to cost $22,000.

MONTREAL.—The Universal Engineering and Mfg. Co., have been authorized by the Dominion Government to change their name to that of the "Universal Vacuum Cleaner Co."

TORONTO.—The Mason & Risch Piano Co. will build a six-storey building in this city.

TORONTO.—The Rice, Knight Co., Toronto, manufacturers of gasoline lighting systems, had a small loss by smoke and fire. It was covered by insurance.

OTTAWA.—The Laurentian Mica Company's premises on Bridge Street were gutted by fire on June 16. The loss is estimated at $9,000, covered by insurance. About 175 girls are temporarily thrown out of employment.

HAMILTON.—The Canadian Shovel & Tool Co. announce that they will increase the size of their plant and install new machinery, enabling the output to be doubled.

VANCOUVER.—The Sullivan Fireproof Walls and Partition Co., of Canada, have established a factory here for the manufacture of gypsum and coke breeze fireproof bricks.

SASKATOON.—The Canadian Agricultural Motors Co., an institution which has been operating in Australia for the last few years, will erect a factory for the manufacture of gasoline engines and other motors which can be used in agricultural pursuits in this city.

Municipal Enterprises.

HULL.—Carriere & Wilson have been awarded the contract for the construction of the new sewer on Champlain Ave., for $2,850.

OAKVILLE.—The town council will have T. A. Murray prepare plans for the sewerage disposal.

BARNABY, B. C.—The Brouse-Mitchell Co., Vancouver, have secured the contract for the construction of waterworks here.

TOFIELD.—The by-law to spend $4,000 on preliminary work for waterworks was carried.

ESTEVAN.—Sealed tenders will be received by L. A. Duncan, secretary-treasurer, until 8 p.m., on Wednesday, August 24th, 1910, for the following works:—Contract "A"—Pipe-laying on storm sewers; contract "B"—Power house; contract "H"—Two return tubular boilers; contract "J"—High-speed steam engine; contract "K"—Electric lighting system; contract "S"—Sewer pipes. Plans and specifications may be seen at the office of the engineers, Chapman & Power, Winnipeg and Toronto, and at the town hall, Estevan.

BERLIN.—Tenders will be received by the undersigned up to August 1st, next, for a Compound Duplex Pumping Engine, capable of pumping two million imperial gallons per day, against a head of 125 pounds per square inch. A second hand pump will also be considered. For further information apply to H. Hymmen, Superintendent Berlin Waterworks.

WINDSOR.—It has been decided to purchase electric power from Niagara. The 110,000-volt line to London, Ontario, will be extended over the 108 miles separating Windsor from this city. The expense of building the line to the city limits will be paid for by the Ontario government. Windsor, which is a small town, cannot use more than 2,000 horsepower, but it has contracted to sell a large share to the city of Detroit, which is directly across the river. The power used in Detroit will thus be conducted over a distance of 220 miles from the point where it is generated.

WINNIPEG.—Sealed tenders on prescribed forms, addressed to the Chairman of the Board of Control, Winnipeg, Canada, and marked on the envelope "City of Winnipeg Electrical Distribution System, Tender for Cable," will be received at the office of the undersigned up to Noon on Thursday, September 1st, 1910, for the manufacture, delivery and installation, 46,000 feet of thirteen thousand volt, three-core cable. Copies of the specifications and forms of tender may be obtained at the Power Engineer's Office Carnegie Library Building, Winnipeg. These specifications may also be examined at the offices of Messrs. Smith, Kerry and Chace, Confederation Life Building, Toronto, Ont., M. Peterson, secretary.

WINNIPEG.—The contract for supply of sewer pipe and junctions for this city has been awarded to W. F. Lee, Winnipeg, for $20,120.25.

STEWART, B. C.—The Dominion government has granted $20,000 towards the instalation of a sewerage system here.

STETTLER, ALTA.—The John Galt Engineering Co. have charge of the installation of the waterworks system here.

ST. BONIFACE, MAN.—A new waterworks system will be installed shortly at this place.

CHAUDIERE CURVE, QUE.—A. Leofred, C.E., has closed a contract with the town council at this place for a waterworks plant to cost when completed, $250,000.

STRATHCONA, ALTA.—The contract for the sewer and water extensions at this place was awarded to Hulbert & Wilson at $13,847.95.

VANCOUVER.—Macdougall & Co., of this city, have been awarded a contract for the construction of $50,000 warth of sewers at Nanaimo, B.C.

LADYSMITH, B. C.—The town council have passed a by-law to raise $25,000 to improve the waterworks system.

FERNIE, B. C.—J. J. Wood was awarded the contract for the construction of storm sewers at this place.

MONTREAL.—The Structural Steel Co., of this city, have been awarded the contract for the construction of an 80,000 gallon stand pipe for the municipality of Longueuil.

TORONTO.—The Board of Control have awarded the contract for the pipe for the 500 foot extension of the waterworks intake pipe to the Canada Foundry Co. The details of tender are: 72 inch steel riveted pipe, per foot—500 foot lot, $19.98; 1,000-foot lot, $19.22, 1,500-foot lot, $19.00; branch for present intake, $709; new intake branch, $1,481; 3-steel flexible joints, each $1,072.

VANCOUVER.—The waterworks branch of the Civic Works Department, is this year laying 100,000 feet of 6-inch pipe, 45,000 feet of 12 inch, 20,050 feet of 20 inch and 18,000 feet of 16-inch.

ST. JOHN.—The city council have awarded the contract for supplying 314 tons of cast iron pipe to the Stavely Coal & Iron Co., Chesterfield, Derbyshire, Eng. Their bid was as follows: 12 inch pipe, $27.15; 10 inch, $27.30; 8 inch, $28.10; 6 inch, $28.60. Others tenderers were: Camden Iron Works, Singleton, Dunn & Co., Watson Jack & Co., D. Y. Stewart & Co., Stanton Iron Works, United States Cast Iron Pipe & Foundry Co., Vroom & Arnold, T. McAvity & Sons and W. H. Thorne & Co.

PRINCE RUPERT.—S. P. McKord & Co., Victoria, have received a $15,916 sewer construction contract for this city.

Electrical Notes.

ST. CATHARINES.—By-laws, giving the Buffalo, Niagara and Toronto Railway Co. and the Ontario Power Co. rights over city streets, were voted upon on July 29.

GRAND FALLS, N. B.—It is announced that arrangements have been completed between the Grand Falls Power Co. and Sir Wm. Van Horne and other owners of property by which the latter will take over the old company and develop power at the falls.

PRINCE ALBERT, SASK.—Goldie & McCulloch, of Galt, Ontario, obtained the contract for boilers for the electric light works here.

YORKTON, SASK.—The town council passed a resolution authorizing the preparation of a by-law to expend $35,000 on a municipal electric light plant.

LONDON.—The Water Commissioners awarded the contract to the London Foundry Co. for 76 ornamental electric light poles at $29 each. The Northern Electric Co., of Toronto, were given the contract for line hardware, amounting to $1,700.

STRATHCONA.—A by-law to provide for raising $10,000 for extension of the city's electric light and power system has been submitted to the ratepayers.

WELLAND.—The by-law to grant franchise to electric railway through the town was carried.

SEAFORD, ONT.—The town council has decided to submit a by-law to the people for the purpose of purchasing 400 horsepower electric current from the hydro-electric commission.

MOOSE JAW.—The by-law to expend $35,000 on extension of lighting system, was carried.

STETTLER, ALTA.—This municipality is to install an electric light plant of which, it is stated, the John Galt Engineering Co. have charge.

INGERSOLL.—Mr. Ross, of the firm of Ross and Holgate, Montreal, has been engaged to prepare plans, get tenders, and generally supervise the recently-acquired plant of the Ingersoll Electric Power and Light Co.

WINNIPEG.—A power sub-station will be erected by this city, to cost $11,400.

OTTAWA.—F. D. Monk, M.P., chairman of the Water Powers Committee of the Commission on Conservation, was here last month conferring with Hon. Clifford Sifton. The committee is making a complete inventory of all the water powers of the Dominion and they will be classified into public and private powers, developed and undeveloped. A grant for the purpose was made at the last session of Parliament, and it is expected that the information will be very valuable, not only to the Conservation Commission, but also as affording correct statement of the total potentiality of such resources.

PORT HOPE.—J. A. Culverwell, of this city, managing director of the Central Ontario Power Co., owners of Burleigh Falls and Buckhorn Falls, located just north of Peterboro, states that these properties are not for sale, and that his company has not joined the power merger.

COBALT.—The Mines Power Co. have taken a lease of Wawaitan Falls on the Mattagami river, near the Porcupine gold camp. This power is said to be one of the best in the north country.

GALT.—The contracts for the Hydro-Electric distributing station have been let to the Packard Electric Co. and the Canadian General Electric Co. for $9,194.

INGERSOLL.—W. R. Reynolds, of St. Marys, who has been manager of the electric plant and waterworks of that town for over three years has been appointed manager of the Ingersoll electric light plant.

TORONTO.—The officers of the Toronto Electric Light Company announce that they are about to open an aggressive campaign looking towards the further doing away with the poles on the city streets. The work of making the change will commence at once in the business districts and will spread through the city as fast as the company can arrange for the work.

BROCKVILLE.—The Brockville Light and Power Department will erect a new power house adjoining the waterworks pumping station for the purpose of combining the plants.

New Companies.

The Universal Gas Co., Toronto; capital $5,000,000; to carry on business as mechanical engineers, gas engineers and manufacturers of maeninery, to manufacture and supply gas for power, light and heat. Incorporators, G. A. Bronder, New York, W. H. Pearson, A. J. Jackson, Toronto.

The Montreal Shirt and Overall Co., Montreal; capital, $150,000; to manufacture men's boys' and ladies' garments. Incorporators, S. W. Jacobs, A. R. Hall, I. Ballon, Montreal.

The National Button Co., Montreal; capital, $99,000; to manufacture and deal in all kinds of buttons. Incorporators, F. E. Gilman, A. W. Powell, T. C. Haynes, Montreal.

Algoma Iron Works, Sault Ste. Marie; capital, $500,000; to manufacture and deal in iron, nickel, steel or any other ore products of the mine also to manufacture coke and charcoal. Incorporators, J. F. Taylor, T. Gibson, H. P. Barnett, Toronto.

The Universal Metals and Aluminum Solder Co., Quebec; capital, $100,000; to manufacture and deal in solder for all metals including aluminum, and also to manufacture all kinds of metals. Incorporators, H. Dussault, J. E. Dussault, Levis, Que., and O. Turgeon, Quebec.

The Dominion Stamping Co., Walkerville; capital, $100,000; to manufacture and deal in stamped goods of all kinds, automobile parts, stove parts and sheet metal work. Incorporators G. S. French, F. J. Armstrong, P. B. Lugster, Detroit.

The George H. King Co., Woodstock; capital, $25,000; to purchase the business and factory owned by George H. King, to manufacture and deal in all kinds of vacuum carpet cleaners and sweepers. Incorporators, G. H. King, R. C. Campbell, J. C. Campbell, Woodstock.

The Mechanical Equipment Co., Mantreal; capital, $50,000; to carry on the business of iron founders, mechanical engineers and manufacturers of all kinds of machinery, tool makers, press founders, metal workers, boiler makers and machinists. Incorporators, S. Davis, J. Presner and J. Franklin, Montreal.

Canada Machinery Corporation, Toronto; capital, $3,000,000; to carry on the business of manufacturers of iron and machinery iron founders, tool makers, brass founders and metal workers. Incorporators, H. Riley, E. C. McMillan and W. H. Walter, Toronto.

Planing Mill News.

WINNIPEG.—The tender of T. D. Robinson & Sons for the supply of 1,000,000 feet, B.M. lumber, at $25,143.75, was accepted by the city council.

SPANISH RIVER, ONT.—The saw mill of Wm. Milne & Sons, was destroyed by fire. Estimated loss, $40,000.

DURHAM, QUE.—One of the largest timber deals in the eastern townships of Quebec has been effected by the Brompton Pulp and Paper Co. acquiring the limits and sawmills of the Champoux Company, doing business in the Quebec Central district. The limits cover an area of 18,000 acres and $200,000 has been paid down.

OWEN SOUND.—J. S. Findlay has advertised his planing mill for sale.

BENTINCK, ONT.—Edward Cawley, sawmill owner, has assigned to Henry Hunt.

Railway Development.

OTTAWA.—Construction on the new railway from Ottawa to Brockville will be begun this fall.

TORONTO.—A charter has been granted to a company, represented by J. B. Bartram, Toronto; Thos. B. Fogg, Toledo, Ohio, railway manager; G. H. Raw, and S. Hirsch, London, Eng. They will proceed shortly from Dartmouth to Guysboro and from New Glasgow to Country Harbor.

WINNIPEG.—The C.N.R. have let the contract for the construction of sixty miles of railway, between New Westminster and Chilliwack, B.C., to the Northern Construction Co., of this city.

VANCOUVER.—The contract for the construction of the first section of the Kettle River Valley Railway, the road which will link Vancouver with the Kootenays, was awarded to the engineering firm of Macdonald, Gzowski & Co., of this city.

PHOENIX.—The Canadian Pacific Railway between here and Eholt, B.C., is now the scene of great activity, the grading and laying of new track having been commenced in earnest. Over one hunhred men are employed. The entire ten miles of track is being raised from eight to ten inches, the material for grading and ballasting being brought from a gravel pit, one mile west of Eholt on the Greenwood road. The old steel is being replaced by new 80-pound rails and the new work is expected to cost upwards of $20,000.

HALIFAX.—A contract between the Nova Scotia Government and the Halifax and Eastern Railway Co. was signed recently for the building of 204 miles of railroad from Halifax to Guysboro, with a branch across the province from New Glasgow to Country Harbor, on the Atlantic seaboard. The enterprise has been promoted by J. B. Bartram, of Toronto, and the company is composed chiefly of London capitalists. The road will be completed within three years. It has subsidies from the provincial and Dominion governments of $12,800 a mile.

EDMONTON.—The contract for the construction of the main line of the Canadian Northern Railway from here to the Yellowhead Pass has been awarded to McMillan Bros.

DUNCAN, B. C.—A branch from here to Cowichan lake will be erected by the E. & N. Railroad, to connect the $750,000 lumber mill, which is to be erected on tidewater.

OTTAWA.—The Dominion government has decided to go ahead with the construction of the Hudson Bay railway. At the recent session an appropriation of $300,000 for construction purposes went through, and since then the plans and specifications have been in preparation for the section of the line on which surveys were completed. Tenders are to be called for at once.

HAMILTON.—The Toronto, Niagara and Western Ry. Co. have filed with the Hamilton city clerk a revised plan of a proposed route between Burlington and Hamilton. The new plan shows the road being built on the north shore of the bay, close to the water's edge. Instead of following the shore line at the end of the bay, the Government proposes to make a short cut by building a bridge half a mile long and tunnelling under the G.T.R. tracks.

BERNE, SWITZERLAND.—The International Railway Congress, after adopting the conclusion of the several sections as reported in the federal body, adjourned on July 16, to reassamble at Berlin in 1915.

Structural Steel.

QUEBEC.—The Phoenix Bridge Co. have appealed to the Court of King's Bench, here, from the verdict recently rendered by a jury by which they were condemned to pay a victim of the Quebec bridge accident named Haley $20,000.

TORONTO.—The Canada Foundry Co. have been awarded the contract for the superstructure of the bridge over the Saskatchewan River, for the Canadian Northern Railway.

STRATHCONA, ALTA.—A by-law to provide for the raising of $38,000 for construction of bridge over Mill Creek ravine was submitted to the ratepayers on July 20.

HAMILTON.—Shareholders of the Hamilton Steel & Iron Co. at the annual meeting on July 6, almost unanimously ratified the terms of sale to the Canadian Steel Corporation. A. B. Mackay was the only dissenter, and he refrained from voting because he said he wanted more information. The old board was re-elected as follows, to serve until the merger takes over the company : C. H. Wilcox, president ; Robert Hobson, vice-president and general manager ; Geo. S. Lynch-Staunton, William Southam, C. E. Doolittle, E. B. Osler, W. D. Matthews, John Milne and H. H. Champ, directors.

TORONTO.—The contract for the superstructure of the bridge over the Saskatchewan river at La Pas, in connection with the Hudson Bay Railway has been awarded to the Canada Foundry Co. of this city.

EDMONTON.—The tenders for the west end bridge were as follows : The Algoma Steel Co., f.o.b., Edmonton, $22,800. The company promise shipment of steel in three or four months. The Dickson Bridge Works Co., $29,960, Walker and Barnes' tender in behalf of the Canadian Bridge Co., was : Steel delivered at site, $24,588, erected ready for planking and paving, $30,000. Gorman, Clancey and Grindley tendered for the Dominion Bridge Co., f.o.b. site, $24,650 ; erected, $29,240.

EDMONTON.—Tenders are called for the Canadian Pacific Railway for the high level bridge between here and Strathcona, estimated cost $2,500,000.

Building Operations.

SOUTH VANCOUVER.—The plans and designs of three new schools for this city submitted by J. H. Bowman, architect, were accepted. The cott of the three new schools totals about $120,000.

WOODSTOCK.—The ratepayers here will be asked to vote on an $85,000 city hall by-law.

FORT WILLIAM.—The Bank of Commerce will build a new office building here to cost $60,000.

MONTREAL.—The old post-office on St. James St., will be re-modelled to the extent of $80,000.

VANCOUVER.—C. T. Perry has prepared plans for St. James Church. Estimated cost, $100,000.

VICTORIA.—A $125,000 addition will be made to the Empress Hotel here.

WATROUS, SASK.—Adam Reid, of this place, was awarded the contract for the erection of the Manitou Lake Sanatorium, at $50,000.

EDMONTON.—The contract for the new hospital building here has been awarded to the Connell-Spencer Construction Co., at $170,000.

EDMONTON.—It is stated that J. H. Rudy is preparing plans for a new theatre which will cost about $70,000.

TORONTO.—An addition will be made to the Victoria University, here. The new building will be known as the Burwash residence, and will cost $230,000.

WINNIPEG.—J. Johnson will build $40,000 apartment house here.

MONTREAL.—A new building will be erected by the Notre Dame hospital authorities here.

NEW WESTMINSTER.—A horse show building will be erected for the Provincial exhibition at this place.

VANCOUVER.—H. O. Lee will build a large business block here, to cost $100,000.

WINNIPEG.—The board of directors of the Children's Hospital, hero have purchased the old Ladies' College site on which they will erect shortly a new hospital. Cost of site and proposed building, about $80,000.

MONTREAL.—Jos. Venne, architect, is preparing plans for an extensive ampitheatre to be erected on Mount Royal, in the interests of the Eucharist Congress, to be held in this city in September next.

WINNIPEG.—Leonard Kenwrick, Winnipeg, is the architect for the new St. John's Anglican Cathedral. The nave will be erected first at a cost of $75,000.

MONTREAL.—Peter Lyall & Sons have been awarded the contract to erect on the Seminary of St. Sulpice property, here, a ten-storey office building to be, it is said, the largest in Canada and to cost $1,000,000.

VANCOUVER.—Kelly, Douglas & Co., wholesale grocers, of Vancouver, New Westminster and Prince Rupert, will immediately commence the construction of a large new warehouse at the Grand Trunk Pacific terminal, Vancouver.

TORONTO.—The contracts for the central wing of the Toronto Western Hospital have been awarded by the Board of Governors. The Hamilton Bridge Co. will supply the steel work ; Douglass Bros., the galvanized iron work, and A. M. Brown, the painting and glazing. The steam heating and plumbing has not yet been let. Cost of wing, $50,000.

General Manufacturing Notes.

CHATHAM.—Negotiations are in progress for a merger of the four leading natural gas companies now operating in this district, these being the Volcanic Oil & Gas Co., Leamington Oil & Gas Co., United Fuel Supply Co., and Northern Pipe Line Co. English capital is promoting the merger, which, if completed, will be followed by a big development of the resources of the gas fields, and extensions to London, St. Thomas, and probably other centres of population till now untouched.

CHATHAM.—Arrangements are under way whereby the Dominion Sugar Co., of Wallaceburg, will erect at that place a plant for the manufacture of denatured alcohol as a by-product of the sugar beet. The new factory, it is stated, will duplicate the present sugar factory and employ as many hands.

CHATHAM.—The Empire Oil Refinery, at Wallaceburg, is adding two new stills to its equipment. A plant for the manufacture of wax goods of all kinds is also being erected and equipped.

KINGSTON.—N. C. Polson & Co. will build an extension to their building here.

CALEDONIA.—The Alabastine Co. are erecting a $50,000 plaster plant at the Caledonia gypsum mines.

TORONTO.—The Pure Gold Mfg. Co. are erecting a warehouse here, to cost $20,000.

VANCOUVER.—T. C. Prior & Co. will build a $22,000 warehouse here.

WINNIPEG.—The Sawyer-Massey Co., are erecting a new warehouse.

CALGARY.—Mr. Watson, ex-alderman of Calgary, states that in a few months work on a steel plant and rolling mill will be started here.

TORONTO.—The Massey-Harris Co., will build an addition to cost $7,500.

OTTAWA.—The Beaver Co., of Buffalo, will build a Canadian branch factory here.

TORONTO.—J. L. Nichols Co. will erect a $20,000 factory here.

LACHINE, QUE.—The Canadian Railway Signal Co. are erecting $100,000 plant at this place.

STRATHROY.—The Strathroy Furniture Co., and Strathroy Canning Factory will both enlarge and make additions to their plants here.

MOOSE JAW.—The Gordon, Ironsides & Fares Co., meat packers, will locate their western plant here. They will commence work on the construction of their buildings in the near future.

GUELPH.—R. Graesser, a manufacturing chemist, who has large chemical works in the North of Wales, will establish a chemical works at Guelph.

OWEN SOUND—The Canadian Heating & Ventilating Co. are adding a second storey on their shipping room, to be used as a storehouse. The addition is 56 feet by 90 feet, giving 5,000 square feet of floor space. The old storehouse, which has become too small for the company's rapidly increasing business, will be used as a finishing room.

Trade Notes.

HAMILTON—The Smart-Turner Machine Co., 141 Burton St., report the following recent orders for pumps: David Morton & Sons, Co., Hamilton; Lincoln Paper Co., Merriton, Ont.; Kilsyth Portland Cement Co., Raven Lake, Ont.; Parks Packing Co., Harriston, Ont.; Jas. Stark, Prescott; Louis A. Pettie, Glace Bay, C.B.; London Electric Supplies Co., London; Imrie, Ltd., Montreal; Jas Stark, Paisley; Canada Cheese Co., Parry Sound, and Gananoque Spring & Axle Co., Gananoque. They also report sales for traveling cranes as follows: Two to Canadian American Gas & Gasoline Engine Co., Dunnville, and one to the C.P.R., Toronto.

DETROIT—The Northern Engineering Works, Detroit, have installed two 5 ton cranes and one 2 ton, 3 motor Cleft design crane in the plant of Besser Gas Engine Co., Grove City, Pa.

Merger of Wheel-makers.

It is reported that another merger is now being consummated of considerable importance whereby the manufacturers of wheels will be amalgamated. The companies going into the merger are the Ontario Wheel Co., Gananoque, the Dominion Wheel Co., Lindsay, Chaplin Wheel Co., St. Catharines, Benjamin Wheel Co., Napier, the Finlay Wheel Co., Norwood and Caslin Wheel Co., Chatham. At going to press it was unable to confirm the report by phone with St. Catharines, but the belief was expressed strongly that the Benjamin Wheel Co. is not in the consolidation.

Oliver Chilled Plow Works.

The plans of the Oliver Chilled Plow Works for their new plant at Hamilton, Ont., for which tenders have been called for, are on a more extensive scale than was at first contemplated, so that the total outlay when completed will probably be $2,000,000, instead of $1,500,000, the original estimate. The forge shop will be 514 x 100 feet, instead of 420 x 100 feet; service building and machine shop, 200 x 70 feet, in place of 180 x 50 feet; and the size of the concrete dock has been increased from 500 x 80 to 800 x 100 feet.

Dominion Wire Co. in Merger.

Robert Hobson, general manager of the Steel Company of Canada, is authority for the statement that a majority of the stock of the Dominion Wire Mfg. Co., Montreal, had been acquired by the merger. The Dominion Wire Co. have a large manufacturing plant at Rockfield, near Lachine, Que., valued at $1,000,000. Of the authorized issue of $10,000,000 bonds of the Steel company, $6,850,000 are being issued, $485,000 being offered in Canada.

Iron Ore in Northern Ontario.

Considerable interest is taken in the reports about the iron ore deposits at Grand Rapids, on the Mattagami River. The Mattagami is a tributary of the Moose River, the trunk stream

draining the northern part of Algoma district into James Bay. From Moose Factory, which stands at the point of the Moose River's discharge into James Bay, the ore deposits are about 60 miles south. They are about 100 miles north of the National Transcontinental Railway and west of Cochrane on the Temiskaming & Northern Ontario Railway, which will eventually be extended to James Bay.

The iron ore deposits at Grand Rapids were not previously unknown. They were discovered in 1875 by Dr. Robert Bell of the Canadian Geological Survey, and were again brought to notice in 1903 as a consequence of explorations made by a party sent out by the Ontario Bureau of Mines. The bureau's report for 1904 contains a description of the deposits, whose contents are classed as of the limonite variety of ore. The ore body is very large, and the metallic iron found in some cases is as much as 60 per cent., phosphorus being present to the extent of about 0.08 per cent. Parties who have been up in the field staking claims this spring bring back very optimistic accounts of the quantity of ore in sight and the quality of it, and they incline to the opinion that the ore is brown hematite. They say that no other known ore body in Canada is to be compared with this one in economic importance. If the ore is as good and plentiful as official and private reports agree in representing it to be, the railway is almost certain to be pushed on to the place at which it is located.

Five New Mallet Engines.

The big Mallet compound engine recently constructed at the Angus shops, to aid in getting freight trains over the grades of the C.P.R. in the Far West, is reported to be doing fine work and it is stated that orders have been given to construct five similar engines at the Angus shops also for work in the West.

Will Establish Steel Works.

Mr. W. Owen, C.E., who contested Merthyr Tydvil, a Welsh borough, against Mr. J. Keir Hardie, the Labor leader, at the general election of 1900 in Great Britain, was in Vancouver recently representing a group of British capitalists who intend establishing large steel works in British Columbia for the manufacture of steel rails, angle bars, wire goods and tin plate.

Mr. Owen was sent out here to make the preliminary arrangements for the establishment of the factories mentioned. It is intended to spend no less than $15,000,000 in the acquisition of sites, coal and ore supplies, erection of mills and installation of plant, which will be the most scientific and up to date in the world.

While here, Mr. Owen acquired 150 acres of land for a site and also concluded arrangements for the acquisition of the necessary coal and iron ore supply.

Record Car Building.

That the present year will make a new record in car building in Canada is the statement of Secretary Skelton, of the Canadian Car Works merger, who has just returned from a business visit to Amherst, N.S. Mr. Skelton said that orders had been coming in so fast that all the corporation's plants were scheduled for continuous work for some months to come, while there was every indication that more cars would be built in the Dominion this year than ever before.

The railroad prosperity, said Mr. Skelton, had compelled the railroads to give large orders for rolling stock, in addition to the large amount they were building for themselves, and big orders had been received by the company from the Canadian Pacific, G. T. P., Canadian Northern, and Grand Trunk. The majority of this work was for freight cars, mostly of the new type of steel underframe with wooden superstructure. Many of the recent orders have been turned over to the Montreal works, as the shops at Amherst are busy turning out orders for the Canadian Northern.

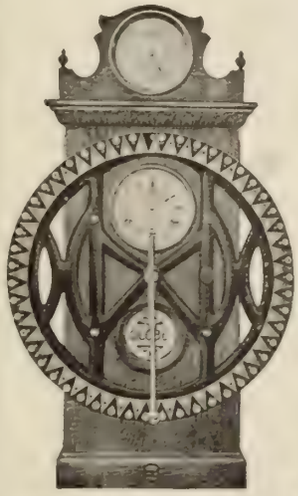
"GLOBE" TIME RECORDERS



are made in Canada by expert mechanics. They are accurate, simple in construction, strong, and of good chaste appearance. They will record with absolute accuracy the arrival and departure of your employees (TO THE MINUTE), making you pay for what you get and no more. All lates and short time marked in red, regular time in green. The small cut at the top illustrates the WEEKLY MODEL, an entirely automatic recorder requiring no attention whatever during the week as all changes, etc., occur automatically (DONE BY CLOCK WORK). The DAILY MODEL is shown in the cut at the bottom. This recorder is being used mostly in large shops, etc., where a large number of hands are employed. With the "GLOBE" TIME RECORDERS only one operation is required as against five with most others.

Inspection may be made through the glass sides of the case, but tampering with records is impossible, no danger of having soiled, torn or lost records when same are unfavorable, as is the case with all CARD CLOCKS. We are now manufacturing over 224 DIFFERENT TIME RECORDING CLOCKS, and are in a position to meet the requirements of any business. Write us about your needs and let us suggest what will best meet with your requirements. WE SOLICIT YOUR ENQUIRY.

CATALOGUES.

FRICTION CLUTCHES.—Catalogue No. 8, of the Will Clutch Co., Cleveland, Ohio, is a particularly well gotten up 54 page booklet, of very attractive form, devoted to friction clutches. The friction clutches are described and illustrated very fully, the development of the clutch from its original form being shown and the changes noted. A tabulated price list, which shows considerable care in its preparation, is also given. Reference is made to the special flange pulley construction used with the clutch. Quills for use with their clutches are illustrated in detail. At the back of the book a department called Engineering Notes, contains much useful information in power transmission, and every engineer ought to have a copy if for no other purpose than this alone.

PAPER MACHINES.—Escher Wyss & Co., Zurich, Switzerland, have issued catalogue No. 124-P, containing a complete list of the users of their paper machines. In addition, there are several photos of typical installations.

BEATERS AND EDGE-RUNNERS.—Catalogue No. 125-P.B. of the Escher Wyss & Co., Zurich, Switzerland, contains a long list of users of their beaters and edge runners. Short description of the machines are given with illustrations. Some typical instalations are also shown.

REACTIONS.—Is the title of the quarterly house-organ of the Goldschmidt Thermit Company, 90 West St., New York. As it states, it is a quarterly periodical devoted to the science of aluminothermics. The second quarterly number, this year, contains 14 very instructive articles, most of which show the application of Thermit-welding to various conditions. Numerous photos of the processes are shown, together with good descriptions, forming very instructive and interesting reading matter.

MACHINE TOOLS.—George Richards & Co., Ltd., Broadheath, near Manchester, Eng., have a very convenient and expansible system for their machine tool catalogue, as it is arranged in loose-leaf form, each sheet descriptive of a different form of machine-tool. A large variety of tools are illustrated, and briefly described. Among the many are:—Side planers, turbine planers, radial drills, slot drills, key seaters, horizontal boring machines, boring and turning mills, combined turret head boring and turning machines, high speed universal facing, boring, drilling and milling machines, vertical millers, grinder for piston rods, etc., and band saws, as well as other minor machines. Quite a variety of each of these types are illustrated and the salient features described in brief form. Every machine shop man ought to have a copy.

GANG SAWS.—Two large leaf bulletins of Wickes Brothers, Saginaw, Michigan, illustrate their gangs Nos. 10 and 12, and their self-contained gangs Nos. 15-19 inclusive. Little reading matter is appended, for the cuts of the machines are made page size and are of particularly good quality, practically self-explanatory. Other publications are also issued by the company.

FANS AND MOTORS.—C. A. Vandersvell & Co., Warple Way, Acton Vale, London, W., Eng., have issued leaflets Nos. F 50-57, F 70-72, F 81-84 descriptive of their C.A.V. fans and motors, in a neat form, fastened in a detachable cover. Most of the information is arranged in tabulated form, and is therefore convenient for reference purposes. It is gotten up in handy desk form.

RECORDING INSTRUMENTS.—Bulletin No. 150, a handsome 64 page book, is the latest of the Bristol publications, and forms an illustrated index of their recording instruments for pressure, temperature and electricity, and their electric pyrometer. As the title page states, it is not a catalogue, but simply a series of illustrations of the most important Bristol instruments

with partial explanations of the instruments and their application. It collects these types in concise form, and more detailed information can be obtained from their individual bulletins, of which they have many. An interesting feature of this bulletin is the history of the company, giving the development of the recording meter from its early stages, up to the present advanced state.

LIFTING MAGNETS.—The Cutler-Hammer Clutch Co., Milwaukee, Wisconsin, have a little eight page folder on their lifting magnets. It briefly describes their uses and possibilities, and gives a cross-sectional view, numbering and describing 18 of the parts. The pamphlet is not intended as a catalogue, but merely gives a few of the more salient features dealt with at greater length in their 48 page Lifting Magnet booklet.

WIRE ROPES AND FITTINGS FOR MINING.—W. N. Brunton and Son, Musselburgh, Scotland, who makes a specialty of every kind of wire rope, have issued this 42 page catalogue which is gotten up for pocket reference use. Notes are given on the handling and care of wire rope and on such things as uncoiling, lubrication, capping, galvanised ropes, winding ropes, and haulage on inclines. Reference is made to a special book on splicing which like this book may be had on application. Various convenient tables are given, and also notes on the "lay" of the wires for best results. Various special connections, etc., manufactured by them are also detailed.

ROLLING DRAWER CORE OVENS.—A booklet entitled a Remarkable Battery of Rolling Drawer Core Ovens, has been published by the J. D. Smith Foundry Supply Co., Foundry Engineers, Cleveland, O. It describes a large installation for the Ferro Machine and Foundry Co., Cleveland, O. These ovens are on the third floor of a building specially built for core making, with larger ovens on the second floor, with sand preparation room on ground floor. This idea of having ovens on second and third floors, and firing from first floor, is a new idea in core oven buildings. The plant is well described and fully illustrated.

FRICTION HEADSTOCK AND LEVER CONTROL.—This is described in its application to the Gisholt Vertical Boring Mill, in a pamphlet issued by the Gisholt Machine Co., Madison, Wis. The mechanism has several points of particular value for this class of work, and which are explained in the pamphlet.

ROCKWELL REVERBERATORY MELTING AND REFINING FURNACES—Are explained in Bulletin No. 10, of the W. S. Rockwell Co., 50 Church St., New York. These furnaces use either oil or gas fuel, but may be designed to use coal or coke. It is suitable for melting and refinery drosses, reducing copper and brass wire and miscellaneous scrap to ingot form, melting lead, tin, zinc, etc., in large quantities, and for melting quantities of brass or bronze for castings which are too large for the ordinary crucible furnace and which cannot be economically cast from a cupola. The description goes on to give details of construction.

GEOMETRIC CHASER OR DIE GRINDER.—is the title of a leaflet issued by the Geometric Tool Co., New Haven, Conn., describing this machine. This machine was designed for the uniform grinding of chasers or dies of no matter what form. This they claim is a necessity to insure a good thread on bolt and reasonable life to chaser. It is adapted to other grinding as well, and has a micrometer attachment for accurate work. It is also fitted with a vise.

DUNHAM VACUO-VAPOR HEATING SYSTEM.—A handsome 40 page booklet issued by the Dunham & Co., Continental Life Bldg., Toronto, goes into the construction and advantages of the Dunham System, and is worthy of

careful reading. Special reference is made to the patent Dunham Trap which is said to act quickly, have large capacity and to absolutely not pass steam. Tests are shown as well as a number of installations with letters of recommendation.

INDUSTRIAL RAILWAY.—An 80 page booklet issued by C. W. Hunt Co., West New Brighton, New York, gives a description of the Hunt Industrial Railway system with illustrations of the mechanical principles and interesting details. Numerous illustrations show the application for handling materials and saving labor.

DRIVING CHAINS.—Renald Driving Chains and their use is the subject of a 130 page catalogue issued by Hans Renald, Ltd., Manchester, and distributed by their Canadian agents Jones & Glassco, St. Nicholas Building, Montreal. The book is a useful treatise on chain drive, many applications being described and illustrated. Chain sprokets are shown and cutters for making them. How to join chains is made clear and the tools needed are shown. Shops with general chain drive, machine tool chain drive, etc., are shown with cost and production tables. The application to wood working machinery is also illustrated.

ROCKFORD MACHINE TOOLS.—The Rockford Machine Tool Co., Rockford, Ill., have issued a neat folder containing illustrated descriptions of a number of Rockford Machine Tools. These include shapers of various styles, both belt and motor driven and Rockford planers in several sizes. The special features of each machine, are pointed out in the description.

ROLL CRUSHER.—Bulletin 39 of the Jeffrey Mfg. Co., Columbus, Ohio, describes the Jeffrey roll crusher for coal, coke, salt, gypsum, etc.

FOUNDRY EQUIPMENT.—A folder from the Adams Co., Dubuque, Iowa, contains illustrated descriptions on coated paper of Farwell Squeezers Universal Molding Machines, Snap flasks, grinders, milling attachments, gear hobber, etc. The operations on the different machines are clearly described and illustrated, such subjects as "How Spur Gears are cut with a Hob," being treated in the folders.

Shelby Tubing.—"Shelby Hot Finished, Seamless Steel Tubing," is the title of a neat little booklet issued by John Mullen & Sons, Ltd., 321 James St., Montreal, who are the sole Canadian distributors of this product. This brochure describes the advent of this kind of tubing on the market, as well as giving a long list of its possible uses.

Foundry Machinery and Equipment—Is a little 24-page booklet, No. 93, issued by the Northern Engineering Works, Detroit, Mich. To quote the booklet, it "is merely a reminder of what we make in the line of Foundry Machinery." Other catalogues are published by the firm dealing with their products more completely, which are obtainable on request.

The Coventry Noiseless Chains and Wheels Is the title of a very instructive 24-page catalogue, issued by the Coventry Chain Co., Ltd., Coventry, England. The development of this chain from its introduction in 1896, is dealt with, as well as a complete description of its present form and applicability to various conditions. Some hints are given for users, as well as an article on the lubrication and care. A number of common uses are cited, and convenient table arranged giving details of various sizes of chain. Mention is also given to the company's Shock Absorbing Wheel, which is worthy of considerable notice.

Jeffrey Conveying Machinery.—In a neat little 24-page brochure, which is catalogue No. 38, of the Jeffrey Mfg. Co., Columbus, Ohio, a general outline of their line of machinery and its wide range of application, is given. The catalogue consists essentially of a series of illustrations, admirably filling the intention of the firm, as it very completely shows their lines of activity. A complete list of their catalogues is given.

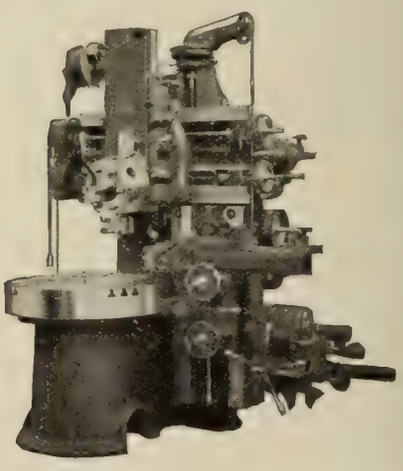
The Heating System.—This 12-page brochured describes the Webster Q. R. Modula-

A Constant-Speed Drive

A fundamental underlying principle of a constant-speed drive and the mechanically obtained speed changes incident thereto is convenience.

Any machine so designed as to entail the absolute stoppage of the driving pulley, as well as the machine in order to change speeds by the shifting of a tumbler gear or engagement of a positive clutch does not in any way meet the requirements of the case.

Friction back gears are, comparatively, an advantage, but the quick change so obtained is too great. Quick speed changes should have but a slight increment from one to another, in order that the surface speed of the work may be readily and properly accommodated to the capacity of the cutting tool.



A perfect constant-speed drive is one of the many features incorporated in the VERTICAL TURRET LATHE which tend to make it such a remarkable machine for rapid production of absolutely perfect work.

This feature is only one of the many incorporated in the VERTICAL TURRET LATHE which is fully illustrated in catalog C-15, which is free for the asking.

The Bullard MachineTool Co.
Bridgeport, Conn., U.S.A.

tion System of Factory and Office Heating, as installed by Darling Brothers, Limited, Montreal. As well as describing the system, and outlining its advantages, an actual test of its efficiency is given. Several important installations are shown, and a number of letters of recommendation given.

ROPE BLOCKS AND SHEAVES.—Anvil Brand Wire Rope Blocks and Sheaves, is a little folder issued by Mussens, Limited, Montreal. Quite a number of different types are illustrated and price lists given.

NEWTON CUPOLA.—This is catalogue No. 51 issued by the Northern Engineering Works, Detroit, Mich., containing 16 pages, describing their type of cupola, laying special stress on its advantages which they claim are rapid, continuous melting, high fuel economy, saving in wear on lining, latest design, best construction, and wide range of work. It is well written and instructive catalogue for foundrymen. The catalogue is illustrated with several line drawings and half-tones.

THOR AIR TOOLS.—This is a four page pamphlet issued by the Independent Pneumatic Tool Co., 1307 Michigan Ave., Chicago, showing the various kinds of pneumatic tools made by this firm. While not descriptive, complete data concerning each of the different kinds is given, as well as size and price. Applications of their use are also shown, giving an idea of the many uses to which air tools can be put.

NEWTON BOLT THREADING MACHINES.—A new form of die head is described in this 15 page booklet, which is catalogue No. 46 of the Newton Machine Tool Works, Philadelphia, Pa. The die head consists of four chaser blocks, each with four chasers, so that machine can be rapidly set to cut any one of four sizes of thread. Other sizes have different chaser blocks. The head is well illustrated. Four pages are devoted to illustrations of other machine tools that they manufacture.

JEFFREY SPIRAL CONVEYORS.—Booklet No. 36, published by the Jeffrey Mfg. Co., Columbus, Ohio, deals with the different types of spiral conveyors made by that firm, illustrating the sane and describing their varied uses. Conveyor fittings are also included and complete price list given. The company also manufacture complete coal mine equipment and labor saving machinery for handling bulk and package material of all kinds, a complete list of catalogues for which is given in this booklet.

INSPECTING AND TESTING ENGINEERS AND CHEMISTS.—The Canadian Inspection Co., Montreal, have issued an 8 page brochure with this title. It gives a very complete list of the materials they test, and the quantities for which the tests are made. Special tests are also made by them.

INLAND GALVANIZED SHEET.—A most interesting 32 page booklet is that gotten out by the Inland Steel Co., Chicago, Ill., called The Story of an Inland Galvanized Sheet. This book first describes the circumstances that forced the firm to build their own steel mill to supply the necessary steel for the galvanized sheet that they manufactured. It then goes on to describe the process of manufacture, from the time the ore leaves the Lake Superior iron ore beds till the finished galvanized product is turned out passing through the basic open hearth process, clearly describing the various steps through which it goes, mentioning particularly what they consider are the points of superiority in their own method of manufacture. The book is very instructive, as all the various stages are dealt with so completely. It is very fully illustrated, every step being shown.

STANDARD ELECTRIC TIME SYSTEMS.—Catalogue No. 32, published by the Standard Electric Time Co., Waterbury, Conn., describes their time systems. The system consists essentially of a master clock, electrically self-winding [illegible] controls secondary clocks, time registers, etc., and other time-keeping apparatus, for use in any large institution. This catalogue fully describes the system in all its details. It is a book every manager ought to have when changing his shop system in any way.

OIL BURNING EQUIPMENT.—Circular No. 129, of the late Jones & Co., Inc., Pittsburgh, Pa., describes their fuel oil burning equipment for open hearth furnaces. It is an 8 page circular, large size sheet, and contains a number of illustrations of installations, as well as a couple of plans and sections of plants. Beginning with a general dissertation on the advantages of oil as a fuel for such purposes, presenting several very taking arguments in its favor, it goes on to describe the various parts of the equipment, such as the burners, reversing valve stand, ladle drying and heating burner, and the pumping, heating and regulating system. All these various details are well described and fully illustrated.

TWIST DRILLS, REAMERS AND TAPS.—The 1910 catalogue of the Morse Twist Drill and Machine Company, New Bedford, Mass., is quite a comprehensive book 5" x 7" on coated paper, containing 336 pages, describing and listing their various products, as well as a 28 page appendix, containing many useful standardized tables, and much useful data. It is a book that ought to be in the hands of every machine shop superintendent and foreman. Besides describing their usual stock of increase and constant angle twist drills, reamers, chucks, milling cutters, taps, dies, machinery, and machinists' tools, some 39 new productions are listed. These show considerable developments, with many labor-saving ideas. So many different tools are shown that even a partial list is impossible. The book serves as an excellent reference, containing so much useful information.

RECORDING THERMOMETERS.—The Bristol Company, Waterbury, Conn., have issued Bulletin No. 125, a 12 page pamphlet, descriptive of their class 1 self-contained recording thermometers, which are adapted for low and atmospheric ranges of temperature up to 150 degrees Fahrenheit. The different sizes manufactured by them are shown and described, as well as the accompanying paraphernalia. A brief description is given of the electric alarm attachment, for apprising the operator of too high or too low temperature for the desired conditions.

GRITS AND GRINDS.—The April issue of this monthly news bulletin issued to the sales force of the Norton Company, Worcester, Mass., contains several good articles relative to grinding. The first article details the similarity of operation between grinding wheel and abrasive stones, as compared to the milling cutter, showing that in principle they are the same. The article goes on further to show how the microscope and camera are useful adjuncts in leading to better grinding, illustrating the point with several photos taken under the microscope. These are of interest. Another article on the cause of checking in fine finishing machine tools, is instructive, and consists of several letters, containing the opinions of several men of authority on these lines. Other equally interesting but shorter articles are given as well as some short news items. It is a progressive little house-organ.

FIRE BRICK.—Catalogue No. 2, of the Detroit Foundry Supply Company is entitled Fire Brick and Refractory Material Catalogue. It is a 24 page booklet, descriptive of the various brands of fire-bricks marketed by this firm. It starts in by a general description of fire-brick, going from that to details of the brands, with sketches of all the different kinds. In addition to this, the last few pages contain tables and data of value to foundry men in general, the information being contained in concise and useful form.

PULVERIZERS AND CRUSHERS.—The Jeffrey Manufacturing Company, Columbus, O., have issued a 38 page catalogue No. 31-C describing the

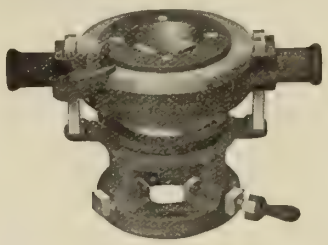
ONE MAN

can cut threads on 6-in. pipe with a

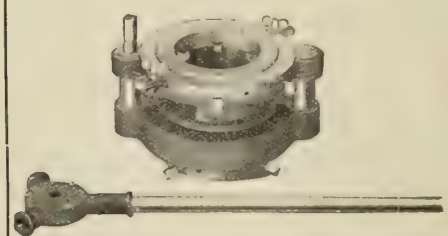
"BEAVER"

ADJUSTABLE DIE STOCK

No. 6, threading 1-4, 3-8, 1-2, 3-4 in. complete. No changing of Dies or Bushings.

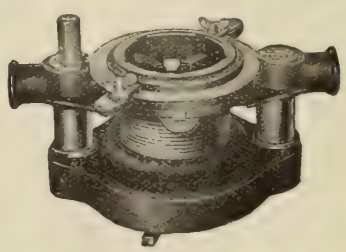


No. 25B, 1 in. to 2 in., R.H. complete.



No. 60, cuts 2½, 3, 3½, 4, 4½, 5, and 6 inch pipe.

NOTE—That with the three tools shown above you can thread from 1-4 in. to 6 in. pipe. No loose parts.



No. 41, cuts 2½, 3, 3½ and 4 in. pipe.

"WARREN" DIE STOCK

(Non-receding dies adjustable.)

Each stock cuts two sizes. Made in four sizes

Prices $5.00, $5 50, $6.00 and $7.00.

THEY SAVE TIME AND MONEY

Write for our Illustrated List

Borden-Canadian Co.

Richmond St. East, Toronto, Ont.

Jeffrey pulverizers and crushers. The latest model of Jeffrey swing hammer pulverizer is well described and illustrated, and, judging from the list of firms operating these machines, its usefulness is unlimited, being used in all kinds of pulverizing from bark and chips to hard dolomite rock. Their crushers are also described, special significance being given to the coal, coke and salt types. The rotary crusher and the Jeffrey disintegrator are also given and in addition a complete list of catalogues published by the firm is listed, which is convenient for reference in case of different kinds of machines are required.

ELECTRIC FANS.—The Westinghouse Electric & Mfg. Co., Pittsburgh, Pa. Circular No. 1165. Shows the company's very complete line of electric fan motors for the season of 1910. These motors are designed to operate on the regular lighting circuits at the frequencies and voltages which are in general use.

ROLL CRUSHERS. The Jeffrey Mfg. Co., Columbus, Ohio. Bulletin No. 39; size 6 x 9 in.; pages 16. Covers the Jeffrey line of crushers for coal, coke and salt. The description of these crushers is supplemented by illustrations of the different parts and tables of dimensions. Space is also given to two types of pulverizers.

FINISHING STEAM TURBINE DISKS.—Gisholt Machine Co., Madison, Wis. Loose leaf circular. Illustrates and describes the finishing of steam turbine disks on a Gisholt 42-in. vertical boring mill. The entire operation from facing the rough forging to completely finishing the disk was performed in this machine, and it is stated that the work was completed in greatly reduced time and had a very fine finish.

VERTICAL TURRET LATHE.—The Bullard Machine Tool Co., Broad Street and Railroad Avenue, Bridgeport, Conn. Pamphlet entitled "The Vertical Turret Lathe for Machining Automobile and Gas Engine Parts." Refers to its use for machining such parts as flywheels, brake drums, sprockets, etc. A number of illustrations show the different operations performed on this machine.

BORING MILLS.—The 40-page, 8 x 10-inch catalogue issued by the Gisholt Machine Co., Madison, Wis., is an excellent piece of work. The line of boring mills, ranging from 30 inches to 84 inches in capacity, is fully described, views of details being added wherever necessary to bring out prominent features.

FAN MOTORS.—The Westinghouse Electric & Mfg. Co., Pittsburg, Pa., has issued a 55-page, 7 x 10-inch catalogue descriptive of a complete line of fan motors, of desk, ceiling and fan types, and in a wide variety of designs.

LIFTING JACKS.—Is the title of an attractive 100-page catalogue just issued by the Joyce-Cridland Co., of Dayton, Ohio. Besides listing their complete line of jacks for all purposes, the catalogue also contains discussions of the construction and recent improvements in this line of jacks. It also discusses the relative merits of various types of jacks, such as hydraulic, lever, automatic, automatic geared, screw, telescoping, etc., for different classes of service and recommends the most suitable jack for the different lines of work. The catalogue contains complete information concerning the dimensions, weight, price, etc., of the various jacks, and should be on file with anyone who is interested in the purchase of jacks for any purpose. Copies may be had by addressing the Joyce-Cridland Co., Dayton, Ohio.

BOOK REVIEWS.

COPPER HANDBOOK.—The ninth annual edition of the Copper Handbook, edited and published by Horace J. Stevens, Houghton, Michigan, is just received. This work, which has become a standard authority on the subject for the entire globe, has, in its latest edition, 1628 octavo pages, containing considerably more than a million words, and, in addition to the miscellaneous chapters, lists and describes no less than 7,751 copper mines and copper mining companies, in all parts of the world, descriptions ranging from two or three lines in the case of companies that have died recently, to sixteen pages in the case of one of the largest mines—a mine, by the way, that employs some seven thousand men, and has paid dividends of considerably more than a hundred million dollars. The mine descriptions are the same as in the preceding volume, except that upwards of eight hundred new titles have been added, covering descriptions not contained in any previous edition. The chapter of statistics, containing upwards of forty tables, treating of copper from almost every conceivable standpoint, has been fully revised, and brought as nearly as possible to date.

The miscellaneous chapters of the book, twenty-four in number, treat of the subject of copper from a great variety of viewpoints, including the history, chemistry, mineralogy, metallurgy and uses of the metal, and this section of the book also has chapters devoted to substitutes, alloys, brands and grades, and a copious glossary.

The plan on which the book is sold remains the same as for seven years past, the publisher sending the book by mail, fully prepaid, to any address ordered, without advance payment of any sort, and subject to approval after a week's inspection. The price is $5.00. That this unusually liberal plan has proven successful is shown by the statement of the publisher that net losses through returned copies and defaulted payments are less than four per cent. Anyone interested in the subject of copper, as producer, consumer or investor in shares, should write to Mr. Stevens for a copy of the Copper Handbook on the unusually liberal terms noted.

"The Thermal Conductivity of Fire-Clay at High Temperatures," by J. K. Clement and W. L. Egy, issued as Bulletin No. 36 of the Engineering Experiment Station, University of Illinois, is a report of the results of experiments on the thermal conductivity of several commercial fire-clays at high temperatures. A detailed description of the instruments and methods of high temperature measurements is included. Copies of Bulletin No. 36 may be obtained gratis on application to W. F. M. Goss, Director of the Engineering Experiment Station, University of Illinois, Urbana, Illinois.

Algoma Railway Extension.

Thos. J. Drummond, President of the Lake Superior Corporation, is authority for the statement that the Algoma Railway will probably be extended 150 miles to connect with the C. P. R. Probable cost, about $4,000,000.

STRETCHING THINGS

I am mighty careful not to stretch the facts in these publicity efforts.

You see, I base all my statements from information received from practical foundrymen, who know the subject.

I have reports from more than fifty progressive Foundrymen who say my KING KORE KOMPOUND is a new era in economy, in investment of money, in time-saving and in saving of castings. If there is now any one whose detail differs from the majority, I make it to fit his case.

It's the same way with GENUINE EAST INDIA PLUMBAGO, the only Lead any foundryman can afford to use.

With the Core Compound goes STEVENS' CARBON BLACKING, the ideal core-wash; there is no trouble, when making hollow castings, with this combination.

I manufaoture FOUNDRY FACINGS, FOUNDRY SUPPLIES, BUFFING COMPOSITIONS and PLATERS' SUPPLIES.

PETERSON'S CORE OIL

The Strongest Core Binder on the Market

Peterson Core Oil is the one oil that is fully equal to the best linseed oil for all core-making purposes.

It has the additional advantage of costing considerably less than high-grade linseed oil.

We do not expect to convince you by a mere assertion. We request the opportunity to demonstrate its truth to your utmost satisfaction.

A communication with us will probably lead to a great saving in your core-room. Write us to-day.

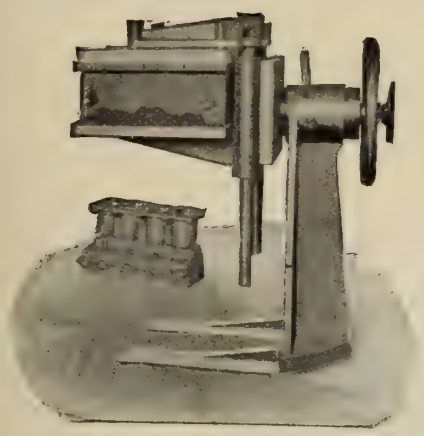
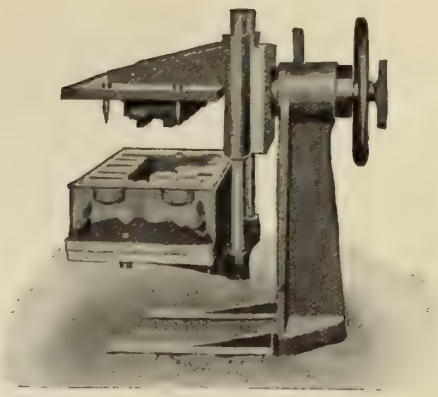
Grimes Roll-Over Molding Machine



No. 1

This is a simple, standard machine, requiring small floor space.

It is perfectly balanced, requiring no counter-balancing mechanism, as centre of gravity is centre of rotation.



No. 2

By means of small hand wheel shown in cut, one man can turn largest flask smoothly and without jerk.

Pattern is drawn by absolutely straight gravity drop.

This machine is adjustable for deep flasks and can readily take care of flask 24 in x 36 in. and 4 to 12 in. in depth, with maximum pattern draft of 12 in.

Positive adjustable pins at four corners of clamping device, Fig 2, compensate for unevenness of floor boards.

PRICE, f.o.b. cars Windsor, $125.00

HIGH GRADE CASTINGS are not made with low grade materials. Think this over when you see a poorly finished casting in your cleaning room, and remember, if you please, if you wish to place the pattern in the high grade class, our No. 48 Plumbago will do it, also that the saving in cleaning room expense would pay for three times the necessary No. 48 Plumbago to have made it high grade.

Another vital point is that you have a core wash which will peel clean and not run before the metal. Try our Eureka Blacking, the best core wash on the market.

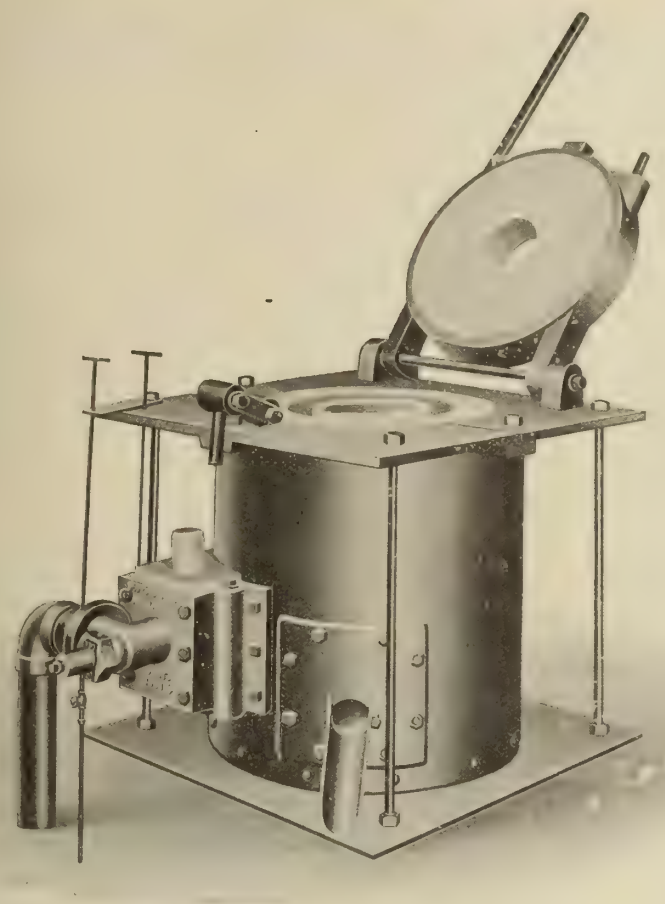
Made in Canada, under Canadian Patents

The "King" Fuel Oil Furnace



Built in sizes from No. 30 to No. 400 Crucible capacity, Burner and all parts working in full view of operator at all times.

This is also made in the same size in the Tilting Type.

The "KING" Furnace is the least complicated, and the most economical on the market to-day, operating on from four to five ounces of blast.

When at the American Foundrymen's Convention in Detroit, do not be deceived into believing that Canada does not, nor cannot, produce goods of equal quality to those manufactured in the U.S.A. Hear what they have to say, but give the Canadian manufacturer preference, providing he can show you superiority.

We also manufacture Melting Furnaces for use without Crucibles, and a full line of Forging, Annealing Furnaces, etc.

By June 1st, we will have the Foundry of the Montreal Technical School fully equipped. All the equipment was made in our own shops, and we invite every foundryman in Canada to see for himself what we can do in that line.

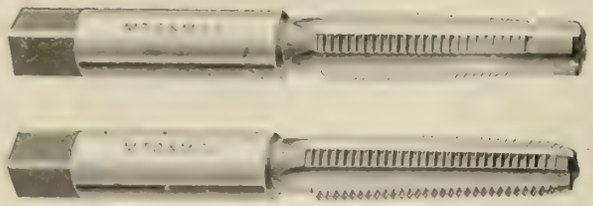
Do not forget that we also handle FOUNDRY SUPPLIES, of all descriptions, and the quality is right, also the price.

SOLE CANADIAN AGENTS FOR GLUTRIN

FRANCIS HYDE & COMPANY

MONTREAL

Straight and Taper Boiler Taps



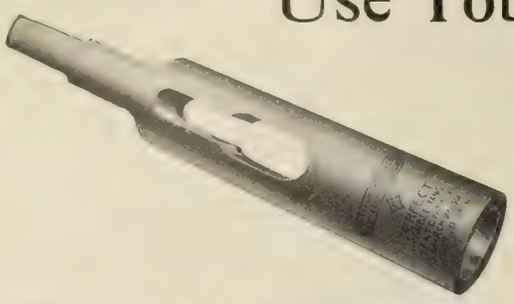
These Taps are carried in stock $\frac{1}{32}$ inch over size up to $1\frac{1}{4}$ inches, and will be furnished at same prices as standard sizes. All taps have 12 threads to the inch and will be furnished in either U. S. form or V form of thread.

WHEN ORDERING SPECIFY FORM OF THREAD DESIRED

Our goods are handled by Rice Lewis & Son, Limited, Toronto. Aikenhead Hardware Co., Limited, Toronto. Frothingham & Workman, Montreal. Mechanics Supply Co., Quebec.

MORSE TWIST DRILL & MACHINE CO.
New Bedford, Mass., U. S. A.

Use Your Drills With Broken Tangs



You have heaps of drills, whose tangs are broken off, lying around your shop. They are no use and considered loss.

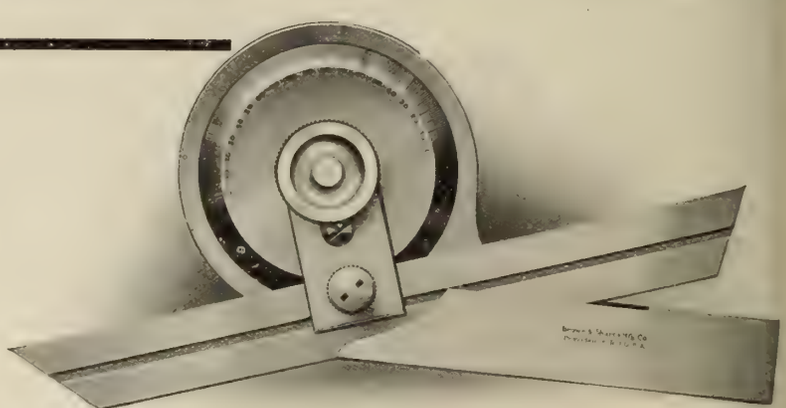
The Perfect Double Tang Socket is a simple, inexpensive means of reclaiming them. *Grind or mill* a new tang below the old one and which is from 25% to 60% stronger, according to the size of the shank.

All our regular taper shank drills are fitted with double tangs at no additional cost. *Send for Circular 18c.*

The CLEVELAND Twist Drill Co. CLEVELAND Chicago New York

High quality of material and workmanship makes it economical to buy

B. & S. Improved Bevel Protractor



The dial of the protractor is graduated to degrees, and the graduations extend over an arc of 180° reading 0 to 90° from each extremity of the arc. The tool is not intended for work requiring very fine measurements, and on this account there is no vernier, a point where it differs from the **Improved Universal Bevel Protractor.**

Other points in its favor are the independent clamping of the blade and dial, adapting the tool for work where other protractors cannot be used; one side is flat, permitting tool to lie flat on work or paper; dial rigidly clamped by nut. **Send for New Folder.**

BROWN & SHARPE MFG. CO.
PROVIDENCE, R.I., U.S.A.

HARBISON-WALKER

The Standard of Quality

Fire Brick for Boiler Settings

Look up, **not** your prices per thousand Brick but your **costs** for repairs per thousand H.P. per hour.

Remember the costly shut downs when every H.P. was needed. It all shows up on the cost sheets.

It's on the cost sheet basis we want to take it up with you. A postal will bring catalog and any data you wish.

HARBISON-WALKER REFRACTORIES COMPANY

PITTSBURGH, - PENNA.

THE BEST FIREBRICKS

ARE

GLENBOIG AND GARTCOSH

and BEST RESULTS can only be got by using these brands, as they will stand the highest heat without melting.

Are also largely used for building purposes where a handsome appearance is desired.

ALEXANDER GIBB

13 St. John Street : MONTREAL

Sole Agent for Canada

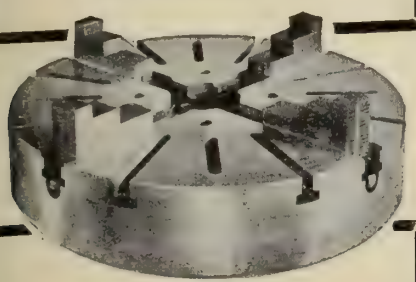
Cleveland, : : Ohio

Test It At Our Expense

We wish to introduce the



Imperial Chuck

to every shop in Canada, and if you will give an "Imperial" a fair trial, we will send YOU one at our expense and risk. Keep it thirty days, test and use it any way you can think, and if it won't answer every test you can apply, send it back at our expense.

WE know how good is the "Imperial;" won't you avail yourself of our offer?

Write us to-day.

Not an Enterprise for the "Quitter"

"If there is one enterprise on earth," says John Wanamaker, "that a 'quitter' should leave severely alone, it is advertising. To make a success of advertising one must be prepared to stick like a barnacle on a boat's bottom.

"He must know before he begins it that he must spend money---lots of it.

"Somebody must tell him that he cannot hope to reap results commensurate with his expenditure early in the game.

"Advertising does not jerk; it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year, until it exerts an irresistible power."

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

To Our Readers—Use this directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

To Our Advertisers—Send in your name for insertion under the heading of the lines you make or sell.

To Non-Advertisers—A nominal rate of $1 per line a year is charged non-advertisers.

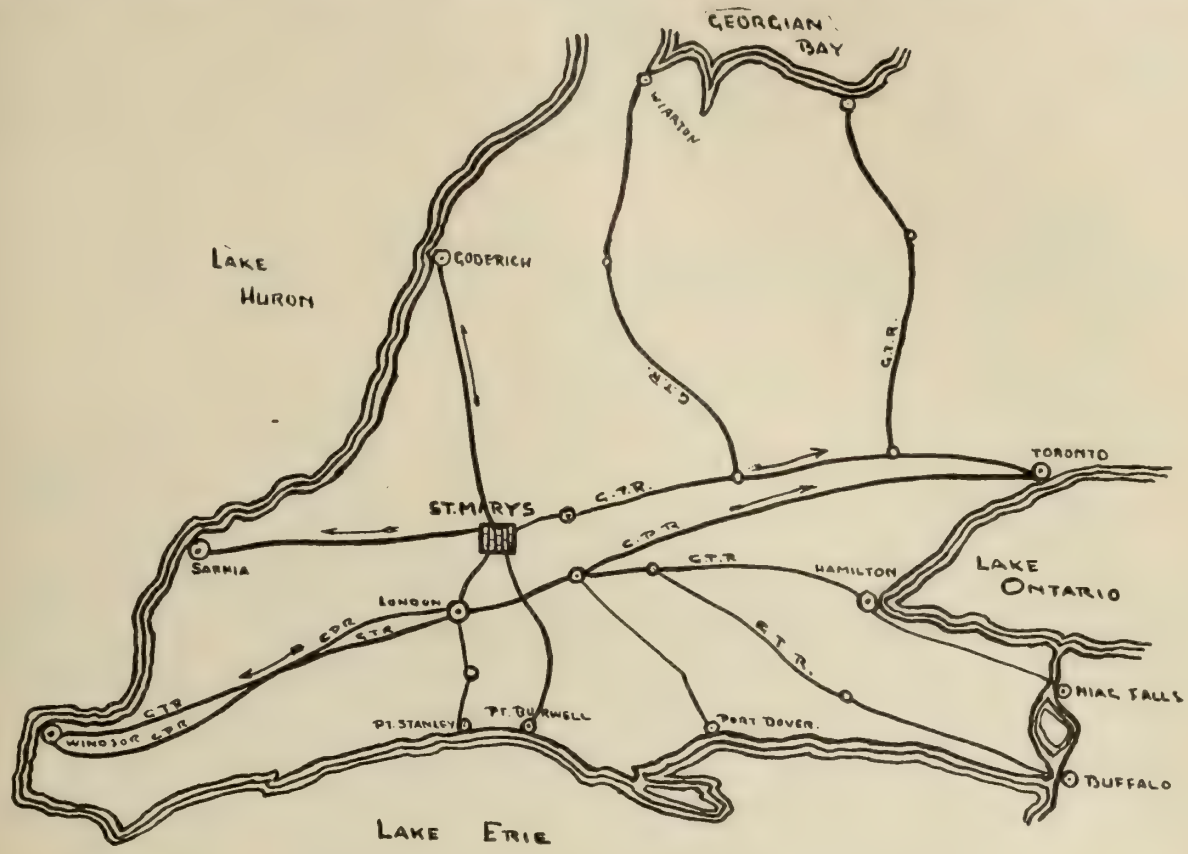
Town of St. Mary's, Ont.



MR. MANUFACTURER:

Are you looking for a location where you may establish your factory?

St. Mary's is looking for you.

Please take time to consider its advantages.

Located in the heart of the finest agricultural district in Canada. Niagara power always on tap. C.P.R. and G.T.R. One million population within a radius of one hundred miles. Splendid water. Healthy surroundings. Beautiful. Good schools and churches. Abundance of labor. Get in touch with T. M. CLARK,

Secretary Industries Commission.

GRINDING WHEELS

YOUR business probably requires Corundum and Emery Wheels that are well-balanced and porous; that cut free and fast; that give long, reliable service. Our business is to supply just such wheels in any size up to the largest grinding wheels used. Our facilities mean prompt shipment of reliable wheels. Let us quote on your next order.

MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe-Screwing Machines

GAP LATHES—16, 18, 20, 24," in any length of Bed.

A Gap Lathe for a Jobbing Shop is an almost absolute necessary Machine Tool.

The improvements embodied in our Lathes made for absolute solidity and steadiness of cut.

The Brace under Carriage allows Gap diameters to be turned at High Speeds with resultant work as good as can be done on an Engine Lathe of large swing.

Double Back Gears give a range of Spindle Speeds which are all found useful.

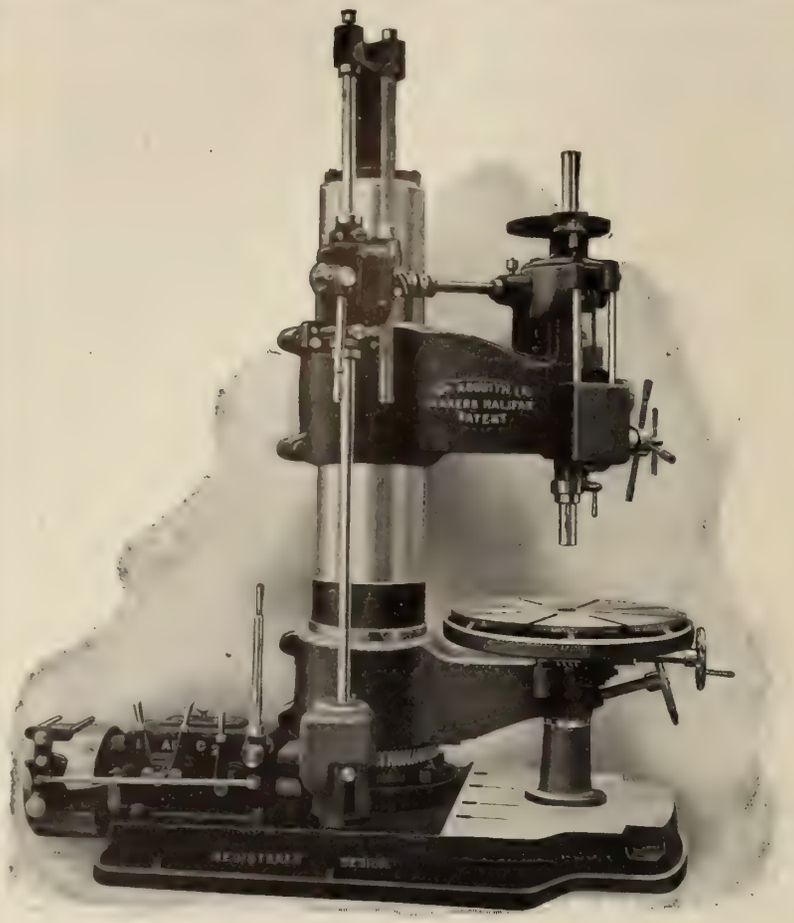
Our extra large belt surfaces, combined with specially heavy spindles, ensure highest efficiency both in quantity and quality of work

We invite the closest scrutiny of materials, workmanship and finish, and have adapted Highest Quality as standard from which we will not deviate.

Particulars, yours for the asking.

The R. McDougall Co., Limited

The Canadian Fairbanks Co., Sales Agents. GALT, CANADA



IMPROVED RADIAL DRILLS

Manufactured by

William Asquith, Limited

Halifax, Eng.

In these machines which are made in sizes from 5'-0" to 10'-0", every part is of massive proportions, designed to give utmost rigidity during heavy strains and the use of high speed steels.

THE SPINDLES are of carbon steel, have Central Thrust, and are balanced by improved arrangement. The thrust pressure on spindle is taken by improved Ball Bearings, reducing friction to a minimum.

The spindle is provided with clutch motion enabling the spindle to be instantly stopped, started or reversed, without using belt motion.

The spindle works midway between the two long walls of the arm, ensuring central thrust, and entirely eliminating sidetwisting strains.

IMPROVED GEAR BOX—Any change of speed can be effected practically instantly, whilst the machine is running, without shock or jar to the teeth. All the gearing throughout is machine cut and all feed gears are of steel.

These machines are fully equipped for Radial Drilling, Boring, Tapping and Studding

Write us for data and information on all kinds of Metal and Woodworking tools.

We also carry VELOS HIGH SPEED STEEL and TWIST DRILLS and steel for all purposes, Pneumatic Tools, Chain Hoists, etc.

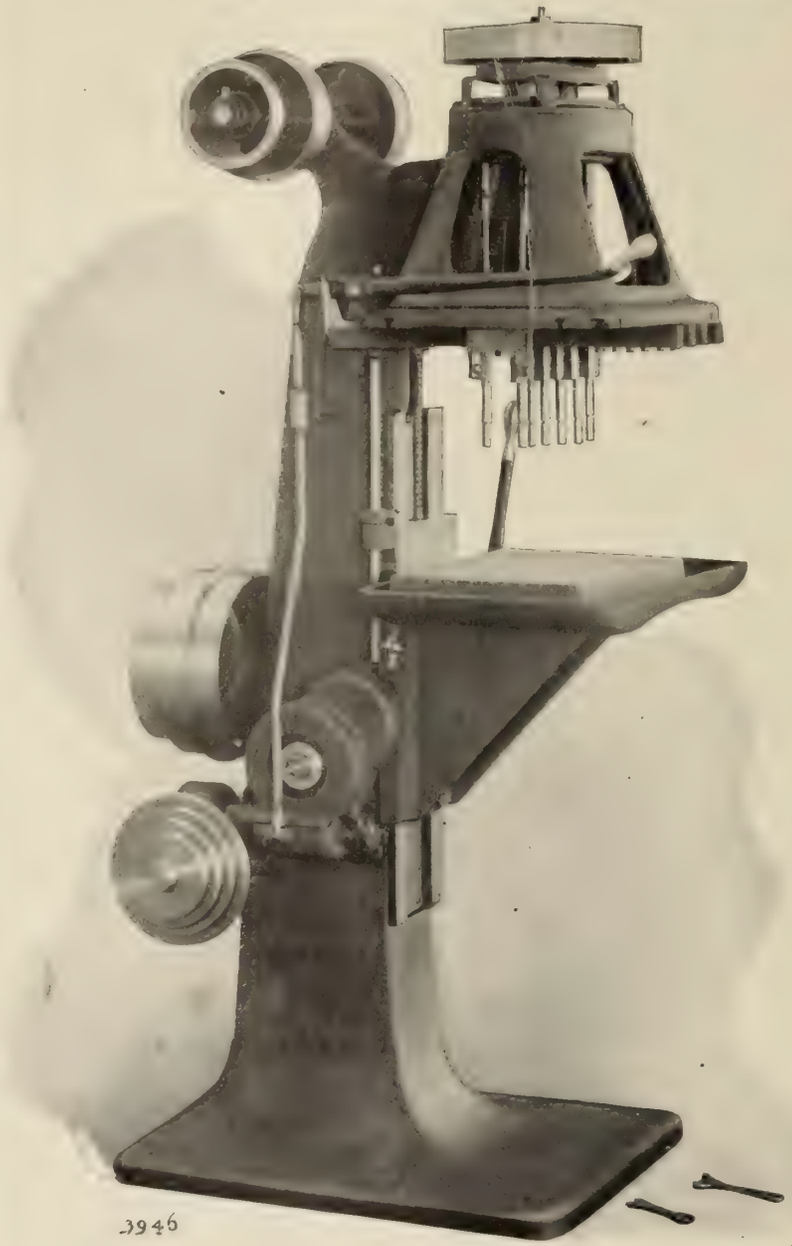
DUNDAS, ONTARIO, CANADA

Sales Agents—The Canadian Fairbanks Company, Limited

It is a Waste of Time and Money To Drill Each Hole Individually

of any regularly or irregularly shaped layout.



No. 11 P. & W. Adjustable Multiple-Spindle Drill

The P. & W. Adjustable Multi - Spindle Drill

can do the same operation as many times faster than individual drilling as there are spindles working. In addition it assures exact duplication of any layout. Also, in case the holes are to be counterbored, reamed and tapped, part of the spindles can be so arranged, thus permitting the entire work to be done without taking it from the table.

Most Economical when Used in Connection with Jigs

Machines are very rigidly built and are very powerful. One drill or the entire complement in a machine can be driven to the limit of endurance of modern high power drills.

Built in several types and sizes and of any practical number of spindles for drilling holes up to 2 inches. Belt or motor drive.

Write for Catalog "Multiple Drills."

Westinghouse

Electrically-Heated

Glue Pots & Glue Cookers

are best for cooking glue and keeping it at a continuous working temperature for pattern makers, cabinet makers, piano builders, leather workers and bookbinders, because they offer

The safest way—there are no flames to cause fires.

The cleanest way—no fumes of any kind, no steam escaping from leaky pipe connections.

The most convenient—a turn of the switch starts the heating of the glue, and the same operation stops it.

The most economical—they eliminate the enormous waste of glue usual with antiquated methods of heating.

The cookers are built in capacities ranging from 3 to 25 gallons, the pots in 2 and 4 quart sizes. Send for complete information.

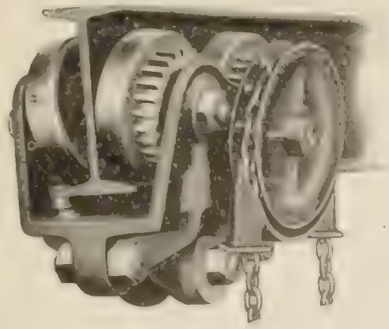
The "Matchless" Trolley

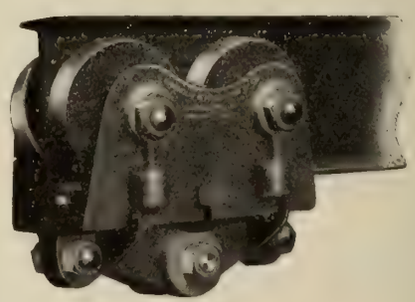


GEARED

Has Flangeless Track Wheels with vertical guide rollers. This gives two important advantages—less friction than with flanged wheels, and the ability to take curves as short as 18-inch radius.

Has Adjustable Frame. The vertical guide rollers are on eccentric shafts, and by turning these and locking at the right point each size "Matchless" can be made to fit at least three different sizes of I beams.

Axles and bushings of the track wheels are of hardened steel, fitted with hardened steel rollers in brass cages. On the geared trolley the gears are cut. They work very freely and have a large safety factor. The Hoist hangs on the central bolt and reaches within ONE INCH of the I beam.



PLAIN

The "Matchless" is made in 9 sizes, capacity from 1,000 to 20,000 pounds. For full information write

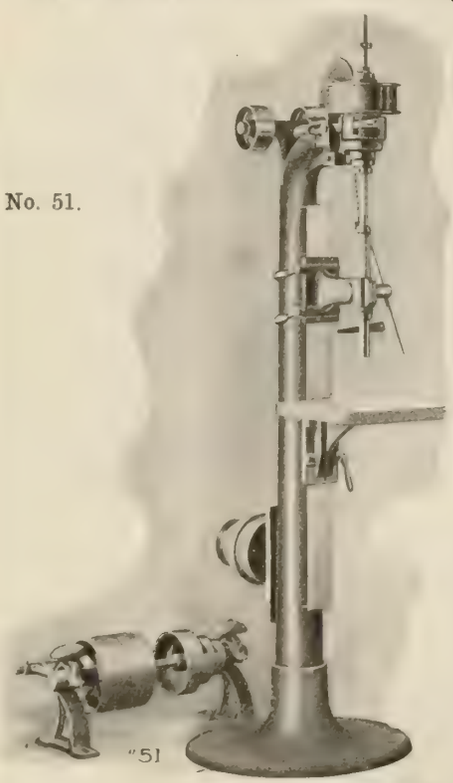
We Give You a Change. We are Offering You Something New.

No. 51.



We are offering at once a convenience and a labor saver. These machines are self-contained combination drilling and tapping machines. As a drilling machine all extra parts are idle. As a tapping machine it is ahead of all devices that are in combination with drilling features. Originally designed for use on our multiple spindle drilling machines, it created a demand for use on the single spindle machines, and these two machines are the result. The No. 51 weighs 550 pounds, drills up to ¾-inch holes and taps up to ½-inch holes in cast iron. We have tapped ⅝-inch holes in steel on this machine, but we do not recommend it for work as heavy as that. The No. 11 weighs 275 pounds, drills up to 9-16 inch holes, and taps up to 7-16 inch holes in cast iron. We have a Style A and a Style E designed for use on our Styles A, B, E, and F multiple spindle drills. We can give you power feed, lever feed, and tappers in any combination to suit your requirements on machines having from two to six and seven spindles, and we are the only ones offering these conveniences and labor saving combinations.

INVESTIGATE.

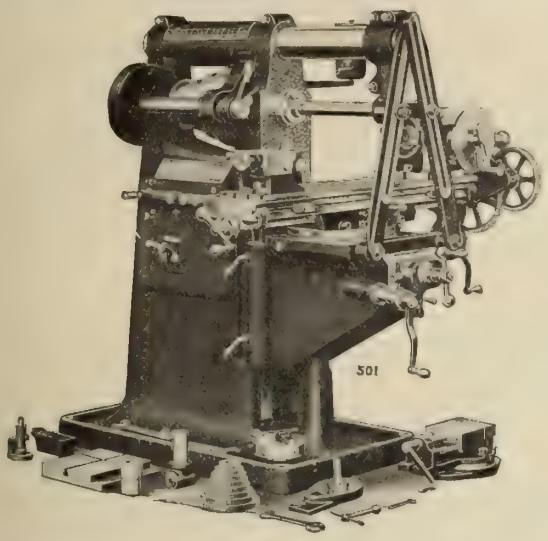
WILLIAMS & WILSON, Montreal. **A. R. WILLIAMS MACHINERY CO., Toronto**

The advertiser would like to know where you saw his advertisement—tell him.

The New Cincinnati Cone-Driven Miller

In every shop there is some work on which the cutting is light that can be milled to best advantage on a modern Cone-Driven Machine. To meet such requirements we have redesigned our line of Cone Type Millers, Plain and Universal. They have many important features far in advance of other Cone-Driven Millers. The COLUMN is a complete box of rectangular form. The FEED MECHANISM is a single unit, assembled complete by men who are specialists on this work. When in place, it is an integral part of the machine. It is located high above the floor—the operator need not stoop to reach the levers. The feed changes may be made within the practical limits of milling while taking a cut, without inconvenience or injury to the gears, because they all run at moderate speeds.



The FEED INDEX is direct reading—no chance for confusion or doubt as to the proper lever movements. It is the simplest index used on any machine tool.

All these features make this type the ideal machine for manufacturing small parts and for toolroom use.

We make a complete line of newly designed millers:—Plain, Universal, Vertical—Cone-Driven, High Power.

Ask for our catalog.

The Reason Why

The reason Nicholson-made Files and Rasps have such a splendid reputation is that they "make good" under every condition of service. They cut better, smoother and do the work faster than any other make of files.

We use steel made to our own specifications and the method of hardening is the result of many years' experience. We are only stating a plain fact when we say that no other firm in the world has an experience in file and rasp manufacture equal to this company.

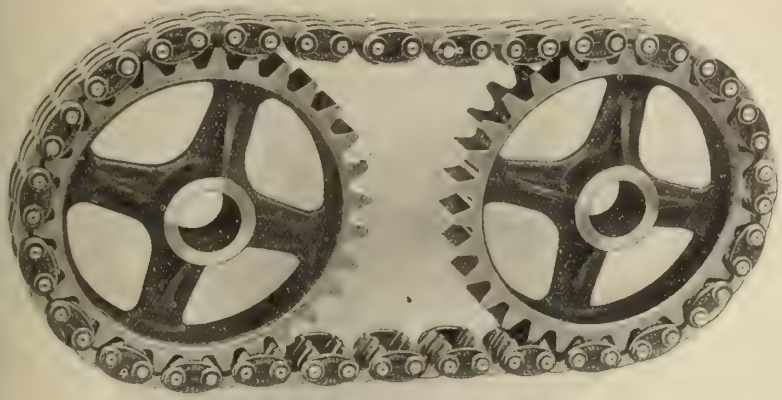
SOME ADVANTAGES OF THE

Coventry Noiseless Chain Drive

Over Belting

¶ May be run quite slack, even at short centres, thus reducing journal pressure, friction, waste of power and wear on bearings. ¶ Never slips. ¶ Gives an accurate ratio between driver and driven. ¶ Allows line shafting to be more closely grouped, reduces size of pulleys, and does not obstruct light as belts do. ¶ Can be run in hot or damp places.



Over Gearing for short connections

¶ Much lighter. ¶ Reduces noise and friction.

Over Other Chains

¶ No sliding friction between link and tooth, thus reducing noise and tear to a minimum. ¶ When wear does take place, the "Coventry" Noiseless automatically adjusts itself to the teeth of the wheel. ¶ Can be run at very high speeds, up to 1,400 feet per minute.

INCREASED EFFICIENCY

250 PER CENT.

THERE ARE TWO WAYS OF INCREASING THE PRODUCTION OF YOUR GRINDING DEPARTMENT:—

Enlarge your floor space and double your working force—

Or put in Carborundum grinding wheels and enable every man of your present force to do two or three times as much work in a day.

In grinding hardened steel wrist pins in a Cleveland motor car factory, Carborundum wheels are averaging 70 pins a day each.

The best record ever made by any other wheel in that factory was 20 pins a day. Carborundum wheels are also producing a finer finish and lasting more days before wearing out.

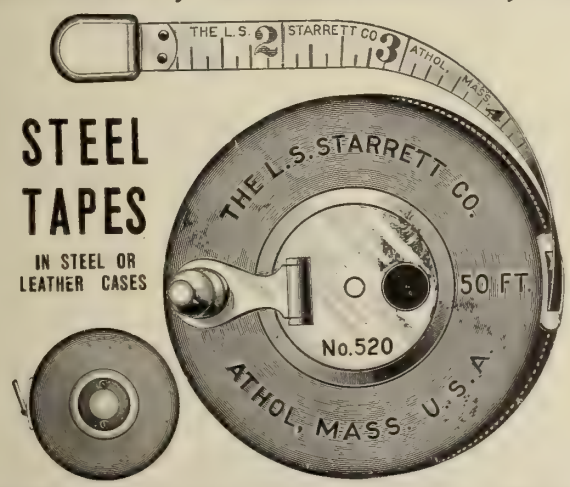
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH



STEEL TAPES

IN STEEL OR LEATHER CASES

In our tapes the figures denoting feet are smaller than those denoting inches. Two reasons for this:

This dissimilarity of figures materially lessen (in fact ought to entirely prohibit) the liability to erroneous readings that frequently occur through the uniformity of all figures in steel tapes of other makers.

The smaller figures denoting feet allow the graduation line under each to be plainly visible, instead of being obliterated by the usually larger figure.

Graduated in feet, inches and eighths of an inch, or in feet, tenths and hundredths of a foot.

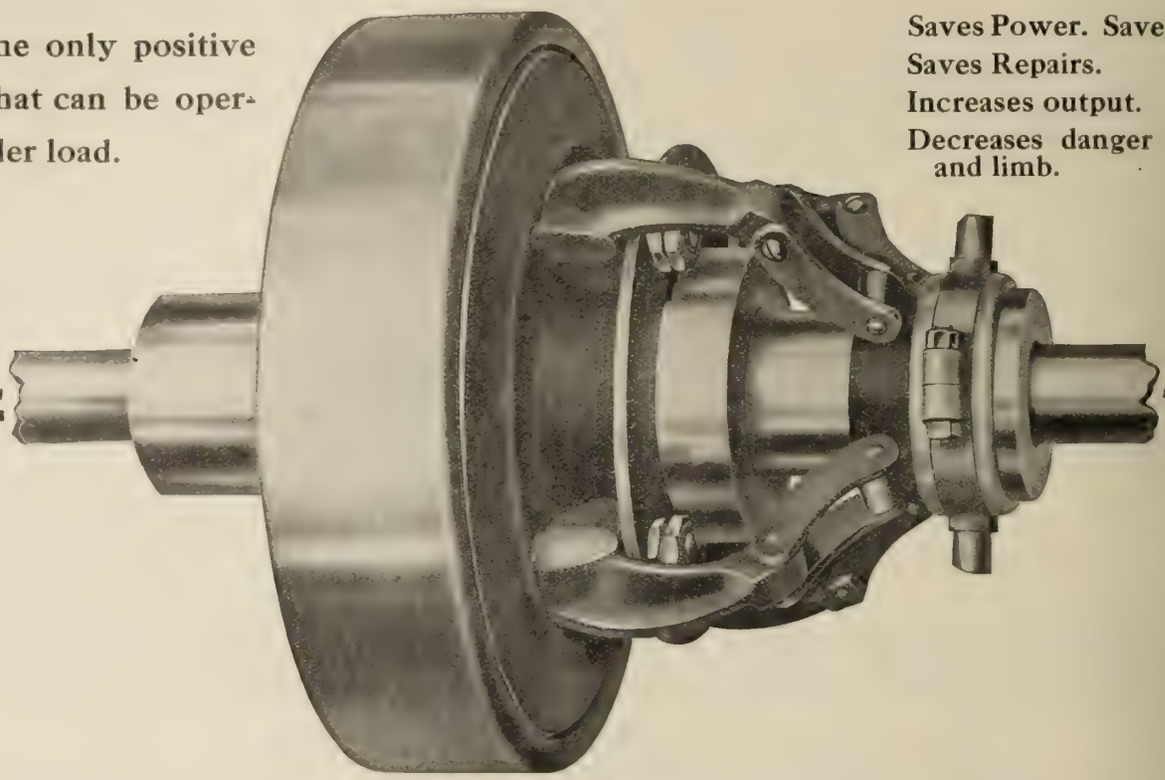
All the advantages of a Friction Clutch with the Positive Drive of a Jaw Clutch are combined in this

Combined Jaw and Friction Clutch

It is the only positive clutch that can be operated under load.

Saves Power. Saves Belts.
Saves Repairs.
Increases output.
Decreases danger to life and limb.



¶ The frictions are not obliged to carry the load, but are used only for the purpose of operating the jaws.

¶ The friction capacity need only be sufficient to pick up the speed of the unloaded shaft or pulley, as the jaws when engaged will carry the load which is afterward applied up to their rated capacity.

¶ Springs are provided to prevent the frictions or jaws from engaging or disengaging except by movement of the operating lever, and to automatically engage or disengage the jaws.

¶ The frictions are made of fibre instead of wood, which prevents them burning and overcomes the usual necessity of constant renewals.

¶ Sleeves are provided with graphite lubrication, eliminating the oiling troubles common to all other clutches, and are made to standard diameters to fit the standard bores of pulleys

¶ The levers and fulcrum rings are malleable iron. The thrust collars are bronze and the links are steel.

¶ Every clutch is supplied complete with wrenches, keys, collars, lever straps and fulcrum, also grease cups, and a tin of specially prepared graphite clutch grease

Extraordinary Opportunity!

To Purchase a High-Grade Gas Engine at Wholesale Prices

400 FAIRBANKS-MORSE ENGINES TO BE SOLD AT ONCE

The Reason---

We have had manufactured and have ready for delivery in anticipation of this year's Grain Elevator business in the West,

100— 5	Horse-power	Gasoline Engines.
150— 8	do.	do.
100—10	do.	do.
50—12	do.	do.

Owing to the drought there will be little elevator building, and rather than carry them over another year, we will sell them at great reduction, as long as they last, as we haven't room to carry them.

Fairbanks-Morse Gas Engines are used all over the world, EIGHTY THOUSAND engines having been sold up to date. The engines are the result of years of experience on all problems connected with Gas Engine Practice. No company in the world has spent so much money as Fairbanks-Morse & Co. on experimental and development work in connection with every type of Gas Engines.

The many thousand in use to-day stand as a guarantee of the absolute correctness of the principles involved, the high class of workmanship, careful selection of materials and the reliable and efficient service rendered by the finished machine.

A record like this is based solely on recognized merit.

"The Saving of Heat Units" is a Clue to Larger Profits

How a Leak of $2,600 was Turned into a Profit—How Manufacturers Can Turn Waste into Profits by Taking Care of Condensation.

By H. L. Peiler *

Modern engineering presents to its students many fascinating features.

Civil engineering has achieved many triumphs of construction, and in its discoveries of the practical application of theory to the utilization of the special qualities of steel and concrete, has overcome so many difficulties, has raised so many and such various monuments to its own skill, that the average man is lost in admiration while contemplating the results.

Electrical engineering, while relatively an infant branch, has made such rapid and brilliant strides that we already regard as ordinary commonplaces achievements that less than one generation ago aroused the wonder of the world. It is really difficult to realize how very youthful are such every-day utilities as the incandescent lamp and the telephone. Long distance transmission of currents of relatively high potentials only dates from yesterday.

In mechanical engineering, while progress has been steady, it has not been so rapid, and the advances have come in short rushes with a rest between. In recent years, we have progressed from the single cylinder engine to the compound, from the low-pressure slow-speed engine to the high-piston speed, long-stroke and quick revolution engine necessitating high pressures. Then comes the development of the turbine principle and as a crown to all of these, the successful application of the superheating of the steam. Keeping up with the development of the engine, the steam-generating plant has also progressed, and boilers with their accessories from grates, mechanical stokers, automatic feed-control and other fuel-saving attachments, make the modern boiler-room a very different proposition from that of even fifteen years ago. In another direction, we have the internal combustion engine in its various forms and many other devices for cheapening the cost of power-production and simplifying the complex problems that confront the present day manufacturer when he is contemplating his costs.

In view of all these bright and outstanding achievements in the mechanical world, it seems as if it might be a very difficult task that I have undertaken when I presume to address you on such a commonplace topic as that which has been chosen for me.

I am in the position of the gleaner of the scriptures. Before me have gone the reapers and the binders, they occupy the whole skyline because their work is more prominent. But in their haste to show large and brilliant results, they have neglected the apparently small waste that lies scattered here and there in the furrows, so small perhaps that it has to be searched for, and yet, in the aggregate, so large that its accumulation hour after hour, day after day, and month after month, presents at the end of a whole year a sum total that is surprising.

Waste of Hot Water.

On going over a certain plant with the owner, I asked him where a particular return line led that originated in

H. L. PEILER.

a dry-room. He replied that it emptied into the drain. I asked how much water he was losing, and he stated that it could not be much and that the water was cheap. However, I managed to arouse his curiosity sufficiently to have the pipe uncovered and the water measured. To his surprise he found that a 50 gallon barrel was filled every 40 minutes and that the temperature of the water near the outlet of this large drier and while still under pressure, was 306 F. His engineer calculated for him the approximate cost, in tons of coal, of heating nearly 250,000 gallons of water from 50 F. to 300 F., and this manufacturer came to the conclusion that he was not sufficiently wealthy to continue that system, when at relatively low cost, the same water could be returned to the boilers direct and without loss of heat-units. This plant had almost every practical device for making steam cheaply. High-class boilers, modern engines, approved equipment everywhere, including ball-bearing shafting and everything to reduce friction loss to a minimum, and yet this was only one of a series of "leaks" that were discovered during a careful investigation, and eventually he found that leaks, which cost him $1,800 to stop, had for years previously been trickling $2,600 annually into the drains. Everybody possible had apparently been done to make the whole plant modern and up-to-date, which is equivalent to saying "economical to operate," but the men in charge had neglected to "look into the furrows." This is only one of a series of similar incidents which I can recall in my own experience.

I am a hunter of leaks, and this saving of the heat-units in the water of condensation, while being on a superficial view only a very minor matter, is one of those smaller details of the engineering field that seems to be fated to be left to some hanger-on of the profession like myself, and it keeps me very busy gleaning what I find in the furrows. If I were permitted an attempt at a joke, even on such an apparently mirthless topic as condensation, I could say that it keeps me constantly "in hot water."

Present Day Conditions.

For purpose of comparison, it is necessary for me to state briefly the conditions that are most frequently met with in steam-using plants in this country. They are of course quite familiar to all engineers. The steam is trapped at the point of discharge at the apparatus in which it is used. The water is then usually run by gravity to some low point, gathered in an open heater, vented receiver or hot well, and after the make-up-water has been added, the boiler is fed from this central reservoir. Where the steam is used under very low pressure (0—5 lbs.) and where exhaust steam from the engines is mixed with this low-pressure live steam, the temperature of this water of condensation upon reaching the receiver is frequently under the boiling point and the addition of the cold make-up water further reduces it to a point where it can readily be handled by a good hot-water

* Of Peiler & MacKenzie, Montreal.

pump. Under these conditions, it is not economical to handle the returns in this manner. But here I would like to point out that in drawing hot water from an open heater or receiver, and passing it through a pump, the temperature is still further reduced, and many engineers who have thermometers on the heater or receiver, overlook the important fact that in most cases they lose from 8 to 12 degrees between the heater and the point where the feed water enters the boilers, and that this means a direct loss of from 2-3 to over 1 p.c. of the total fuel consumption.

However, there are very few plants that answer to this description. In nearly every industrial process in which steam is used for heating, drying or boiling, it is more economical to use higher pressure in order to obtain the greater rapidity of result from the higher temperature. Even in paper mills and the finishing departments of textile mills it is usual to find pressures of from 5 to 10 lbs. used for drying. In laundries, in breweries, in confectionery boiling, in wool and cotton drying and many other lines of work, 60, 80 and even 100 lbs. pressure are usually employed, and in all these cases the pump and receiver method is wasteful. It must be remembered that in a dry-room, for instance, on which 80 lbs. pressure is carried, the water of condensation as it leaves the outlet, and while still under pressure, has almost the same temperature as the steam from which it originates, that is to say about 320 degrees F. When this water reaches atmospheric pressure, it at once cools by expansion to the boiling point, and throws off 108 degrees of its temperature, and a considerable portion of its own bulk in the form of expansion vapor, all of which is a dead loss. It is manifest to the most inexperienced new hand, that if this water can be carried back direct to the boilers without being allowed to expand, there will be an absolute saving of the amount of coal necessary to re-heat this water by the 108 degrees that it has lost. When one recalls the fact that steam or hot water under even 5 lbs. pressure has a temperature 16 degrees, at 10 lbs. 28 degrees, at 30 lbs. 62 degrees and at 60 lbs. 95 degress above boiling point at atmospheric pressure, and that between 10 and 12 degrees increase in the temperature of the feed water means a theoretical saving of 1 p.c. in the fuel account, it follows as a natural consequence that it is wrong in theory as well as in practice to cool off water and then spend good money in replacing a loss of heat that can readily be retained and used over again.

Stormont Mill Installation.

If the water can be returned into the boilers above the evaporation point, at atmospheric pressure, the gain is very much larger in proportion than if the boiler feed is below the boiling point. The reason for this is that the working capacity of the boiler has been changed, and has been brought to a state where the boiler is more efficient in heat-units. This difference of efficiency must be also credited to this method of feeding, and the change will naturally show greater total results, than if the saving has been computed from changes due to the difference in the temperature of the feed-water alone. I give one interesting case out of a number I have met in my own experience. In the Stormont mill of the Canadian Colored Cotton Mills Co., at Cornwall, Ont., when the average temperature of the boiler-feed was 165 deg., five 80 h.p. boilers were used to do the drying and dyeing. Under the re-arrangement now in force, about 80 per cent. of the feed-water goes back direct to the boilers through return traps at 280 degrees, the make-up water at 140 degrees making the average temperature of the boiler-feed 252 deg. F. This shows a gain of 87 degrees with a theoretical saving of about 8 to 9 p.c. in fuel. In reality, two of the boilers have been shut down, the other three are more efficiently operated, and the actual saving in fuel is over 30 p.c. allowing for the fact that a portion of the dyeing plant has been removed to another mill. This was originally a receiver and pump lay-out with the make-up water running into the receiver-tank to cool the returns, and nothing was done by me, except to handle the returns independently from the make-up. The cost of making the change actually pays for itself in this plant every six months.

In many sections of Canada, and particularly throughout Central and Western Ontario, another consideration is that of the quality of the feed-water. Every engineer realizes the value of using the condensation over again, and how much it improves his general conditions to minimize the amount of fresh water that is fed into the boilers, and most of which in many places has to be paid for. And yet, for some unknown reason, I find many plants where the engineer appears to have failed to convince his owners. Only last week I was in a factory in Western Ontario, where the feed-water is so bad that the 2 inch feed pipes to the boilers are practically choked up completely every four weeks by the heavy deposit of solids from the water. In this same plant, the exhaust from two engines and four pumps is utilized for heating water for manufacturing purposes, but every drop of this valuable condensation is allowed to run into the sewers. Enough distilled water is wasted to feed one 125 h.p. boiler practically continuously.

If it were a matter of enormous expense or engineering difficulty to save and use this water, one could understand the objection. But it is such a simple problem, and as this water is always at or near the boiling point, the saving in fuel would also pay for the cost in a reasonable time. All that is necessary is an oil-separation system, and a trap or pump that will lift this water back to the feed system.

While the attention of power users in Ontario and elsewhere at the present time is being largely attracted to electricity, this also opens up an equally large field for the steam-trap, especially the return trap. While we have our good Canadian climate to contend with, and while we need heat for boiling, drying and other purposes, so long will we require steam. Where steam is used for heating only, the return trap will operate efficiently with a much lower boiler-pressure than is required to work a pump. However, it is entirely automatic and its simplicity, lowness of operating and up-keep cost, and other advantages, make the return steam-trap in every way more desirable than a pump for boiler-feed purposes. Where the lift from the lowest point of drainage to the top of the boiler is low (say, 6 to 8 feet), a boiler-pressure of 6 to 10 lbs. is ample.

A very little experience will show that results will be obtained much lower in cost than by any other system of heating. There is no loss of heat-units between the point of drainage and the boiler. This is the important factor of saving.

Another equally important matter, and in fact one that in some cases is more important, is that of the proper trapping of steam-using machinery of every description. It is a point that has been very much neglected by the engineering profession. The steam-trap in general has been condemned by many engineers and is a cause of dissatisfaction in many factories and plants. An examination of the conditions will often show the reason. The chief reason, in my experience, is that steam-traps are seldom purchased intelligently. This may appear to be a strong statement to make, but it is an absolutely true stricture, and one which I am able to substantiate.

Causes of Trouble.

The first great cause for this, is that extremely few engineers take the trouble to find out what the actual quantity is in pounds or gallons of water that is condensed in any given process or machine. The ratio of water condensed from steam varies enormously according to the service performed by

that steam. It is ordinarily calculated that one square foot of radiation used for heating an ordinary building will condense .625 of a pound of water per hour, when the building has been heated to 68 degrees F. But this will vary according to the construction of the building, the amount of glass surface and the humidity of the air as well as its changes in a given time due to wind. Condensation in a dry-room will vary according to the moisture of the goods being dried. A mangle in a laundry will condense more steam or less, accordingly as the quantity of the goods passing over it in a given time is greater or smaller. Indirect coils where air is forced over the pipes, will show enormous differences when the air is drawn from out-of-doors and when the air is re-circulated within the building. A vacuum pan will condense steam much more rapidly than a pan in which the same liquid is boiled at atmospheric pressure. Every process shows different results, and a proper test of the quantities almost invariably shows that the ordinary methods of guess-work run from 25 p.c. to 50 p.c. too low. It is quite usual to find a steam-trap with an interior valve-opening of ¼-inch, and actually able to discharge about 10 lbs. of water per minute with 5 lbs. pressure, placed where it has to take care of double that quantity of water, a thing that it is not possible to do. The trap floods, it refuses to do work that is against all natural laws, and in consequence the trap is blamed, and not the man who attempted to force it to do impossibilities. A certain amount of blame also attaches to the engineer, because the chances are that he probably did not by actual personal investigation, find out for himself the size of the opening through which the water had to pass. On the other hand, a certain amount of blame attaches to the makers of these traps, who fail to inform the engineering public of this most important detail in trap construction.

Ordinary so-called catalogue ratings are useless. They are usually based upon a fixed pressure of, say 50 pounds, and their drainage capacity in feet of one-inch pipe, is misleading. No allowance is made for varying conditions, and a trap that will handle a given quantity of water at 50 lbs. will do nothing like that amount at 5 or 10 lbs. pressure.

Every engineer knows that in order to obtain from steam the heat-units which he wishes to utilize, he must first condense that steam. Engineers know that in order to obtain the best results, the apparatus must be drained quickly and most engineers know that condensation does not usually leave the apparatus in a steady stream, but that the water nearly always comes in gulps and sudden gushes. It is this maximum condition that must be taken care of by the trap, and the most economical and useful trap is that which is a little larger than the actual average condition calls for.

With steam traps, as with every other kind of machinery, it is mistaken economy in every way to buy too small sized units. The over-loaded boiler and the over-loaded engine are expected to give poor results in the long run, and yet I think I am not in the least guilty of exaggeration when I make the statement that fully 60 p.c. of all the steam-traps in use in this country are over-loaded and expected to do work of which they are not capable. This means another direct loss in the efficiency of the apparatus being drained, and in many cases reduces the output as much as one-half.

I wish to emphasize this important feature, and it covers the two great points to be aimed at in the economical handling of condensation, namely, that, first, all steam-using machinery should be amply and quickly drained, and secondly, the water of condensation kept under pressure and returned direct to the boilers without loss of its heat-units.

Trap System.

The method of doing this is simple. A proper system of proper traps will do the work automatically. The upkeep expense is practically none, and depreciation allowance less than that of any other part of an ordinary power-plant. Return lines should be covered to retain the heat in the water ; this is a practice which I always suggest and which the results justify.

It is usual in most steam-using plants to cover the supply pipe and leave the return pipes uncovered. You will tell me that the reason for covering the supply lines is to prevent excessive condensation in the line through radiation of heat through the pipe. My argument goes farther. Prevent that same radiation loss in the return. It represents just as much cool on the return side as in the supply side. If you can handle your water into your boilers under pressure as hot as you get it, why allow any unnecessary loss at either end ? Pipe-covering only represents a small first cost ; loss of heat by radiation represents a perpetual expense in coal.

By a proper trap I mean one of ample discharge capacity, and not a trap of the kind that requires a cooling of the water to open its valve, such as the usual expansion type. Remember that your object is to utilize as fully as possible every heat-unit contained in the water as it leaves the place of condensation. The rest is merely an application of ordinary common sense and reasoning power. Get your condensation back above the boiling point at atmospheric pressure, and you are making money.

It is difficult to imagine what argument any owner or engineer can set up against the proofs of economy that can be submitted in favor of this method, and yet I find that many owners and engineers of plants where the old methods exist have the greatest prejudice against venturing on a change that is such a simple and reasonable one. I have made these changes in a great number of industrial establishments, and in every case the owners have expressed their regret that the change had not been made sooner.

One question has been frequently put to me, and that is : "If this thing is so simple and if the saving is so large, why has it not long ago become the general practice ?" "Why is it not the rule rather than the exception ?" My answer to this is that this is a young country, and that technical education was until recently almost an unknown quantity. Our conditions in the early days were peculiar. We had an apparently unlimited amount of fuel at our doors, and we were a wood-burning nation, even our railways burning the wood that was piled up everywhere, a refuse from the clearing of the land. Then we began to manufacture, and every aim was directed at increase of output. Go to many of our largest manufacturing establishments to-day, especially those that have grown with the country during the past thirty or forty years, and I can instance numbers where the original plant can be traced, now a small corner of a large factory. Around it have grown the subsequent additions and extensions, a new building here, another there, not built and located according to one preconceived plan, but simply thrown on anywhere where room or convenience dictated, to meet the temporary exigencies of our growing time. "Output" has been the moving factor.

In the meantime, cheap fuel has gone and coal must be bought. Competition has arisen in nearly every line that compels closer margin of profit. Every effort is made to procure the latest types of machinery, the most modern processes, more skilled labor. But it has only recently come to the point that every other means for cheap production having been exhausted, the manufacturer is forced to turn his attention to other methods of increasing his ever smaller margin of profit.

There is no other line left open. Wages must remain at their present high level, owing to other economic conditions. Other charges are fixed by persons whom the manufacturer cannot

control, raw materials are bought in the open market where his competitors have an equal chance, and his finished goods have prices fixed largely against his will by outside competition. The days of monopoly are gone almost without exception, and therefore he must look to decreased running costs. The United States Steel Corporation are to-day the largest buyers in the world of labor and fuel-saving devices. Only thus can they hope to increase the narrow margin between profit and loss.

This stage has only recently been reached in Canada, and it is now being forced upon the attention of all mechanical engineers.

In the eastern United States the principles which I am laying down in this paper, have been longer recognized, and I am not preaching the gospel of experiment. The methods which I am endeavoring to spread, are the result of twenty years continuous effort along these lines by engineers of experience, and to-day we can handle the most varied conditions in the light of the certainty of result attained elsewhere, and of the accumulated experience of many difficulties overcome. In the main, the whole question resolves itself, as I have stated above, into the practical application of common sense and ordinary reason to natural principles. One of my chiefest difficulties, strange as this may appear, is to persuade owners and engineers that it costs money to heat water, and that when once heated, it is cheaper to retain the heat than to allow it to be wasted and then spend more money to re-heat it. I am not exaggerating the matter in the least when I put it thus strongly. Against me is the prejudice born of long years of different usage, and it is frequently difficult to convince men, without doing injury to their self-esteem, that methods which they have been accustomed to use during an engineering life-time of perhaps many years, are not only merely out-of-date, but are also wasteful and extravagant.

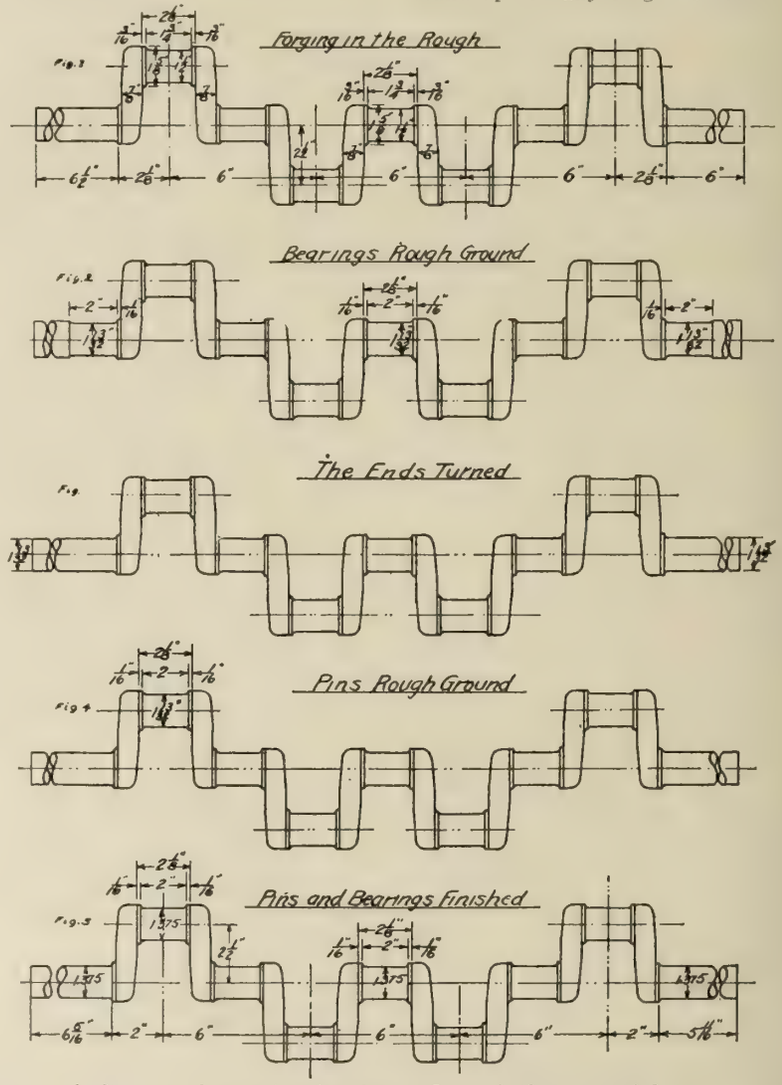
I sometimes fancy that if the idea were more complex, if it involved a more intricate solution of an abstruse problem, it would be less difficult to impress its value on the average man. But gradually the engineering profession is being forced to a realization that one of the very easiest methods of reducing the fuel bill is the ridiculously simple one of not allowing the valuable heat-units contained in water pf condensation to escape to the atmosphere unnecessarily, but to retain them where they have been put at the expense of the man who foots the bills.

In conclusion, I would again impress upon you that we have no longer the fertility and large productive powers of the virgin soil. We have reached the stage already, where it pays well to glean the odd ears of corn that have dropped into the furrows.

CRANK SHAFT GRINDING.

By J. C. Spence.*

The grinding of certain types of automobile crankshafts directly from the rought forging is a process that has been highly developed by the Norton Grinding Co. For a long time and, in fact, even to-day, many mechanics doubt that a wheel will grind a true cylinder when the wheel is not traversed parallel to the cylinder axis. The only convincing argument for the doubter is to see the trick performed—to actually measure the resulting work—to see the quality of finish.



Such a shaft as shown in sketch marked "Forging in the Rough" is received from the drop forger after passing through the trimming dies. This means that, in addition to the stock shown by the sketch dimensions, there is a certain amount of "flash" to be dealt with. The shaft is cut off to correct length and centred. It is then sent to the plain grinder to have the bearings rough ground. This operation consists of bringing forward five times a wheel 2-inch wide and grinding down to 1-32 inch over finish diameter.

A glance at the second sketch clearly shows the condition of the shaft after this operation. Note that the outside ends of the shaft are not ground down as are the bearings. These ends are left in the rough to be turned off on a lathe, as per the third sketch.

A great many readers of grinding machine advertisements have obtained the erroneous idea that makers of grinding machines claim that the grinder will remove stock faster than will the lathe. This is true only in a few special cases —cases where the lathe tool cannot be properly supported or in dealing with material where the lathe tool will not stand up for any length of time.

One of these special cases occurs in the machining of the crankshaft pins, as shown in the fourth sketch. Such a pin as here illustrated, stock being 40 points carbon, 1½ p.c. nickel, heat treated, can be rough ground with an actual wheel cutting time of 40 to 45 seconds, with an expert running the machine. The ordinary operator will take about 1½ minutes.

Since the corners of the wheel start to cut on the 1⅝ inch diameter and continue to bear the brunt of the work until the full face begins to cut at 1½

* Of Norton Grinding Co., Worcester, Mass.

inch diameter, it is only fair to state that a pin 1⅝ inch in diameter can be reduced to 1-25-32 inch in diameter in 1½ minutes by the ordinary operator. As a matter of fact, it would be to the advantage of the grinding machine if the whole pin were 1⅝ inch diameter instead of having the 1½ inch diameter depression. The wheel would then perform a uniform amount of work across the entire face and would stand up even better than it now does.

The rough grinding of the pins completes the roughing of the shaft all over and it may now be finished. The pins are first finished and then the bearings. After squaring the ends to the proper length, the shaft is complete.

The method above described applies only to shafts that require no finish on the "cheeks" and that do not have a considerable depth to the thrust shoulders. Regarding this latter feature, our experience up to date leads us to believe that it is not wise to attempt to grind with a full width wheel when the thrust shoulder, beyond the fillet proper, is more than ⅛-inch high. Oftentimes a slight increase in the fillet radius will bring the shoulder within this limit.

Besides the rapid removal of stock by using this method, there are two very important time-saving features; the first lies in the fact that the fillets are made by the wheel at one and the same time that the stock is removed from the balance of the shaft. This is possible because the wheel corners are rounded to the proper curvature by means of a simple radial truing device, which is a part of the crankshaft grinding machine.

The second time-saving feature is due to the Norton Grinding Company's patented method of spacing the work table along through a predetermined distance, and there fixing it by means of a spacing bar and locating pin, while the wheel cut is being taken. This method gives extremely accurate lengths and at the same time eliminates all need for measurement on the part of operator. In a crooked piece like a crankshaft the measuring takes as much time as the actual cutting time.

Such a shaft as the one shown should be produced by fairly good men using a plain grinder, and any good 18-inch engine lathe as follows:

Cut off ends and centre	6	minutes
Rough grind bearings	15	"
Turn ends	8	"
Rough grind pins	20	"
Finish grind pins	20	"
Finish grind bearings	25	"
Square ends	6	"
Total	100	"

This includes handling, wheel dressing, etc.

Calipering of Car Wheels and Axles for Mounting

The Subject was Discussed at the Recent Convention of Master Car Builders in Atlantic City, and a Number of Good Rules were Suggested.

It is important to remember that good work cannot be performed without good tools. Proper shop practice will not permit lathes and boring mills to get in bad repair. Lathe centres out of line or the V's worn may allow an axle to be turned tapered. A tapered wheel seat with the wheel bored straight cannot be expected to make a proper fit at any mounting pressure.

A very satisfactory test for lathes is to take two or three light cuts from an

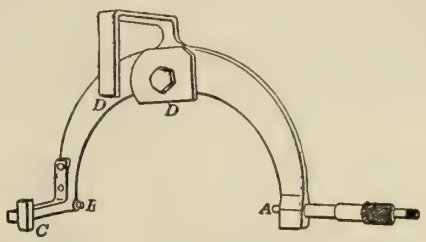


Fig. 1.—Caliper for Wheel Slats.

axle-wheel seat, say seven inches long, and measure the diameters with micrometer calipers. Good practice indicates that there should not be a variation in diameter exceeding 0.002 inch. The same attention given to lathes should be extended also to boring mills to see that they are in proper condition to turn out good work.

The general tendency has been to finish axles with too rough a wheel seat, which results from too coarse a feed. This makes only partial contract between the wheel seat and axle, While axles may hold satisfactory under these conditions, there is always an element of uncertainty, which can be eliminated by better practice. The axle. roughly turned in this way, cannot be accurately calipered, and this is the essential to good fitting and security. Furthermore, in mounting the wheel, the high ridges obtained with a roughly turned wheel seat are pushed off, principally at the outer end of the axle, reducing its diameter and making the turning of the wheel seat necessary when preparing the axle for mounting wheels at a later time. There is, also, a bad moral effect on men, who, if permitted to carry out this practice, will extend it to journals as well.

It has been demonstrated that with fairly rigid lathes axles can be turned at a speed of 40 to 50 revolutions per minute, the limit of speed being the chattering of the tool rather than the cutting speed. With this high-speed run with a fine feed, an axle can be turned in about the same time as by slow speeds and coarse feed. The higher speed results in better work without increased cost.

Having secured straight and true wheel seats and wheel bores, the next necessity is for the proper diameters necessary in secure mounting.

Micrometer calipers are necessary for several reasons. The axles and wheels can be calipered more quickly and more accurately than by machinist's calipers or snap gages. The "draw" or difference in diameter of wheel seat and bore which has been determined for a proper fit, can be secured without difficulty. The difference between diameters of wheel seat and bore of wheel expressed in thousandths of an inch, can be measured accurately, whereas with ordinary calipers it is a question of skill of the workman and with snap gages the same is true to a lesser degree.

To successfully use the ordinary trade micrometer caliper for wheels and axles, takes time and a certain amount of skill. To reduce this time and skill to the minimum, micrometer calipers have been designed and used successfully. Fig. 1 shows a caliper for wheel seats. A is an ordinary micrometer head that can be bought in the open market; B is the anvil; C is a stop set square with a line through A and B; D is a stop or limit which may be turned, so that the distance from the stop to the line from A to B shall be approximately the radius of the wheel seat. In practice, this stop D for the 5½ x 10-inch journal axles is correct for wheel seats 6⅞ inches in diameter, and is approximately correct

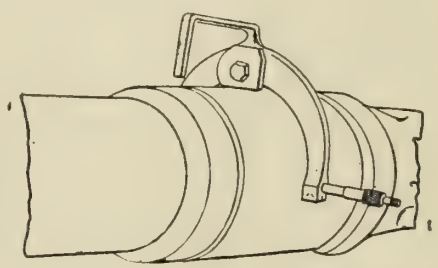

Fig. 2.—Caliper Resting on Wheel Slat.

for wheel seats from 6¾ inches to 7 inches. By turning the stop D one-quarter turn, it is suitable for 5 x 9-inch journals.

In using this caliper, it is placed over the axle, with stop D resting on the wheel seat, as shown in Fig. 2. The stop C and anvil B are then brought firm against the wheel seat. The micrometer is screwed up by a ratchet stop until the

ratchet clicks. The caliper is then removed and read. On a trial, eight axles were measured in five minutes, and twelve wheels were measured in the same space of time. Each wheel seat was measured at three points, the average taken and size chalked on the axle. The wheel seats had not been previously measured, and but few were of the same size. This is much more rapid than calipering by other means, especially for axles varying in diameter.

Fig. 3 illustrates a caliper for wheel bore. A is the micrometer head, but graduated for internal measurements; B is the anvil; C the stop set at right angles to a line from A to B; DD are right and left-hand screws, turning together by means of a link not shown in sketch.

In calipering a wheel the screws DD are roughly adjusted somewhat smaller than the bore of the wheel. The anvil B and stop C are brought against the bore and micrometer screwed out until the ratchet clicks. See Fig. 4. On a trial five wheels were calipered and size chalked on wheel in five minutes.

This method of calipering and marking each wheel seat with the points and the further calipering of the bored wheels with the sizes marked upon them permits the proper selection of wheels at wheel seats for mounting, in order to secure the pressures necessary.

As to mounting pressures, your committee recommends the following, in con-

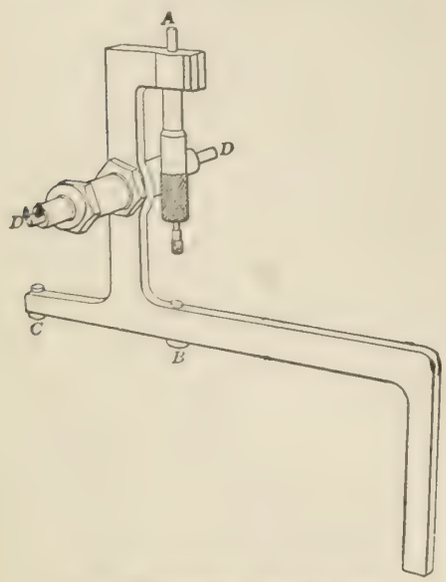

Fig. 3.—Caliper for Wheel Bore.

junction with the character of workmanship already referred to, as being an essential in the problem.

The following general specifications, which have been quite thoroughly tested, are submitted for consideration.

Axle Wheel Fit.

Must be turned as smooth as possible with lathe tool having flat cutting edge. Finishing cut must not be taken with lathe feed coarser than 16 pitch. Taper on axle-wheel seat for entering wheel must not exceed one-half in length and must be turned with broad, straight-faced tool, making regular taper without ridges or rings. Wheel fits to be calipered at three points, namely:

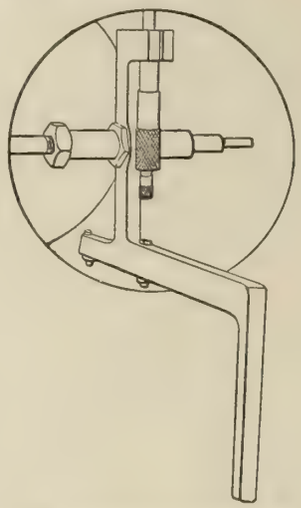

Fig. 4.—Caliper Adjusted to Wheel.

One inch from each end and middle and other points if indications to excessive variations in diameter.

Axles shall not be considered as suitable for mounting where there is a difference in diameter between any two measurements exceeding 0.003 of an inch. This, however, shall not be counted to mean that wheel seats on each end of axle are to be of one size. Each tenth axle from each lathe shall be measured for soundness. No axle varying over 0.001 of an inch when measured at two points, 90 degrees apart on circumference at equal distance from end shall be considered as suitable for mounting.

Wheels.

To be bored smooth. Finishing cut shall be made with tool or tools having a cutting face at least 3-16 of an inch wide. Feed not to exceed 8 pitch. To be bored with a rough and finishing cut. The finishing cutter when taking the finishing cut must not be cutting when roughing tool is also rough-boring, unless the finishing tool is supported independent of roughing tool, the latter to prevent spring of roughing tool being transmitted to finish tool, causing an irregular bore.

Wheels to be calipered with micrometer caliper. A wheel varying over 0.002 of an inch in any two diameters will not be considered satisfactory for mounting.

Mounting presses to be provided with recording pressure gauges. All wheels not mounted within limits given, or wheels that are forced against shoulder to be withdrawn.

One point that may be foreign to the subject should receive attention, which is lathe centres. It would be very desirable if all shops were to adopt one angle. Generally, lathe centres used for ordinary work are 60 degrees, including angle. If this were adopted for all axle work, it would result in the axles running true on centres, reducing the amount of material necessary to turn away when truing up axles that have been previously turned.

USES OF SAWDUST.

Sawdust is usually regarded as an objectionable product because it increases the danger of fire if deposited near mills or lumber piles and necessitates either cartage with accompanying expense or the construction of a "burner" and the use of conveyors or carts to transfer it from the saws.

A double economy, however, is now in process. As a result of the use of band saws instead of the old circular and gang saws, a log that, under the old system produced 8 boards, will now produce 9, a very substantial increase in product with a corresponding decrease in the amount of sawdust produced.

Owing to its chemical and mechanical properties, it has an ever increasing field of usefulness. Used as an absorbent for nitro-glycerine, it produces dynamite. Used with clay and burned, it produces a tera-cotta brick full of small cavities that, owing to its lightness and its properties as a non-conductor, makes excellent fire-proof material for partition walls. Treating it with fused caustic alkali produces oxalic acid. Treating it with sulphuric acid and fermenting the sugar so formed, produces alcohol. Mixed with a suitable binder and compressed, it can be used for making mouldings and imitation carvings; while, if mixed with Portland cement, it produces a flooring material. It is excellent packing material for fragile articles and for dangerous explosives and can be used as packing in walls to make them sound-proof and cold-proof.

William J. A. Bailey, who recently returned from a successful trip around the world representing a number of American manufacturers, is now preparing another business tour. He expects to leave this country early in the fall and will be gone about a year, visiting the leading commercial centres of the world. Mr. Bailey markets his lines in conjunction with permanent sales offices in the different countries so that this trip would no doubt be of interest to manufacturers seeking foreign trade. His address is 32 Broadway, New York City.

The Wood-Working Department at the M.A.C.

Technical Classes in Manitoba Agricultural College

The Reason Leading up to the Establishment of the Course in Mechanical Engineering at Manitoba Agricultural College.

By L. C. Harkness

In recent years the great farming communities have looked with appreciative interest at the work being done in agricultural colleges. It was not always so. The bluff farmer is prone to believe that those excellencies of skill required in every branch of agricultural work can only be developed on the farm by the practical every-day routine of duty. The old tiller of the soil is reluctant to admit that anyone in a college can teach him regarding any ordinary farm work. But the scene is changing. Not only is the farmer sending his sons to acquire agricultural efficiency, but the old bearded sires are coming themselves.

It is not surprising that the science of grain-growing and expert stock feeding and judging was the first to attract the attention of the agriculturists. It was this branch of study that paved the way for the equally important branch of mechanical science. In Ontario the farm mechanics course of study was obviously more difficult to bring about than the same course in Manitoba. Farms were smaller, market facilities were more convenient, and the comparatively smaller land owner did not feel the urgency of iron and woodworking knowledge, or the training required to construct a building or the ability to repair a gasoline engine. Such knowledwe was left quite unmolested in the hands of a few who lived in the towns and villages throughout Eastern Canada, and who served the "less fortunate" for whatever fee the mechanic cared to levy. In the west it is different. Farmers as a rule are not so convenient to a town or even a neighbor, and often he is urged by sheer necessity to bring his own inventive genius into operation, fertile or unfertile as the case may be.

Establishment of Agricultural College.

So the establishment of an agricultural college near Winnipeg was hailed with

PROF. L. J. SMITH, B.S.
Head of the Department of Mechanics at Manitoba Agricultural College.

joy, by the great mass of intelligent agriculturists in Western Canada. In less than three years after its opening a strong foundation was laid for a fully equipped mechanical science department. At the present time, one of the finest buildings to be found on the continent, where mechanical science is taught, stands on the college farm. It is 180' x 100' in dimensions, and a three-storey structure. Prof. L. J. Smith, B.Sc., formerly of Ann Arbor, Michigan, took charge of the department in the fall of 1909, and at the outset made some important announcements regarding the future of the great work of which he is a master,

The dominant idea in carrying out the work of the department, which is designated "Agricultural Engineering," is simply to increase the efficiency of the student in the practical work on the farm. The theoretical work is not gone into to any great length during the two first years of the course, but the more highly technical work is only utilized to make the practical efficient. The course in reality covers only two years, but owing to an enlarged idea, a four years' course will be inaugurated, this year (1910), in which the third and fourth years' work will be a continuation into the more advanced stages of the previous year's work. The last two years training is designed to prepare students for pedagogical and government professions.

The complete course is divided into six subjects, namely, mechanical building construction, draughting, carpentering, blacksmithing and sheet metal and pipe work.

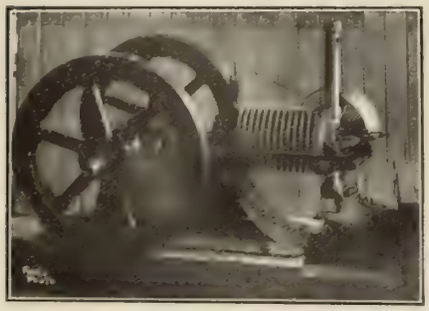
The Courses.

The work under mechanics is very far reaching. It involves the study of construction, care and repair of farm machinery. Students are taught to operate gasolene and steam engines, and a superficial knowledge of their construction. Threshers are made a thorough study of, and indeed all training necessary for good expert threshermen, is given.

In the more advanced work of the third and fourth years the science of engine construction is studied in detail as well as the various other branches. This sort of training is considered very important at the present stage of Western Canada's agricultural development. On the distant prairie where there are thousands of acres of wheat waiting to be threshed, it is rather serious when the only threshing outfit available cannot be used, owing to some technical dilemma in its mechanism. It has often happened that experts had to be dispatched from thresher works offices or the training school to repair the much needed machine, in order that the great harvest toward which everyone looks with eager anticipation, might not be waylaid.

The study of friction and lubrication of engines and machinery is an important factor in this course. The care and cleaning of boilers is given considerable attention, as is also the points of fuel and engine economy. The design and care of agricultural field machinery is by no means a secondary line of study, and this branch is manifestly an important one to those who follow the farming pursuit.

First Year Class in Blacksmithing and Iron Working.



Model Gasoline Engine Used for Teaching at M. A. C.

Building Construction.

In the second year an important course in building construction is given. Twenty lectures along the lines of plans and specifications. The construction of roof and bridge trusses; quantity and cost of material; the heating, ventilation and sanitation of buildings, are delivered, and it is evident from the large registration in this course that it is enjoyed and found valuable.

Draughting.

The draughting department is one where a student acquires an adequate knowledge of how to lay out plans for any contemplated construction. He is taught to become his own architect in the erection of farm buildings. In this way a prospective farmer is enabled to "count the cost" before he enters upon what might otherwise prove to be an unwarranted scheme.

The knowledge of carpentering is perhaps the most valuable line of study in this department. Every farmer his own carpenter, is the prevailing need. The far-reaching effects of such a study is not at once perceived. It involves the care of tools; the choice in the selection of tools; the filing of saws, and then on to the practical uses of the tools in their myriad forms. How few know how to use a chisel or saw, and many less know how to match lumber and plane a stick of wood. In this study comes the invaluable training in the judgement of the strength of wood materials.

Forge Shop.

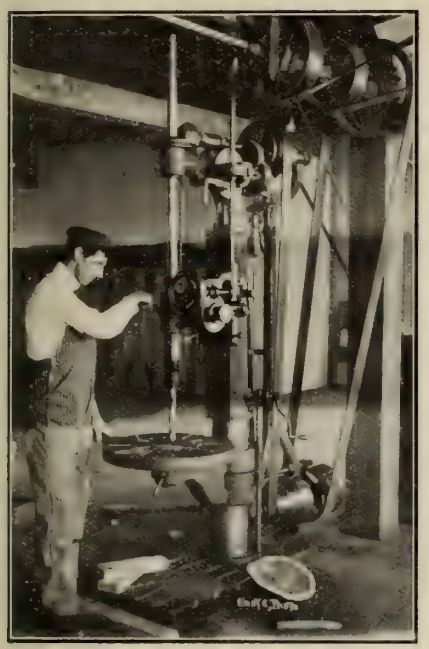
In the forge room the farmer is put to the test as to his ability in iron working. Most of the boys enjoy this rigorous discipline. It is a place not only where good welds are made, but good characters. The boy that stands by his forge and spoils an iron perhaps twenty times before he makes a proper weld is a better man when he is through than when he began.

The value of forge knowledge is manifestly of great value to the farmer. The ability to make hooks, clevices, links, staples, bolts, grab-hooks, etc., is always envied by the farmer, and this, the young son of the soil is taught to do perfectly. One needs not be very imaginative to see a mechanically trained

Farmers' Sons at the Forges.

boy rushing home for the vacation to build a forge beside his father's barn and work diligently until he turns out a new pair of clevices.

As civilization advances, the science of metal working and the ability to handle iron pipe will be invaluable to the farmer. Metal roofing is fast replacing the shingle, and windmills and engine pumps with pipe attachments have already replaced the "old oaken bucket."



Large Drill at Manitoba Agricultural College.

If the young farmer is taught how to solder metal, and cut threads on pipe, he is surely quite in step with the onward march of scientific development.

WHEN TO INSTAL NEW MACHINE.

A question often asked is, "How are we to know when the proper time arrives for scrapping old machinery and installing new?" From the economic standpoint the answer may be stated as follows: It pays to scrap old machinery when the new machines to be installed will, during their useful life, make a sufficient additional profit in one way or another to pay for the cost of installing themselves and all incidental expenses.

Money is easiest made in manufacturing when machines are worked continuously, and as far as possible turning out the same objects. Other things being normal, it is a workshop axiom that the longer a machine is run, producing one article in the greatest possible numbers in a given time, the bigger will be the profit. Displacing an old machine involves checking temporarily the production of a given article or articles, with the result that the burden of expense is shifted and falls unequally on the rest of the departments. Moreover, to have to acknowledge that pending the erection of new machinery this or that order cannot be executed is calculated to divert trade, which may cost a considerable amount of effort and trouble to regain. Many good orders have been lost through firms not being able to supply a particular article promptly.

It follows then that when changing a machine or altering the methods of producing stock articles, the new machine should be installed, if possible, before the old one is scrapped. This is not always possible. One of the features of modern life is the increasing demand for space and the growing difficulty of finding it. A machine that is one of a series working together could hardly be replaced by another fixed in some other part of the works. The point we wish to enforce in this connection is that all of these chances of loss, or possible necessity for additional outlay, must be taken into consideration when the problem of scrapping a machine or group of machines arises.

The manufacturer then, who contemplates displacing old machinery should draw up a balance sheet showing every likely item of cost and profit, and only when the credit side shows a substantial balance should he venture on a change, unless indeed he has lost, or is certainly likely to lose, his trade without the step is taken. That, however, is exceptional and outside the present argument.

On the outlay side of the balance-sheet indicated must be put down the cost of the new machine, freight, charges for packing, and the cost of fixing it. In addition to this, the probable loss during the period of change should be carefully estimated. This last may prove a serious charge, unless the manufacturer is lucky and manages to get in the new tool during a slack period. Due thought should also be given to stock in hand, because one result from a new machine will be the output of the articles either better in appearance than the old, or at a lower first cost. If the new article is smarter than the old the latter become a drug on the market, and may even have to be scrapped themselves. A safe rule in such case is to take the worst possible view of things.

On the other side of the account should be set an estimated sum likely to be realized by the sale of the old machine. It is wise not to take too rosy a view of the set-off on this count. If it is sold for old metal it may have to be dismantled and carted to the auction rooms or to the metal dealer's premises, with attendant expense at every stage.

The next point on the credit side of the balance-sheet to be estimated is the probable amount of increased profit that can be realized by the use of the new machine. Increased profit may arise in two ways—from decreased cost of manufacture or from increased price obtainable, along with the probable sales at the increased profit. These are difficult points to decide, but the next is perhaps the hardest of all to determine—the estimation of the probable useful life of the new machine. There appears to be no rule that can be taken as a guide for this. The life of the old machine affords little or no help, because it usually represents a different period of development. It is wise not to take too rosy a view of the possible life, for modern machinery develops at a rapid rate, and what may be up-to-date this year may be too expensive to continue in use twelve months ahead. The estimate of the probable profits during each year upon the articles turned out by the new machine, multiplied by the estimated number of years, will give the total profit that may be hoped for from the use of the new machine. When this exceeds by a fairly substantial sum the amount on the debit side of the account representing the cost of installing the new machine, with all attendant losses, it should be safe to scrap the old machine.

ROYAL COMMISSION ON TECHNICAL EDUCATION.

The commission on its tour through the Maritime Provinces, has stopped at several cities gathering information. At North Sydney, N.S., where considerable progress in technical education has been made, an extended investigation was entered upon. The chief industry of the place being the coal and steel plants of the Nova Scotia Steel and Coal Co., technical education had become very much of a necessity. Several of the officials on the engineering staff were in the habit of assisting by teaching these night classes themselves. All of these officials were called upon to testify before the commission and from them many valuable suggestions towards the work of the commission were gleaned.

The Russell Machine Co., St. Catharines, who were burnt out some months ago, are now in their new factory, which is fully equipped with all the latest machinery. The firm is prepared to give estimates for all kinds of work, and will guarantee workmanship and quick delivery.

The foreman of a certain railroad boiler shop carries his requisition pad in a tin box of the dimensions of an ordinary check. Thus the blanks are kept clean, smooth and unworn at the corners. The box gives a solid writing surface for the many requisitions that must be filled out during shop hours.

The Scientific Lighting of Factories and Offices

By Recent Advances in Illumination, Better Lighting May be Had at Less Cost than Formerly, adding to the Comfort and Efficiency of Employes.

The proper lighting of factory and office is often neglected by manufacturers. With the many recent advances made in illumination it is well worth while investigating the question of illumination. In the office and in the machine shop there should be good lighting for the employes. Some Canadian factories have made installations greatly decreasing their light bill.

The new tungsten (Mazda) lamp consumes only 1¼ watts per rated candle-power compared with 3 to 4 watts per rated candle power with the carbon filament lamp. Thus three to four times the same light with the same current consumption. Thus 10 candle power Mazda lights may be used where 16 candle power carbon filament lights were formerly used without increasing the light bill.

R. B. Basham, vice-president and general manager of the Canadian Tungstolier Co., 96 King St. West, Toronto, designed a system of lighting for the offices of the Massey-Harris Co., Toronto, which is making a large saving for that company.

Fig. 1 shows a corner of one of the offices where Sunbeam Mazda lamps installed in the anti-vibratory Tungstolier, give a very even distribution. In the Tungstolier all vibration is absorbed and there have been no burn outs though the system has been in use for some time.

Proper reflectors add to the efficiency of the system. By this means the light falls where it is needed and this is another point in favor of scientific illumination.

In making the installation the various offices were measured and from this the required amount of light was figured out. This decided the number of fixtures. The correct reflectors were then

Fig. 1.—Advertising Office, Photo Taken With Light of Mazda Lamps. Note distinctiness of detail and Photos.

Fig. 2.—A Machine Shop, Showing General Illumination from 100-Watt Tungsten Lamps with Holophane Intensive Reflectors.

decided upon and the final result shows that the whole installation has been well designed and there are no shadows.

Factory Installations.

Fig. 2 is a view of a machine shop showing the general illumination from 100-watt Mazda lamps with poloplane intensive reflectors. Fig. 3 is another view of general illumination using 100-watt Mazda lamps. In the three views shown there is a great deal of vibration but in all cases it is well provided for to protect the fragile tungsten filament.

Fig. 1 clearly shows the anti-vibration tungstolier which makes the use of the tungsten filament lamp possible in factories, offices and any other place where there is a great deal of vibration. The tungsten lamp, of course, will burn practically wherever the carbon types are used, but by protecting it from jar, better results are obtained.

Importance of Reflector.

The vibration provided for, the next item in scientific illumination is the reflector. The custom of putting a light here or there irrespective of whether it gives the best light or not, is not only unscientific but it is uneconomical. The space to be illuminated must be considered as well as the walls and special attention must be given to the reflector. Different reflectors have been designed for general illumination and for the lighting of work. Using the same reflector for both will result in lost light.

If a workman is employed at a machine the light must be focussed on his work and reflectors should be used that will deliver the proper light rays at the proper angle. This angle should be 15 to 30 degrees, or it should be focussed to within 15 degrees of the perpendicular, depending on whether it is for general or special illumination. The point is that the light should be delivered where it is required, thus securing correct illimination with often a less consumption of electricity. In scientific illumination as much attention should be gipen the reflectors and diffusion as to the light source itself.

Employers should therefore realize that a skilled workman's value as a producer is dependent on the tools he uses, as has been stated above. In the case of a machinist it means properly sharpened tools and hence the lighting of an emery stone is of considerable importance. The light must be placed so that not only the face of the wheel but the edges can be properly lighted. This can be done by means of a proper reflector and so throughout the whole shop, the lathe, the planer, the shaper, the miller, the boring machine, etc., can all be properly lighted if the right reflectors are used. A careful consideration of the question of factory and office lighting will result in better illumination and a saving of current.

Fig. 3.—General illumination of a factory obtain ed from a double row of one hundred watt tungsten lamps, provided with special distributing reflectors and hung on short drops from the ceiling, as illustrated. Special steel reflectors, each provided with an eight-candle-power carbon lamp, direct the light at the machines.

SOUVENIR PAPER KNIFE.

An unique paper knife has been designed by the manufacturers of Shelby Steel Tubing. As it is made from a piece of the tubing it is a practical demonstration of how this material can be used. John Millen & Son, 321 St. James Street, Montreal, the Canadian agents of the Shelby Steel Tube Co., offer to send one of these paper knives to any reader of Canadian Machinery who will write for same on their business stationery. With the paper knife will be mailed some interesting literature on Shelby Steel Tubing.

Souvenir Paper Knife.

NEW KIND OF STEEL INTRODUCED.

At Chester, Penn., a new kind of steel is now being manufactured under the name of "cementation steel." It is of the high carbon variety, but contains more sulphur and less manganese than ordinary tool steel. The steel is so dense that it remains unresolved under the microscope with a magnification of 1,200 to 1,600 diameters, although that of the open-hearth, crucible and Bessemer steels can be resolved with a magnification of 100. Its elastic limit is said to be very high and its ultimate strength 80,000 pounds. It is intended specially for cast gears, crank-shafts, connecting rods and so on. The process of manufacture takes from six to eight weeks.

CELFOR DRILL SPEED CARD.

The Celfor Tool Co., Buchanan, Mich., are mailing to machine hands on request a table of feeds and speeds for Celfor drills. This is mounted on heavy cardboard and is well suited for use in the machine shop.

John H. Tilden, for many years president and general manager of the Gurney-Tilden Co., is retiring from that position, on the re-organization of the firm.

Comparison of Wearing Surfaces for Factory Floors

Relative Merits of Granolithic and Wood Top Surfaces for Factory Floors, Abstracted from a Large Number of Enquiries among Factory Owners.

Much has been said regarding the various flooring surfaces used in fire-proof buildings, comparison usually centreing in a choice between granolithic surface and a wood top laid on concrete floor slabs. The reports of the experience of owners with granolithic finished floors have not clearly given the causes of success or failure of the particular floor under particular conditions. There is also a marked lack of information and experience concerning other wearing surfaces, which in some cases might be preferable.

In order to obtain the fullest possible testimony from engineers and manufacturers as to the relative values of granolithic and other substances for floor surfaces, the Aberthaw Construction Co., of Boston, Mass., sent letters to some two hundred engineers, machine shops, paper and textile mills, and other large establishments in the region north of Baltimore, and east of the Mississippi, asking for their opinions as to whether they considered granolithic or masonry surfaces injurious to operatives, and if so the reasons why; and whether they knew of any better floor surfacing.

One hundred and eighteen replies were received which related varied experiences with the different substances. As 68 p.c. of the replies were from machine shops we will consider those for the other establishments heard from were pretty evenly divided. Of this 68 p.c., 27 p.c. had had no experience with granolithic, 25 p.c. were in favor of it, while the larger number or 48 p.c. reported more or less unfavorably on it, from its bad effects on operatives, and its poor wearing quality. Most of the testimony regarding the wearing capacity seems to bear out the statement that a large proportion of the bad effects was due to poor workmanship in laying improperly, and that when properly laid it was satisfactory is borne out by the favorable 25 p.c.

Granolithic Floor.

Under certain conditions, however, it is clear that the granolithic floor has an unfavorable effect on the comfort, and perhaps to a small degree on the health of operatives who have to stand inactive for long periods, as for instance, in tending a machine. The real cause of workmen's complaints is undoubtedly due to the coldness, rather than the hardness of the concrete floors. This arises from the high conductivity of concrete, as compared to wood, making the former appear much colder than the latter, so that, in cold weather when the concrete is in outward contact with the ground or cold air, it actively withdraws heat from it under surface, thereby making it cold. Besides, its high specific heat causes it to remain cold longer than its surroundings, from its inability to heat up as quickly. The effect of the rapid heat conduction on the operative is to slow the circulation, often giving rise to sore feet, where the pressure of the body comes on the ground. Lameness and stiffness of the legs are logical results in some cases. Moisture aggravates these conditions.

Two remedies for these bad effects were discovered. One of these consisted in the use of small movable gratings of wood or other material having low heat conductivity, for the workmen to stand on, and the other was the actual heating of the floor itself by means of contained steam pipes or hot-air ducts in the substance of the floor-slab. Cases have been cited where the whole place was heated by the above method. Where these devices have been introduced, no complaints from operatives are heard, conveying the fact that it was the cold that was objectionable.

The complaints regarding wear are four-fold: liability to rut under heavy trucking, presence of dust due to abrasion, difficulty of repairing floors, and finally, the trouble of attaching machines to the floor.

Trucking.

Trucking is the most serious cause of wearing, and when carried on extensively will result in considerable rutting, especially if the floor is marked into squares, as the edges break and wear back. The common, flat-thread truck wheel acts like a cutting tool at the edges and when carrying considerable weight the very hardest substances will give to it. This is aggravated when the truck is turning a corner, for a better cutting edge is then presented. It would appear to be readily remedied by slightly convexing the thread. This would decrease the wear quite considerably. Enlarging the size of the slabs tends to decrease the wear at the edges, and some we recommend doing away with the squaring altogether. Cracks will occur, and whether they are straight or otherwise matters little. The uncut floor is said to give much better wear, as well.

In paper mills, and in some other factories where heavy trucking occurs, nothing but iron or steel will bear up under the pounding and cutting of the truck wheels. Cast iron plates and steel racks, embedded in the soft finish concrete, have been successfully used for that purpose. The steel plates are commonly made fifteen to eighteen inches square, with checkered surface, and with a flange which turns down around the edge of the plate, a hole being left in the top for the escape of air. The plate is pounded into place with a mallet, and levelled, the cement bond holding the flange securely. A cheaper, and equally satisfactory arrangement has been the embedding of racks of small flat bars, separated by thick washers and bolted together. They are set flush with the surface, and take the truck wear satisfactorily. It is inadvisable, when using plates, to bolt them down, as then the expansion of the plate, due to wear, has a tendency to buckle them up.

The trouble from dusting appears to arise wholly from faulty material and workmanship, for with these corrected, a dustless floor is quite possible. The fact that wood floors will not show dirt readily, and will, even under the worst conditions, add no grit to the situation, is a decided point in their favor. In metal-working shops, or in shops where machinery with delicate bearings is to be used very great care must be exercised in order to get an entirely satisfactory floor of cement, and because of the uncertainty of having all conditions thoroughly favorable to this, a wood-top floor is oftentimes the wisest policy. With a poor concrete floor, at the best, but a temporary relief may be obtained by the use of paint, or of boiled linseed oil which has been thinned with gasoline or naphtha so as to permeate the pores. The latter is the better way, and has the advantage of being waterproof as well if the floor is porous.

Wooden Floor.

Wooden flooring is much preferable when the item of repairs is considered because of the difficulty of bonding new cement to old. This item is, however, small as but slight repairs are required with concrete.

Wooden floors are also more advantageous when machines have to be attached, as the expense and labor of so doing is much less with wooden floors than with cement. This advantage is not so prominent as to make much difference.

A very important feature is the liability to fracture of machine parts, if allowed to fall on a cement floor, and which, if let drop on a wooden one, would merely dent the floor. If the article to be manufactured is fragile, wood top floors are preferable.

Considering the relative water-proofing qualities it can at least be said that a wood top floor receives no good from a wetting, and, as seldom any provision is made for waterproofing the concrete below, there is usually trouble with water. A granolithic floor needs to be trowelled hard to be durable, and this trowelled surface is practically waterproof, with no leaking except at joints, and at such spots as have been worn.

Cost.

As regards cost, a one-inch trowelled surface of cement finish can be put in place for about the cost of good quality maple top flooring, delivered on cars at the site of the work. The difference in cost between the top floor of cement and that of wood will be the cost of the under floor, the screeds and cinder, or other fill between the screeds, plus the cost of the extra strength in columns and girders required to carry the load of combination wood floor, which is heavier than the one-inch granolithic finish. This is partly due to the fact that, if the granolithic surface be laid when the under floor is green, the surface is made an integral portion of the floor slab taking up part of its strains, and by so doing, permitting of a lighter slab than is required for a wood top. On the other hand the wood floor and accessories form a dead load. It would therefore seem, that from the point of view of cost, the granolithic is better.

It also appears to have the advantage as regards quickness of construction, for the granolithic floor may be laid immediately, whereas the wood top must await the drying out of the floor thoroughly, as it would otherwise warp, and maybe have the rot set in.

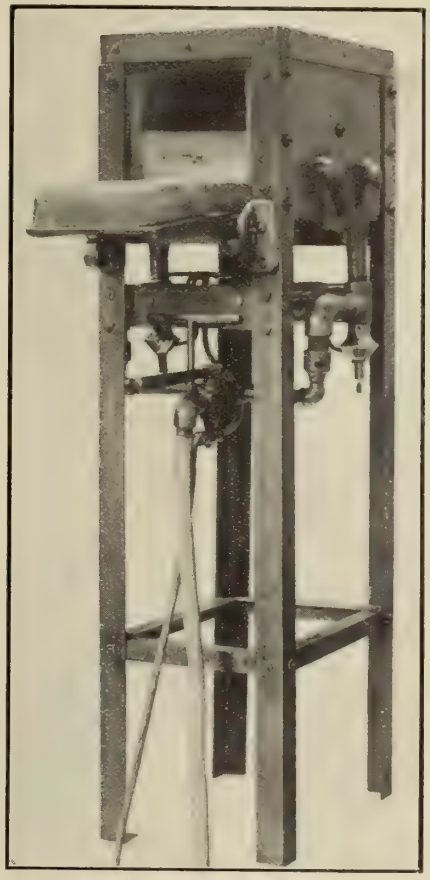
REMARKABLE GAS BLAST FURNACE.

By Frank C. Perkins.

For hardening dies and tools as well as for annealing and other similar service a unique furnace of the type shown in the accompanying illustration is utilized to advantage, no bellows or air compressors being necessary. Gas and water only are utilized the gas consumption being about 65 cubic feet per hour. A water tank is hung seven or eight feet above the burner and a rubber tube connected between the furnace and the tank, a ½-inch gas hose being attached to the furnace. After lighting the oven becomes hot in about 10 minutes when it is ready for service.

It may be stated that oyxgen and hydrogen gas in connection with the open flame will raise the temperature of the flame to a very high degree. Water consists of two parts, hydrogen and oxygen, if converted into steam and superheated, thereby becoming dry, it will be a combustible vapor when fed to the flame. Air is composed of approximately four parts of nitrogen and one part of oxygen. By forcing it into the flame, as for instance, with a bellows or on a smaller scale in the Bunsen burner, the mixed elements will burn with a raised temperature. To force air into a burner has hitherto been accomplished either with a bellows or a mechanically driven compressor.

The "Revelation" gas blast is based and constructed on the above scientific principles. Broadly stated it consists of devices for generating a combustible vapor under pressure, such as steam,



Remarkable Blast Furnace.

utilizing the vapor pressure for entraining air, thus producing a mixture of gas, vapor and air, and igniting the resulting mixture of these components, producing an intense heat by the consumption of low pressure gas fuel.

It is claimed that the construction of the "revelation" gas blast process is so simple that one cannot help wondering as the strong and sustained blast produced with the aid only of a small tank of clean water suspended about 8 feet above the appliance and connected by quarter-inch rubber hose.

It is held that the principle involved in the construction of the apparatus here illustrated is a radical departure from that of the familiar gas blasts now in use.

To a Bunsen burner is attached what may be called a steam generator, consisting of two tubes running parallel with the Bunsen. A smaller tube attached to the top of the generator serves to carry the superheater steam to an injector. Small perforations in the "Bunsen" tube keep the generator under a continuous heat sufficient to convert a fine film of water into superheated steam which is forced out of the nozzle of the injector under high pressure, thereby entraining air by suction of the steam pressure.

There are three components, viz: air, gas and steam which, being dry is converted into a gaseous fuel containing hydrogen and oxygen, and are closely mixed and issue from the burner nozzle as a powerful blast capable of melting silver, gold and copper.

PERSONAL NOTES.

W. H. Carrick, general manager of the Gurney Foundry Co., is severing his connection with that firm, to take up the position of president and general manager of the Hamilton Stove & Heater Co., which is the re-organized Gurney-Tilden Co.

C. J. White, of Toronto, is now residing in Prince Rupert, B.C., where he will represent several manufacturing firms for the sale of machinery of all kinds. Mr. White has had an extensive experience as salesman and should prove to be a good representative in the new country.

James Reid, Wilson, and K. W. Blackwell, of Montreal, have been appointed to the board of the Nova Scotia Steel Co., to fill vacancies created by the retirement of Messrs. Reford and R. E. Chambers. The retirement of the latter is said to be only temporary, due to his absence in Brazil, examining some iron ore property.

James R. Wilson, and K. W. Blackwell has joined the board of the Nova Scotia Steel & Coal Co., in the place of Robert Reford and R. E. Chambers, who resigned recently. Mr. Wilson is on the board of the Dominion Steel Corporation and a director of the Montreal Steel works. Mr. Blackwell is a practical iron and steel man, being president of the Montreal Steel works.

J. P. Fillingham, until recently assistant superintendent of the Reo Factory, Lansing, Mich., has been appointed general superintendent of the Reo Motor Car Co., St. Catharines. Mr. Fillingham, who has been for the past ten years engaged in the manufacture of automobiles designed by R. B. Olds, is a native of Canada, and received his early mechanical training in the Waterous Engine Works, Brantford.

Filing Catalogues to Secure the Greatest Benefit

One problem more or less serious according to the size of the business, and the systematic proclivities of the man in charge of the buying, that is under discussion in many manufacturing business-

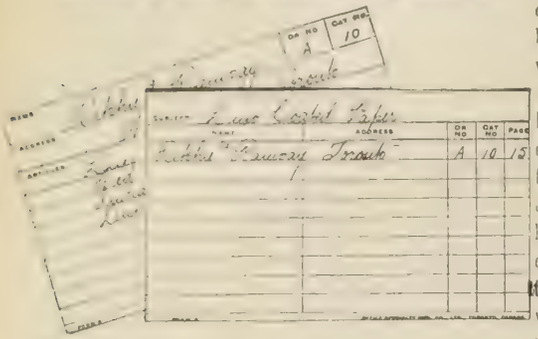


Fig. 1.—Card Forms for Indexing Catalogues.

es, is how to file catalogues, so that they can be quickly and easily found when wanted.

This company went all through this problem of filing catalogues years ago, and determined that some method must be found by which catalogues from other manufacturers, to which reference was made frequently, should be designed, and the catalogue cabinets which are illustrated here were the result of this effort.

Catalogues come in all shapes, sizes and thicknesses. Where and how to keep them for easy reference is the question. In the course of a year several hundred catalogues and price lists will probably be received from manufacturers and wholesale houses. The purchasing agent or the buyer must refer to these catalogues and price lists numerous times every day, and unless he has lots of time to spare, he must keep these catalogues on file in a convenient place, where he has only to reach out his hand and secure the catalogue wanted, without distracting his mind from his work, or in wasting time and energy fumbling through desk drawers and other places.

The basis of this catalogue filing system is the two card index forms illustrated in Fig. 1. These two forms are the index by which every catalogue and the articles listed in each catalogue can be found. Sectional vertical filing cabinets are particularly adapted for filing catalogues, on account of the different sizes in which the drawers are made. Card index sections are in reality simply small sized vertical drawers. The card index and the vertical system of filing are both based on the same principle of filing cards or papers upright on edge, behind heavy pressboard guides.

This is illustrated in the stack of sectional cabinets shown, Fig. 2. In the top section are the index cards filed under both makers and subject guides.

In the next section which is the 6 in. x 4 in. card index section are filed small price lists, and below this is another card index section size 8 in. x 5 in. for larger price lists and small catalogues. The next section is the bill size vertical, containing three drawers for catalogues not larger than 7 in. x 9 in., and the bottom section is the letter size vertical, 25 in. deep which will take catalogues 9 in. x 11 in., and if a larger section is re-

Fig. 2.—Cabinet for the First Method of Filing.

Fig. 4.—Cabinet for the Second Method of Filing.

quired the cap size vertical will take catalogues 9 in. x 15 in.

The method of filing the catalogues and price lists for quick reference is very simple. Each size of drawer is known by a letter. The 6 in. x 4 in. drawers in the stack illustrated are "A," and each drawer in the section is further subdivided with a figure, as A1, A2, A3 and A4. The next largest size drawer is "B," the next "C," and the next "D," each of which also has a supplemental figure. The guides in the drawers are numbered by tens, so that the first catalogue filed in A1 drawer will be known as A1, No. 1, and as there will be only 10 catalogues behind each guide reference is both quick and easy.

This catalogue system may be started with a single vertical drawer, and if there are only a few catalogues to be filed, a card index will not be necessary, but when the catalogues accumulate to completely fill the vertical drawer it is best to have a card index by both makers' names and articles. This index can be kept in a special card index tray, but it is better to have a card index section in the same stack, as the vertical sections.

If a large number of catalogues are to be filed, it would be wise to select filing sections with drawers of graded sizes, so that there will be no waste room. Small catalogues are more easily located and kept in good condition in small drawers than if catalogues of all sizes are filed in a large drawer.

A Second Method.

There is another method of filing catalogues which is required by many business houses. This company recog-

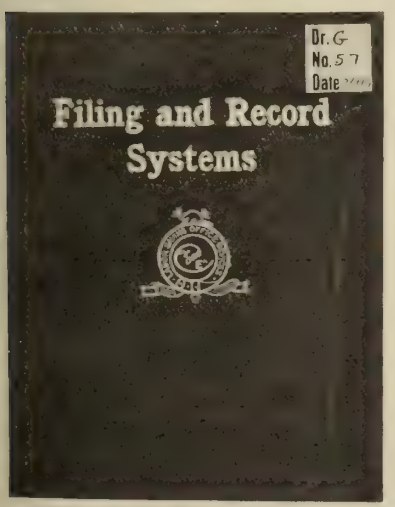

Fig. 3.—Labelled Catalogue Ready for Filing.

nized the need of a simple and practical catalogue file a great many years ago, and as vertical filing was them in its infancy a special cabinet was designed for filing catalogues, in which the drawers were made of various depths, and each drawer was subdivided into pigeon-holes. These pigeon-holes were also made in various sizes, so that a catalogue of any size could be readily filed away.

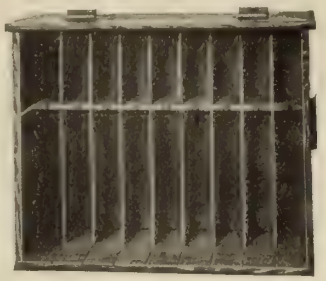

Fig. 5.—Detail of Subdivided Drawer.

The method of indexing is similar to that explained before, each drawer of the cabinet is known by a letter, such as "A," "B," and so on. Each compartment in the cabinet is numbered beginning with one. The stalls in the cupboard are numbered, 1, 2, 3, 4, etc., and these numbers are continued throughout the cabinet, so that the last compartment in the second lowest drawer is number 164. The bottom drawer has no divisions. It is used for filing extra large books.

When a catalogue is received the size of the drawer and the compartment in which it will most conveniently fit is determined, and a gummed sticker is affixed to the front cover of the catalogue. See Fig. 3. The two index cards are then written out for the catalogue, one with the subject, and the other the maker's name. See Fig. 1. The drawer number and the compartment number are placed on the maker's card in the upper right hand corner. On the subject cards the drawer number, compartment number and page number on which each article in the catalogue will be found are placed on the right hand side in columns provided for that purpose. These cards are filed in the two 5x3 card index drawers, behind alphabetical guides which may be supplemented by subject guides if desired.

To find all the catalogues of a certain line of goods it is a simple matter to open the index drawer by makers' names, and glance behind the alphabetical guide under which the principal part of the maker's name comes. On this card will be found the drawer letter, and compartment number where the catalogue or catalogues will be found, or if you want to turn up all the catalogues of makers of one article, such as coated paper, the cards with the names of the different makers will all be found in one place in the subject file.

Fig. 5 is a detailed view of the interior of one of the drawers in this catalogue cabinet. The numbers are stamped on the partitions above the compartments.

CHANGE OF RATE CARD.

The following card is useful for informing the proper parties about a change in rate in the machining operations of certain castings. If a new pattern is made necessitating a change in price the card is filled out similar to the one shown.

The foreman fixes the price and sends it to the superintendent for approval. If satisfactory he initials it and passes it to the time-keeper who makes a note of it passing the card to the cost department where it is filed for reference.

This card is used in machine shop, erecting shop, wood shop, foundry and in the various departments where work is done on a piece work basis.

MACHINE SHOP METHODS AND DEVICES

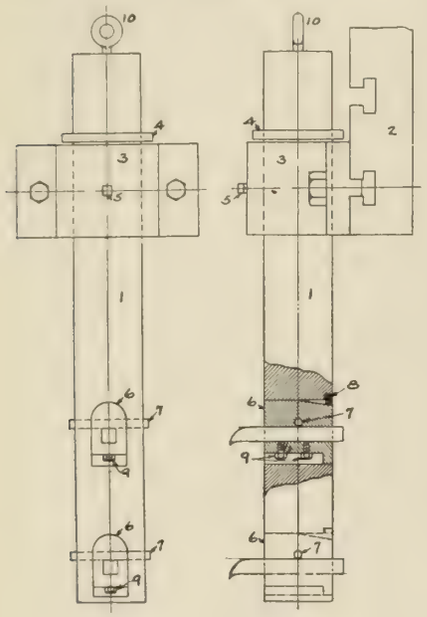
Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

SLOTTING BAR.

By H. Howard.

The bar shown in the accompanying sketch was designed by the writer for a 32 inch slotting machine, which he operated for some four years in England.

1 is the bar, 6-inch in diameter, attached to the slotting machine ram ; 2,



Slotting Bar.

by the bar holder ; 3, the latter two being held together by two 1½-inch bolts. Adjustment of the bar was permitted by adjusting the set-screw 5, the weight of the bar being held up during the setting period by the collar 4. 6 is the tool holder held in the cut out bar by the pin 7, and capable of allowing the tool holder to turn slightly on the up-stroke, against the spring 8. The tool itself is held in the tool-holder by set screws 9, as shown, the tool being first put in its holder, and the latter slipped into the bar. An eye bolt 10, at the top of the bar, makes the removal of the bar an easy matter.

As shown, the bar has only two tools, while as originally made it had three, designed to slot a complete set of marine crank webs in one operation. The 6 webs being set up in pairs, a set of 2-inch parallels were placed between each pair, so that a complete set could be machined in one operation with the same expenditure of time as for a pair.

As the bar is round, it may be adjusted as desired to suit the work, requiring no adjustment of the machine ram which is usually difficult to move.

INSERTED TOOTH REAMERS.

The London Machine Tool Co., Hamilton, have an especially good inserted tooth reamer that they use in their own works, one which was devised by their foreman toolmaker. Fig. 1, gives an idea of its construction.

Essentially, it consists of a machinery steel body, milled to receive inserted high speed steel blades, the latter held in position as shown, by countersunk cap screws, engaging with a notch in the

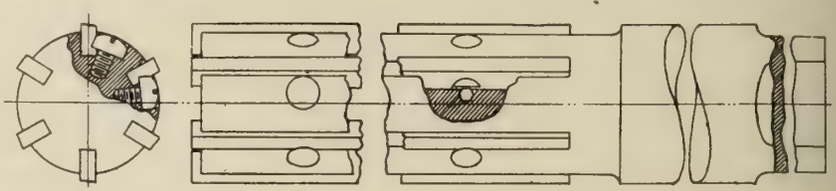


Fig. 1.—Inserted Tooth Reamers.

side of the blades. The beauty of the construction lies in the fact that standard bar stock may be used in the blades. When new, they are screwed down and ground to the desired size, which is ⅛ inch larger than the body, allowing 1-16 inch clearance all around. When re-grinding becomes necessary, paper packing, or when that is not enough, tin foil, and even sheet tin may be used, as much as 1-16 inch wear being permissible before new blades are required.

A standard construction has been adapted. In sizes up to 2 inches, 6

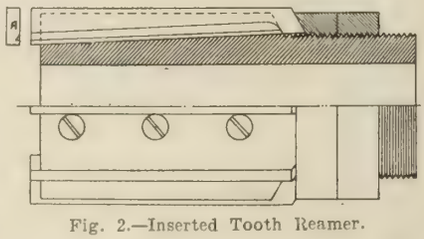

Fig. 2.—Inserted Tooth Reamer.

blades are used; while over 8 blades are required. Under 1½ inches the blade stock is ⅛'' x ¼''; while over 1½ inches, it is 3-16'' x ⅜''. The cap screws are 10-24, their axis passing slightly to the left of the centre of the reamer, so as to clear the bottom of the blade.

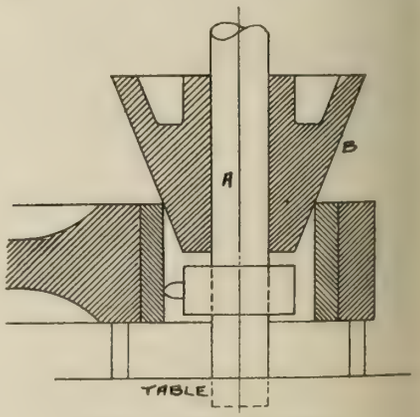
Fig. 2 shows an adaption of the same principle to an adjustable shell reamer, much the same in construction as the solid type, with the exception of the adjustible feature. The same rule regarding the number of blades is used. The recesses in which the blades fit, however, tapers at an angle of 10 degrees, while the cut-out for the cap screw in evidence in the solid type, is replaced by a corresponding groove, parallel with the bottom of the blade recess. This is shown in the end view of one of the blades at A. The upper end of the shell of machinery steel is threaded, small pitch, and has two knurled nuts, the inner one of which cupped at an angle of 60 degrees, and fits against the similarly fixed ends of the blades. By loosening the tightening cap screws, and turning the inner knurled nut adjustment of the reamer is very readily made and locked by the outer nut, making adjustment for re-grinding an easy matter.

The principle of the construction is excellent as is evidenced by the number of reamers of this type and of the solid type, in actual service at these works.

CENTRING DEVICE FOR BORING.

The C.P.R. shops, West Toronto, use a neat little scheme for rapidly aligning a connecting-rod, or side-rod, end for re-boring.

The end of the rod is placed on parallel strips on the mill table, and the height of the overhanging end adjusted



Centering Device for Boring.

until the rod is level, when the boring-bar is placed in position. On this boring bar A, is a tapered drum B, free to slide on it, and capable of being set in any position by a set-screw, so that when centring the job, the boring bar with tool in position need not be disturbed. This drum B is lowered into the hole and the job adjusted until it touches all around the drum, signifying that it is now located centrally. When the job may be bolted down. The drum B can then be lifted up out of the way and set, while the job is being bored.

Very rapid work can be done in this way, and while it is used on this class of work, the principle could be applied to other work equally well.

FEEDS AND SPEEDS.

No arbitrary standard of cutting speeds and feeds per revolution or per inch can be established for drills. Not only do the physical and chemical characteristics of the material being drilled affect the proper rate of drilling, but the strength and condition of the drilling machine and the shape and degree of sharpness of the drill point also have great influence; therefore, much must be left to the judgment of the mechanic. The following table, prepared by the Celfor Tool Co., Buchanan, Mich., will serve as a guide for Celfor drills under average conditions. In many cases, if the drilling machine is strong and accurate, and the drill is sharp, rates for above those given in this table may be obtained in regular practice. In tests, our men frequently attain to double and treble the rates given in this table.

The necessity for careful and frequent grinding to secure economical and satisfactory results in the use of our drills must be emphasized. The point should be reduced to proper thickness by grinding it evenly on each side, and the two cutting edges should have the proper angle, the proper clearance, and should be precisely alike; that is to say, the point of the drill should be absolutely symmetrical.

Any drill which is run too fast will burn on the corners. The maximum safe cutting speed, in general, is independent of the rate of feed, but in hard materials drills will burn at smaller feeds (at the same speed) than in soft materials. The following table is laid out for a cutting speed of 100 feet per minute in cast iron, 60 to 80 feet per minute in medium steel, and 40 to 60 feet per minute in hard steel. The torsional strength of the larger drills will permit of far greater feeds than those given in this table, but due regard has been given to the capacity and rigidity of available drilling machinery in constructing this table, the object being to give practical, rather than theoretical figures.

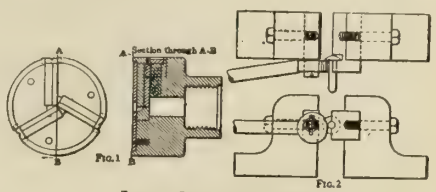
It is essential to keep the drill point properly shaped and sharp in order to give best results. Sharp drills economize time, power and drills, and drill better holes.

ROUNDING ENDS OF PINS.

By Herbert E. Chittenden.

Having a batch of 100,000 button-head pins to form to a nicely rounded point it was necessary to devise some quick way for doing the work. Our chamfering machine is a home product, being made from the bed of a single-head threading machine fitted with a sliding head operated by a foot treadle and driven by a cone pulley. The head, as is seen by Fig. 1, is fitted with formed cutters, which can be ground on the end and adjusted to position by the fillister-head screws shown.

To make the cutters we saw them to length from a bar of $\frac{5}{8}$ square Novo steel, put them in the slots in the head, fasten on the steel plate (shown in section 1) by means of three 5-16 countersunk screws, put a piece of $\frac{1}{2}$ round



TOOLS FOR ROUNDING ENDS OF PINS

tool steel, which has been turned and fluted to the shape of the point of the finished pin, in the drill press and drill down in the blank cutters the depth required. Then we take out the cutters and shape them down their full length to the shape formed by the drill.

The vise is of the ordinary threading-machine pattern and is bolted to the bed, but can, of course, be shifted to various positions to accommodate different lengths of stock. The vise is fitted with cast-steel jaws, as shown by Fig. 2. The eccentric gripping lever is made from $\frac{5}{8}$ round tool steel and fluted similar to a pipe wrench. Any turning

of the pin serves to increase the grip of the lever. This method has proved such a success that the principle is being applied to several other jobs of a similar nature.—American Machinist.

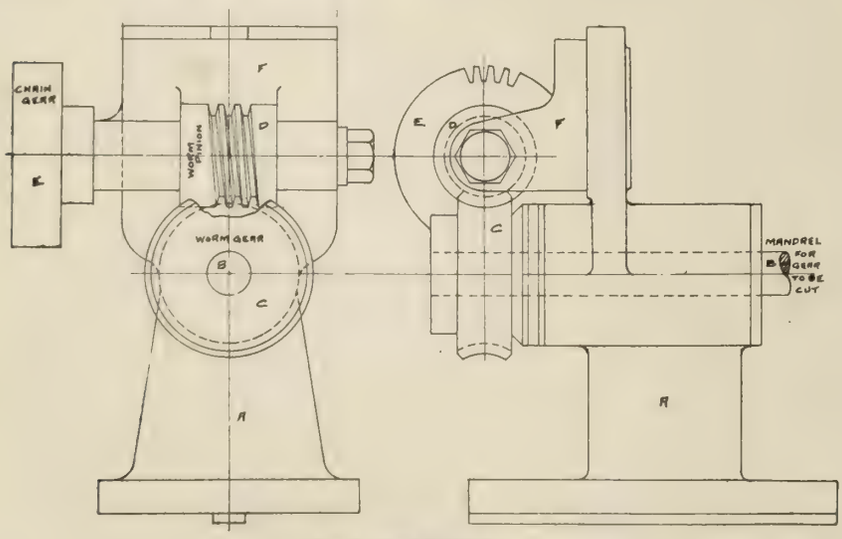
WORM GEAR CUTTING.

In a large Canadian plant where the class of machinery manufactured requires many worm gears, a different method of production than that in common vogue is made use of.

The customary method of cutting worm gears, is to attach to a dividing head in a milling machine, and make the first cut with an approximately shaped milling cutter, and afterwards allow a hob to run loosely in the roughed blank, producing a finished gear in two operations.

The accompanying sketch shows the simple device used by this firm. A is bolted to the milling machine table, the base fitting one of the grooves in the table. Through the centre of this stand A, passes a mandrel B, on which the gear blank is placed. On the other end of this shaft or mandrel B, is a worm gear C, meshing into a worm D, on a crosswise shaft, on the end of which is a chain gear E. This chain gear is driven from another chain gear on the milling machine spindle, secured on the spindle with the hob. The combinations of gears, worms, etc., is so arranged that through the train, the gear blank is made to revolve at just the proper speed for the hob.

The casting F is bolted to A, and is so arranged as to permit of vertical displacement, making possible various combinations of worms and gears at D and C, respectively, as well as different chain gear changes at E and on the spindle. By these changes, and having a suitable stock of gears, worms, etc., almost any worm gear can be cut, absolutely true, for the only chance for error lies in the chain, which gives no trouble as the strain on it is practicallly nil. This method is used exclusively by the company before mentioned, and gives most satisfactory results.

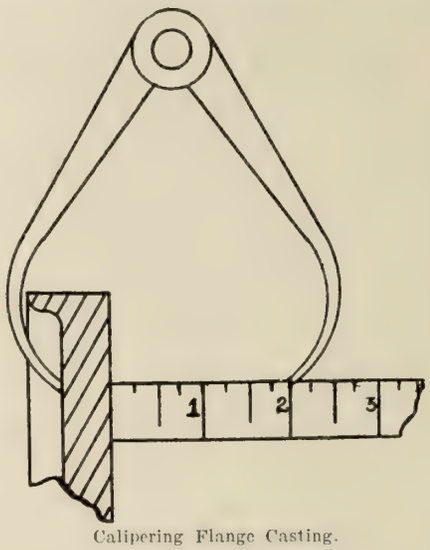


Worm Gear Cutting.

CALIPERING A FLANGE CASTING.

By K. Campbell.

One of the simplest ways of calipering over the flange of a casting is shown in the accompanying illustration. The calipers are set at an even distance on the rule, sufficient to allow the calipers to pass over the flange. In the illustration, the rule is set at two.



Calipering Flange Casting.

After carefully adjusting the calipers to 2 inches, remove the calipers over the flange and measure the opening of the calipers. By subtracting 2 from the second measurement, the actual thickness of the webb of the casting is given.

JAW FOR GRIPPING WOOD.

Reference to Fig. 1 shows a peculiarly outlined surface, intended for the gripping face of a wood clutch in a woodworking machine. First impressions would seem to convey the difficulty of producing such a surface, while in reality the operation is very simple, the finishing and grooving as shown being all done in one operation. The surface is covered with grooves about 1-16 in. wide by 1-32-inch deep, making a good gripping surface for the wood.

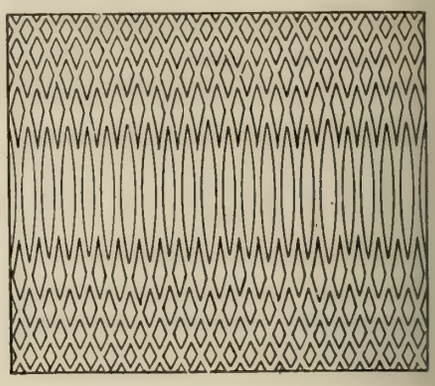


Fig. 1.—Wood Grips.

As already mentioned, the operation is simple, it being all done in a vertical miller, using an inserted tooth cutter with 16 blades and 1-6 in. feed One of these inserted teeth is ground as shown in Fig. 2, the projection cutting the groove in the face of the plate. The outer edge of the grooving tooth, and all the other teeth do the plain finishing of the surface, while back from these cutting edges, once every revolution, a circular groove is cut every 1-6 inches, determined by the pitch. By continuing the cut across the face, so that the other side of the miller comes into the surface, the grooves in the other direction are formed. In order that these grooves match at the centres, as shown in Fig. 1, the projection as in Fig. 2 must be at a radius that will give a diameter in even inches or even sixths of an inch. In this case, it is an even 5 inch diameter.

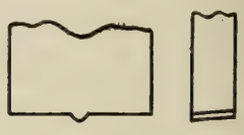

Fig. 2.—Wood Grips.

This process gives a good grip at low cost, as the plain operation of machining takes nearly as long as the completed job, the two being simultaneously done, with the exception of the last little while that the back part of the cutter is merely grooving.

CANADIAN MACHINERY AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

Vol. VI. September, 1910 No. 9

A CRY FOR BUSINESS MEN.

The National Council of Industrial Defence of the United States are dissatisfied with the legislators at Washington. They say there is not enough practical business men among them and venture the opinion that "every thinking man who reads" must recognize that they are constantly building into the laws of the United States "restrictions that bind the hands of our manufacturers and control the decisions of our courts on questions involving the relations of capital and labor."

Our experience in Canada is not of such an extreme type. Justice is administered with equity. One reason for this may be that our judges are not dependent upon the whims of a fickle electorate for continuance in office. Prejudices may at times influence them, but ulterior motives is not one of the sins that can be laid at their door.

But when it comes to a need of more business men among those who make our laws, the conditions are much the same in this country as in the United States.

Such business men's organizations as the Canadian Manufacturers' Association find it necessary to watch very carefully when the Federal and Provincial Parliaments are in session that no legislation inimical to their interests is allowed to slip through. All this costs money.

Sir Wilfrid Laurier, the Premier, and Mr. R. L. Borden, the leader of the Opposition, have both expressed a desire to see more practical business men in the House of Commons. It is not, therefore, business men themselves alone that recognize the need.

Possibly some time in the future there will be found more successful business men who will be self-sacrificing enough to give a due portion of their time and attention to the affairs of the state. Until then it is futile to look for much improvement in the businesslike qualities of our legislators.

SAVING HEAT UNITS.

The saving of a little hot water which formerly went to waste resulting in the saving of thousands of dollars should make superintendents and manufacturers think carefully of what the attention to seemingly minor things, means. Allowing the hot drips from a heating system to run into the drain loos likke a small thing, but is it?

If a plant is located on a water front try throwing a bushel of coal into the water each day. Figure what the waste will mean in a year. You will then have an idea of the fuel that is being thrown away by hot drips being fed into the sewer. Mr. Peiler's paper in this issue gives a clear idea of what saving of waste means and it should be perused with a great deal of interest.

MAN'S HUMANITY TO MAN.

It was with pleasure that Canadian Machinery read the following announcement showing the interest of one large corporation in its men:

J. R. Booth, two thousand of whose employes were out of work for several days, owing to the closing of his big lumber mill, through the strike, has announced that every man will be paid for his lost time. A deputation of employes waited on him at one o'clock this afternoon to thank Mr. Booth, and the veteran lumberman was cheered by the entire mill staff.

TO INCREASE OUTPUT WITHOUT ENLARGING.

Sometime, perhaps, in the history comes to the manager the question of increased production. Ways and means are considered and it is often decided that the only way possible is to enlarge the plant. The next step is to secure the necessary capital. To take it from the working capital is to cripple the productive end of the business.

If foremen, superintendents or managers will look carefully over their plant they will possibly find a way of increasing production with the investment of very small capital, as other companies have done. Machinery has greatly improved, and by a few changes old machines can be made to use high-speed steel and thus increase the output.

Another way is to increase the efficiency of the men. This can be done by installing a bonus or premium system. The men make higher wages and both men and company benefit by the arrangement.

In a boiler works in Ontario, about a year ago there was little work, and a number of men were laid off. The best mechanics were kept on, though there was not much for them to do. They got into the habit of doing little and manufacturing costs went up to a high figure. Then business became brighter, men were taken on, but the costs continued to soar. After a thorough examination by the cost clerk, it was found that the men were working at a very low speed. On his recommendation boilers were manufactured for stock, putting the men on piecework, and keeping them working at their former pace before business had been slack. This increasing the efficiency of the men had the expected result of lowering the costs to their normal amount.

There are few works in which there is not waste space. A manager looking carefully over his plant can discover

this. Then, by a little re-arranging of the machinery in the shops additional space is available.

Jigs and templets assist in the rapidity and accuracy of production. Where there are a number of duplicate parts, a carefully made jig or templet will ensure rapid machining, such as drilling, etc., and if the jigs and templets are taken care of they will last for many years.

A great number of other points could be brought to the attention of the manager, such as installing new machines with greater capacity, replacing heavy cast iron with wood split pulleys, studying the question of bearings, etc. All these changes may be made without spending a cent for new buildings. There are probably many other things about a plant which will only be revealed by a critical examination. In this way the capacity of a plant may be increased from ten to forty per cent., some changes giving a greater increase of production than others.

Of course, we do not mean to say that new buildings should not be erected, nor should additions be made. We have only tried to point out how increased production may be obtained with a small investment, when the necessary capital for a new plant is not available.

THE TECHNICAL PRESS AND TECHNICAL EDUCATION.

At the present time, when the matter of technical education is one of the subjects uppermost in the minds of many, it seems an excellent opportunity to draw attention to the wonderful assistance the technical press has afforded technical education in bringing it to its present developed state.

The commission appointed by the Government has been looking into the educational matter, and on their trip so far through the Maritime Provinces, have accumulated much information, reports of which appear in the daily press. Canadian Machinery has endeavored to keep abreast of this want for further knowledge along these lines, as is instanced by a description of one of the most progressive schools in the United States—the Cleveland Technical School—given in the August number; and in this issue appears an article on the technical course at the Manitoba Agricultural College.

Coming to the point of relationship between technical education and the technical press, a very little consideration will show that the latter has been probably the most potent factor in the agitation that is being felt all over the world—for more complete education for the working man, along the lines of his daily work, rather than going to the opposite extreme of educating with the professional idea in view as has been customary till quite recently.

The technical paper in its present form is a comparatively recent innovation. Its scope is very wide, reaching representative men in every trade. As most of the articles given are not gotten up on the spur of the moment, as with the daily paper, the element of error liable to enter is eliminated to a great extent, with the result that the technical paper has gained a reputation for veracity and reliability, built up largely by the fact that most of the articles are written by experts in their line. Thus, a power has been created. Information obtained as it has been, at regular intervals, has created a desire for more complete knowledge. This is stimulated by the appearance from time to time of articles containing more than the usual amount of mathematical theory, developed to deduce some practical result. The mechanic, reading this, feels his lack of education along this line, and out goes the cry for assistance—for lessons in fundamental engineering. Some papers have attempted to meet this demand themselves, with varying degrees of success, for the majority of papers have new subscribers adding to their number constantly, so that anything like consecutive work is difficult to obtain. Still further have these attempts stimulated the desire. This is witnessed in the United States, the Mecca for technical papers, where the agigation for more technical education has been very strong, resulting in the foundation of many such schools—the Cleveland school affording an example.

From this it can be seen that the technical press has been creating this desire—unwittingly to a large extent—and this desire fortunately has taken, and is taking, action, as witnessed by the constant agitation for it in the daily press.

LIGHTING THE MACHINE SHOP.

That men should have light to work with on dark days is conceded. But why give him a candle, if for a few cents more you can save his eyesight, add to his comfort, make him more efficient, and save money on the running cost of the light?

When one considers the number of working hours in which production is dependent either wholly or in part on artificial light, it is surprising that more superintendents and manufacturers of industrial plants do not take proper interest in the subject of illumination, and the higher standard of lighting installed in some workshops.

If a workman has poor tools, poor work is a direct sequence; therefore, give him proper light with which to work. By taking care of the employes, their productive efficiency is increased. Man dislikes a gloomy room. On the other hand, he likes the cheerful effect of the brightly-lighted shop, and proprietors, superintendents and managers would do well to investigate the modern scientific system of illumination.

A GROWING REVENUE.

For the first four months of the present fiscal year Canada's revenue shows an increase of $5,625,148 over the corresponding period of last year. For the same period the expenditure on revenue account increased by $1,258,651, while the capital expenditure decreased by $631,884, leaving a net betterment of over five millions.

For the four months the total revenue has been $35,655,439, the customs receipts totaling $23,005,748, or $5,087,918 better than last year. The expenditure on the consolidated fund account has been $22,044,077, and on capital account $5,797,337. The excess of receipts over the total expenditure has been $7,804,025. Indications point to a surplus this year of revenue over all ordinary expenditure even larger than last year's record surplus of $22,000,000. For the month of July the revenue totalled $9,320,586, an increase of $883,148 over July of last year. Expenditure on consolidated fund account increased by $1,242,290, and on capital account by $232,380.

The net public debt of the Dominion at the end of the month was $328,615,687.

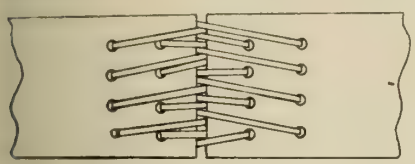
BELT LACING

By James E. Noble.

Wire lacing for belts is extremely good, as it has numerous advantages over other types, viz., elasticity, belt can be laced quickly, practically noiseless operation, and small cost, for considering everything, it costs less than most lacings.

In lacing with wire it is a good idea to insure the ends of the wire being



A Good Joint for Small Belts on small Pulleys at High Speeds, but All Right Anywhere.

forced into the belt, as otherwise a cut hand might result should an attempt be made to shift the belt by hand.

The ordinary rawhide lace is also good. A favorite method of lacing with rawhide is the hinge-joint ; for joints of this nature have been known to run for several years without trouble. Another wrinkle, when putting up new belts, is to have a short intervening piece at the joint. After a few days operation, the belt will have attained such a slackness that the piece may be removed, and the belt will be then found to be at the correct tension.

It is said that a tension of 35 pounds per inch, exclusive of load, is quite sufficient to prevent belt slipping or creeping as it is sometimes called. A belt might run with practically no slip with a light load, and yet slip considerably with a heavy one, if the tension were not correct.

Much belt trouble is occasioned by the use of pulleys too narrow for their belts. In many cases, the pulley is exactly the same width as the belt. This should not be ; the pulley should be wider than the belt whenever possible.

More caution should be exercised in the use of many of the so-called "belt dressings," which are often home-made mixtures of castor-oil and resin or some such combination. No matter how slack, dirty, greasy, wet, etc., a belt may be, use dope, appears to be the watch-word of most engineers. If the belt is large enough, and hugs the pulley closely, there should be very little slip. A simply experiment shows this. Wash and dry your hands thoroughly, and slide them along a smooth polished surface, such as glass, and it will be noticed that the drag is considerable. A belt behaves similarly. If it is clean and large enough to carry the load, and if the tension is correct, no belt dope should be required. Of course, a little belt dressing to keep the belt soft and pliable, is essential, but it should be a dressing made by a reliable firm.

REPAIRING BOILER TUBES.

In the method of repairing boiler tubes, as done at the C.P.R. shops, West Toronto, there are several features of particular interest, which are worthy of note.

In old boilers, the tube ends sometimes become so rusted and corroded, that they must be removed, the ends cut off, and new ones welded on. As a large number of tubes require this treatment, several labor-saving devices have been improvised at the shops with the object of reducing expense, and at the same time improving the quality of the work.

In many shops where new ends are welded on, it is quite customary to merely expand the end, introduce the new piece, and weld in that position, without tapering the ends to fit each

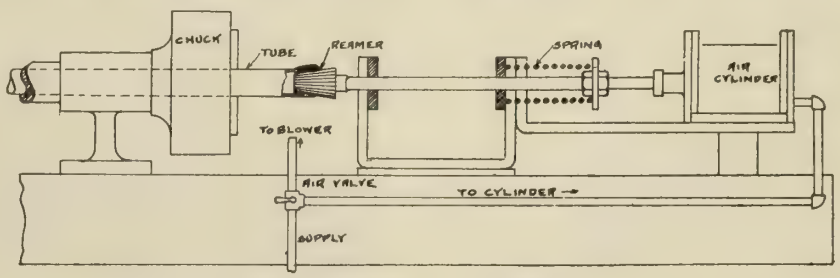


Fig. 1.—Repairing Boiler Tubes.

other. This method, owing to the sharp ends coming on the flat of the other part of the tube, always leaves a seam around the tube, which tends to weaken it, often producing fracture. The C.P.R. always ream out the end of the tube with a taper reamer to a sharp edge at the end, and the new end is tapered down similarly to fit in.

In reaming out the ends, an improvised machine, Fig. 1, is used, unique in some respects. Essentially it is a late, the original idea being the feed, which consists of an air cylinder which shoves forward the reamer. Air is controlled by a two-way valve, which allows air out another passage as desired to a piece of rubber hose, used to blow the chips away. When the cylinder is released, the piston resumes its initial position again by the spring expanding. The make-shift construction of the lathe is interesting. It is formed of 2—7"x7" scantlings, on which are attached several wrought iron straps for securing the cylinder, etc. The reamer

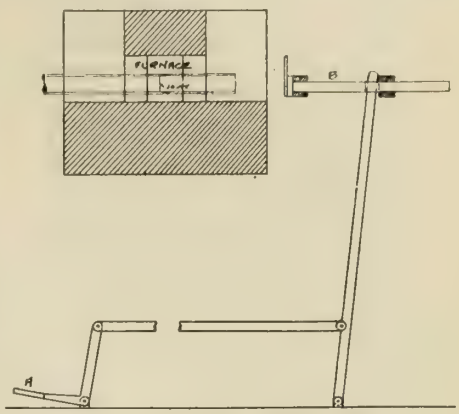

Fig. 2.—Repairing Boiler Tubes.

has a square shank which works in square holes in the cross-sectioned cross-pieces, which prevent it turning. The tubes are rapidly reamed by this method, a greater pressure being given than if fed by hand.

When ready to be welded, the two parts are placed together, and shoved into a furnace as in Fig. 2. The heat has a tendency to loosen the pieces which were lightly placed together, so,

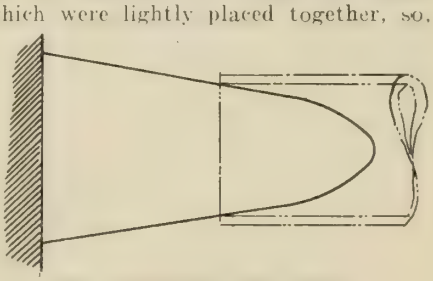

Fig. 3.—Repairing Boiler Tubes.

if removed when heated without precautions, they would probably part. A single expedient prevents this. When ready to remove, a tread A, some 4 or

5 feet back from the furnace, is pressed which slides bar B in its guides, the plate on the end striking the short piece of tube sharply, driving it further into the tube to be repaired, for the pieces are soft from the intense heat. This act in itself practically welds the pieces together, as well as doing what was originally intended, i.e. preventing the pieces falling apart before welding.

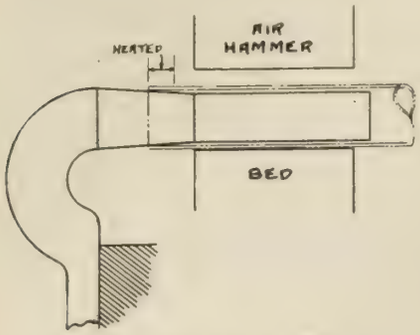

Fig. 4.—Repairing Boiler Tubes.

The welding is done under a quick-acting air hammer, the tube being slipped over a mandrel during the operation. The process insures a very nearly perfect joint, without mark, the size of the pipe being but slightly below the standard.

Before putting into the boiler the back end must be expanded slightly so as to fit the tube sheet better. Formerly, this was done as in Fig. 3, by first heating the end of the tube for about an inch, and driving the tube up on a tapered pin, by a couple of men swinging back and forth onto the pin, driving it further each swing till expanded the proper amount, a very slow job.

Fig. 4 shows the method used now for expanding the end. As before, the end is heated, but with the difference that it is now placed on a mandrel, tapered at one end, and under an air hammer. The oscillations set up in the pipe by the quick acting hammer striking the cold part, back from the heat, causes the end to swell, the operation being practically instantaneous, the blows being so rapid. The method is very much quicker and better than the old way, and the production is greatly increased.

DISINFECTION OF RAILWAY CARS.

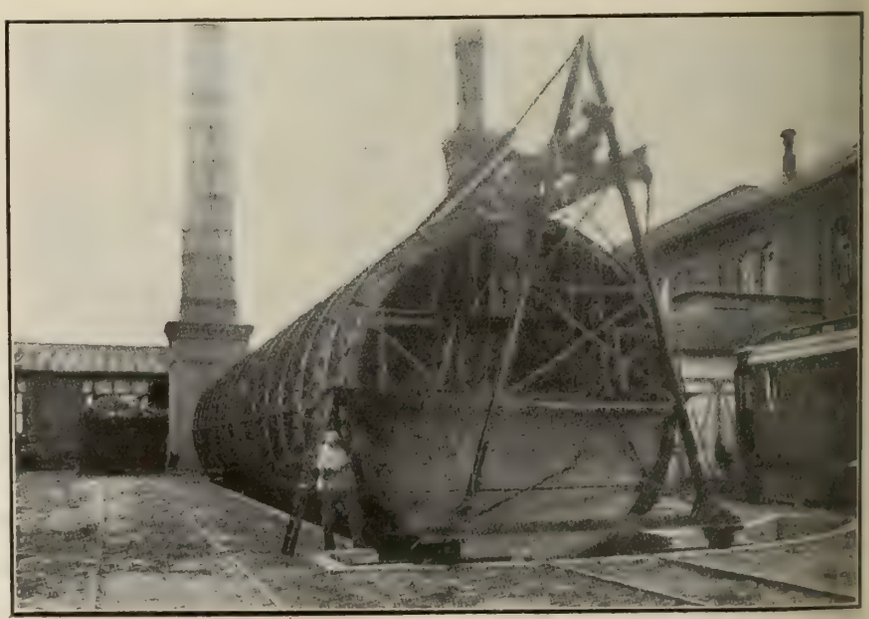
The running of a railroad in Germany is evidently accompanied with unpleasantness, if one may judge from the accompanying photograph. The Potsdam shops, which are responsible for the proper maintenance of rolling stock, have been confronted with the difficult task of disinfecting the cars. It seems that the coaches which return from Russia are literally a-swarm with vermin. Even after the cars had been cleaned with true Teutonic thoroughness, there was still the possibility that living disease germs might lurk in the walls and hangings. It was therefore the practice for some years to take down all the upholstery, curtains, etc., and to clean everything thoroughly. Naturally, the expense involved was heavy, and the cars were withheld from service for a considerable time. Moreover, there was also the danger of infesting the shops and other cars.

The problem seems to have been successfully solved by Julius Pintsch, who applied to the railway car a principle of disinfection which has been successfully employed on vessels. His disinfecting apparatus consists of an iron cylinder built up of cast iron annular sections, of 16 feet internal diameter. The inside length is about 72 feet. The cylinder is so stoutly constructed that it can easily support without deformation a 30-ton car.

During disinfection the air within the cylinder is considerably rarefied by a pump, and as a result the outer air exercises a pressure of about 1,900 tons on the disinfecting cylinder. Since the apparatus is heated during disinfection, allowance has to be made for expansion. Hence the cylinder is mounted upon rollers, so that the apparatus can yield to an extent of about three-quarters of an inch in length, which is the amount of expansion.

Before it is run into the cylinder, all the windows and transoms of the car are opened. By means of a crane a two-ton closure is brought against the open end of the cylinder. A rubber gasket is employed to make the closure hermetic. Huge bolts hold the closure gasket and cylinder together. Steam is blown into the interior of the cylinder. Two hundred and fifty steam pipes line the interior of the cylinder, all receiving their supply from the main pipe. The total length of all these pipes is about 1¾ miles. In order to heat the air within the cylinder quickly and uniformly two blowers are set in motion, so that all the air is brought in contact with the heating tubes. Even during the coldest weather the temperature within the cylinder can be raised to 140 deg. F. in from one to two hours. In order to heat an entire coach to this temperature about five hours is required. After the car has reached the proper temperature the air is pumped out of the cylinder until a vacuum of 70 to 74 centimeters of mercury under the normal pressure is obtained. At this atmospheric pressure water will boil at 104 deg. F. Hence all moisture is evaporated from the car without injuring the parts by the excessive heat. In no other way is it possible to kill vermin effectually. The upholstery, curtains, hangings, etc., are not in the least injured.

For very special purposes the car may be disinfected with formaldehyde gas. At the very first attempt, a car was thoroughly purged of vermin. To make assurance doubly sure, and to test the efficacy of this formaldehyde disinfecting method, a glass vessel full of the living insects had been purchased from a professional vermin-exterminator in Berlin. This vessel was placed in the car and covered with cotton and linen. The insects were all killed.



Sealing Cylinder With Two-ton Gasketed Closure Before Exhausting Air and Turning on Steam to Disinfect Car.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

CINCINNATI CONE DRIVEN MILLER.

Some of the milling work in every shop is light and can therefore be done on a modern cone driven miller as fast and as accurately as on the more highly developed single pulley type of machine. It follows therefore, that the cone driven machine is the most economical one to use on such work.

There is of course a recognized field for the heavy and powerful single pulley type of machine, but this does not in any way restrict the field of usefulness of the cone driven machine.

That these facts are thoroughly appreciated by the Cincinnati Milling Machine Co. is evidenced by their having redesigned their entire line of cone driven millers. The illustrations herewith show the more important improvements that have been made. The column is very similar to the column used on their line of high power machines. It is a symmetrical box section, having straight lines and large enough to contain the entire feed drive mechanism.

The feed changes are all obtained from a single group of mechanism which is mounted in the column at a point high above the floor, bringing all the levers within easy reach, and the index in plain sight, of the operator.

The inside of this mechanism is shown in Fig. 2. It is a single unit,

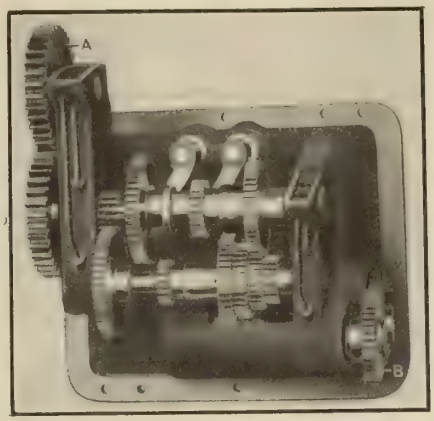


Fig. 2.—Feed Change Mechanism.

assembled complete by men who are specialists on this work and when placed in the column, it becomes an integral part of the machine. It provides 16 changes of feeds, from .007 to .300 per revolution of cutter, and all these changes are obtained by means of the 12 gears shown between the two housings in Fig. 2.

The keynote of the entire design is simplicity coupled with handiness in operation. The drive is direct from the face gear which meshes with gear A. Power is transmitted through the change gears to the gear "B" which drives the universal joint shaft.

The outside of the box, showing the lever arrangements and the feed index, are shown in Fig. 3. All of the sixteen feed changes are obtained by the three levers shown. The position is clearly indicated by letters and figures. The feed index, mounted immediately above the levers, is of the same simple form that is used by this company on their line of high power machines. There is no chance for confusion, because the exact lever positions are plainly given below the figures representing each one of the feed rates, and all that is left for the operator to do is to move the levers to these positions.

The most striking feature of this design is the tumbler construction. This tumbler is made in the form of a cylinder of large diameter which supports the tumbler shaft and gear, and is itself supported in the frame of the feed box. This construction obviates all bending of the tumbler shaft, as well as all vibration in the tumbler.

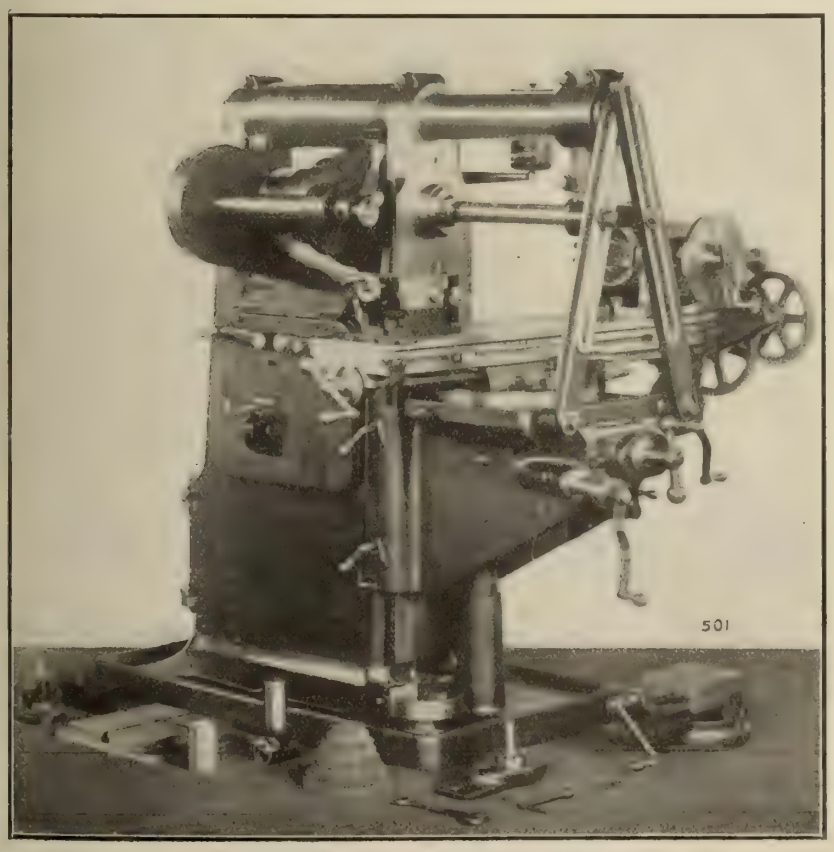

Fig. 1.—Cincinnati Cone Driven Miller.

Fig. 3.—Outside of Feed Box.

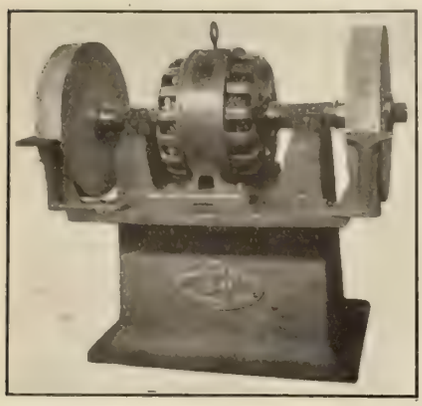
The tumbler operating lever projects through a hole in the feed box in the usual way, but this opening is completely closed at all times by the tumbler, thus thoroughly protecting the inside mechanism from dust.

The cone driven miller is manufactured by the Cincinnati Milling Machine Co., Cincinnati.

MOTOR DRIVEN DRY GRINDER.

The accompanying picture shows an example of the extreme simplicity very often obtainable with direct motor driven machines. While the equipment possesses all the advantages inherent with the use of electricity in this class of service, its most striking features are its space economy and that it is entirely self-contained.

The equipment, with the exception of the motor, is made by the Springfield



Motor Driven Dry Grinder.

Mfg. Co., Bridgport, Conn., and is known as their "Type D-M Dry Grinder." The wheels are 24 inches in diameter by 4-inch faces and are driven by a Westinghouse CCL induction motor. The motor shaft is special, being extended at each end to carry a grinding wheel. The regular motor bearings are omitted and the shaft turns in special self-oiling bearings two inches in diameter by eight inches long. The supports for these bearings are cast solid with the grinder base.

STATIONARY DIE HEAD FOR PIPE THREADING.

The illustrations given herewith show a stationary die head for pipe threading as manufactured by the Landis Machine Co., Waynesboro, Pa., using the Landis type of die with a manually operated die head.

This head is made especially for use on pipe threading machines wherein the pipe revolves and the head remains stationary, the dies being opened and closed by hand. The head is made entirely of steel as are also the die holders. The head can be mounted on the carriage of any of the standard pipe machines and can be handled in the same manner as the other styles of heads, but has the advantage of the long life die as illustrated herewith.

The chaser for these die heads can be made to good advantage from high speed steel, as they never require to be annealed, rehobbed or retempered, and their life is much greater than that of the usual type. The sharpening of the die is taken care of by grinding on the ends of the chasers and again setting them to the correct cutting position in the holders by means of a small gauge furnished with your die head.

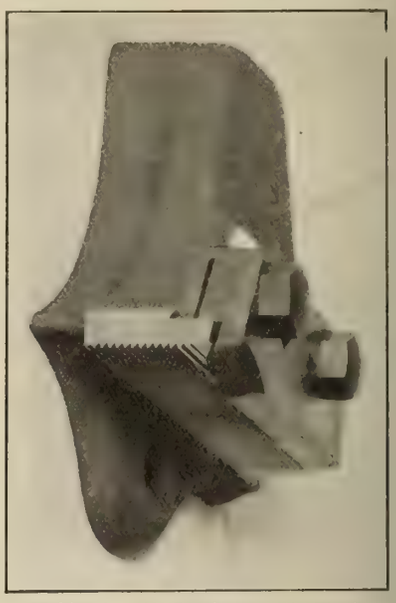
The heads are made in standard sizes to take work up to and including 4 in. One of the great advantages in this die for threading pipe is the fact that one set of dies will cut all the diameters coming within the same pitch. As there is but one pitch covering the sizes from 1-inch to 2-inch inclusive one set of dies covers this range. The same is true on the other pitches.

The small cut shows one of the holders used on pipe for threading where it is not necessary to cut very close to a shoulder. The clamp with which this chaser is held is what is known as their mill clamp, which besides holding the chaser rigidly protects the chaser in case the pipe splits which very frequently happens. The clamp as shown in the cut comes down over the throat of the die and is rounded out near the cutting point so as to act as a guide for rough ends, and at the same time protecting the die in such manner that the liability to breakage is very small. In cases of threading close to a shoulder, a clamp is used which comes flush with the front edge of the chaser only, thus permitting the die to run close up against the shoulder as in threading short nipples, etc.

This new type of die admits of greater cutting speeds than the hobbed type and the rake can at all times be ground to suit the quality of the material in the pipe to be threaded.

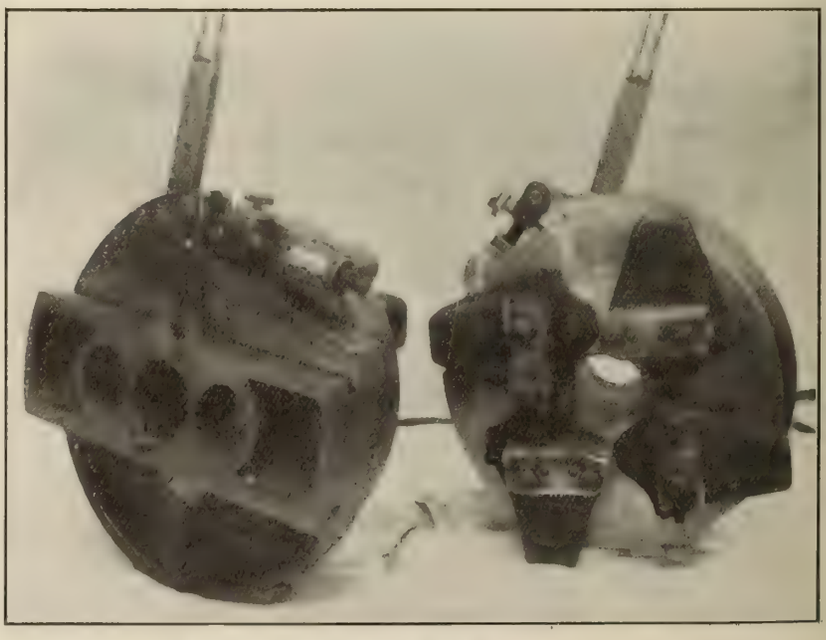
The heads are graduated for setting the dies to the different diameters to be threaded. The head is opened and closed by hand and when in the closed position the die is rigidly locked, but opens and closes freely by means of the lever.

The advantages in this head lie in the life of the dies, the higher cutting speeds that can be obtained, and the flexibility of the die to the different qualities of material to be threaded.



Holder for the Stationary Die Head.

All dies are made interchangeable and if one chaser of a set should be worn out in advance of the others this single chaser can be replaced without replacing the entire set. Dies of any one pitch will interchange on any of the die heads so long as the pitch is within the range of the head.



Stationary Die Head for Pipe Threading.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

PIPE PATTERN.

By F. S. C.

As a practical knowledge of molding is necessary to enable a patternmaker to intelligently make patterns, I am giving my reasons for stating that patterns are best made as here described.

Pipe patterns from the small gas pipe fitting to the largest iron sewer or drain pipe, are, perhaps, the most common patterns required of the patternmaker.

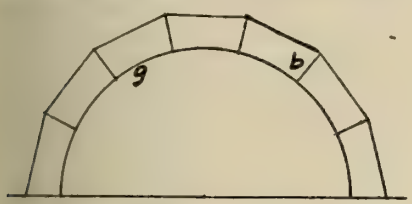


Fig. 1 a.—Pipe Patterns.

An enumeration or description of all the ways by which different pipes can be made would take too much space, so will be dispensed with in this article.

The small gas pipe fittings have been made in past years from gated brass patterns on follow boards and molding machines using cores made in multiple core boxes, where required. The more modern way of making these or any other small or moderate-sized castings in quantities, is by means of iron molds. These molds are like large core boxes, made to suit the shape of the outside of the casting required, and are hinged and locked with a convenient and rapid-locking attachment. These molds must be of sufficient thickness of iron (not less than 3 inches) to prevent it becoming hot and sticking to the casting while being

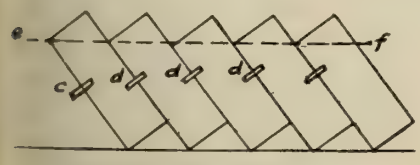

Fig. 1 b.—Pipe Patterns.

made. The gate is made to run down the parting so that when the mold is open the gate and casting required will drop out. Castings made in these molds are not chilled, because the molds are heated before receiving the iron, and the casting is dumped out before it becomes chilled, as iron does not chill until after it has become a solid casting.

In making patterns for what we might term the common sizes of pipes, that is, from 6-in. to 30-in. drain, there are a few kinks worthy of notice. When building up a pattern with staves, as shown in Fig. 1 (a), if it is not possible to saw them with the circular saw, to the correct

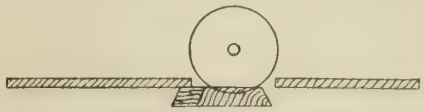

Fig. 1 h.—Pipe Patterns.

bevel necessary at b, a very convenient and rapid way is to bevel a piece of wood, as shown at c, Fig. 1, (b), and fasten the staves to it by means of pinch dogs, as shown at dd, when then can be conveniently planed off across the dotted line ef, and then reversed for the other edge. If the staves are required to be concaved at g to fit round heads or ends, a good way is to run them across the circular saw, as shown at h, Fig. 1, using a crosscut saw and having the saw guard set at an angle, as shown at i, Fig. 1.

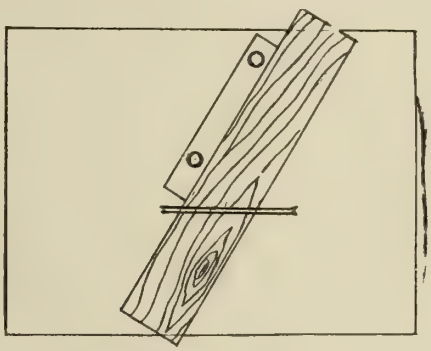

Fig. 1 i.—Pipe Patterns.

To make a strong and serviceable pipe pattern of approximately two feet diameter, it is best to make the heads of two layers of pine, crossing the grain, as shown at (a), Fig. 2. This prevents any chance of them warping out of the circular form. The flanges are best built up of two or three layers of segments and bound on the outside by $\frac{1}{8}$-in. band iron. This prevents breakage if struck

Fig. 2 a.—Pipe Patterns.

by the rammer in the foundry. The core print should be turned to leave a fillet at c, Fig. 2, which prevents the sand breaking away when drawing the pattern, and also obviates any risk of crushing the sand into the mold when putting in the core.

A pattern for a pipe, as shown in Fig. 3, may be made in several different ways. When the diameter of the pipe is small enough to permit of being made solid without having the pattern too heavy, the branches may be joined to the main pipe if they are both of the same dia-

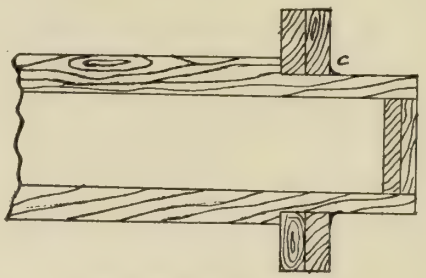

Fig. 2 b.—Pipe Patterns.

meter by sawing a piece out of the main pipe at an angle of 45 degrees, and making the branches to suit, as shown at e, Fig. 3; or, if the branch is smaller, it may be sawed by means of two pieces temporarily mailed on, as shown at d, Fig. 3, so that the branch may be bandsawed to fit main pipe. First a piece of 1-in. stuff should be sawed to fit around branch pipe, as shown by lines between e, f, g, h, the distance from the

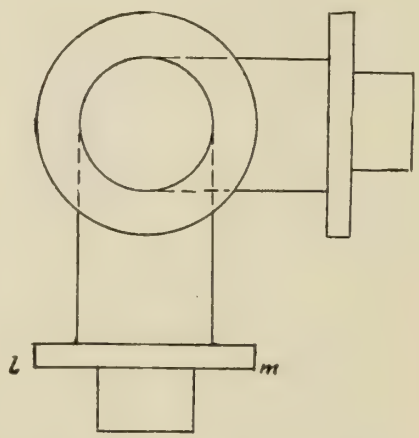

Fig. 3 a.—Pipe Patterns.

centre of pipe to the line gh being equal to the radius of the flange on other end of branch, as both will bear on the saw table when being sawed. The piece ij is sawn out, as shown at k to suit the diameter of the main pipe e, f, g, h, the lines ij being made parallel with the line gh. These pieces being secured to

the branch, it can be sawn, using circle at k as a guide, and secured to main pipe without any further fitting.

The next point of interest is the lower branch part. The easiest way for the

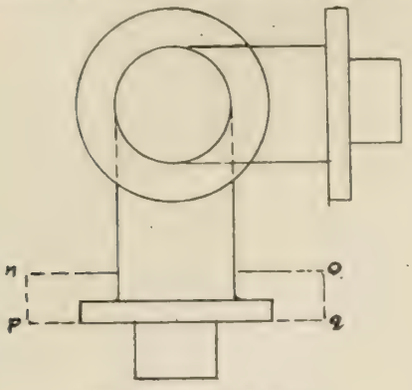

Fig. 3 b.—Pipe Patterns.

patter maker would be to leave the flange lm loose over the core print, letting the core print act as a dowel to centre it. But when a number of castings

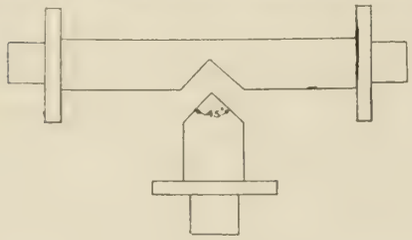

Fig. 3 c.—Pipe Patterns.

are required, the best way is to make a core box to produce a core the shape of the dotted lines between n, o, p, q, Fig. 3, (b), having the flange in, and fitting the pattern in centre, on the line no. This core is placed on the pattern which

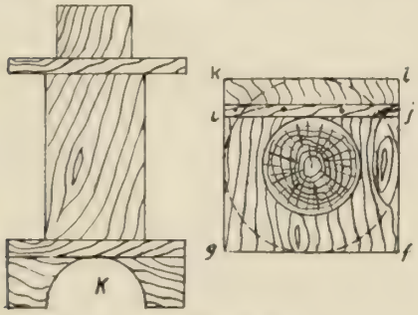

Fig. 3 d.—Pipe Patterns.

is made as if there was no flange required on it, and the green sand is rammed around, holding core in place and permitting pattern to draw as if it were a straight piece.

A very successful picnic was held a short time ago when the Gartshore-Thomson Pipe & Foundry Co., Hamilton, went to Niagara Falls, taking about 700 pleasure seekers. A tired but happy crowd arrived home that night after a most enjoyable day.

CHEMICAL STANDARDS FOR IRON CASTINGS.

By John Jermain Porter.

Cast iron is a complex alloy of six or more elements. The common elements are: Iron, carbon, silicon, sulphur, phosphorus, manganese; and the other elements sometimes present are: copper, nickel, oxygen, nitrogen, aluminum, titanium and vanadium.

Iron occurs in three allotropic forms known as alpha, beta and gamma, whose properties differ greatly. Absolutely pure iron is unsuitable for castings.

Carbon is the most important element in cast iron. It exists in many forms, all of which are included under the two heads of graphite and combined carbon.

There is still much doubt about the iron-carbon diagram. Upton's construction is the most recent, and probably nearest the truth. This diagram holds only for very slow cooling, but gives us a consistent basis of reasoning.

The total carbon is dependent upon the temperature in the blast furnace, the conditions of melting and the percentage of other metalloids.

Graphite weakens iron. The amount depends upon the per cent. of total carbon, the rate of cooling, the per cent. of silicon, the per cent. of sulphur, and the per cent. of manganese. The normal graphite limits are shown by equations.

Combined carbon hardens iron and may increase or decrease the strength. The amount depends upon the per cent. silicon, the rate of cooling, the per cent. sulphur and the per cent. manganese.

The approximate effects of carbon are shown diagrammatically.

Silicon exists io cast iron in the form of silicides. Its chief effects are through its action on the carbon.

Increasing the silicon decreases the total carbon because it replaces carbon in the molten solution.

Increasing the silicon increases the graphite because it replaces carbon in the solid solution, the displaced carbon being preceipitated as graphite.

Iron-carbon diagrams for commercial cast irons containing 1, 2 and 3 p.c. silicon are given and explained. The theory of malleableizing and of Custer's process are explained by these diagrams.

Phosphorus exists in cast iron as the phosphide Fe 3 P which is insoluble in the solid iron-carbon solution. It forms a ternary eutectic containing 2 p.c. carbon, 6.7 p.c. phosphorus, and 91.3 p.c. iron, which has a freezing point of 1740 deg. Fahr. Phosphorus decreases the total carbon and the relationship is shown by a diagram.

The net effect of 1 p.c. phosphorus is to lower the temperature at which freezing begins 50 deg. Fahr., lower the temperature at which freezing ends 425 deg. Fahr., increases the temperature range of solidification from 50 deg. to 375 deg. Fahr.

According to Upton, the effect of phosphorus on carbon is to slightly increase graphite and decrease total carbon.

Sulphur exists in cast iron as iron sulphide and manganese sulphide.

Iron sulphide forms a eutectic with iron melting at 1780 deg. Fahr. and insoluble in the solid iron-carbon solution. It therefore forms films between the iron crystals and causes brittleness.

Manganese sulphide does not form these films and is less detrimental. Manganese has a greater affinity than iron for sulphur and with enough manganese all the sulphur will be in combination with it.

Sulphur has a greater tendency to segregate than any other constituent of cast iron. This tendency is greatest with manganese sulphide.

Sulphur tends to decrease graphite and increase combined carbon. Upton's explanation of this is given.

The presence of silicon decreases the amount of sulphur which cast iron can take up. Much sulphur reduces the total carbon, and vice versa.

Manganese may exist in cast iron as manganese sulphide or as manganese carbide. According to Upton's theory, manganese carbide does not exist but the manganese is in the form of a solid solution. This theory does not seem satisfactory.

Manganese has little effect on the melting point or composition of the iron-carbon eutectic. It strongly retards the gamma to alpha transformation and thus tends to harden iron.

Manganese can neutralize sulphur and will also remove dissolved oxide at high temperatures as in the blast furnace.

Traces of copper are common in pig iron. Its effects on cast iron are poorly understood. In steel, copper increases fluidity, hardness, and tensile strength, and decreases ductility and ease of forging. Cast iron will take up only about 5 p.c. copper and this does not affect the casting properties. Copper accentuates the red-shortness due to sulphur through the formation of the ternary Fe-Cu-S eutectic. Copper prevents a complete evolution of sulphur in iron analysis.

Small amounts of nickel occur in many pig irons. Its chief effect is to lower the gamma-alpha transformation temperature and to increase the graph-

NOTE: "und." is abbreviated from under and "sug." from suggested.

ite. Its effects on the strength and ductility of cast iron are relatively unimportant.

Oxygen probably exists in cast iron and causes lack of fluidity, weakness, brittleness, unsoundness, etc.

White iron is most liable to this trouble. The variable quality of different brands of iron may be due to more or less oxygen.

Deoxidizing agents, titanium, vanadium, aluminum, manganese and silicon may be used.

Little is known regarding the effects of nitrogen on cast iron. If present in any quantity it probably causes weakness and brittleness. It exists in iron as a nitride and can be removed by means of titanium.

Aluminum is sometimes added to cast iron. A few tenths per cent. causes finer grain, freedom from blowholes, decreases the tendency to chill, decreases the hardness, increases the strength, improves the elasticity. These effects are probably due to its deoxidizing power. Large amounts of aluminum decrease fluidity and increase combined carbon.

Titanium is used as a deoxidizer. It may be added to cast iron as ferro titanium alloy in the cupola or in the ladle, or as titanium thermite in the ladle.

Dr. Moldenke's experiments show 52 p.c. increase in strength for gray iron and 18 p.c. increase for white iron which has been treated with titanium. Only .05 p.c. titanium is necessary.

Titanium does not affect hardness or shrinkage of gray iron but on white iron lessens the death of chill and makes the remaining chill much harder.

Vanadium may be added to cast iron as a ferro vanadium alloy. Dr. Moldenke's experiments indicate that small amounts greatly increase the strength of cast iron, especially of white iron. It is also thought to increase the resistance to shock.

Properties of Cast Iron.

The strength of cast iron is dependent upon nine factors: 1—p.c. graphite; 2—size of graphite flakes; 3—p.c. combined carbon; 4—size of primary crystals of solid solution, Fe-C-Si; 5—amount of dissolved oxide; 6—p.c. phosphorus; 7—p.c. sulphur; 8—p.c. silicon; 9—p.c. manganese.

The best method of reducing graphite is to reduce total carbon by the use of low carbon pig iron, by melting in the air furnace, or by the use of steel scrap in the cupola mixture. The chief difficulties in making semi-steel are, trouble with blowholes, high shrinkage, imperfect mixture of steel and iron, and absorption of carbon in the cupola.

The size of graphite flakes accounts for many cases of difference in strength of irons of the same composition. The factors influencing the size are very poorly understood. Among them may be rate of cooling, pouring temperature, time which iron has remained in the molten state, presence of dissolved oxide, presence of steel scrap in the mixture, mixture of different brands, nature of ore from which iron is made, and treatment in the blast furnace, per cent. metalloids.

From analogy with steel combined carbon probably increases the strength of cast iron up to about 9 p.c., beyond that, decreasing it again.

Size of primary crystals of solid solution Fe-C-Si should, by analogy with steel, be important. This is uncertain.

The effect of dissolved oxide is probably important. To reduce oxide we may get the best brands of pig iron, avoid oxidizing conditions in the cupola, and use deoxidizing agents.

Phosphorus lessens strength, particularly resistance to shock. 1 p.c. produces a marked effect.

Sulphur may indirectly strengthen iron through decreasing the graphite, but is more likely to weaken it through causing blowholes and high shrinkage.

Silicon and manganese act chiefly indirectly. Silicon should be kept as low as possible and still have the necessary softness. Manganese should be high but if too high produces weakness.

Practical rules for making strong castings and a table of analysis of strong irons are given.

Of the elastic properties only toughness and elasticity are important in cast iron. The sum of these properties is given by the deflection. The factors influencing them are about the same as those influencing strength. Practical rules for obtaining the maximum toughness and elasticity and a table of very tough irons are given.

Maximum rigidity with the least sacrifice of strength and toughness is obtained through the use of manganese and combined carbon.

Hardness is due both to combined carbon and gamma solid solution. The latter explains the cases of hard cast iron which are yet low in combined carbon.

Phosphorus has only a slight hardening effect. Manganese may soften iron through its action on the sulphur, but in larger amounts will harden it. Sulphur is an energetic hardening agent. Silicon softens iron due to its action in decreasing combined carbon up to a certain point. Beyond this point it hardens, due to its direct action. The relationship between hardness and silicon is shown by a diagram.

Combined carbon is the chief hardening agent in cast iron. Gamma solid solution is formed by rapid cooling from above 1300 deg. Fahr. and may cause hardness in some cases.

In chilled iron the factors influencing the depth and quality of the chill are, pouring temperature, and percentage of silicon, sulphur, phosphorus and total carbon.

The higher the pouring temperature the deeper the chill. A table showing the relation between the per cent. silicon and the depth of chill is given. Sulphur causes a brittle chill and is undesirable. Phosphorus injures the strength of chill and causes a sharp line between the white and gray portions. Manganese increases the hardness of the chill and its resistance to heat strains.

The grain structure and porosity depend on the size and percentage of the graphite. Practical rules for getting close grained, dense iron are given.

The term shrinkage includes contraction of the fluid mass or "shrinkage" and contraction of the solid mass or "contraction."

The mechanism of fluid contraction is not well understood. It is less the greater the amount of graphite. The tendency to form shrink holes bears little relation to chemical composition but varies in different brands of iron. A means in testing this tendency is described.

Shrinkage curves showing the manner the solid mass contracts are given. The first expansion is due to the separation of graphite. The second expansion is due to the solidification of the phosphide eutectic. The third expansion is probably due to the change of the iron from the alpha to gamma form.

Rules for obtaining minimum shrinkage are given.

The fusibility of cast iron depends primarily on combined carbon, and to a less extent, on the phosphorus. Graphite affects the melting point only in so far as it dissolves in the iron at temperatures below the melting point. A diagram and table are given showing the experimental results of Dr. Moldenke.

Fluidity is determined by per cent. silicon, per cent. phosphorus, freedom from dissolved oxide, and temperature above the freezing point. Practical rules for obtaining fluid iron are given.

The factors affecting resistance to heat are, per cent. phosphorus, sulphur and combined carbon, the the density or closeness of grain.

Cast iron undergoes a permanent expansion on repeated heatings. It may increase as much as 46 p.c. by volume. The strength is decreased proportionately. A minimum temperature of 1200 deg. F. is necessary. The growth is favored by the presence of graphite and silicon. This growth is probably

NOTE: "und." is abbreviated from under and "sug." from suggested.

connected with the change from the alpha to the gamma state taking place at about 1300 deg.

A summary of published statements regarding the proper composition for castings exposed to high temperatures is given.

Behavior of cast iron at low temperatures is unimportant and is only mentioned.

Of the electrical properties of cast iron, permeability only is of importance. Some typical permeability curves are shown. The effects of the various elements on permeability are shown diagrammatically. Practical rules for obtaining high permeability iron are given.

The factors influencing the resistance of cast iron to corrosion are poorly understood. A summary of published information along this line is given. Practical rules for obtaining castings resistant to corrosion are given.

Two classes of castings subject to wear are typified by a grinding roll and a brake shoe. Practical rules are given for obtaining resistance to wear.

There is no data as to the relation between the composition of cast iron and its co-efficient of friction.

Blowholes may be caused by oxidized metal or by excess of sulhur. Dirty castings may be due to high sulphur, kish or segregated graphite, or oxidized metal. Porosity is usually caused by kish. Pinholes are often due to excessive sulphur. Segregation is the greatest in the case of high phosphorus and high sulphur iron.

White spots in the interior of castings are usually due to the iron boiling in the bottom of the cupola. Shrinkage strains may be aggravated by high sulphur. High phosphorus improves the surface or skin of castings and high manganese will cause the sand to peel readily.

The remainder of this report consists of tables giving the composition of 83 different classes of castings; of a directory of all brands of pig irons made in the United States; and of a bibliography of 201 titles.

Table of Chemical Standards.

Under this heading is presented what is probably the largest collection of analyses of iron castings ever gathered into one table, and it is thought that the information contained should be of considerable value and interest.

The sources of this data are three in number: first, published work; second, the private notes of the writer; third, the replies to the inquiries sent out by your committee.

Regarding this last source, which has supplied the greater number af analyses, approximately 1,000 inquiries were sent out to as many different foundries, selected largely at random from "Penton's List." These inquiries ran in substance as follows:

"At the last convention of the A. F. A. it was decided to make an attempt to formulate chemical standards for

iron castings, in the belief that such standards would be of great use both to the individual foundryman and to the industry as a whole.

"The information on which these should be based could, of course, be obtained by analyzing typical castings bought in the open market. This would, however, involve much trouble and expense, and will be unnecessary if foundrymen will freely donate the information for the good of the industry.

"We urge you, therefore, to act generously in giving us the data indicated below, and since composition is but one item in the successful manufacture of castings, we feel sure that in so doing there can be no possible detriment to your personal interests.

"Replies will, of course, be entirely confidential as regards the names of those giving information. There is desired the following information :

"Name or Class of Castings, Silicon, Sul., Phos., Mang., Comb. Carb., Graph. Carb., Total Carb."

To this letter about 10 per cent. of replies were received, the greater number of which contained more or less information.

Regarding the classification of castings, it is evidently impossible to consider as separate cases all the different patterns. Nor would this be desirable, since any foundry must itself class its castings into comparatively few groups which are each poured from one kind of iron. For example, a shop doing machine-tool work may make castings from several hundred patterns and will use not to exceed four mixtures of iron for all of these, probably dividing the work into light, medium and heavy castings, with possibly a special mixture for pulleys. It is thought, therefore, that a classification according to use or properties necessary is in the majority of cases desirable.

Thickness is, of course, taken into consideration, since this largely determines the percentage of silicon necessary, and it has been the aim to subdivide the various classes according to section wherever possible. In this respect the writer has endeavored to follow the definitions of the American Society for Testing Materials, who have grouped castings according to thickness as follows : (126).

"Castings having any section less than one-half of an inch thick shall be known as light castings."

"Castings in which no section is less than 2 inches thick shall be known as heavy castings."

"Medium castings are those not included in the above definitions."

It is unfortunately true that there is much lacking in this table, many important classes of castings being entirely missing, while others are inadequately represented by only one or two analyses. These deficiencies are due to the lack of available data in certain cases, and it is to be hoped that they may be at least partially remedied by future work.

Malleable cast iron is omitted entirely, partly because of the small amount of data obtained and partly because its manufacture is a process entirely different from those involved in the ordinary iron foundry.

Regarding arrangement, the analyses taken from published sources are preceded by a number in the first column referring to the bibliography, Part V. The last analysis under each head is preceded by the word "Sug." (abbreviated from suggested) and is the tentative standard or probable best analysis suggested by your committee. It should be clearly understood in this connection that while this is based on careful study of both theory and practice, it represents only the individual opinion of the writer, and is not necessarily infallible.

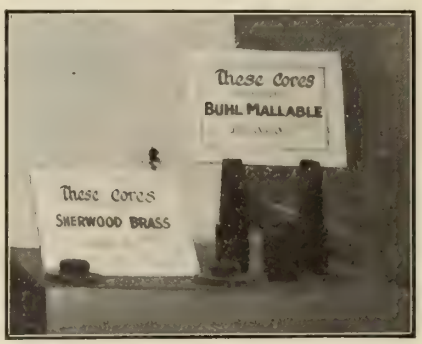
Furthermore, these suggestions are incomplete in certain other respects. The most desirable percentage of silicon, for example, will depend largely on the exact thickness of the casting and the practice followed in shaking out. These factors, being in many cases undetermined, have been allowed for by giving fairly wide limits to this element. Again, the possibilities in the use of purifying alloys have not been taken into account here, although they have been discussed in the preceding parts, and the use of steel scrap has been ignored except that the "low" total carbon specified in some cases must, as a rule, be obtained in this way. Finally in many cases, a very wide range of composition is permissible and compatible with the best results, and in such cases the question of cost will be the first element to be considered in fixing the composition.

PETERSON'S CORE OIL.

The T. J. Peterson Co., 6th floor, Security Building, Chicago, are placing their core oil on the Canadian market. This oil is used by some of the largest foundries in United States making automobile cylinder cores, radiator cores, gasoline engine, malleable iron casting and general foundry cores.

Cores Shown at Detroit Foundrymen's Convention, Made With Peterson's Core Oil.

At the Foundrymen's Convention at Detroit the T. J. Peterson Co. had an interesting exhibit of cores made by Detroit companies using their core oil. These are shown in the illustrations and show intricate cores made in the foundries of the Ideal Mfg. Co., Standard Foundry Co., E. M. F. Co., Sherwood Brass Works, and Buhl Malleable Co. The Aluminum Castings Co., who have under erection the largest aluminum foundry in the world, a description of which appeared in the August issue of this paper, are also users of Peterson's core oil. This fact will no doubt be appreciated as aluminum castings are hard to make with core oil.



Cores Made With Peterson's Core Oil.

The T. B. Peterson Co. have branch offices in New York and Buffalo from which Canadian orders will be supplied. H. S. Peterson is arranging to visit Canadian foundries and will demonstrate the core oils to anyone interested. A card to the Chicago office will receive the personal attention of H. S. Peterson. As the core oil sells at considerably less than linseed oil no doubt Canadian foundrymen will be interested in this core oil.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

VANCOUVER.—The B. C. Electric Railway will build new carshops on the mainland to employ 1,000 hands.

BRANTFORD.—The Verity Plow Co. proposes extensions for four departments of their Brantford works at a total outlay of $60,000 for buildings and machinery. The present staff of 300 employees will be increased by 200, when the extensions are completed.

REGINA.—The contract for the new boiler building of the Regina foundry has been let to T. Scott.

CHATHAM.—The Western Bridge & Equipment Co., contemplate building a new plant to accommodate their increased business.

PASCOE, B.C.—Final arrangements have been made by the Shingle Bolt Works, of Everett, Wash., for the establishment of a plant at West Pascoe, where logging and other heavy machinery will be used.

GOODSTOCK.—The Canada Lithograph Manufacturing Co., of Montreal, capitalized at $100,000 are erecting here. The company will manufacture lithographic and printing machines for making boxes out of good scraps.

FORT DAVIS.—The following new buildings will be immediately erected for the Widespread Investment Co. Planing and shed stores, 40 x 50 ft.; engine house, 20 x 25 ft.; foundry 40 x 97 ft.; and machine shop 37 x 50 ft.

BELLEVILLE.—The G.T.R. have commenced the construction of a roundhouse to accommodate 12 locomotives.

GALT.—R. McDougall Co. have completed an addition to their shops.

WALKERVILLE.—The Ford Motor Co., Detroit, is having plans drawn for a three-storey brick building, 60 x 100 ft., here, for the manufacture of automobiles.

SHERBROOKE.—Adolphe Lambert, Ed. Morris, A. Turcot, G. Rousseau, N. Reuben and A. Turgeon are applying for incorporation from the Government under the name of the Robertson-Turcotte Foundry Co. The capital of the new company is $50,000, divided in shares of $1,00 par dollars each. The works of the new industry will be situated near the station of the Q.C.R.

LONDON.—Thomas and Ward, stove factory, have had fourth storey put on, have bought four acres of land in the western part of Winnipeg, and will build a large factory there this fall. They have asked the Westboro City Council for a fixed assessment.

ST. CATHARINES.—In order to take care of the increasing demand throughout the Dominion for the Reo Touring car, the directors have decided to increase the capacity of the Canadian plant. Additional ground in the vicinity of the factory has been purchased and on it will be erected a modern two-storey brick building, 90 x 100 feet. Work on the erection will be begun at once. Machinery to the value of $20,000 has been purchased for installation in the new plant, and orders for material sufficient to build 500 four-cylinder cars have been placed. A majority of the orders for raw material are being placed with Canadian firms.

CHATHAM.—The International Harvester Co. has secured control of the Chatham Wagon Co. by the purchase of practically the entire capital stock of the local concern, the deal being completed last week. The Chatham Wagon Co. was established in 1882 by Wm. Ball and the late D. R. Vanallen, has since been several times enlarged, and has a rapidly growing trade with the Northwest. Under the new regime the present plant will be very much enlarged and many new hands employed, though no definite announcement has been made as to the exact nature of extent of the proposed changes.

CHATHAM.—The Western Bridge & Equipment Co. is purchasing a 5 acre site here and will within six weeks commence the erection of a new 82 x 160 steel concrete factory. On the completion of the new factory, between 50 and 100 hands will be regularly employed.

LONDONDERRY, N.S.—The machine shop of the local plant of the Canada Iron Corporation has been destroyed by fire entailing a loss of $15,000.

ST. JOHNS.—T. McAvity & Sons are considering the advisability of moving their foundry business west, and establishing a foundry and factory at Fort William. Representatives of the firm are going over the ground.

VANCOUVER.—Tucker & Co., Ltd., are being merged into a new concern called The Great Western Automobile Co., Ltd. The stockholders are all local.

DUNDAS.—The cotton mill property has been purchased for a new gasoline engine works. Extensive alterations are necessitated.

THREE RIVERS.—The foundry and machine shop of Bellefueille & Frere were destroyed by fire. The loss will be about $10,000.

FORT WILLIAM.—The G.T.P. have awarded to Carter-Halls-Aldinger Company, of Winnipeg, the contract for their roundhouse and machine shops on the Mission. The buildings will cost about $100,000.

ST. THOMAS.—Architect N. R. Darrach has prepared plans for the additions and alterations to the Red Foundry (extension to Norseworthy Company's foundry). The plans provide for the erection of a brick building, 60 x 110 feet.

GUELPH.—Edgar Bloxham, representative of the Taylor Forbes Co., Guelph, at Paris, France, is on a visit to Canada, conferring with the principals of the company regarding export business of boilers and radiators to that country.

TORONTO.—The Canada Metal Company, have secured property in Winnipeg and expect to open a plant there in the near future.

CALGARY.—The Woodhall Metal Co., have occupied new premises in East Calgary. The building is large and spacious and fitted up with modern machines. It is the intention of the firm to extend the business and carry enamel ware and fancy hardware. The plant is possibly the largest of its kind west of Winnipeg. P. S. Woodhall is president of the company.

WELLAND.—Negotiations have been going on for some time and have just been concluded by which a million-dollar plant will be erected at Welland to employ 1,500 hands. The firm is Deere & Company, one of the largest concerns in the world, with head office at Moline, Ill. The following industries are affiliated with Deere & Company:—John Deere Plow Company, Moline Waggon Company, Marseilles Sheller Company, Velie Carriage Company and Velie Motor Company. The products of the Welland factories will be harvesters, waggons, plows, carriages, grain drills, harrows, disc harrows and other articles. The ground has been secured and a staff of 500 men will be required to construct the buildings.

Municipal Enterprises.

MOOSE JAW.—The city council instructed City Engineer Wilson to revise plans for the sewage disposal plant, and call for tenders to be in by October 17.

LONDON.—Gartshore-Thompson Co., Hamilton, were awarded the contract for special castings for the Horton St. pumping plant, at 4½ cents a pound.

CALGARY.—By-laws have been passed to raise $284,000 for watermains; $30,000 sewer connections, and $125,000 for building and equipping an addition to the electric power plant.

VANCOUVER.—The contract for the supply of sewer pipe has been awarded to the Dominion Glazed Cement Pipe Co., Vancouver, at $70,910.

ORANGEVILLE.—The by-law to procure a system of waterworks was carried.

WINNIPEG.—It is proposed to extend the high pressure system over many of the principal thoroughfares, at a cost of $230,858.

OUTREMONT, QUE.—The council has awarded contracts for the construction of six brick and three tile sewers at an approximate cost of $60,000.

TORONTO.—Premier Whitney has given the mayor assurance that the proposed expenditure of $40,000 for the extension of the intake pipe for a distance of 500 feet into the lake will receive government sanction.

CASTOR, ALTA.—A new waterworks system is to be installed at an estimated cost of $85,000.

HALIFAX.—It is proposed to erect a reservoir for the high pressure service system.

OTTAWA.—The installation of additional street hydrants for fire protection is contemplated.

STRATHCONA.—The ratepayers voted in favor of extending its sewerage and water systems at a cost of $48,000.

YORKTON.—The contract for the construction of sewers was awarded to N. B. McInnis, Regina.

VANCOUVER.—J. C. Kennedy was awarded the contract for the laying of the Tenth Avenue sewer, at $48,700.

TORONTO.—The Board of Control has instructed the city engineer to report on the cost of constructing storm sewers to relieve the present system in time of flood.

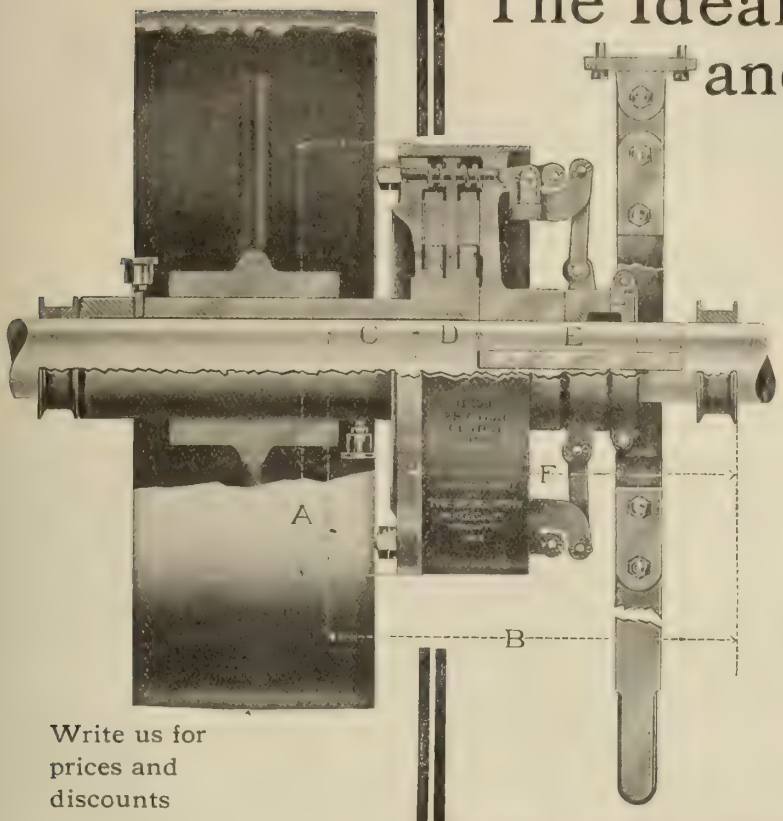
ESQUIMAULT.—A committee has been appointed to gather all available data on the installation of a sewerage system.

COATICOOK.—The contract for the new reinforced concrete bridge has been let to Nomer & Winstanley.

ST. MARY'S.—The contract for the Fulton Bridge, which is to be a reinforced concrete structure, has been let to Jos. Patterson, for $670.

VANCOUVER.—The Dominion Glazed Concrete Pipe Co. has secured the contract for pipe for sewer purposes during the coming year, the figure submitted being $70,910. Two other tenders were submitted, these being for the clay article, one from Evans, Coleman & Evans at $76,930.50, and the other from C. Gardiner Johnson & Co. at $75,261.50. The contract awarded yesterday

The Ideal Friction Clutch and Cut-off Coupling



Write us for prices and discounts

A perfectly balanced Clutch with big power for its size due to large friction surfaces and powerful lever movements

IT is easily adjusted to suit any load up to its rated h.p. and it is perfectly safe because it cannot start when out of gear. Levers and draw bolts are made of steel and do not break. It can be used with either wood or iron pulleys as desired. It is provided with either solid iron sleeve or split babbitted sleeve, interchangeable without disturbing the mechanism.

We make Castings, Engines, Boilers, Tanks, and Sheet Metal Work of all kinds, Mining and Brick Machinery.

calls for pipe all the way from four inches in diameter upwards. On the four-inch article the price is the same as for the older clay style but above that size the city saves on every foot in the quotations submitted by the Dominion company, the reduction running from 35 to 50 cents per foot above the 12-inch size. This latter condition is accounted for by the fact that when the clay pipe is laid over the 12-inch diameter, it has to be encased in cement, a precaution not necessary when the glazed concrete article is used.

BELLEVILLE.—The tender of the Canada Foundry Co. for an electric pump for the water works has been accepted. It is to be a two and three stage turbine, with capacity of 70,000 gallons per hour, driven by a motor of 115 horse-power.

TORONTO.—Additions and alterations to the high level pumping station are now open to tender.

ESTEVAN.—Tenders are being called for the electric light and sewer system, including pipe laying, power-house, boilers, engine, electrical equipment and sewers.

CHARLOTTETOWN.—Electric lighting tenders are being called for.

BRANDON.—The hospital board has decided to instal a big steam heating plant to cost from $7,000 to $8,000. The plant will include two seventy-five horse-power boilers.

MONTREAL.—Tenders for the new intake pipe are being called for Sept. 14 as a good section of the work must be completed before winter.

OUTLOOK, SASK.—Ratepayers carried the $25,000 waterworks by-law.

MOOSE JAW.—The $375,000 by-law for sewer and waterworks extensions was carried.

SWIFT CURRENT.—By-laws for sewerage, sewage disposal and water supply were carried.

LETHBRIDGE.—The by-law for the expenditure of $148,000 on waterworks and sewers, was carried.

MEDICINE HAT.—A by-law to expend $45,000 on waterworks extensions has been submitted to the ratepayers on Aug. 15.

COLLINGWOOD.—It is probable that a by-law will be submitted for authority to spend about $5,000 on the increase of the water supply.

WINNIPEG.—Pavements, walks and sewers, totalling $224,506, were passed by the council at last meeting and will be advertised for tenders.

SASKATOON.—The tender of the Robb Engineering Co., for the 250 h.p. water tube boiler, to cost $4,756, has been accepted.

LONDON.—Tenders for the new pumping station at Springbank are to be awarded in the near future.

MONTREAL.—The matter of purchasing the plant of the Montreal Water and Power Co. is again under discussion.

MONTREAL.—An expenditure of $250,000 is contemplated for the laying of water mains in the newly annexed wards.

MONTREAL.—Instructions have been given to have the smoke by-law observed. Smoke consumers must be installed where soft coal is used in quantities.

Electrical Notes.

PETERBOROUGH.—The capital stock of the Auburn Power Co., of Peterborough, Ltd., has been increased from $99,000 to $500,000.

MONTREAL.—It is stated on good authority that the Montreal Street and Canadian Power

are to be merged, as the interests friendly to this merger have secured sufficient stock to have a controlling interest amounting to forty thousand shares.

OTTAWA.—In order to supply the increasing demand the city electric plant has made an agreement with the hydro-electric commission to obtain 1,500 additional horse-power from the Ottawa and Hull Power Co., making a total of 4,000. The city will build a conduit for the high voltage wires from the power house to the distributing centre.

SHERBROOKE.—As the Sherbrooke Power and Railway Company cannot come to an arrangement with power owners on the banks of the Magog, the company has given notice of expropriation. This property is required in connection with a dam that the company propose building.

OTTAWA.—A permit has been taken out by the Ottawa Electric Co. for a brick transformer station, to cost $18,000. The various minor departments are to be located in this building as well.

FORT FRANCES.—An assessment of $400,000 has been placed on E. V. Backus, president of the Minnesota and Ontario Power Co., for his improvements here.

VICTORIA, B.C.—The Hinton Electric Co., Ltd., has received from the corporation of Ladysmith the contract for the supply of all electrical materials in connection with the installation of the new Tungsten street lighting system in the coal city.

LISTOWEL.—The electrical supply business of G. P. Thomas has been purchased by E. Seger.

LONG BRANCH, ONT.—One hundred horse power has been contracted for, to be supplied by the Erindale Power Co.

BELLEVILLE.—It is announced that the Healey Falls Development Co. has sold its property at Healey Falls on the Trent River, to the Seymour Electric Power Co., and that the latter company will develop the power at that point.

BRANDON.—Work on the heating system that is being installed by the Brandon Electric Light Co., is under way, and it is expected that it will be completed by Oct. 1.

SASKATOON.—Contracts have been let to the Northern Electric Co., for the supplying of wire and electrical supplies.

NIAGARA FALLS.—The plans for exporting Niagara power from Windsor to Detroit have fallen through, due to the United States law being contrary to this procedure.

PETERBOROUGH.—Tenders for the new power station at Auburn are being let by the Peterborough Radial Railway Co.

COBOURG.—A meeting of the shareholders of the old Northumberland-Durham Co. ratified the sale of the company's water powers to the Seymour Electric and Power Co., and wound up the affairs of the company. The sale price was $250,000.

TILSONBURG.—By a vote of 324 to 61 the ratepayers endorsed the by-law providing $25,000 to distribute hydro-electric in the municipality.

OTTAWA.—The difficulty concerning the water power along the line of the Trent Valley Canal has been settled by the Department of Railways and Canals. At dam No. 2 the power goes to the Trent Power Co., to be arranged between themselves. Five thousand horse power to be reserved for the Town of Trenton. At dam No. 1 the power is to be allotted free to the Trenton Power Co., the Trenton Electric Light and Water Co., and the town of Trenton.

"GLOBE" TIME RECORDERS

are made in Canada by expert mechanics. They are accurate, simple in construction, strong, and of good chaste appearance. They will record with absolute accuracy the arrival and departure of your employees (TO THE MINUTE), making you pay for what you get and no more. All lates and short time marked in red, regular time in green. The small cut at the top illustrates the WEEKLY MODEL, an entirely automatic recorder requiring no attention whatever during the week as all changes, etc., occur automatically (DONE BY CLOCK WORK). The DAILY MODEL is shown in the cut at the bottom. This recorder is being used mostly in large shops, etc., where a large number of hands are employed. With the "GLOBE" TIME RECORDERS only one operation is required as against five with most others.

Inspection may be made through the glass sides of the case, but tampering with records is impossible, no danger of having soiled, torn or lost records when same are unfavorable, as is the case with all CARD CLOCKS. We are now manufacturing over 221 DIFFERENT TIME RECORDING CLOCKS, and are in a position to meet the requirements of any business. Write us about your needs and let us suggest what will best meet with your requirements. WE SOLICIT YOUR ENQUIRY.

Co., of Milwaukee, Wis. The president of the company is to be Montague Aldons, vice-president, V. V. Richardson; secretary-treasurer, G. Laing. These officers are all well-known western business men, and, with expert operatives, who have been brought in from the large works of the Brodesser Company, of Milwaukee, the success of the new Canadian company is assured.

The Health Canopy Bed and Mfg. Co. have been incorporated with headquarters in Ottawa to make collapsible cots and beds. The capital is $100,000 and the incorporators, A. G. Cole, Barrett P. Dewar, Alf. Stewart, W. L. Scott and C. H. Maclaren.

Marx & Rawolle, of Canada, Montreal; to manufacture, refine and deal in glycerine, shellac, varnish and oils. Incorporators, R. C. Smith, F. H. Markey, W. W. Skinner, Montreal.

Gas Producer Co., Ltd., capital, $1,000,000; to manufacture and deal in all kinds of apparatus for refining, heating, recovering, producing, and obtaining gas and oil of all kinds, and to manufacture, refine, treat, recover, produce, obtain, buy, sell, trade, and deal in gas and oil of all kinds. Incorporators, E. B. Ryckman, C. S. MacInnes, C. C. Robinson, E. B. Coleman and A. E. Lloyd, all of Toronto.

Canadian H. K. Porter Co., Toronto; capital, $50,000; to manufacture and deal in locomotives, cars, trucks, machinery, tools, iron, and steel work of all kinds. Incorporators, H. K. Porter, W. E. Lincoln, W. E. Martin, Pittsburg, U.S.A.

Gareau Motor Car Co., Montreal; capital, $300,000; to construct and manufacture automobiles, motor vehicles and all kinds of motors, engines and machines. Incorporators, J. Therrien, N. Giroux, J. A. Therrien, Montreal.

The Sheet Metal Products Company of Canada, Limited, with head office at Toronto, has been incorporated. The incorporators include W. J. and H. A. Holliday, manufacturers, and H. H. Loosemore, banker, of Toronto.

Structural Steel.

OTTAWA.—The contract for the substructure of the bridge over the Saskatchewan River at the Pas Mission has been let to Mackenzie and Mann, the contract figure being $100,000. The contract for the superstructure of this bridge, which will constitute the first link of the Hudson Bay Railway, was let to the Canada Foundry Co.

EDMONTON.—Work on the big million-dollar high level bridge across the Saskatchewan, that is to connect Edmonton and Strathcona, the twin cities of northern Alberta, is to be commenced at once. The contract for the approaches and substructure, including all excavation, filling in and cement work, has been let by the C.P.R. to John Gunn & Sons, Winnipeg.

TORONTO.—Tenders are being called for the new steel viaduct on Queen St. E.

KAMLOOPS, B.C.—Plans have been prepared by direction of the minister of public works for the new bridge across the Thompson river at Walhachin. The work will be started this fall, and the bridge, a steel structure, will cost in the neighborhood of $30,000.

VANCOUVER.—A by-law providing a sum of $250,000 is being put through by North Vancouver, to defray the expenses of a bridge across the Second Narrows of Burrard Inlet. Two types of bridges are under consideration, one is to have a bascule span in the center of the Narrows and the other is to maintain the same general design, but to substitute a lift span in the centre for the bascule.

PORT ARTHUR.—The contract has been let, totalling $30,000, for a reinforced concrete bridge over Current River, to facilitate transportation to the manufacturing district.

ST. JOHNS, QUE.—The loan of $16,667 has been authorized for the construction of the bridge between St. Johns and Iberville across the Richelieu. Iberville is to advance half this amount.

Planing Mill News.

CRAWFORD, B.C.—The Nicola Valley Lumber Co., are to build a new mill.

NELSON, B.C.—W. H. Kreyscher, is organizing a company to rebuild his mill.

GALETTA, ONT.—The Canadian Cooperage Co. are figuring on erecting another stave and hoop plant.

LULU ISLAND.—The Barnet-McDonald mill, which was burned down last winter, will be rebuilt, probably next year.

CROFTON, B.C.—A lumber mill to cost $750,000 is to be erected in this neighborhood as soon as a suitable site is selected. This was decided upon finally after a conference between R. Marpole, vice-president of the E. & N. railway and W. E. Marsh, representing the American Finance and Securities Co. A railway addition is to be built in conjunction.

Saw Mill News.

RIVER CHARLES, N.B.—The saw mill owned by C. I. Keith, was destroyed by fire recently with a loss of $4,000.

RUSKIN, B.C.—The E. H. Heaps' lumber mill was destroyed by fire recently. The loss will be in the neighborhood of $50,000. It is likely that the mill will be rebuilt.

REVELSTOKE.—The Dominion Saw Mills and Lumber, Ltd., is the title of a British Columbia corporation which is now raising $4,000,000 on the London money market by an issue of 6 per cent. first mortgage debentures which will be secured on some 140 square miles of timber situated near Three Valley, a station on the main line of the C.P.R. a few miles to the west of Revelstoke. The authorized capital of the company is $5,000,000.

Building Operations.

SACKVILLE.—B. C. Rayworth has commenced work on a new concrete machine shop and woodworking plant, which will be 35 x 60.

MONTREAL.—Contracts for the completion of the new C.P.R. station amounting to $1,000,000, have been awarded to C. E. Deakin.

BATTLEFORD.—Tenders for the construction of the post office will be received until August 22. by R. C. Desrochers, assistant secretary, Department of Public Works, Ottawa.

PORT DOVER.—The Board of Education have decided to erect a new building for the use of the High and the Public school. The estimated cost is $15,000 and it is expected that the building will be ready for occupation in about a year.

VANCOUVER.—The Electrical Construction Co., will erect a new business block to cost $16,000.

PRINCE ALBERT.—N. H. Russell is erecting an abattoir.

TORONTO.—The Fairbanks-Morse Co., will build a warehouse.

TORONTO.—Thos West, will build a 4-storey brick factory, to cost $15,000.

TORONTO.—Mason & Risch Co. will erect a 6-storey reinforced concrete brick and steel warehouse, at a cost of $100,000.

ST. LAMBERT, QUE.—Application has been made from a shirt and collar manufacturing firm in Troy, N.Y., for erecting a factory to employ 400 hands.

OTTAWA.—A permit has been issued for the new factory for the Continental Bag & Paper Co. The building will be of solid brick, two storeys high, and will cost $30,000.

FORT FRANCES.—Peabody, Houteling & Co., Chicago, one of the largest pulp and paper manufacturing concerns in the United States, have decided to erect an immense mill here.

BERLIN.—The furniture factory of Baetz Bros. & Co. was completely destroyed by fire recently, with a loss of about $50,000. The company will rebuild if the town will grant a loan.

SASKATOON.—The Hill Mfg. Co., whose sash and door factory was totally destroyed by fire recently, are considering rebuilding in the autumn so as to be ready for the next spring's trade.

OSHAWA.—The contract for the erection of the three-storey factory building addition for the

NEW WESTMINSTER.—Work has been commenced on a wire nail factory which will give employment to one hundred men.

COBOURG.—The International Tool Steel Co., of Toronto, will build a plant in this town, and work on the new factory is to commence shortly. The estimated pay roll is $25,000 a year, probably more. Tool steel will be manufactured.

Rumored Merger.

A charter is being applied for by a company under the name of the Steel and Radiator Co., Ltd., with a capital of $5,000,000 for the avowed purpose of taking over the Expanded Metal Co., King Radiator Co., Dominion Radiator Co., all of Toronto, and the Taylor-Forbes Co., of Guelph. The promotion is in the hands of T. H. Brown, and the directorate is composed of Sir Henry Pellatt, Wallace Near, of the Page, Persey Co., Welland; M. J. O'Brien, Thos. Home, R. J. Cluff, and T. H. Brown.

The proposition is said to be to take over the Expanded Metal Co., and the King Radiator Co., first, giving them shares in the new company and then gradually absorb the other plants.

So many contradictory rumors are in circulation that nothing definite can be said.

Deere & Co., for Welland.

The Canadian plant of Deere & Co., with head works at Moline, Ill., and branch factories at numerous points in the United States, are going to build a million dollar plant at Welland and will employ upwards of 1,500 men in the manufacture of farm machinery. The firm was not granted a bonus.

Steel Corporation United Offices.

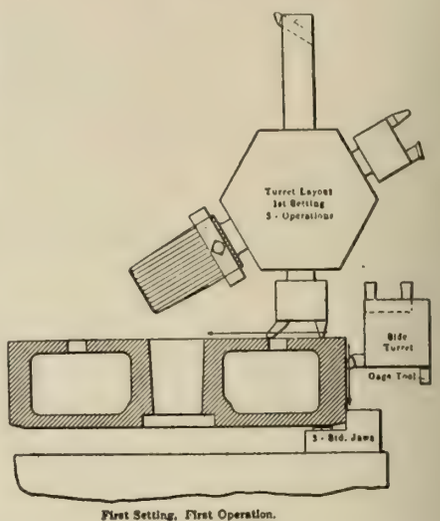
Street, Toronto, are being remodeled, and hereafter will be the Toronto offices of the Steel Corporation of Canada. The Montreal Rolling Mills' office in the Home Life building, and the Dominion Wire Co.'s office at 27 Wellington Street East, will be closed, and the staffs removed to Bay Street. No changes will be made in the representatives. Chas. G. Knott will, as usual, look after the Canada Screw Co.'s business; Jno. H. Webber, the Montreal Rolling Mills, and Thos. F. Hodgson, the Dominion Wire Co.'s. This is the first move towards amalgamation since the various companies formed their merger.

Eadie-Douglas, Ltd., Extend Agencies.

Under the management of G. M. Mulligan, formerly with Manning, Maxwell and Moore, New York, Eadie Douglas, Ltd., 12-14 University St., Montreal, with branch offices at 65 Victoria St., Toronto; 445 Main St., Winnipeg; and 81 Band St., Ottawa, have opened a mechanical and steam specialty department. The following firms are represented:—B. F. Sturtevant Co., manufacturers of fans blowers, ventilating sets, etc.; Shaw Electric Crane Co.; Platt Iron Works, manufacturers of the Smith-Vaile pumping machinery, condensers, etc.; Lenher Engineering Co., manufacturers of Taylor gravity underfeed stokers; Direct Separator Co., manufacturers of Sweet's steam and oil separators, exhaust heads, etc.; James Beggs & Co., manufacturers of Blackburn-Smith oil filter and grease extractor; Frank L. Patterson & Co., manufacturers of Berriman feed-water heaters, etc.; Linton Machine Co., manufacturers of combination feed-water heaters; Alphons Custodis Chimney Construction Co., manufacturers of radial brick and concrete machinery, and several other companies. Valves, boiler trimmings, engine room accessories, insulating specialties, etc., will also be handled.

Side Head of the Vertical Turret Lathe

A Big Factor in Reducing the Cost of Production of Many Kinds of Face Plate Work.



First Setting, First Operation.

Perhaps the greatest productive difference between modern and pre-modern machine tools is the doubling up or "tripling" up of cutting tools. One cut at a time is no longer sufficient to get competition-meeting results, and it was the realization of this fact that led to the designing of the Bullard Vertical Turret Lathe.

Besides the main turret head this machine has a side head which enables the operator to take simultaneous cuts on various surfaces. It does not interfere in any way with the operation of the main head.

The illustration herewith shows a job on whirh the Vertical Turret Lathe made a new record of 90 min.

The piece is a 27½ in. piston on which simultaneous cuts with the Side Head cut 30 minutes from the best previous time.

The Vertical Turret Lathe has two heads—a turret head and a side head—which allow two or more tools to be used at the same time.

All the tools needed for a whole series of operations are held in instant readiness.

In a word the Vertical Turret Lathe is a unique combination of the good points, the advantages of the vertical boring mill and the horizontal turret lathe.

Its vertical construction allows many a piece to be finished before it could be chucked ready for work on a horizontal turret lathe. For modern work—especially for duplicate pieces—the Bullard Vertical Turret Lathe is an innovation. It is a tool you must know about.

The entire sequence of operations on the piece shown here and other pieces is graphically illustrated in our new catalogue, which is free for the asking. Send for catalogue C-15.

The Bullard Machine Tool Co.
Bridgeport, Conn., U.S.A.

Large Order for Plows.

A contract to manufacture $250,000 worth of plows, under the patent held by Dr. Rowntree, of Red Deer, has been awarded to the Edmonton Iron Works, of which T. J. Cornwall is the general manager. It covers a period of five years and calls for the manufacture of 1,000 plows per year. The contract will make necessary an extension of the plant on Kinistino Avenue to nearly double its present size and will mean the doubling of the present payroll. Mr. Cornwall will at once visit the east to order new equipment to the extent of $10,000 for the manufacture of the plows.

New Works Started at Sydney.

The erection of new mills at the plant of the Dominion Iron & Steel Co., has been commenced. The area to be cleared is near the chemical company's plant and contains about 100,000 square feet of ground. The purpose of the excavation is to create a location for new or rather extended departments. When the ground has been prepared, foundations of concrete will be laid for a new machine shop and locomotive repair shop 500 by 130 feet, a foundry and blacksmith shop 500 by 130 feet, a boiler shop 250 by 130, a pattern shop and store house 300 by 60 feet, a warehouse 250 by 60 feet, and an oil house 150 by 60 feet. These buildings will be constructed of steel, and Sydney pressed brick and concrete. When these buildings are ready for occupation it is understood that the machinery at present in use will be transferred, with a large order of additional apparatus, from the original machine and other shops to the new ones. The old buildings will probably be removed to make way for new mills. The erection of a new acid house near the coke ovens department will also be shortly undertaken. This building will have twice the productive capacity.

New Car Shops for Montreal.

N. Curry, president of the Canadian Car Company, Montreal, was recently in Nova Scotia. To a reporter he said the railway development in Canada is so great that the output of cars from Canadian plants this year will exceed that of any preceding year by fifty per cent.

"During the present year," said Mr. Curry, "even if we book no further orders whatever, we have built or will build, 12,000 cars. Of this number 4,000 are already delivered. Our output, valued in money, amounts to between $1,1000,000 and $1,200,000 per month. This statement includes all three of our plants. The orders for passenger cars have amounted to only 110. These go to the G.T.P., Canadian Northern, Temiskaming and Northern Ontario and some of the smaller roads," Mr. Curry made the announcement that his company is considering the erection in the near future, of a plant to be devoted to the building of steel passenger cars. He considers that the time will soon be reached when all cars will be constructed of steel. At present the proportion of steel utilized in the construction of cars is rather variable. In some cases the under frame is of steel, in others the top frame is of steel, but the majority of cars are composed chiefly of wood. The all-steel plant, Mr. Curry said, will be located in Montreal. It will stand close to the present plant. The surplus output of the rolling mill at Amherst is now being shipped to Montreal. This consists of bar iron and steel and malleable iron. With this outlet the Amherst shops are at present extremely busy. There are now 3,500 men on the pay roll of the three plants.

Steel Mills for B.C.

The Middlesborough Steel Strip and Hoop Co., Middlesborough, Eng., are interested in the project for establishing an iron and steel plant, including blast furnaces and rolling mills, in British Columbia. The plant is to be erected close to deposits of magnetite at San Juan and Harris Creek, sixty miles northwest of Victoria. A sum of $110,000 has already been spent in preliminary development work at San Juan, and there is now a shaft 300 feet down, with cross-cuts at 100-ft., 200-ft., and 300-ft. levels. High-grade magnetite has been found at the 100-ft. level, and the deposits are considered to be the largest workable on the Pacific slope.

Large Car Shops.

NEW WESTMINSTER. The British Columbia Electric Railway Co. is now considering the question of the erection of more extensive car shops at some point on the lower mainland where sufficient cars may be built to supply the growing demands of the system. It is estimated that shops giving employment to 1,000 or 1,200 men, will be required to fill the programme of car construction for the next few years which the company is now mapping out.

First Steel Craft at Winnipeg.

The first steel boat ever built on the Red River was launched yesterday. It was built for the Arctic Ice Co. by the Doty Engine Works Co. Its dimensions are as follows: Length, 70 feet; beam, 16 feet; depth, 6 feet, and its cost was $15,000. It has 80-horse power, and is of the twin screw structure.

Copper and Brass Companies Unite.

The Booth Copper Co., of Toronto, and Wm. Coulter & Sons, brass manufacturers, Toronto, are to amalgamate, and an application will shortly be made to the Ontario Government to grant a charter to the Booth-Coulter Copper and Brass Mfg. Co., the name of the amalgamated concern. The capital will be $1,000,000. No change will be made in the personnel of either companies for a while, at least. Coulter & Sons' brass works on George Street will be closed and the machinery transferred to the larger premises of the Booth Copper Co., on Sumach Street.

Brandon's Heating Plant.

The Brandon Electric Co. have started operations upon their heating plant. This will be the first venture of its kind in the Canadian west and will be watched with interest. The agreement between the Brandon city council and the Brandon Electric Light Co. states that the company will establish, maintain, and operate a public steam heating plant for a period of twenty years. The rates to be charged for heat, according to the agreement, will be $1 per 1,000 pounds, on a monthly consumption up to 10,000 pounds, with a graduated reduction to any consumers using an excess of 10,000 pounds per month, according to the amount consumed, the minimum charge per month to be $3 net.

Another Merger.

A Dominion charter has been granted to the Sheet Metal Products Co., of Canada, capitalized at $5,000,000 with headquarters at Toronto. Considerable mystery surrounds its formation. Rumors have been prevalent for some time that the Metallic Roofing Co., Toronto, Metal Shingle & Siding Co., Preston; The Pedlar People, Oshawa, and the Galt Art Metal Co., Galt, were to be merged into one concern at the end of this year, and consequently the "Sheet Metal Products Co.," with its big capitalization has been connected with the proposed merger of metal roofing concerns. The lawyers who are the provisional directors of the company decline to give out any information, and J. O. Thorne, managing director of the Metallic Roofing Co., when asked for information stated that he was interested in learning all he could about the "Metal Products Co.," but said he could be quoted as saying that his company had no con-

Test It At Our Expense

We wish to introduce the

Imperial Chuck

to every shop in Canada, and if you will give an "Imperial" a fair trial, we will send YOU one at our expense and risk. Keep it thirty days, test and use it any way you can think, and if it won't answer every test you can apply, send it back at our expense.

WE know how good is the "Imperial;" won't you avail yourself of our offer?

Write us to-day.

Ker & Goodwin

Brantford, Canada

in connection with the new concern. In his opinion it seemed probable that the new company was formed to take over the various stamped metal ware manufacturing plants. A. E. Kemp, of the Kemp Mfg. Co., when interviewed, was also unable to give information but unable to throw any light upon the proposed "Sheet Metal Products Co."

Verity Plow Co. to Enlarge.

The following additions will be made to the Verity Plow Company's works, Brantford:

An addition to the warehouse, 200 x 60 feet, three storeys and a basement to be utilized both for warehouse and manufacturing purposes; an addition to the blacksmith department, 200 x 40 feet, one storey; an addition to the paint shop, 100 x 58 feet, one storey; the erection of a new core room, 50 x 60 feet, one storey.

The contracts for the extentions have been awarded. Eli Riddolls will build the blacksmith and paint shop, and Richards and Tindle the warehouse.

The outlay in connection with the extensions and the installation of new machinery will be $60,000. The firm is now employing 500 men, and under the new conditions there will be room for 200 additional.

Gurney-Tilden Co., Reorganize.

A new charter taken out in the name of the Hamilton Stove and Heater Co., with a capital of $600,000 has for its object the reorganization of the Gurney-Tilden Co. John H. Tilden, for many years president and general manager retires, and W. H. Carrick, formerly vice-president and general manager of the Gurney Foundry Co., becomes president and general manager of the new company.

The original intention of the new company was to take over the four stove foundries of Hamilton, namely: Gurney-Tilden Co., D. Moore Co., Burrow, Stewart & Milne, and Bower, Jamieson & Co., but although a couple of meetings were held, the promoters were unable to complete negotiations, and Mr. Carrick states that as far as his firm is concerned the merger is off.

Pender Nail Works Merged.

Sydney—Reports of the purchase by the Dominion Iron and Steel Co. of the Pender Nail Works, of St. John, N.B., have received confirmation from James Pender, the owner of the latter concern.

The scheme to purchase is part of the Dominion Iron and Steel Company's fight against the new Upper Canadian Steel combine, which has declared its intention of cutting into the local firm's business. The idea is to manufacture nails in the Maritime Provinces and ship right through to Western Ontario by cutting down the Company's steamers so that they can get through the locks into the Great Lakes.

THE JOHNSON FRICTION CLUTCH

The Johnson Friction Clutch is so nicely balanced that it runs at any speed, high or low, without the least bit of vibration, bang, or clatter. The working parts are all completely covered so that no dirt can get at them.

Clutch with Pulley on Hub

By using Johnson Clutches you can use the Line Shaft direct for driving and thereby save not only in power, but in countershafts, pulleys, space and so on.

You will be interested in our "*Book of Clutches that Clutch.*" Send for Catalog No. 5.

Detroit Solvay Coke

AVERAGE ANALYSIS

91% Carbon, 8% Ash and 65/100% Sulphur.

The analysis of contents of every car is shown on every invoice.

Insures Increased Melt
and Extra Fine Castings.

BAIRD & WEST

DETROIT

Sole Selling Agents Detroit Ovens.

STRETCHING THINGS

I am mighty careful not to stretch the facts in these publicity efforts.

You see, I base all my statements from information received from practical foundrymen, who know the subject.

I have reports from more than fifty progressive Foundrymen who say my KING KORE KOMPOUND is a new era in economy, in investment of money, in time-saving and in saving of castings. If there is now any one whose detail differs from the majority, I make it to fit his case.

It's the same way with GENUINE EAST INDIA PLUMBAGO, the only Lead any foundryman can afford to use.

With the Core Compound goes STEVENS' CARBON BLACKING, the ideal core-wash; there is no trouble, when making hollow castings, with this combination.

I manufaoture FOUNDRY FACINGS, FOUNDRY SUPPLIES, BUFFING COMPOSITIONS and PLATERS' SUPPLIES.

PETERSON'S CORE OIL

The Strongest Core Binder on the Market

Peterson Core Oil is the one oil that is fully equal to the best linseed oil for all core-making purposes.

It has the additional advantage of costing considerably less than high-grade linseed oil.

We do not expect to convince you by a mere assertion. We request the opportunity to demonstrate its truth to your utmost satisfaction.

A communication with us will probably lead to a great saving in your core-room. Write us to-day.

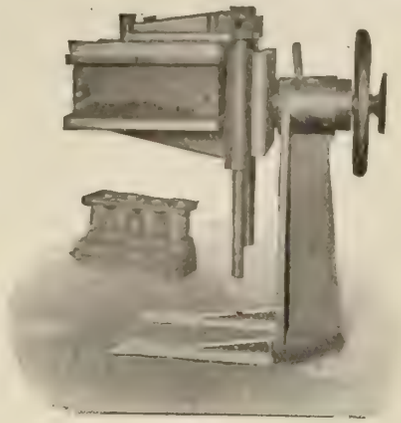
MANUFACTURERS OF

Crucibles of Quality

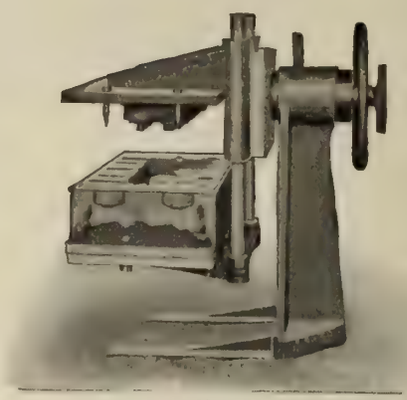
Grimes Roll-Over Molding Machine



No. 1

This is a simple, standard machine, requiring small floor space.

It is perfectly balanced, requiring no counter-balancing mechanism, as centre of gravity is centre of rotation.



No. 2

By means of small hand wheel shown in cut, one man can turn largest flask smoothly and without jerk.

Pattern is drawn by absolutely straight gravity drop.

This machine is adjustable for deep flasks and can readily take care of flask 24 in. x 36 in. and 4 to 12 in. in depth, with maximum pattern draft of 12 in.

Positive adjustable pins at four corners of clamping device, Fig 2, compensate for unevenness of floor boards.

PRICE, f.o.b. cars Windsor, $125.00

HIGH GRADE CASTINGS are not made with low grade materials. Think this over when you see a poorly finished casting in your cleaning room, and remember, if you please, if you wish to place the pattern in the high grade class, our No. 48 Plumbago will do it, also that the saving in cleaning room expense would pay for three times the necessary No. 48 Plumbago to have made it high grade.

Another vital point is that you have a core wash which will peel clean and not run before the metal. Try our Eureka Blacking, the best core wash on the market.

Made in Canada, under Canadian Patents

The "King" Fuel Oil Furnace

CANADIAN Manufacturers and their representatives are assured of courteous treatment, and of thoroughly practical information regarding the operation of the **KING Fuel Oil Furnaces,** which we will have on exhibition in the annex of the Manufacturers' Building at the **Canadian National Exhibition,** August 27th to September 12th.

Our operating display will consist of forging, bolt making, tempering, welding and brass melting furnaces. Some will be fitted with high pressure, or compressed air, others for blast, and again others for steam, showing that fuel oil can be used to great advantage with any of the above-named agents for atomizing.

Ours is the only furnace now being manufactured which can be adapted to the above—all other makes requiring a combination of two of the above-named agents for atomization.

In the Manufacturers' Building we will show and demonstrate **Foundry Equipment and Supplies.**

FRANCIS HYDE & COMPANY

31 Wellington Street **MONTREAL, QUE.**

Don't fail to mention "Canadian Machinery" in writing to advertisers.

Morse Twist Drill & Machine Co.

NEW BEDFORD, MASS., U.S.A.

—MAKERS OF—

Twist Drills, Reamers, Chucks, Cutters, Taps, Dies, Screw Plates, Taper Pins, Etc.

Patent with Morse Taper Shanks

Constant Angle Twist Drills and Holes through Solid Metal for Lubricant.

These drills have holes through the solid metal and have great advantages over any other drill devised for conveying lubricants, as well as air, to the point. Air is sometimes used for blowing out the chips and keeping the drill cool.

These drills, 15-32 and smaller, are furnished with one oil hole only. They can be furnished with two, if ordered, but at customer's risk.

FOR INFORMATION IN REGARD TO MANNER OF USE SEE PAGE 116 OF OUR 1910 CATALOGUE.

Our goods are handled by Rice Lewis & Son, Ltd., Toronto; Aikenhead Hardware Co., Ltd., Toronto; Frothingham & Workman, Montreal; Mechanics' Supply Co., Quebec

"PERFECT" Double-Tang Sockets

Reclaim the scrap heap, and make useless drills as good as new. All you need to do is to grind on a new tang below the old one which twisted off, and slip into socket.

This new tang is stronger than the old one, being twenty-five to sixty per cent. thicker. New drills can now be had with double tangs if so specified, at no extra cost.

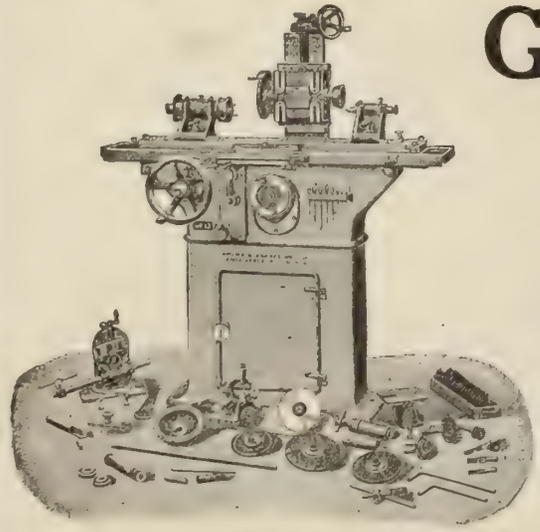
Fits any spindle having regular tapered holes. Drift easily removes drill. Foolproof.

Send for Circular C18.

The CLEVELAND Twist Drill Co. CLEVELAND Chicago New York

If you have a large variety of grinding, but not a large quantity, you can do all economically on the

B. & S. No. 13 Universal and Tool Grinding Machine



This machine is intended primarily for the grinding of cutters, both small and large. Careful attention has been given to secure accuracy in the finished product.

As a further advantage for the small shop where there is not a great quantity of cutter grinding, the machine can be adapted for cylindrical work, either straight or taper. By the use of attachments, internal and surface grinding can be done.

We have a circular giving full particulars.

CONQUEROR

HIGH-SPEED

TOOL STEEL

is now rolled in Special Profile Sections
GREAT SAVING IN WEIGHT

CONQUEROR IMPROVED

HIGH-SPEED **DRILLS**

made by twisting the rolled bar.
NO EXPENSIVE MILLING. NO WASTE of COSTLY MATERIAL
The natural fibre of the Steel remains undisturbed.

RESULT—
BETTER DRILLS, LESS BREAKAGES, LOWER PRICES

Write for Particulars to-day

A feature of these Drills is that no special holder is required. Shanks made to fit ordinary Morse Sockets

Every Dominion Business Man

should become a subscriber to Canada's leading monthly—BUSY MAN'S MAGAZINE.

Real Editorial Merit has laid the foundation of Busy Man's Success, and it is brimful of articles of widespread interest. Foremost among these are the articles on System and Business Management, which contain pointers of inestimable value. In addition, other contents may be noted as follows:—Men in the Public Eye, Political and Social Affairs, four or more really excellent Short Stories, and Articles of Interest to the Home, Finance and Business. The Magazine is profusely illustrated and there are numerous competitions for valuable prizes.

Will you do a little congenial work for us in your spare time, obtaining among your friends subscriptions for "Busy Man's"? We pay a most handsome commission, and will send specimen copy of the magazine and subscription blanks on application.

HARBISON-WALKER

The Standard *of* Quality

Fire Brick for Boiler Settings

Look up, **not** your prices per thousand Brick but your **costs** for repairs per thousand H.P. per hour.

Remember the costly shut downs when every H.P. was needed. It all shows up on the cost sheets.

It's on the cost sheet basis we want to take it up with you. A postal will bring catalog and any data you wish.

HARBISON-WALKER REFRACTORIES COMPANY

PITTSBURGH, - PENNA.

BROWNING

Locomotive Cranes
Wrecking Cranes
Lifting Magnets
Automatic Buckets

Browning Double Truck Locomotive Crane with Lift Magnet un oading scrap iron from gondola car. We make complete installation of this kind. The cranes are also fitted to use an Automatic Bucket Steam Shovel, and Pile Driver attachments.

Write us for full particulars.

The Browning Engineering Co.

Cleveland, : : Ohio

St. Marys, Ontario, Canada

offers manufacturers many advantages:

Good Labor Conditions	***Cheap Building Material***
Low-Priced Homes	***Railway Competition***
Moderate Rents	***Municipal Lighting***
Low Assessments	***Niagara Power***
Abundant Water Supply	***Ideal Location***
Healthy Environment	***Splendid Schools***

A Million People Within a Radius of One Hundred Miles

Write T. M. CLARK, Secy. Industrial Commission

GRINDING WHEELS

YOUR business probably requires Corundum and Emery Wheels that are well-balanced and porous; that cut free and fast; that give long, reliable service. Our business is to supply just such wheels in any size up to the largest grinding wheels used. Our facilities mean prompt shipment of reliable wheels. Let us quote on your next order.

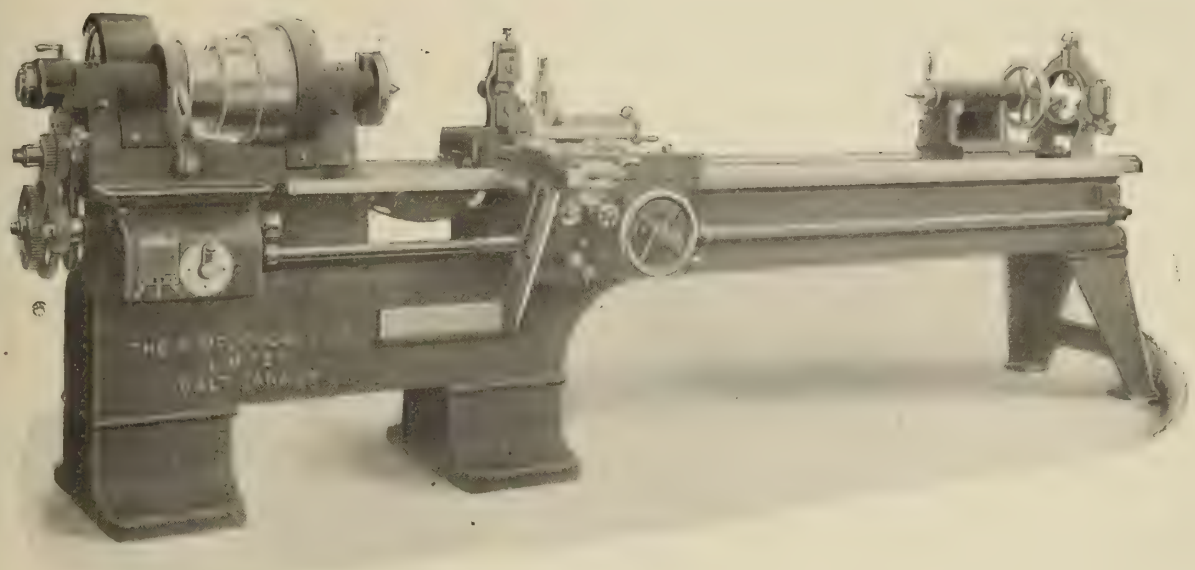
MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe-Screwing Machines



GAP LATHES—16, 18, 20, 24," in any length of Bed.

A Gap Lathe for a Jobbing Shop is an almost absolute necessary Machine Tool.

The improvements embodied in our Lathes made for absolute solidity and steadiness of cut.

The Brace under Carriage allows Gap diameters to be turned at High Speeds with resultant work as good as can be done on an Engine Lathe of large swing.

Double Back Gears give a range of Spindle Speeds which are all found useful.

Our extra large belt surfaces, combined with specially heavy spindles, ensure highest efficiency both in quantity and quality of work

We invite the closest scrutiny of materials, workmanship and finish, and have adapted Highest Quality as standard from which we will not deviate.

Particulars, yours for the asking.

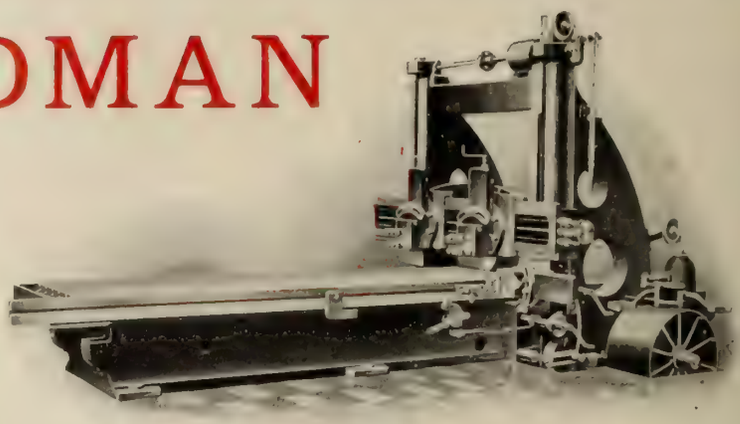
The R. McDougall Co., Limited

The Canadian Fairbanks Co., Sales Agents. GALT, CANADA

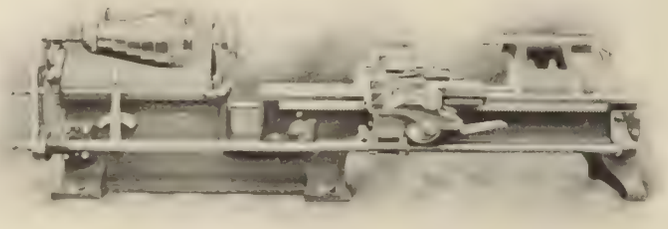
THE REDMAN

PATENT IMPROVED
HIGH SPEED

PLANING MACHINE



will get better results from the latest high speed steels than any other Planer on the market to-day. All feed motions for Horizontal, Vertical and Angular cuts are REVERSIBLE and VARIABLE without stopping the machine, and without the use of any screw-key.



THE REDMAN LATHE

as illustrated, we recommend as being particularly serviceable for general repair shops, etc. The bed is fitted with an Improved Gap Piece, which cannot wear loose or spring the bed, and at the same time will allow narrow pieces of large diameter being machined without removing gap piece.

All gearing and racks are machine cut from the solid metal with such accuracy that when the lathe is running at its fastest speed the noise is scarcely perceptible.

We Will be Glad to Submit Specifications and Prices

DUNDAS, ONTARIO, CANADA

Agents—The Canadian Fairbanks Company, Limited

A Revolution in Surface Reduction

The P. & W. Vertical SURFACE GRINDER

The New Method of Surface Reduction that is Rapidly Displacing Milling and Shaping Operations

10 to 25 times faster than milling.

Produces an absolutely flat surface with a mirror finish and grinds uniformly to within 0.0002 inch.

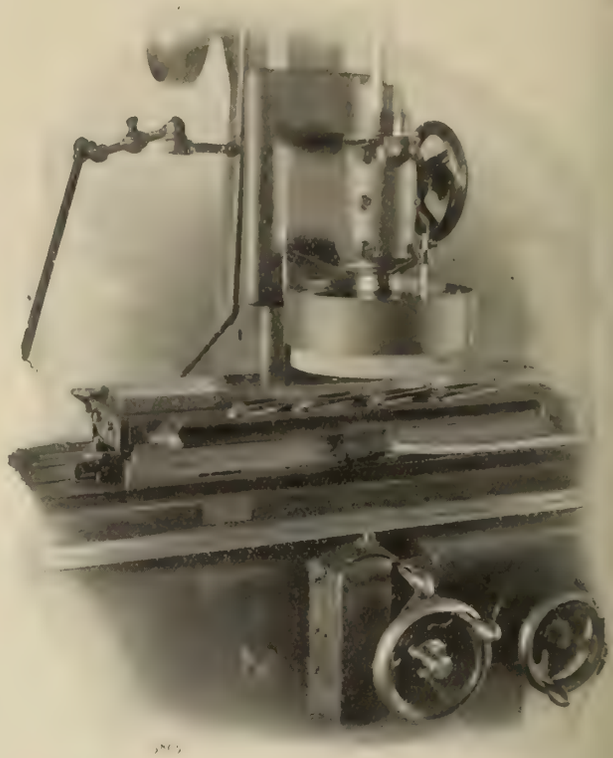
Works directly on the rough and hardened forging or casting.

Overcomes all surface errors that were impossible to correct in milling, shaping or vertical wheel grinding operations.

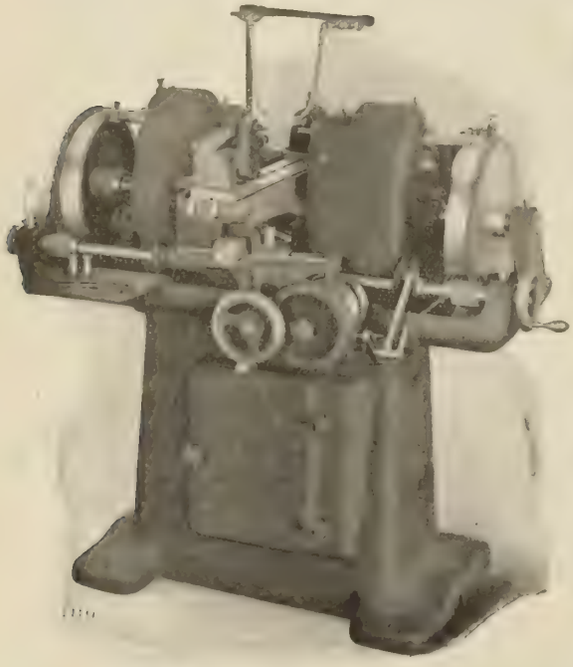
Working surface 10¾ x 36 inches.

"Grinding, not Milling," is the new shop slogan.

Write for book "Grinding, not Milling."
It illustrates over 75 economical applications in all branches of machine manufacture.



Partial View of the P. & W. Vertical Surface Grinder, showing cup-shaped grinding wheel and magnetic table.



P. & W. Spline Milling Machine.

No More Trouble or Expense to Mill a Slot with a P.&W. Spline Milling Machine

Than to drill a hole with a drill press.

Cutters used are cheaper than drills.

To obtain a tang slot or key-way, a cutter, the diameter of which represents the width of slot desired, is placed in collet, table traverse set for length, and, in case of a key-way, the cams set to limit the depth, and the power thrown in.

Operation is entirely automatic.

No starting-hole, lay-out, hand-milling or vise-work required.

Write for Catalog "Spline Millers."

Don't fail to mention "Canadian Machinery" in writing to advertisers.

20-inch x 36-inch Gap Lathe

Swings over bed, 21½ inches
Swings over carriage, 14½ inches
Swing in gap front of Face Plate, 12 in.
Takes between centres 8-ft. bed—4 ft. 0 in.
Maximum Cone diameter, 13 inches
Belt on Cone, 3 inches

Diameter Front Bearing, 3¼ inches
Length Front Bearing, 5½ inches
Hole through Spindle 1 9-16 inches
Diameter Tailstock Spindle 2⅜ inches
No. Taper Spindle Centres, No. 4 Morse

Gap Lathe swings in gap 39½ inches
Countershaft Pulleys, 12x4½ inches
Countershaft Speeds 125 and 175 R.P.M.
Weight, 4,800 lbs.—8-foot bed
Extra per foot, 200 lbs.

In the design of these Lathes the following points have been given the greatest consideration:

POWER ACCURACY DURABILITY CONVENIENCE

In the manufacture the parts are carefully inspected, and before leaving the works the machine is thoroughly tested under working conditions

THE SPINDLES are made of high grade crucible steel; after being bored, they are accurately ground in wet grinder, making the spindles absolutely round.

THE BEARINGS are all of ample dimensions. They are made of bronze, and spindle is accurately fitted into place, making a perfect bearing. Ample means are provided for lubricating, the bearings being supplied with oil cups with grooves for carrying the oil to every part of the spindle. Thrust is taken up by ball bearings of large dimensions working between hardened and ground steel washers.

THE CONES are of large diameter and wide face, three steps being provided. By means of Double Back Gears and large diameter cone, this Lathe is enabled to take extremely heavy cuts at high speeds on all diameters of work. By means of Double Back Gears there are nine changes of speed provided forward and nine reverse, or eighteen forward, as may be desired.

THE CARRIAGE has a long bearing on bed, to which it is accurately scraped. Carriage can be locked to bed at any point by clamp screw.

THE APRON is secured to carriage by means of dowels and screws. All pinions are of steel; all shafts are of high grade steel, wet ground and hardened when necessary.

THE CROSS SLIDE is of exceptional width and well scraped into V's on carriage. Cross Slide has power feed.

COMPOUND REST is graduated, well secured to rest, and is provided with micrometer attachment.

THE TAILSTOCK is of heavy construction, of the cutaway type, and provided with setover for turning tapers if desired.

THE BED is wide and deep, and well tied at close intervals by braces of box form.

LEAD SCREWS are of ample diameter, accurately cut from master lead screw.

THE GEARS are all cut from the solid on accurate gear cutting machinery.

FEEDS---Three instantaneous changes of feed are provided, which with change gears give a very wide range of feed.

COUNTERSHAFTS are double, and are of the friction type, being provided with very powerful friction, with ample means for lubrication and adjustment.

EQUIPMENT. Each Lathe is furnished complete with full set of train gear, steady rest, follower, wrenches three face plates, and one chuck plate.

No. 2 Hollow Hexagon Turret Lathe.

Hollow Hexagon Turret Lathes

This is one of our principal types of turret lathes for Bar Stock or Forging Work coming within their range.

Driving head powerful enough to use high speed steel to the limit.

Resisting parts amply rigid under the heaviest cuts.

The driving mechanism is of simple construction.

All feed changes are obtained through heavy gears (which are always in mesh) thus insuring high efficiency and minimum wear.

WANTED

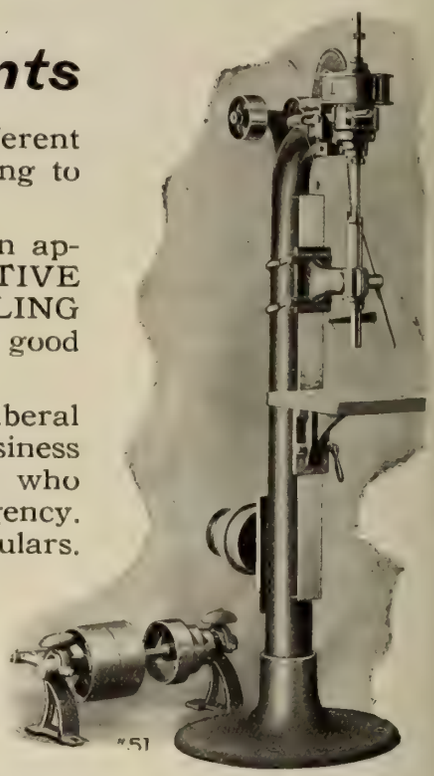
Two or three real live agents

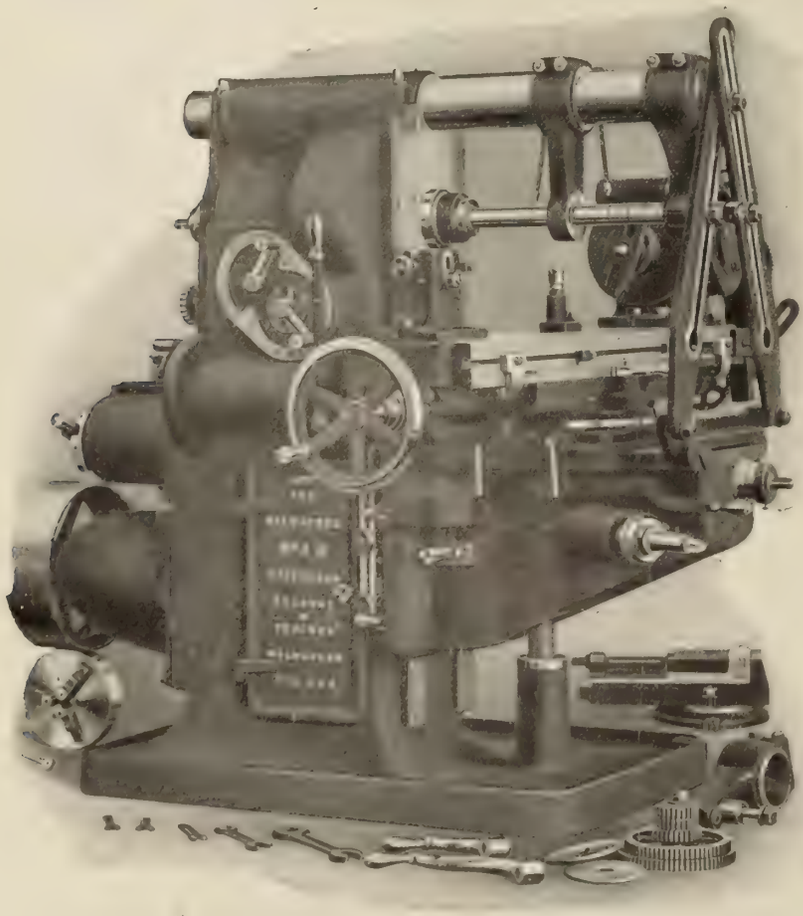
¶ We want to get in touch with two or three men in different parts of Canada—men who have a store and are willing to put in a small stock of our machines.

¶ For men who know the machinery business, who can appreciate the exclusive merits of BARR SENSITIVE DRILLING MACHINES and COMBINATION DRILLING and TAPPING MACHINES, this is an unusually good business opportunity.

¶ We will grant exclusive territory and make very liberal terms with men who will undertake to go after business aggressivly. We believe there are men in Canada who have it in them to make a fine thing out of a Barr Agency. You may be one. Write us at once for full particulars.

H. G. BARR, Worcester, Mass.





THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

Let us send you more particulars.

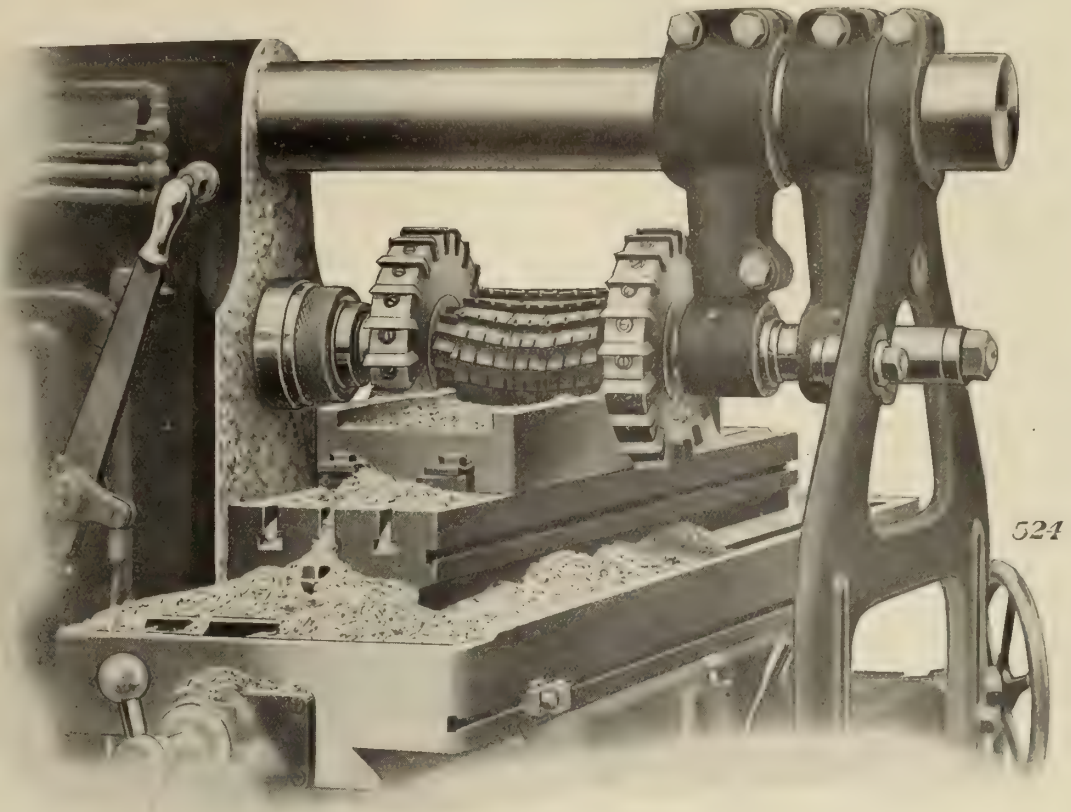
Kearney & Trecker Co.

Manufacturers - Milwaukee, Wis.

Agents:
The A. R. Williams Mach'y Co., Toronto
Williams & Wilson - Montreal

The advertiser would like to know where you saw his advertisement—tell him.

Nineteen Cubic Inches per Minute



THE total width of surface roughed off at one cut on these grey iron castings is 16½ inches—maximum depth of cut 3-16"—length of cut on each piece 8¼"—largest cutters 10½" diameter, running 21 rev.—6.3 feed.

The pieces are held in a string jig, removed as fast as traversed by the gang and others chucked in their places.

The pieces are made in lots of 125 at a time and an entire lot is regularly milled on a No. 4 Plain High Power Cincinnati Motor Driven Miller at this enormous rate without stopping to sharpen the cutters.

It takes a powerful, rugged machine to do such milling, and it must go through without vibration—otherwise the cutters would be dulled, forcing a reduction in the feed, long before an entire lot of pieces is finished. Our machines are designed for this kind of service.

Ask for our Complete Catalogue.

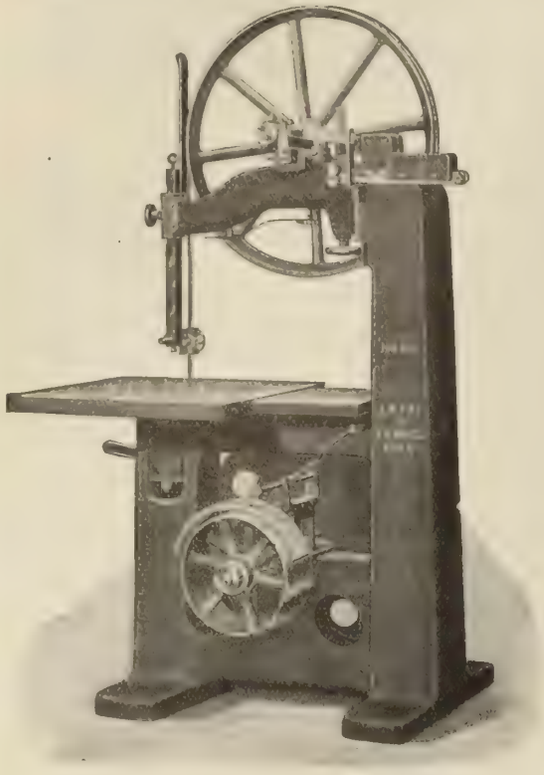
Our No. 50 represents the acme of perfection in our line of

BAND SAWS

for all kinds of plain and intricate scroll sawing, making it especially adapted for use in pattern shops



No. 50 Patent Special Band Saw.

For Pattern Shop work, we arrange the table with a tilting device having micrometer adjustment, which enables the operator to instantly adjust the table to any angle up to 45 degrees to the right and 10 degrees to the left. This device combines a quick and accurate angling of the table, which will be found of great importance to the Pattern Maker.

Some of the things which have contributed to its favor among Pattern Shops are its Square Form of Column, Solid Lower Wheel, Roller Guide and Knife Edge Strain.

The above features, among many others, are fully described in our large illustrated circular. WRITE FOR IT TO-DAY.

J. A. Fay & Egan Co.

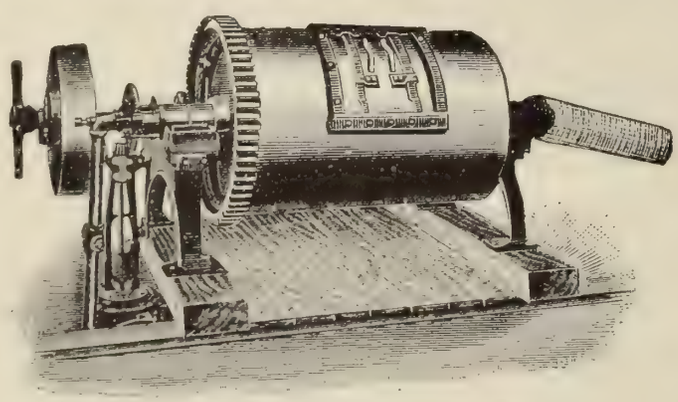
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL
Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture leaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

Greening's WIRE ROPE

¶ Different purposes require ropes of varying constructions and qualities. Your best policy is to buy your ropes from experts, stating conditions under which the rope is to be operated. Greening's Wire Rope is the best on the market. Made from wire specially imported from the world's best producers of wire for rope making. All wire used in Greening Ropes is subjected to a complete set of the severest tests before being made into rope. You may rely upon it absolutely.

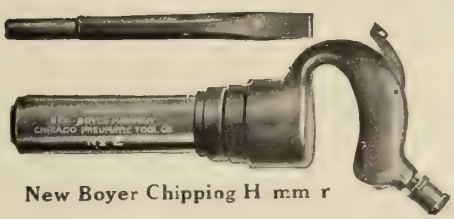
Air Tools That Cost Less Because They Do More

New Boyer Riveting Hammer



New Boyer Chipping Hammer

Sometimes we lose a NEW order because of price, but invariably we are asked to supplement the tools first purchased by ours at the higher price. The reason for this is that we absolutely guarantee our air tools, and although the price may be higher, the service per dollar invested is longer and more accurate. Let us demonstrate this to YOU.

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our warehouse in all current sizes, flat, squares and rounds; annealed and unannealed.

INCREASED EFFICIENCY

250 PER CENT.

THERE ARE TWO WAYS OF INCREASING THE PRODUCTION OF YOUR GRINDING DEPARTMENT:—

Enlarge your floor space and double your working force—

Or put in Carborundum grinding wheels and enable every man of your present force to do two or three times as much work in a day.

In grinding hardened steel wrist pins in a Cleveland motor car factory, Carborundum wheels are averaging 70 pins a day each.

The best record ever made by any other wheel in that factory was 20 pins a day. Carborundum wheels are also producing a finer finish and lasting more days before wearing out.

Top Quality Belting for Permanent Service

This is an accurate description of "Climax" Leather Belting.

We are very careful never to let a single foot of "Climax" Leather Belting leave our warerooms that will not stand the test of long, hard service.

Protect yourself by specifying

"CLIMAX"

Because it stands for care in selecting hides, care in tannage, care in choosing and cutting the butts, care in trimming, care in cementing—care all through—a close motherly care that ensures a perfect belt. Always the same—every foot of it!

All belts may look alike, but!—there are so many chances for makers to cheapen the cost of production—at the expense of the belt—that you must exercise care in purchasing.

Remember we have the largest and best equipped belt factory in Canada. We cut more butts per day than any other and can afford to pick and choose our butts.

STANDS USE OR ABUSE

In the first place, the design was developed by deliberate breaking tests so that we are able to get plenty of metal at the points where it is needed most. Then, too, we give an amount of care and detailed attention to the manufacture of these Vises which would make them cost a lot more money if we did not make them in such large quantities and under specialized methods. Every part is made to limit gauges, and as a general rule these limits provide for variations of not over .001".

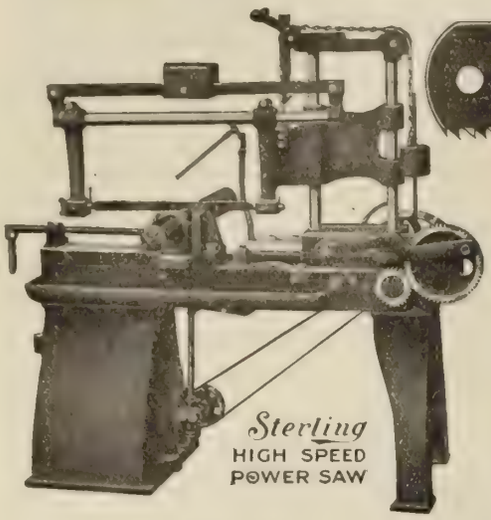
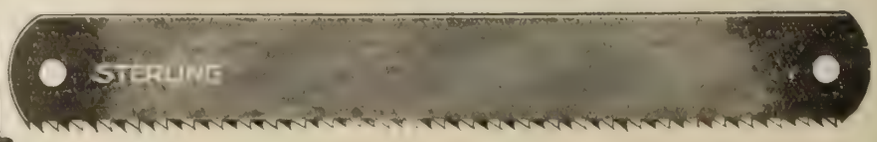
"STERLING" Hack Saws





"Sterling" Hack Saw Blades

The old reliable, but always up-to-date, never follow, always lead—you have used them for years; if not, it's not too late to get the best—don't accept substitutes because they can be bought at a lower price. "STERLING" is not among the cheap lines but in a class by itself.

"Sterling" High Speed Power Hack Saw Machines

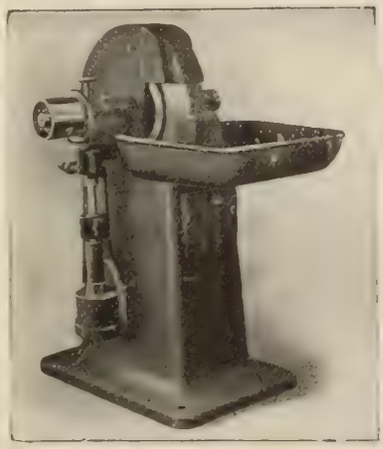
This machine is the product of up-to-date methods, displacing the old, slow-running saw, with from two to three times the capacity of other machines on the market.

For cutting material from two to eight inches in diameter, it is the most economical metal-cutting machine in use.

MANUFACTURED BY

Diamond Saw & Stamping Works

BUFFALO, N.Y., U.S.A.



A Necessity in Every Shop

You can instal no more efficient tool than

Blount's

Wet Tool Grinder

which is fitted with self-oiling bearings and can be run continuously if desired. A vertical centrifugal pump furnishes a constant supply of water, and there is no wear of parts because the propeller is fitted so loosely that it does not touch the case at the nearest point. The grinder is not affected by dirt or grit, and a sleeve cap prevents leakage without the use of packing.

Send for further details. We guarantee satisfaction.

New Process Rawhide Pinions

absorb the shock of gear drive

Even new, perfectly lubricated gears meshing with metal pinions are a source of some noise and vibration. When gradual abrasion, due to high speed and heavy duty, destroys the perfect fit of teeth, the healthy hum of the gears becomes a disagreeable clatter.

If you want positive, noiseless transmission and flexibility in your motor drive, use New Process Pinions where you now use metal.

They are noiseless, but they are also iron tough and iron hard. Our rawhide is treated by us by a process which fits it for heavy duty under which ordinary rawhide fails.

Our booklet explains the extra durability of New Process pinions and gears. Write for it today.

NEW PROCESS IS TO ALL OTHER RAWHIDE AS STEEL IS TO IRON

Goodhue Belts Prevent Shutdowns

BECAUSE

They STRETCH LESS by 15% to 25% than any other leather belts on this market.

This also means that you don't have to pay for belting you can't use, which is represented in the short lengths taken out every time slack is taken up.

These are two points important to a belt buyer and you should consider them when in the market.

Ask us to prove these points to you and if your dealer doesn't stock our belts write us for prices.

HUBBELL GUARDS
FOR THE
FACTORY
FOUNDRY
R. R. SHOP
TEXTILE MILL
STORE
STABLE
GARAGE

LAMP PROTECTION
WITHOUT
LIGHT OBSTRUCTION

wherever lamps are used there's need of strong but simple guards---that do not obstruct light.

HUBBELL LAMP GUARDS

MADE OF STEEL WIRE--GALVANIZED THEN TINNED

ELECTRICALLY WELDED THROUGHOUT

This feature is exclusive with Hubbell Guards. Wires are welded at every contact point and the weld is as strong as the wire it holds. It is surer than solder, clamps or tie wires. Looks better, gives a smoother surface, leaves NOTHING TO OBSTRUCT LIGHT.

No part of the lamp is touched by the guard. When the guard is struck the shock is carried to the socket, not to the lamp.

Quickly adjusted, sure to stay secure. A small metal collar grips the socket and to this the guard is screwed. It cannot tilt or drop down on the lamp.

A Number of Interesting Railroad Shop Bending Devices

Each Operation, Jig or Bending Form is Illustrated and Described, so that Railroad Mechanical Men will at Once Understand the Tools and their Operation.

By Ethan Viall.

Nearly every railroad shop possesses a number of bending devices, besides the regular bulldozer forms. For the benefit of those who are not familiar with these tools, I shall describe a number of bending devices which I have seen in various shops within the last few years.

Fig. 1.—Making Car Footholds.

All of us have seen the footholds or steps on the sides of freight cars, but few, perhaps, have ever given a thought as to how they were made. Fig. 1 illustrates clearly how the bend and twist is made on the bulldozer, at one operation.

The bending arms A-A are made like an inverted L on the half nearest the end, in order to give the twist. The curved guide B, is to keep the arms from lifting during the twisting operation.

While the making of the handholds, used on freight cars, is more of a forging, than a bending process, it will not be out of place to describe here how it is done.

Instead of being done on a bulldozer, a forging machine, of the Ajax type, is used, the punches and dials being shown in Fig. 2. Three strokes of the machine are required for the forging of each end. The first stroke leaves the rod in the shape shown at A, the second stroke as at B, the punch marked B doing the work, and the third stroke the punch C pierces the hole in the end of rod C.

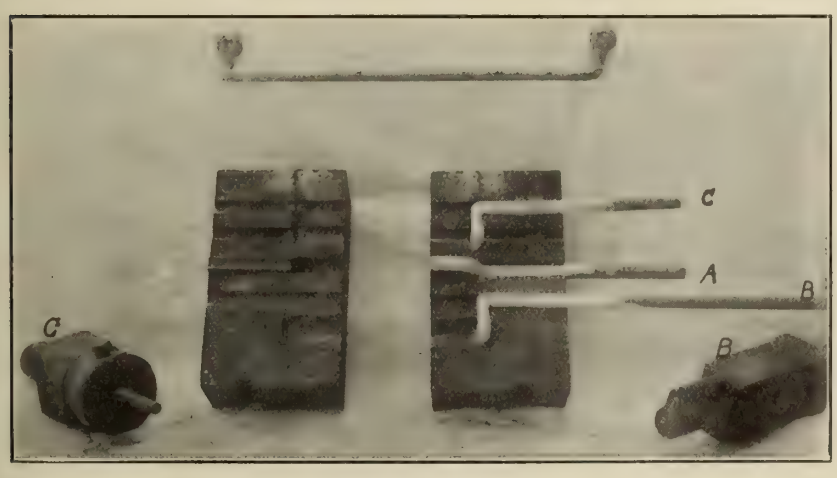

Fig. 2.—Handholds and Forms.

Fig. 3.—Final Bend of Car Foothold.

The final bending of the end is done in the cut-off of the machine, with the punch and die shown in Fig. 3.

Another bending operation which is done on the regular bulldozer is shown in Fig. 4. The bending arms are the same shape on the inside as the loop to be formed, a piece of heavy boiler plate being riveted to the top of them to prevent the ends of the loop lifting and being bent out of shape.

Fig. 5 is another interesting device for bending a special loop. After the bend is made the forming punch is drawn back and the bent piece lifted off.

The forming of handles for pokers, slice bars and the like, is usually done on a pneumatic bulldozer in two strokes, the first operation being shown in Fig. 6.

Fig. 4.—Bending Operation.

This cut shows the first bend completed and the ram drawn back ready for the second stroke, which is shown finished in Fig. 7.

Fig. 5.—Bending Special Loop.

An eye bolt former is shown in Fig. 8.

The bending is done by means of a rack H, which is fastened to the ram of the bulldozer. As this rack moves forward it turns a small pinion fastened to the bottom of M, which causes the block

Fig. 6.—First Operation Bending Slice Bar Handle.

K to travel around, bending the end of the rod as it goes.

A quick way to bend small clevises, used on brake chains, is shown in Fig. 9.

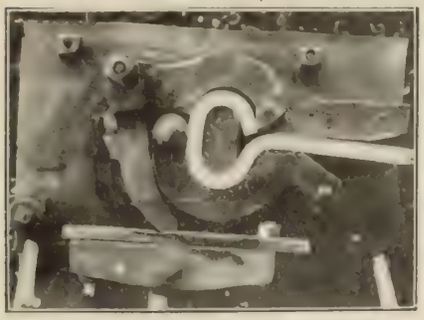

Fig. 7.—Complete Handle.

These clevises are first punched out of sheet metal in a punch press and then shoved through the loop as shown.

Some of the bent clevises are lying on the bed of the machine, at the left.

Practically the same thing in a stationary form is Fig. 11.

Fig. 12 is a portable rail bender, an eccentric at P giving the stroke, while the plunger is fed out by nut R, which has right and left threads.

Fig. 13 is a hand bender for forming

Fig. 9.—Bending Small Clevise.

S-links from iron rod up to ½ inch in diameter. Fig. 14 shows how it is used by setting the shank in the hardy hole of the anvil. The operator shown in this cut is Joseph Damm, blacksmith foreman of the Wabash R. R. shops.

blocks and is heavy enough to do all kinds of bending on.

An arbor press that is good for some kinds of bending as well as pressing mandrels in or out, is shown in Fig. 16.

Fig. 11.—Homemade Stationary Bulldozer.

The sliding head is counterbalanced by a weight and rope, running over pulleys, fastened at B. Steel pins inserted in the holes in the sides prevent the head

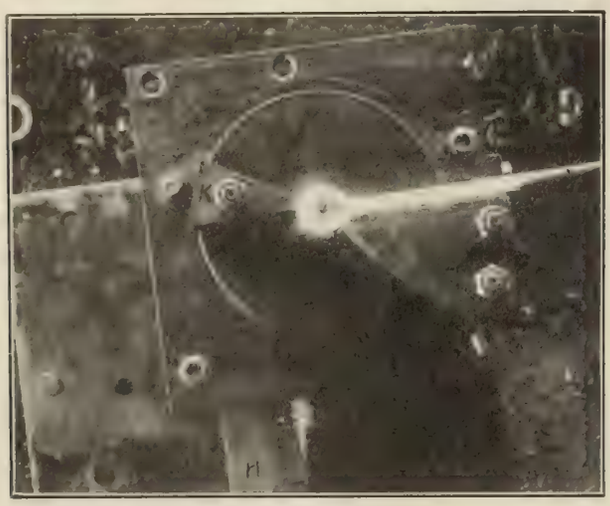

Fig. 8.—Eyeholt Former.

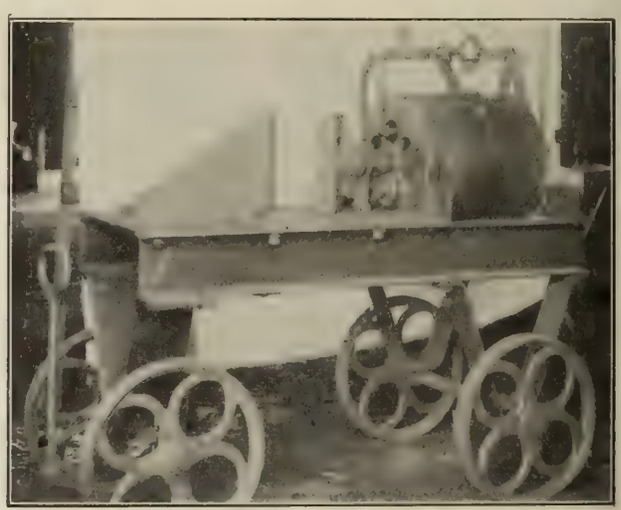

Fig. 10.—Portable Bulldozer.

One of the most convenient portable bulldozers, for bending angles or other forms, is shown in Fig. 10.

The whole affair is homemade and was built for hard usage.

Fig. 15 shows one of the best clamping anvils imaginable. It was made out of cast iron blocks and other scraps found around the shop, and may be used to hold swages, bending forms or die

rising under pressure. The lugs cast on the hand wheel allow the use of a long lever for heavy work. In order to prevent the frame of the press from being twisted out of shape on heavy work the

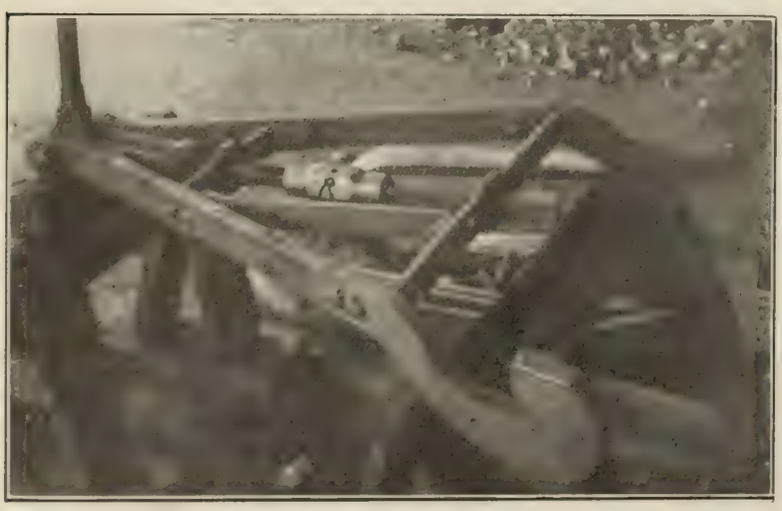

Fig. 12.—Portable Rail Bender.

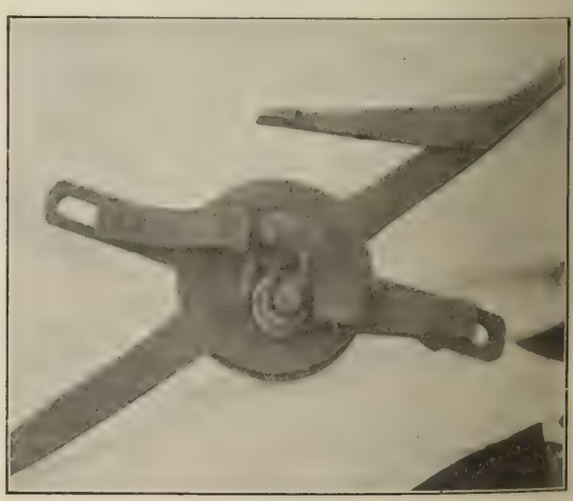

Fig. 13.—Hand Bender.

Fig. 14.—Hand Bender in Use.

sides are braced at the top by heavy wooden beams. The cast iron V-form

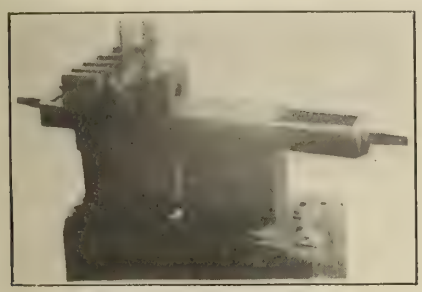

Fig. 15.—Clamping Anvil.

is very handy for various jobs, and especially for mandrels.

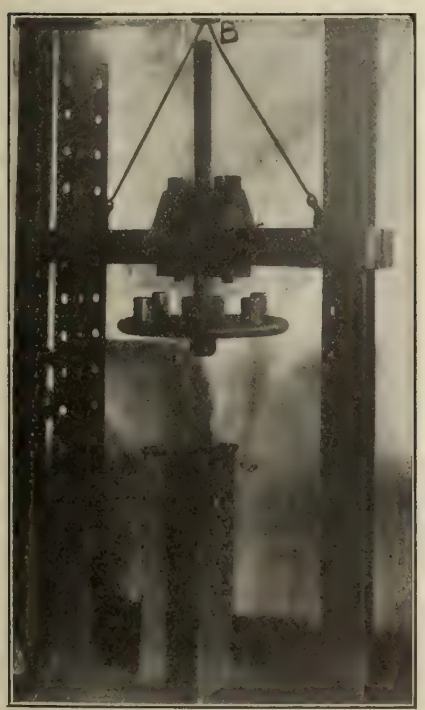

Fig. 16.—Arbor Press.

TOOLS AND FORMERS.*

By Arthur Stockall.**

There is continually a demand for more economy in tools and speed in manufacturing, and this requires that tools and formers be constantly changed in shape so as to reduce breakage in material, cost of tools and time in making a given piece of work. Therefore, IN THE DESIGNING OF TOOLS THERE ARE THREE THINGS THAT SHOULD BE BORNE IN MIND: TO BE EASY ON MATERIAL, EASY ON TOOLS AND EASY TO HANDLE. IN THE CARRYING OUT OF THESE THINGS LIES THE TRUE SUCCESS IN HANDLING OUR WORK; for I think that it is better to have two simple tools to make one piece of work, than one complicated and expensive tool, with the danger of breaking the material in the end.

The formers for the bulldozer, I think, can be made cheaper and more conveniently with cast iron, reinforced with hardened steel at the places where friction will take place, so that instead of wearing out the casting, the steel will take the strain and when this is worn out it can be removed and a new piece put in. In other formers, or in fact wherever possible, the roller tool should be used as the best means to save material and power.

Then there is a tool that can be used to make a lot of work, such as freight car steps, carrier irons for passenger cars, glands and all such work where a double bend is required, or a good square corner is needed. I mean a tool with a hinge made so that it will move back far enough to allow the iron to be put in and far enough apart to let the ram come down to square up the crown or middle of the work, thus making a good clean square job that no one need be ashamed of.

As I said before, these tools may be made out of good clean castings reinforced with steel at wearing points and machined where necessary and by a little foresight they may be made so that one former, with a liner put in, can be used for different articles of almost the same shape, but of a different size; this will save cost of tools and cheapen production.

Use of High Speed Steel.

In all cases where cutting or punching hot material is required high speed self hardening steel is the stuff. It costs more to put it in, but does its work splendidly and it is a relief to the burdened foreman and a joy to the worker, with no more running water, no more burning and peeling of die, or punch, or cutter, and consequent bending and breaking of tools with the machine on the hog half the time, with the toolmaker swearing and workman grumbling.

I well remember my own experience of four years ago in this line. I was punching a lot of steel follower plates. They were pretty hard and of course the usual trouble was intensified by this. If we used water to cool the tools, they split and broke, and the man wading in mud, grumbling and doing very little. I was about to give it up and fall back on the drill; but high speed steel came into my head, and off I started for the toolmaker and stated my case.

"I won't do it," he said; "it is only a waste of time and material."

"Let's try it, anyway," I said.

"I won't" he replied, and he would not, until I went to the master mechanic and got his doubtful consent, and at last the tools were made and put in, and the difficulty was gone. High speed steel is undoubtedly the stuff for this kind of work and pays 100 p.c. every time.

I used to think that mild steel was good enough for bolt headings, etc., and I tried it thoroughly, but it was not satisfactory. It would burn up in spite of all I could do. "Caseharden it," said my bolt maker. This I did, with the result that almost always the block would warp or bulge out in the middle and in grinding this out the casehardening would be all gone and my labor went for nothing. Then I heard a man say cast iron chills are fine, and cheap. I tried this and found that the blocks would chip and split in two. Chilled tools in my opinion are a waste of time; but I consider good clean cast iron tools superior to any of the other above mentioned for durability and economy. They can be put in and used with a little grinding and when used up can be sold for scrap for more than scrap soft steel. But, I think, from my experience, that self hardening or a good water tempering steel is best for this work. It costs more, but lasts longer and does better work while it does last, and for machine forgings of all sorts a good hard, tough cast steel is best.

For steam hammer tools nothing is too good. You can make an endless variety of things under them and a good material for these tools is the question. A dense grained cast steel top and bottom of about .30 carbon; for wedges a good hard soft steel is the best; for forming blocks, cast iron with a wrought iron band around it to keep it from spliting, gives a tool that will make almost anything.

Keeping the Toronto Street Railway Cars in Service

Many Useful Devices are in Use which Facilitates the Work and Reduces to a Minimum the Time a Car is in the Shop for Repairs.

By Gordon C. Keith.

QUICK repair and economy are two watchwords in the shops of the Toronto Railway Co., Toronto. Many devices are in use to hasten repairs and keep the cars in service. Economical methods are followed to keep the cost of repairs down to a minimum.

Fig. 1 shows a jig for boring armature bearings. The jig has a screw (E)

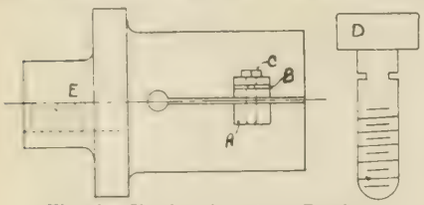

Fig. 1.—Jig for Armature Bearing.

in one end to fit the headstock of a lathe. A is a lug, one being as shown, and a solid one on the opposite side to balance it. The jig is split on one side, the split being opened up by a piece of sheet steel to remove bearing easily. C is the bolt to lock jig. It is shown enlarged at D. B is a slot in the lug for locking the bolt, keeping the bolt from working out of the jig and thus holding the bearing securely during the boring operation on the lathe.

Drilling Brake Shoe Hangers.

The jig for drilling broke shoe hangers will accommodate eight different types of trucks. The jig is shown by drawing in Fig. 2. In drilling the hanger, the undrilled hanger is first drilled on one end. It is then placed in the jig and the pin inserted in the hole, depending on the length required, as shown in Fig. 3. The set-screw adjusts the brake shoe hanger so that it takes the proper position when inserted in the jig.

Fig. 4.—Details of Brake Shoe Jig.

The drill is guided by the steel bushing B, Fig. 2, and there are three different sizes to suit the shoes for various trucks. Fig 4 shows the details of the jig with a brake shoe hanger. With this jig there are no short and long hangers, all being standard length.

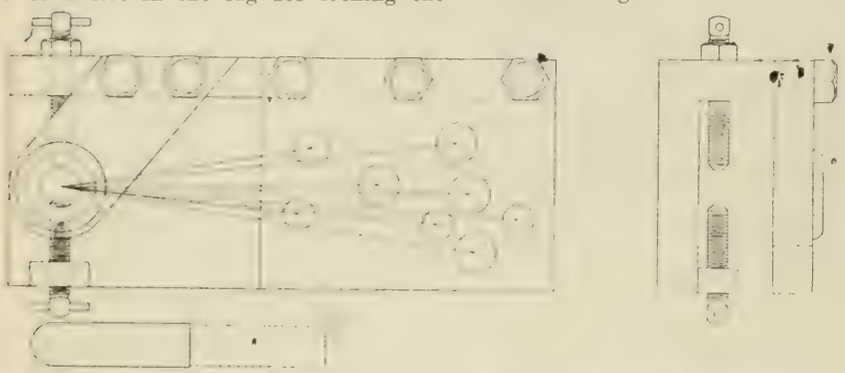

Fig. 2.—Details of Brake Shoe Jig.

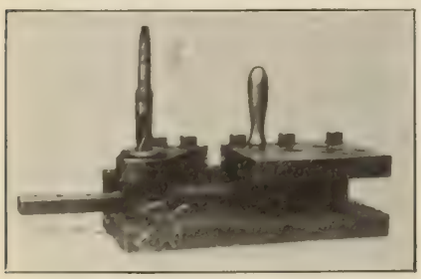

Fig. 3.—Brake Shoe Hanger Jig Complete.

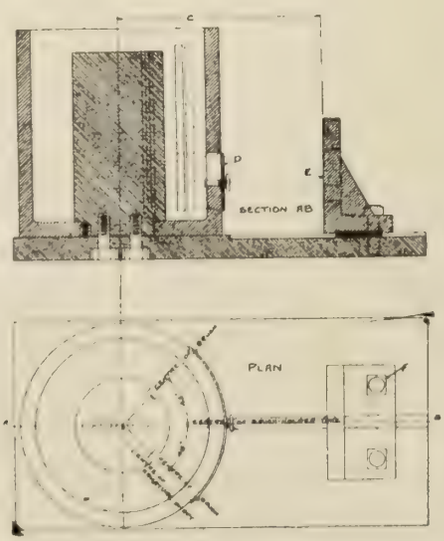

Fig. 5.—Adjusting Brush Holder of the Yoke Type.

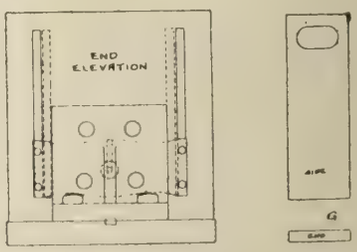
Brush Holder Gauge.

Fig. 5 shows a gauge for adjusting brush holders of the yoke type. To the metal bedplate is bolted a cylinder, the same size as the average commutator. In the centre is a steel post about 4 ins. in diameter. It will be noted in the illustrations Fig. 5, 6 and 7, that the centre post is slotted to receive a steel dummy carbon brush, the cylinder also being slotted to allow the passage of the steel plate.

Fig. 6.—Side View of Gauge with Dummy Carbon.

A section through the jig at AB, Fig. 5, is shown. C is the distance from centre of shaft to brush-holder base. D is guide to make carbon meet commutation square. E is an adjustable bracket bolted to the bedplate, to make allowance for the difference between centres of the different types of motors.



The complete brush-holder is bolted to the adjustable bracket, Fig. 7, and if correct, the dummy will pass through the carbon-holder cylinder, and pass into the slot in the centre post. The brushes are set at 45 degrees to the centre line. At F, in Fig. 5, the holes are drilled and tapped in base to suit different types, as previously mentioned, in regard to F. G is the brush templet, made the same section as the brush, but long enough to

reach through brush-holder, through the cylinder and into the inside slot, as explained above.

Protecting Machinery.

The protection of the workmen from accidents is important in keeping the staff of workmen complete. The machinery, such as drills and planers, which have open belts, are protected by an iron

Fig. 7.—Jig Complete Showing Dummy Carbons in Place. A Dummy Carbon is in Foreground.

fence. Fig 7 shows the protection around the belts and pulleys of a drill.

Machining Car Wheels.

The machining of car wheels is very important, and the master mechanic, W.

Fig. 8.—Protecting Workmen from Injury.

R. McCrea, and his foremen are kept in close touch with the work. The wheels must be pressed on the axles at a certain tonnage. Records are kept of the mechanic who has charge of the boring of each wheel and who presses them on the axle. If a wheel slips, the record shows who machined them. As each wheel is numbered, the keeping of the records is a simple matter.

When a car is in service some of the wheels often develop flats. These are removed by grinding. For this operation the arrangement of motor, shaft and grinders shown in Fig. 9 has been devised. An ordinary starting box is used for turning on the power when the wheels are lowered into position. The

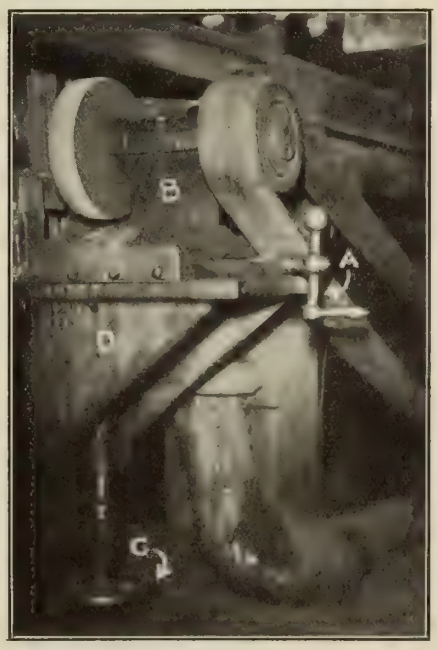


Fig. 10.—Details of Wheel Grinding Machine.

portion of the track on which the truck shown in the illustration is removable allowing the wheels to be lowered to the grinder.

Details of the arrangement are shown in Fig. 10. The other side corresponds to the one shown. By means of the handle A, the rest B to which the wheel is attached is moved backward and forward similar to the tool rest of a lathe. By means of the wheel C the bracket D is raised or lowered, adjusting the grinder to the car wheel.

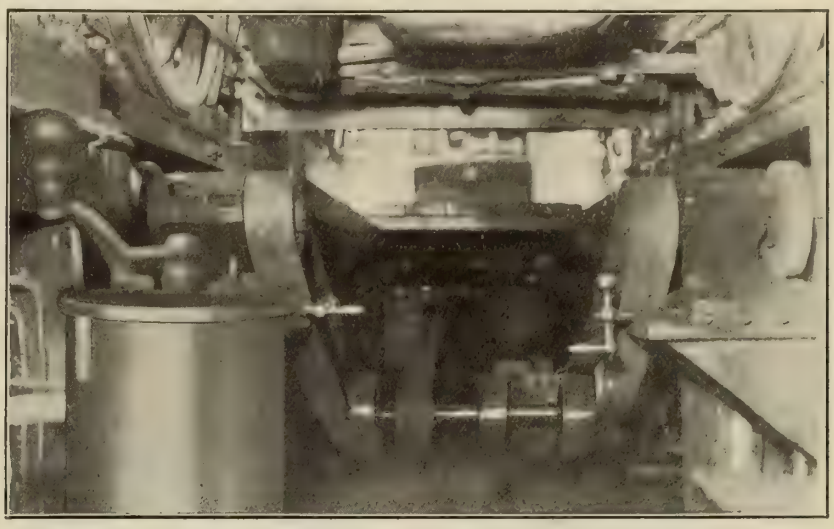

Fig. 9.—Arrangement for Grinding Flats from Wheels.

Tool Room.

The tools are all in charge of one man, who is an expert tool grinder. As each tool is given out, the workman presents a brass check on which is his number. The check is hung in the place occupied by the tool and the mechanic is held responsible for its safe return. The grinding is done on a Yankee Tool Grinder

Fig. 11.—Babbitt Furnace.

made by Wilmarth & Norman, Grand Rapids, Mich. The man in the tool room keeps all tools sharpened.

In the tool room are standard samples of all small pieces. These, also, are given out to workmen on presentation of check and the employe is held re-

sponsible for any sample he secures from the tool room.

Homemade dies are made to run over the thread on the end of armatures. This removes any bur without putting it into a lathe.

Melting Babbitt.

The babbitt for armature and axle bearings is melted in the pots shown in

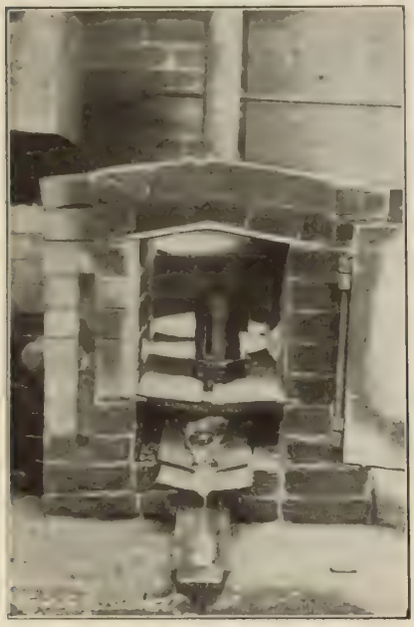

Fig. 12.—Melting Babbitt from Bearing.

Fig. 11. At X is a McCabe nozzle invented by Mr. McCabe, an employe of the Toronto Street Railway Co. Gas and air are blown through a small orifice and a very hot flame is produced, melting the babbitt in about half the time usually required.

At the right of Fig. 11 is shown the furnace in which babbitt is removed from bearings. A hood covering pots and furnace carry away all fumes. Fig. 12 shows the interior of the melting

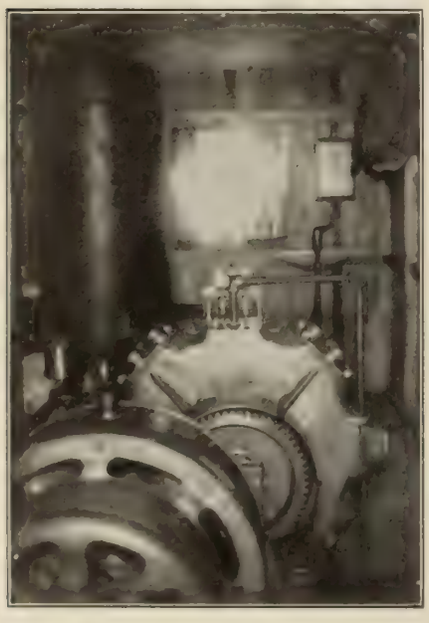

Fig. 13.—Car Cleaning Outfit.

Fig. 14.—Painting Car Fenders.

Fig. 15.—Thermit Welding.

furnace. There are four burners below and one above. The babbitt melted from armature bearings is used for axle bearings. When babbitt is melted from axle bearings it is scrapped. This is analyzed and is brought up to original form. The oven is built of firebrick. As the

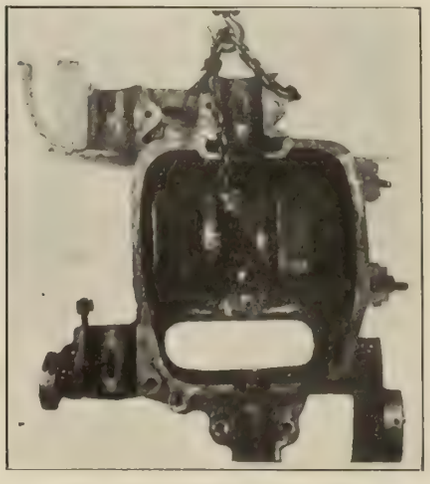

Fig. 16.—Casting Showing Weld.

Fig. 17.—Armature Repairing Stand.

firebrick melts it runs into an ingot mold. The oven is also used for soldering brass axles together, this method being much quicker than by the charcoal fire.

McCabe Cleaning System.

The Toronto Street Railway Co. uses the McCabe combined compressed air and vacuum system of cleaning. The air compressor is a Reavell's single stage, water-jacketed type, installed by Vandeleur & Nichols, Toronto. It is designed to deliver 60 ft. free air per minute and a pressure up to 100 lbs. per square in. It is driven through rawhide gearing by a Laurence Scott motor, coupled on the same bedplate. The compressor is installed on a small car, arranged to run on the street railway system, and fitted with the necessary electrical equipment and air receiver as shown in Fig. 13.

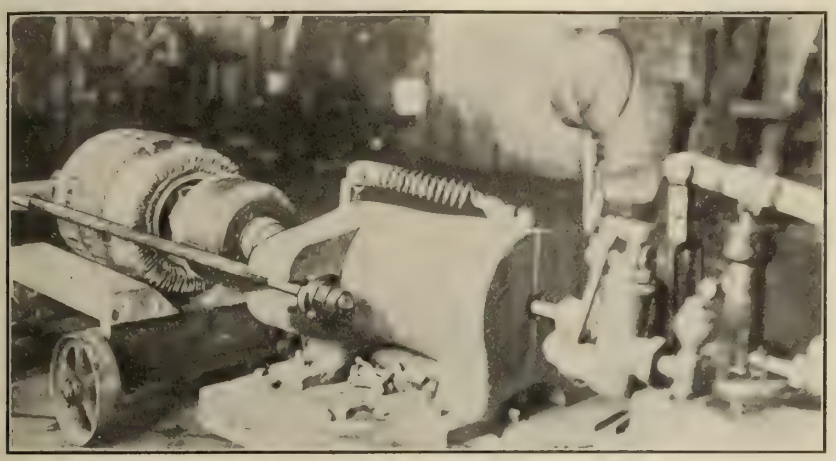

Fig. 18.—Hydraulic Press for Commutator.

Fig. 19.—Core Winding Machine.

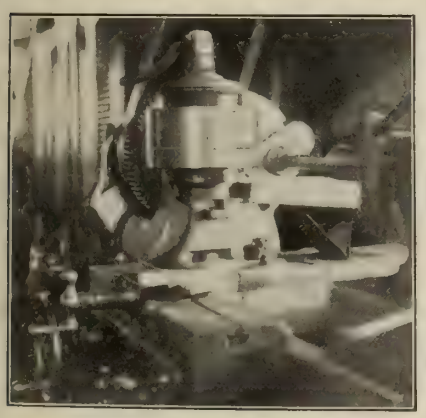

Fig. 20.—Slotting Commutator for Wire Connections.

The McCabe cleaning apparatus consists of a short pipe in which a nozzle is fixed so that it points (parallel with the pipe) towards the discharge end. The nozzle is connected to the compressed air. The compressed air discharging out of the nozzle into the pipe, drives the air into the pipe towards the discharge end, creating a vacuum at the inlet, thus causing a current of air to enter at the inlet end and pass out at the discharge end. This mechanism is known as the vacuum machine.

Fig. 22.—Taping Machine.

Painting Car Fenders.

Car fenders are painted by means of an atomizer. The paint is blown on by compressed air, the surplus paint dripping into a paint vat below. The arrangement is shown in Fig. 14. All paint vats are covered when not in use as a precaution against fire.

Thermit Welding.

The thermit system of cast iron welding is used by the street railway company, the welding being carried on under the supervision of the master mechanic. Fig 15 shows the thermit iron running into the mold while Fig. 16 shows the repaired case.

For welding the casting is set in position in a one-piece mold, the casting being packed around with green sand and fire, provision being made for a supply of metal around the broken part, riser, etc. The heat of the thermit reaction is approximately 5400 degrees F.

Electrical Department.

Many interesting methods are used by the Toronto Street Railway Co. to make repairs to motors as quickly as possible. Fig. 17 shows a unique manner of repairing armatures. A cast iron stand is fastened to the floor by coach screws.

The armature is then stood up perpendicularly for repairing as shown in the illustration.

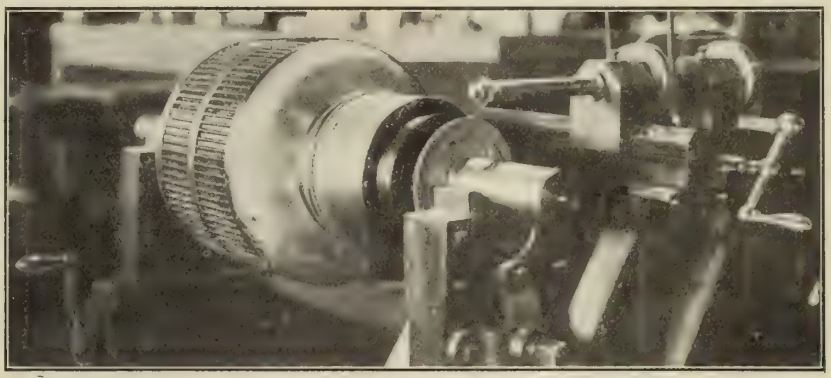

Fig. 21.—Mica Slotting Machine.

A hydraulic press for putting commutators on and off is shown in Fig. 18. The press is worked by hand. The illustration shows the armature in position with side rods on the hydraulic press.

Fig. 19 shows a core winding machine. The man is in position for winding the cores and three are made at once. The machine is equipped with a foot brake.

The arrangement shown in Fig. 20 is a lathe attachment for slotting armatures for wire connections. The machine shown in Fig. 21 is a mica slotting machine. Since taking the photograph a further improvement has been made. Instead of milling out the slots, a cutter has been substituted and the belt done away with. By means of a lever and eccentric a groove is cut at

one stroke. The cutter is adjustable to any size armature. The improved machine is much more efficient than the one run by the belt.

Fig. 22 shows one of the taping machines in operation. The machine operates in the direction of the arrow, the tape being fed from the small wheel at the side. The tape is put on smoothly and quietly.

Fig. 23.—Small Air Presses and Taping Machines.

The small air presses are shown in the foreground of Fig. 23. By means of these paper is put on the coils with hot glue. Two of taping machines are in operation, the countershaft for them being underneath the table.

The field coils are tested by the press shown in Fig. 24 under a pressure of 5 tons. A coil is shown in position. The ram has iron wings which presses down the coil, and if there are any loose wires they will short circuit under the pressure.

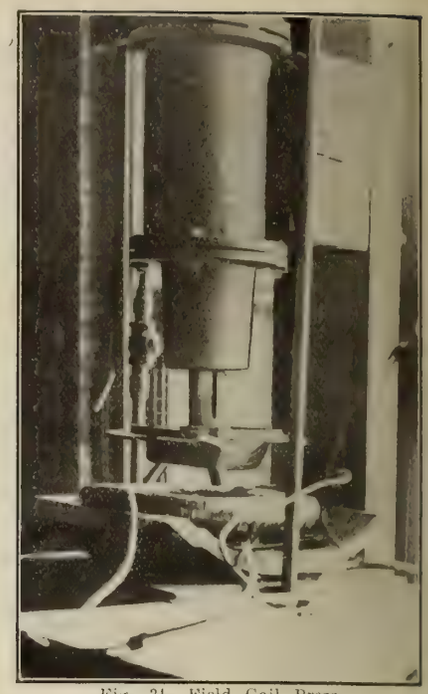

Fig. 24.—Field Coil Press.

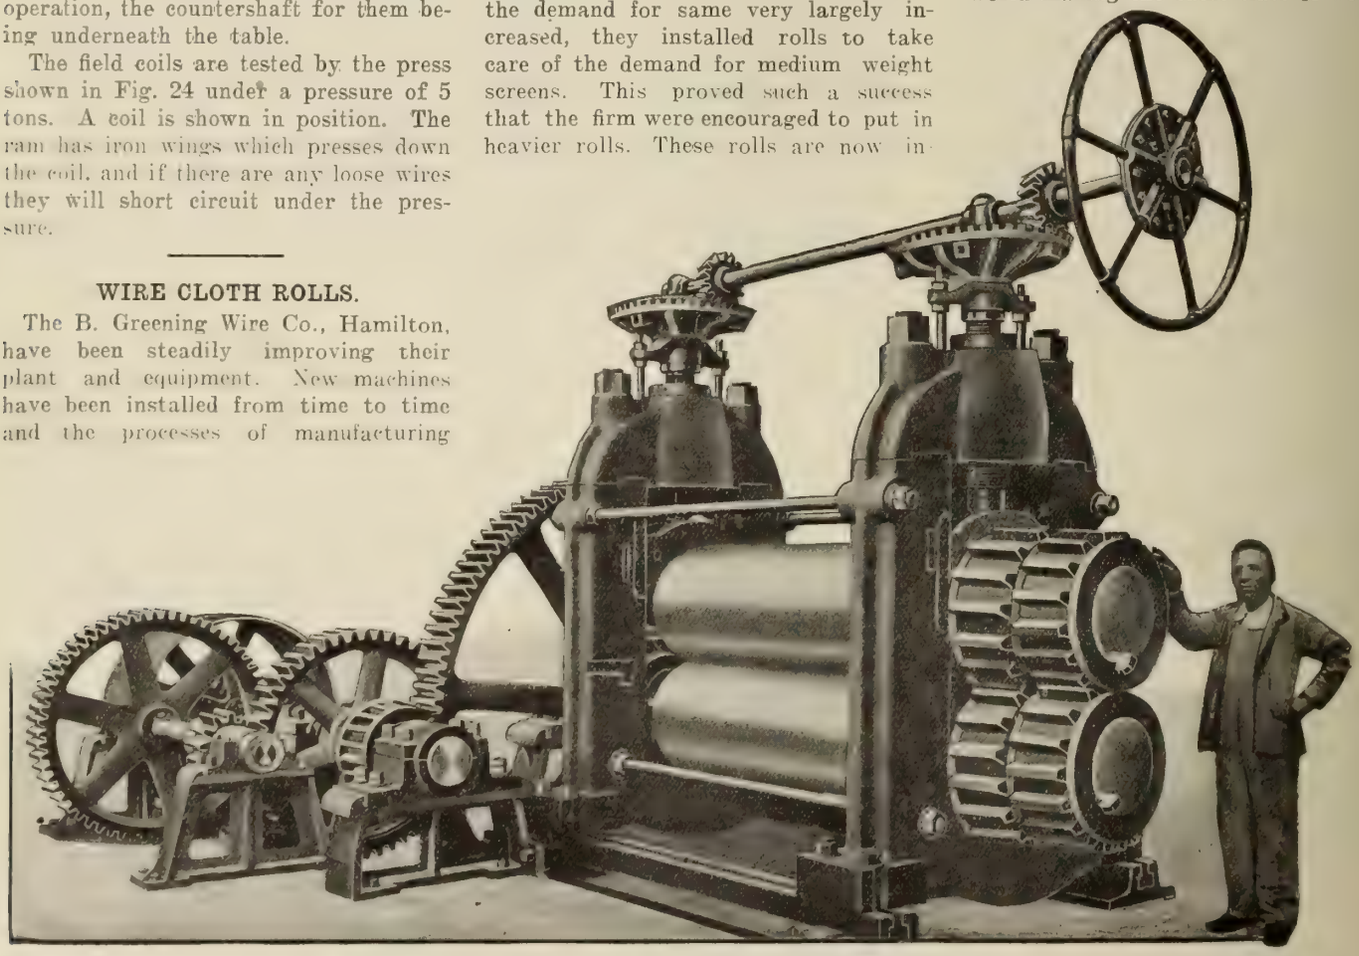
WIRE CLOTH ROLLS.

The B. Greening Wire Co., Hamilton, have been steadily improving their plant and equipment. New machines have been installed from time to time and the processes of manufacturing wire cloth and screens have been greatly simplified and improved by them.

A recent improvement has been the addition of the large wire cloth rolls shown in the illustration. While wire cloth has the advantage over perforated metal for sieving purposes, in many cases the rough or uneven surface of the former has been a great disadvantage. This has been overcome by passing the cloth between heavy rolls to flatten the crowns of the wire. The B. Greening Wire Co. have always done a large amount of this work, and lately, finding the demand for same very largely increased, they installed rolls to take care of the demand for medium weight screens. This proved such a success that the firm were encouraged to put in heavier rolls. These rolls are now installed, and are probably the heaviest rolls to be found in any wire cloth plant on the continent.

The installation of these rolls shown in the illustration marks the completion of a wire weaving plant that is equal to that of any concern in the world making the same class of work.



Heavy Wire Cloth Rolls Installed by the B. Greening Wire Co., Hamilton.

Devices Employed in a Small Railway Repair Shop

Some Ways and Means of Handling Work, as used in the Pere Marquette Shop, St. Thomas, which is a Small Place with limited Labor-Saving Equipment.

By Fred H. Moody, B.A.Sc.

The machine shop, devoted exclusively to repair work, has probably reached its highest stage of development in the railway world, for from the very rough usage afforded locomotives and rolling stock in general, they are constantly undergoing more or less extensive repairs. It is for that reason, that in many cases these railway repair shops have reached the very highest stage of machine shop development. However, even though the very latest and most up-to-date appliances be introduced, from the very great variety of work to be handled, in making difficult repairs, each shop seems to have risen to the occasion and developed its own line of special appliances. This may be readily verified by a trip though any one of the many shops throughout Canada.

The Pere Marquette shops at St. Thomas afford an excellent example of the foregoing, as here rolling stock for both the Pere Marquette and Wabash Railroads, is repaired. In addition, as both these lines do not do a very extensive Canadian business, the rolling stock is not as great as on many other of our lines, with the result that the shops are of only medium size. This fact makes it all the more essential that many devices be improvised to do the work. These conditions have been well met in these shops, of which Mr. Montgomery is master mechanic, and Mr. Griffiths general foreman.

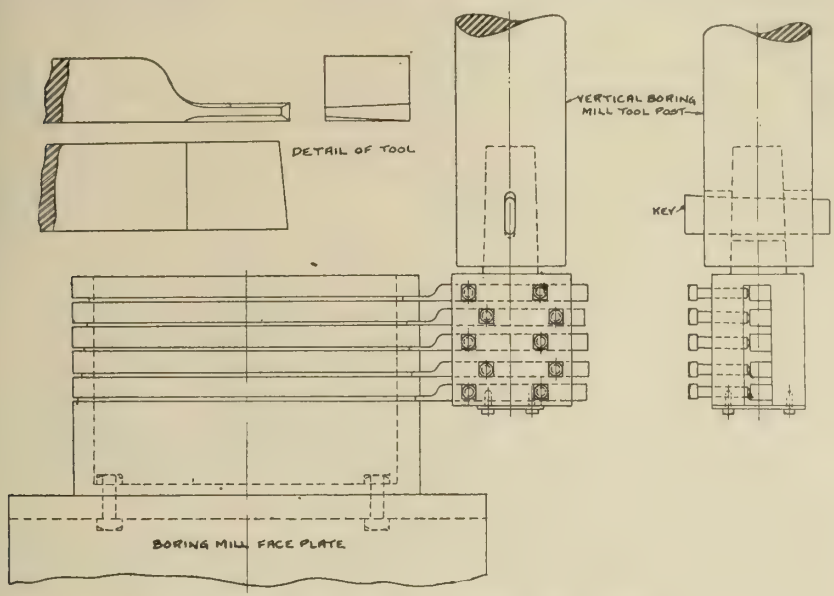


Fig. 1.—Cook Lang Tool for Cutting Piston Rings.

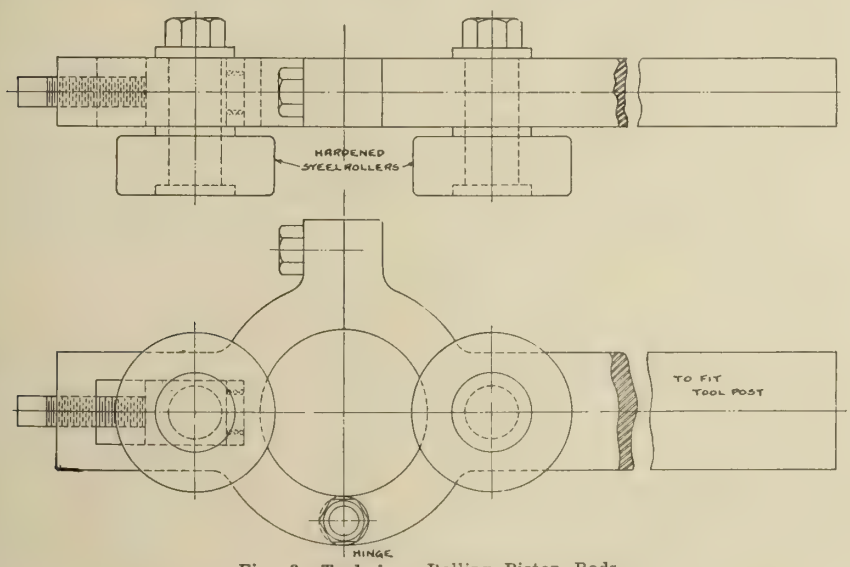

Fig. 2.—Tool for Rolling Piston Rods.

Machine Shop.

This department is well equipped to meet most exigencies; yet, several neat little schemes have been devised and put into use by the foreman, S. W. Cook. Chief among these is a gang tool for finishing up piston rings expeditiously. This is shown in Fig. 1. In design, it is very simple, consisting of a fixture to be attached to the vertical boring mill tool post by a taper shank held in place by a key and therefore readily removable. From a close examination of its construction, a large variety of sizes may be handled, as the tools may be shifted as desired to give the proper width of ring. The strain of the set screws on the tools is taken up by a plate shown at the bottom of the tool. The stock piece requires no comment being of the usual type. It will be noticed that the tools are set, each one slightly back of the one above, so that while the operating cuts are simultaneous, the rings are separated one after the other. Several of these tools are in use in Detroit where it was first devised.

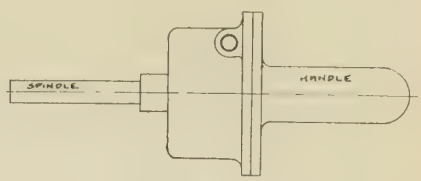

Fig. 3.—Small Air Drill.

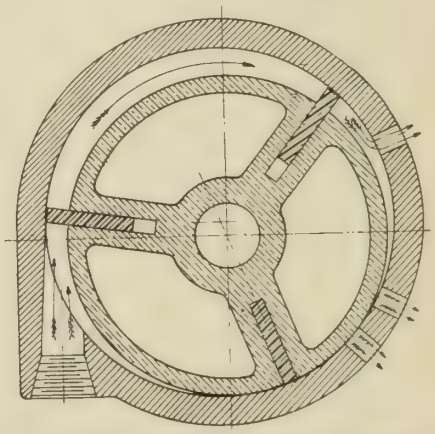

Fig. 4.—Cross Sectional View of Small Air Drill.

Fig. 2 shows a tool, which, while not new in principle, is yet new in its application. It is used for putting a finish on piston rods, after the lathe tool has done its work. As shown, it consists of two hardened steel rollers on an arm which may be attached in the tool post of any lathe. The outer part of the holder is hinged as shown, so that this

portion may be swung back and the tool placed around the piston rod in the lathe. The holder is adjusted perpendicularly to the rod, and shoved up to the shaft until the right hand roller is pressing it, and then the left hand one is tightened on the rod by the set screw shown, the whole tool being first made rigid by tightening up the hinged portion. The rod receives a mirror finish, at the same time in no way interfering with the accuracy of the previous machine work. The same type of tool, with but one roller, is used extensively

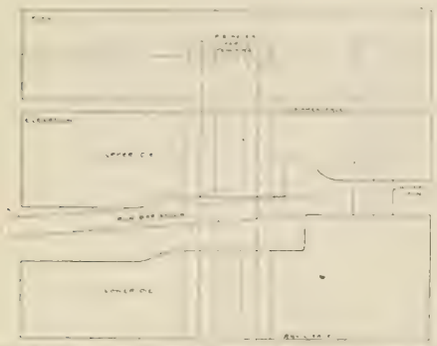

Fig. 5.—Forging the Ends of a Car Coupler Pocket.

in railway shops for finishing coach wheel journals, and similar bearings, as the surface produced is perfect.

C. Trumper, the toolmaker, has made a very neat little air drill which has been found very useful for drilling small holes. This is shown in Fig. 3, and the construction clearly shown in the cross-sectional view, Fig. 4. It operates on the same principle as that used in several recent attempts at producing a high speed rotary steam engine. The shaft is placed excentrically leaving a space on one side. Air impinges against protruding steel blades in the brass rotor, causing it to revolve at an extremely high

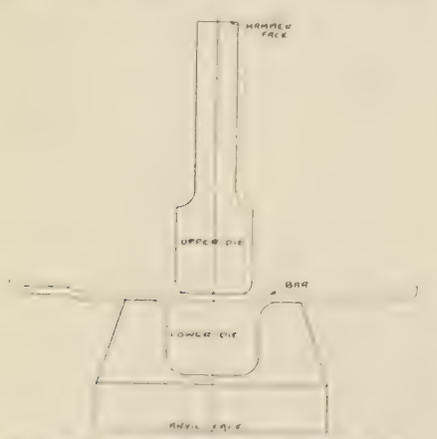

Fig. 6.—Car Coupler Pocket Being Bent.

speed. The air exhausts as shown. The centrifugal force of the revolving blades, keeps them out, requiring no springs for that purpose. While, as previously mentioned, it produces considerable power, it is by no means an economical device, as the air escapes at nearly full pressure, but little allowance being made for expansion. It answers all requirements, which in this case is a more important factor than thermodynamic considerations.

As usual in such shops, there are the usual cylinder boring and crank pin turning attachment for refinishing the cylinder and crank pin without using a boring mill or lathe. The crank pin turning device is one improvised in the shops, for their own services, and is driven as usual through a train of gears, from a motor.

The Pere Marquette and Wabash use different types of babbit piston rod packing rings, the former being made in one piece, while the latter is formed from three specially shaped pieces. These pieces, two of which are similar, are roughly made in a simple little device, an opening die, very easily operated by two levers, around a pin, slightly smaller than the piston rod. They are afterward machined to requirements.

It is customary in making thrust bearings for the locomotive drivers, to first recess the driver hub, and fit in a brass collar, made in two sections, to be placed over the shaft, and then rivet in place, and finish the face. This involves finishing both driver hub, inner face of bearing, and finally the outer face of the latter when completed. Here a different method is employed, saving much of the machine work. The axle with drivers is placed on end and an old piston ring slightly larger than the desired bearing placed loosely around the axle. The hub has previously been roughed out. A small blast furnace holding a small pot, melts sufficient brass for all requirements. This brass is poured into the recess in the hub, and flows out in the vessel formed by the rings. When hardened, the drivers are reversed, and the other end treated similarly, after which the rough brass is finished as required. This process obviates much of the machining otherwise required.

Blacksmith Shop.

Much ingenuity has been required on the part of Mr. Tanner, foreman blacksmith, for the equipment is very limited. Probably the most missed machine, is a bulldozer. The steam hammer, however, has been made to take its place very well, though with nothing like the same rapidity of production. This latter feature is not the important factor in a repair shop.

An example of the many ways in which the steam hammer is made to do the services of a bulldozer is afforded by examining the production of a forging for a car coupler pocket. In general shape, the coupler is like a U, with the arms slightly crimped, and the ends bent in. A bulldozer would crimp, punch and bend the stock, one operation for each end, and then in a third operation, would double into the U shape. A somewhat similar set of dies is here used, the first set shown in Fig. 5. The stock of the requisite length, has the end heated, and placed on the lower die as shown. On top of this is placed the upper die, guided by the guide pin, and in a couple of blows

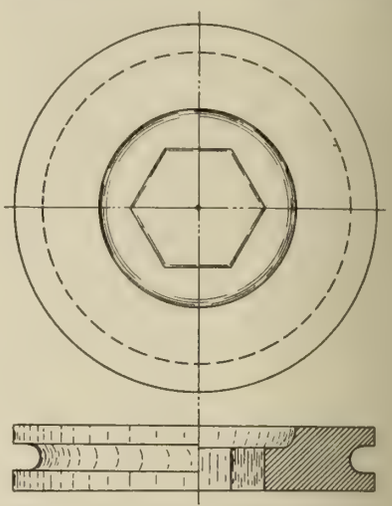

Fig. 7.—Forge Die for Crank Pin Nut.

of the hammer on top of the upper die the end is forged. Pins are next placed in the holes shown, and the bolt holes in the coupler punched through. This operation is repeated for the other end. A similar procedure is employed to bend the ends into the U shape, as shown in Fig. 6. The hammer strikes the upper die, forcing the strap down into the lower die. Careful adjustment is necessitated, as otherwise the ends would be uneven.

The absence of a drop hammer is not seriously felt, as a series of dies, somewhat similar to that in Fig. 7 are used. An ingot of iron or steel as desired, is placed in the die, and hammered under the steam hammer, to

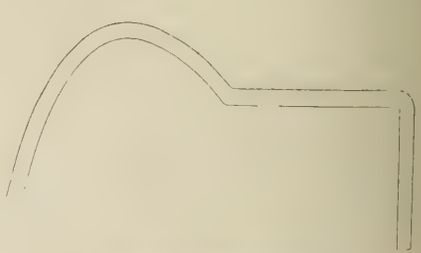

Fig. 8.—Flanging Die.

fill the die. A large variety of drop forge work is done in this way.

It is customary when flanging boiler plates, in the ordinary shop, to use cast iron dies, of the correct curve on which to do the flanging. This process is used at the Pere Marquette shops, and a large variety of dies carried in

stock, but it has been found, that for repair work, to meet all requirements, more dies than they carry would be necessitated. Fig. 8 shows the P. M. method of obviating this difficulty. A 2½"x3½"4 steel bar is bent to a shape, much the same as that shown, the left end forming a series of curves of gradually increasing diameters, on the principal of the French curve used by draftsmen. This has proved a useful acquisition.

The most characteristic feature of the blacksmith shop, showing their ability to improve on conditions, is the method employed for handling frames while forging. Customarily, one crane is used, the frame revolving on a ring in a looped chain from the crane, while the lighter end of the frame is balanced with the heavier by attaching a lot of heavy weights, an inconvenient, and cumbersome operation. In the handling of the frame a small gang of men is required. At these shops two swing cranes are made use of, the frame being slung as before described near either end. These cranes are so placed that the frame may be swung from the fire directly under the hammer, requiring a minimum of help for its manipulation. This feature has proved an inestimable boom for facilitating frame repairs.

Boiler tube repairs are made in a manner similar to that employed elsewhere.

In conclusion, the St. Thomas shops afford an excellent example of what can be done in quite a small shop. It shows how ingenuity can be used to cope with the various exigencies that arise from time to time. The expeditious manner in which the work can be handled is remarkable when it is considered that the shops only have a capacity for handling six locomotives, which is considered quite a small shop.

Joint Meeting of British Institute and the A.S.M.E.

Subjects Discussed by Mechanical Engineers of Great Britain and American Society of Mechanical Engineers at Birmingham and London.

THE Mechanical Engineers of Great Britain and the American Society of Mechanical Engineers held a joint meeting at Birmingham and London, at which a number of important subjects were treated. Two professional sessions were held at Birmingham, the first of interest to railroad men, the second to machine shop men. The third session held in London was devoted to the electrification of railroads. About 700 were in attendance at the convention and besides the professional sessions, these enjoyed trips to points of interest and to the various manufacturing plants in the vicinity of the meetings.

The first paper was on "English Running Shed Practice," by Cecil W. Paget, Derby, England. Running shed is the British term for Round House. Running Sheds in England are two types, those in which the tracks are parallel and those in which the tracks radiate from a turntable. Mr. Pagent described the modern type of shear legs, used to lift a locomotive while removing its wheels. Other features described are the system of keeping stock and supplies, lighting, arrangements for washing out, methods of coaling, ash pits and water softening equipment. The account of running shed arrangements comprehensively covers inspections of locomotives and their parts, running repairs, washing out of boilers, reports on engine failures, cleaning, system in passing engines through the repair shops and assigning them to their drivers, and the study of the results from statistics of the work of the various sheds. This system is that practiced by the Midland Railway, of which the author is the general superintendent.

Engine House Practice

F. H. Clark, Chicago, gave a paper on "The Handling of Locomotives at Terminals to Secure Continuous Operation." It refers to such features of design and equipment as are considered good practice in the United States. A typical engine house is illustrated and described, and different types of coaling stations, sand drying apparatus, water tanks, ash pits and turntables. In contradistinction to English practice, instead of shear legs to raise a locomotive while removing its wheels, it is the custom in the United States to provide drop pits by means of which wheels may be removed and replaced without jacking up the engine. Other details of the engine house construction and appointments are elaborated upon, including the building itself, the pits, heating and lighting, tool equipment, storage of materials for repairs, oil, &c., and means for washing boilers, etc.

Papers on handling locomotives at terminals were given by Frederic M. Whyte, New York, and William Forsyth, Chicago.

Handling Engines

By H. H. Vaughan, Montreal.

This paper discusses particularly the practice of pooling engines. As to whether it is desirable or not depends, in the author's opinion, on whether the engines are engaged in passenger or freight service, and in the latter case on the conditions which exist. He proceeds then to take up these two kinds of service separately, and concludes that in passenger service pooling is objectionable under any conditions, and should be avoided if possible, and that in freight service pooling is advisable if conditions are such that engines cannot be run with assigned crews, and probably on divisions where business is so heavy that 60 engines per day or over are dispatched from the terminal. Where assigned crews can be used on engines the cost of repairs, the amount of fuel consumed and the class of service obtained will all be more satisfactory.

Second Session.

The second session was of interest to machine shop men. An abstract of the papers is here given :

High Speed Tools and Machines to Fit Them.

By H. I. Brackenbury, Newcastle-on-Tyne, England.

After briefly reviewing the history of high speed steel tools and the gradual extension of their use in the 10 years since they were first introduced, the author defines the properties that make it useful and the three general classes in which such steels may be divided :

A, for cutting mild and medium steel.
B, for cutting hard steel.
C, for cutting very hard steel and for use where a sharp and lasting cutting edge is required.

With regard to the power required to remove material, it has been found that more is required for a thin wide chip than for one of double the thickness and half the width, and at high speeds less power is required than at low speeds up to a certain point. It is difficult to lay down rules for cutting speeds, as conditions are so variable and it may be more important to preserve the edge and avoid frequent sharpening than to use the highest allowable speed. The proper cutting angle for a tool is the sharpest which will not break at the edge, as the sharper it is the less power is required. As high speed steel has improved, it has been found possible to make the cutting angle more acute.

On turret lathes the highest class of high speed steel is now being used and in tools with a very sharp cutting angle. In twist drills the steel has been found particularly valuable, increasing the amount of work done in a given time three-fold as compared with tempered steel drills and reducing the frequency of grinding. Generally speaking, full advantage is not taken of the cutting powers of high speed steel.

The author advocates setting aside certain machines for roughing only. Usually old machines have enough power for finishing, and increasing their belt speed, so that they may be run with the back gear in, makes them efficient. Regarding considerations affecting the fitness of machines for the use of high speed steel, it is pointed out that more is involved than the mere ability to remove a large amount of metal in a short time, if such a demand upon it is infrequent, as such a machine is expensive for use on light work and when idle. A machine should be selected with reference of the kind of work it will have to do most of the time.

Objections to cone driven machines are mentioned, and the greater desirability of geared speed changes or var-

iable speed motor drive; also the necessity of accurately cut gears and amply strong feed mechanism. The paper concludes with a summation of the characteristics which should be possessed by machine tools using high speed steel, including roughing lathes, turret lathes, slotting machines, radial drills, milling machines and planers, and is supplemented with tables of data on high speed twist drills, turning tools, milling cutters, etc.

Discussion.

Charles Wicksteed, Kettering, England, agreed with a statement made in the paper that it is a pity more use has not been made of the arrangement fitted to the planers designed by Sir Joseph Whitworth for cutting on both strokes, and referred at greater length to the reversible tool holder, which does away with an idle stroke. Double cutting, he stated, has had a slow growth, but has certain advantages that will mean its more extended use. One use of two tools is to have the leading one cut through the scale, so that the following one enters clean metal. The situation is reversed on the return stroke. The cut is, therefore, divided between two tools. He thought that users of motor driven machine tools will come to realize the cost of power and see the desirability of eliminating an idle stroke. Still he granted the sufficiency in many kinds of work of a planer with quick return motion; for example, where the time of setting tools for double cutting would be a loss of advantage. Both quick return and double stroke have their field of usefulness, and he was pleased that the author had called attention to the advantages of double cutting.

William Lodge, Cincinnati, Ohio, emphasized the fact that high speed in the tool equipment is not the only consideration. How to get the best results from the workmen, route the work through the shop, and kindred provisions for increasing output are equally important. He spoke further of the need of greater attention to system in manufacturing.

The discussion was followed by a paper on "Tooth Gearing," by A. B. Steven, Birmingham, England, and one on "Interchangeable Involute Gearing," by Wilfred Lewis, Philadelphia, Pa.

At the London meeting papers were read by F. W. Carter, Rugby, Eng., on the "Electrification of Suburban Railways;" by H. M. Hobart, London, on "The Cost of Electrically Propelled Surburban Trains;" by W. B. Potter, Schenectady, on "The Economies of Railway Electrification;" by L. H. Pomeroy, New York, on "The Electrification of Trunk Lines," and a paper by George Westinghouse, Pittsburg, on "The Electrification of Railways."

Many Important Topics are Discussed Before C.M.A.

Employes' Compensation, Canada's Patent Regulations and Technical Education were Among the Subjects for Discussion---Officers for 1910-11.

Among the subjects discussed by the Canadian Manufacturers' Association were the following topics of general interest.

Workmen's Compensation.

The committee on Workmen's Compensation reported:

"There seems to be a general tendency to stiffen up legislation on the subject of workmen's compensation," says the report. "There is, of course, no denying the fact that the compensation laws as a whole are in a most unsatisfactory state, whether viewed from the standpoint of the employer or of the employee. While your committee are not in a position to bring in any recommendations, they are inclined to believe that there is a good deal of justice in the contention sometimes put forward that the artisan who works for a wage which is little more than sufficient to support his family, and who, while engaged in his regular occupation, suffers injury through no fault of his own, should be entitled to compensation of some sort without having to fight his case through the courts. They feel, therefore, that the association should be prepared to make some concessions. The tendency, however, on the part of organized labor is to press for legislation which will carry things to the other extreme. If the matter could be compromised by relieving from all further claims for compensation those employers who insure their pay roll up to the extent of a year and a half's wages it would seem as though a solution of the difficulty could be reached, for in that event the cost of insurance could be accurately ascertained by the employer beforehand and provision made for the same, while the employee in the event of an accident would receive the compensation to which he was entitled without having to have recourse to legal process.

Canadian Patent Regulations.

"During the past year it was brought to the attention of your committee that Canada was not a member of the International Convention for the Protection of Industries. This convention, to which most nations belong, has to do with international agreements in connection with patents. For many reasons it seems desirable that Canada should subscribe to this convention, because by so doing any Canadian inventor, on taking out a patent in the Dominion, would automatically secure protection of his invention for twelve months in all other subscribing countries without extra charge. Your committee, with the concurrence of the Council, recommend to the Government that steps be taken to bring Canada into the convention. Thus far, however, nothing seems to have been done.

The subject of Canada's Patent Relations was fully discussed in the July issue of Canadian Machinery.

Technical Education.

The report of the Technical Educational Committee contained the following:—"After six long years of careful planning, peristent effort and constant agitation, all directed toward the one end, it affords your Technical Committee satisfaction to be able to report that the special task assigned them by the Montreal convention of 1904 has at length been accomplished. The committee urged on behalf of the association the immediate appointment by the Dominion Government of a commission of inquiry, with instructions first to ascertain the actual needs of the Daminion in the way of technical education and industrial training, and then to see how those needs could best be met by adapting to Canadian conditions the facilities provided in other countries. In March last the Government made public announcement of its intention to appoint the commission so earnestly desired. About the middle of July the commissioners began their work in the Maritime Provinces, and your committee are informed that it is their intention to cover Canada from the Atlantic to the Pacific. While it is the intention of your committee to prepare for the consideration of the commission a general statement on behalf of the manufacturers of Canada, they wish to take this opportunity of urging every member of the asociation to facilitate the inquiry to the best of his ability."

The following officers were elected for 1910-1911.

President, W. H. Rowley, Hull, Que.

Vice-President, Nathaniel Curry, Montreal.

Provincial Vice-Presidents, T. B. Rogers, B.C.; S. N. Dougal, Que; J. P. Edwards, N.S.; T. R. Deacon, Man.; T. S. Sims, N.B.; Hon. S. L. Haszard, P.E.I.; W. H. Clarke, Alberta and Sask.

Treasurer, George Booth.

OXYGEN WELDING AND CUTTING PROCESS.

When coal is burnt in the air, the heating effect is the result of the chemical combination of the oxygen of the air with the carbon of the coal. The heat developed rises the temperature of the

inert part of the air, viz: nitrogen, as well as the temperature of the gases resulting from the combination with oxygen.

It is obvious that if pure oxygen is used instead of air, the temperature will be much higher, there being no inert as (nitrogen) to heat up. This fact is extensively used in welding by means of blowpipes in which streams of oxygen and combustible gases, hydrogen, coal gas, acetylene and gasoline are mixed and ignited at the nozzle. In the case of acetylene a temperature of above 6,000 degs. Farh. can be easily obtained, and all kinds of metals are quickly brought at the melting point and can be welded up, just like lead in the well know "lead burning" process.

Broken castings of all descriptions (cast iron steel, aluminium, etc.) without any admixture of foreign metals can be easily repaired and made as good as new, and sometimes an enormous saving is done not only in the cost of the repaired part itself, but often on account of the time saved as the repairs can be carried out quickly and saves the time necessary to go through the lengthy process of pattern making, foundry, machine shop, etc.

Besides this very important application, the oxygen welding process is being used in the making of a number of articles, water tight receptacles, pressure tanks of any sizes, tubes of large diameter, welding flanges on tubes, metallic window frames, agricultural implements, bicycles, automobile parts, such as frames, and generally speaking is advantageously use instead of riveting.

The process is so perfect that cracks and corrosions in boilers, (even marine boilers) have successfully been repaired for years, but this work requires specially trained and experienced men.

Another application of the oxygen is the cutting process. Every one knows that red hot iron will burn rapidly in pure oxygen. If a plate of steel or iron is locally heated to redness and a jet of pure oxygen is sent on the red hot spot, in similar way the iron will burn throughout. By moving the blowpipe a clean cut of any shape can be obtained. In this way a cut of one foot long can be made in a ½ inch boiler plate in less than one minute.

The heating flame can be easily produced by means of oxygen and other gases, but the use of oxygen and gasoline enables to have an ideal portable outfit and is the most economical.

By this process, an iron fence which was situated on the Place d'Armes, Montreal, was removed. It was first tried to saw the iron bars, but each cut required at least ½ hour with two men, whereas by the oxygen process each bar was cut in less than two minutes.

This process is used also for the removal of the Quebec bridge debris; as another example we may also mention that it is intended to be used for the removal of a penstock 12 inches diameter and 20 feet long for a Quebec power company.

A liquid air plant for the production of oxygen by the process of the Society "L'Air Liquide" of Paris, France will soon be erected in Montreal.

The matter is now in the hands of Mr. R. J. Levy, 3 Monique St., Montreal, who has a demonstration plant at the above address, and who is one of the inventors of this process. It is intended to form a company to take up the manufacture in every province of the Dominion.

Canada Steel Co. Decides to Locate in Hamilton

Large Steel Mill, Machine Shop, etc., to be Erected for the Manufacture of Steel Shapes, Agricultural Shapes; W. M. Currie, Managing Director.

The Canada Steel Co. have decided to locate in Hamilton where they will spend $400,000 on a large plant and give employment to 300 men. The works will be located on the west side of Sherman Ave., opposite the Atkins' Saw Works.

The Canada Steel Co. was granted a charter by the Ontario Gavernment in May last, while about the middle of June

W. M. CURRIE.
Managing Director of Canada Steel Co., Limited.

the steel merger changed its name from the "Canadian Steel Corporation" to the Steel Company of Canada. To avoid confusion as a result of the similiarity in names the Canada Steel Co. recently offered to change its name to the Colonial Steel Co. if the Steel Company of Canada would pay the cost of a new charter. The offer was not accepted, however.

The directors of the Canada Steel Co. are F. W. Baillie, Toronto, president; R. M. Bertram, Toronto, vice-president; W. M. Currie, Hamilton, managing director; A. L. Malone, Toronto; G. A. Morrow, Toronto.

Mr. Baillie is a member of the financial firm of Baillie, Wood & Croft. He is also a director of the Black Lake Asbestos Co., and prominently identified with many important industrial propositions.

Mr. Bertram was formerly president of the Bertram Shipbuilding Co., and at present is the head of the Collins' Inlet Lumber Co. He is also connected with several other large business undertakings.

Mr. Currie, who will be the manager, was formerly the chief inspecting engineer of the Hamilton Steel & Iron Co., and has been a resident of Hamilton for several years. Mr. Malone is of the firm of Malone & Malone, solicitors, Toronto, and Mr. Morrow is the assistant manager of the Central Canada Loan & Savings Co. In addition to these gentlemen the shareholders include some very wealthy men of Toronto and Montreal.

It is the intention of the company to begin work at once on the erection of its plant. The first building to be erected will be the steel mill. This will be a structure of iron concrete and corrugated iron, 250x70 feet. In addition to this, there will be machine shops, stock shed, etc., and an office building. The plant has been designed by one of the largest engineering firms in Pittsburg.

The Products.

The company will roll entirely from old scrap rails. These rails will be bought from railway companies all over the country. The process used is to break them up into the required lengths, after which they are heated and passed through rolls which split them into three pieces—the head, webb and flange—and finish them simultaneously into different articles, such as bedstead angles, light structural angles, agricultural shapes of all kinds, concrete bars, light plow beams and sleigh shoes. It will be the only mill of its kind in Canada, and many of the articles rolled, such as angles, have never yet been manufactured in this country. The plant will be operated by electric power, special machinery having been designed for that purpose.

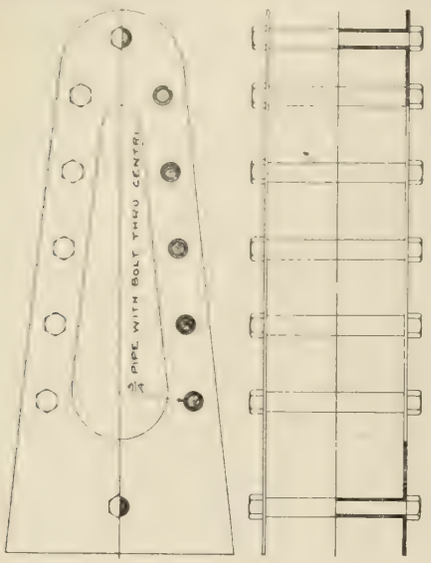
MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

A SHOP FULCRUM.

In a locomotive repair shop, a stand or fulcrum is frequently required to pry up the main brasses, springs, etc. This need has been supplied at the C. P. R. shops, West Toronto, by the simple device shown in the accompanying sketch.

The device consists of two thin sheets of boiler plate of shape as shown. 12 pieces of ¾-inch wrought iron pipe of equal length, and 12 ¾-in. bolts, arranged as in illustration. The pieces of pipe act as distance pieces, while the bolts strengthen and tighten up the same.



A Shop Fulcrum.

This particular stand is about 28 inches high presenting a wide range of fulcrums for various heights. Previous to using this device, which was quite recently made, blocks of wood, piled to the required height were used. It can be readily seen that this presents a much handier and more useful means of doing the work.

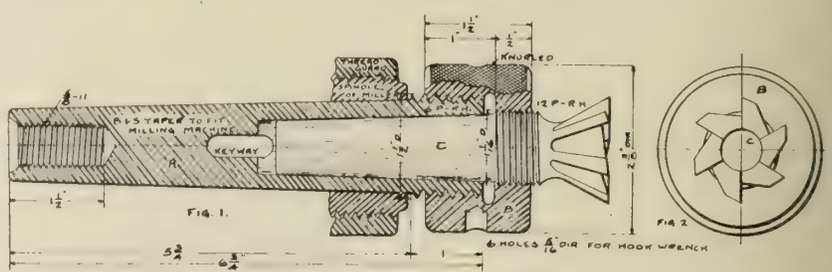
ARBOR FOR END MILLS.*

By "Nene."

I have used many styles of end mill holders, and dovetail cutter holders, in many different shops, but have never used any other that gave such entire satisfaction as the one herein described.

Referring to Fig. 1: A is an arbor made to fit the spindle of a milling machine (in this case a No. 2 Cincinnati), tapped at small end for ⅜ 11 to receive the bolt, which draws the taper arbor "A" into spindle of milling machine, and at the other end is bored taper, and slotted for keyway to conform to Morse Standard Taper No. 3, also "A" is threaded at outer end 1½ dia. and six pitch right hand.

B is the retaining nut, which if turned to the right tightens cutter C in position, and if turned to the left draws cutter C from arbor A. The advantages of this arrangement are: The ability to remove cutter C without removing A from spindle of machine; cutter C is securely held in place, there being no possibilitity of it working loose while cut is on, and thus spoiling a piece of work, and cutter C can readily be removed at any time by turning nut B to the left.



Arbor for End Mills and Dovetail Cutter.

This form of cutters are cheaper to make than the ordinary style of end mills with tang on the end of shank, as we find it costs less to cut the thread than to mill tang on end of cutters.

These cutters require less material than the ordinary form of cutters.

There is positively no need of a tang on end of milling cutters, the key-way in A is only used when using A as a drill holder for drills with Morse Ltd. taper shanks.

To remove arbor A from milling machine, first screw B out a few turns on A, then screw thread guard up against B, then turn B to the right and arbor A will be drawn from the spindle.

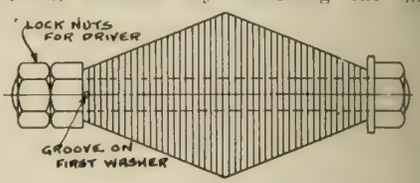
Other details may be readily obtained by referring to accompanying line drawing.

MANDREL FOR COILING SPRINGS.

By Jas. C. Moore.

The following is a shop wrinkle I found very convenient for coiling springs. After being in a fix for some time, as to how a double cone spring could be made, I secured a mandrel of ½-inch cold rolled steel and threaded both ends. I fastened two nuts on one end and proceeded to fill up with washers as per sketch.

A groove was filed on the first washer to receive and fasten the end of the wire. The centre washer was 2½ inches in diameter, turned taper both ways, or to suit the shape of the spring desired. By removing the nut



Mandrel for Coiling Springs.

at end, after spring is coiled, the mandrel is withdrawn leaving the washers inside. These are removed by stretching the spring, thus allowing them to drop through.

POWER AND HAND TUBE CUTTER.

By Frank C. Perkins.

The illustrations, Figs. 1 and 2, show the details of construction and indicate the method of operation of a labor and time-saving tool designed for removing defective tubes from water or fire tube boilers. When driven by power a flexible shaft is connected to the tool as in-

Fig. 2.—Hand Tube Cutter.

Fig. 4.—Power Tube Cutter With Flexible Shaft.

* Arbor for end mills, drills and dovetail cutters is used in a western C.P.R. shop.

dicated in drawing Fig. 3 and illustration Fig. 4, the principle of the operation being the removing of a very small section of the tube instead of forcing the tube apart with the bevel wheel cutter as in the usual practice.

It will be noted that Fig. 1 shows the cutter inserted in tube A to be cut, 11 being the body of cutter which holds the cutter in place in tube and 10 a spindle

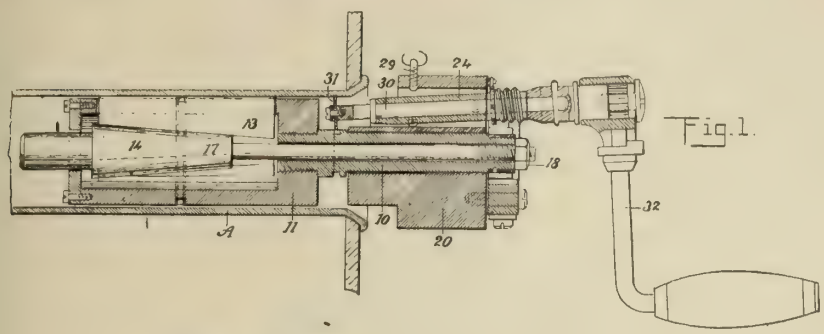


Fig. 1.

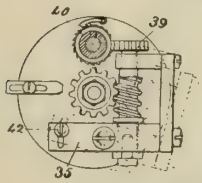

Fig. 3.

Details of Hand Tube Cutter.

attached thereto upon which the cutter head 20, carrying the saw, rotates.

It will be seen that 24 is a sleeve, pivoted at its outer end, carrying the saw arbor 30 and the saw 31 is a small metal slitting saw which cuts the tube. On account of the cutting action of the saw on the tube, the cut being from the outside to the inside leaves the tube with no burr on the outside and does not expand the tube—which will permit the tube being withdrawn through the hole in which it was expanded.

It may be stated that in using the cutter the saw must be down even with outside diameter of body. Then the cutter is inserted in tube so the saw will cut the tube the distance inside the head required. The nut on end of spindle is then screwed up which will clamp the cutter rigidly in tube by means of the conical block and clamping plate. The thumb-screw 42, noted in drawing Fig. 3, is then loosened, the frame 35 which carries worm wheel 39 is swinging out of mesh with 40, after which the thumb screw 42 is tightened.

The cutter is rotated by means of ratchet handle and while so doing the wing nut on side of head is turned to right until the sleeve which carries saw arbor comes in compact with screw on top of head, which will have fed the saw up through the tube.

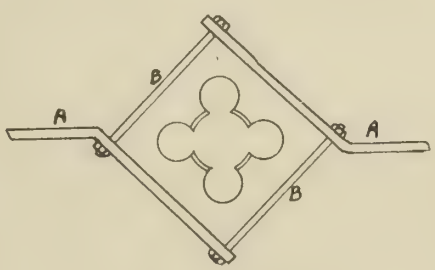
By turning the thumb screw 29 down on the sleeve, it will hold the sleeve rigid, and the frame 35 is swinging so that worm wheel 39 and 40 mesh. By rotating the saw arbor, it will now automatically feed the saw circumferentially around the tube and finish the cut.

After one end of a tube has been cut there should be a round block of wood a little less in diameter than inside of tube, inserted in the end cut to support the tube while the other end is being cut, which will protect the cutter from any damage by the tube dropping down, after both ends of the tube are cut the small pieces of tube are removed and tube can be drawn through the hole.

USEFUL DIE HOLDER.

By K. Campbell.

I had to use a certain size die very often, and as others wanted to use the stock, I fitted up the die holder in the accumpaning illustration. I took two pieces of iron AA, and bent them at about an angle of 45 degrees, as shown.



Useful Die Holder.

I drilled the iron for bolts and put them in as shown at BB.

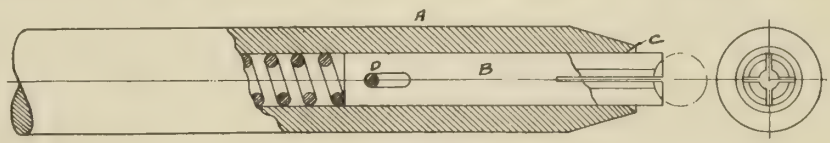
The die is held securely, and is always ready for use. Smaller sizes could be used by using shorter bolts, but I find it convenient to use the home-made die holder on the one die, keeping it ready for immediate use.

BALL-BEARING SET.

For thrust bearings the London Machine Tool Co., Hamilton, use ball bearing plates. These plates are of brass about three-quarter the thickness of the ball diameter, with straight holes, slightly larger than the balls, drilled through. In these holes, the method of setting, in vogue until recently, was to use a pointed chisel, and burr the edges of the drilled hole at four points, on each side, thus retaining the ball, at the same time allowing free play.

A better setting is obtained by the use of the simple little tool shown in the cut. The barrel A should be of cast steel, bored with a hole the same size as the ball to be set. In this hole is a short rod, B, of the same diameter, which is free to move a short distance by a cross pin D in a slot. The lower end of this rod is centrally cupped approximately to the same radius as the ball, and the end split for a short distance. The upper end bears against a coiled spring, which keeps the rod B always extending beyond the lower end of the barrel, about $\frac{1}{8}$-inch. The lower end of the barrel has an annular chisel edge, C, at a diameter about 1-16 in. greater than the ball.

The operation is as follows: The rod B being centrally cupped, centres on the ball when placed on it in the thrust plate, so that the rim C is at a constant distance from the edge of the thrust plate hole when the barrel A is pressed down. A slight blow on the top will spread the metal, forming a burr inside the hole, which, when repeated on the opposite side of the plate, effectively holds the ball in place, at the same time permitting free motion in its socket.



Ball Bearing Set.

It is claimed that by this method the production is increased four or five times, at the same time insuring a much better job than was possible by the old method. A very neat appearance is presented to the finished job.

The road to success is not short, and it is not easy, but it certainly is well worth traveling.

A good executive is a man who can get the thing done without hollering himself blue in the face.

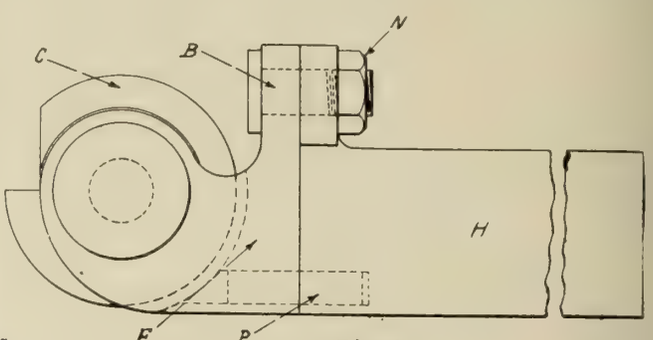

Fig. 4.

Thread Cutting Tool.

THREAD CUTTING TOOL.

By J. H. R., Hamilton.

The accompanying sketch shows a handy tool-holder for cutting threads in the lathe with a single pointed tool.

It is well known that in cutting screw threads on the lathe the clearance of the cutting tool must be ground to an angle corresponding to the angle of the screw to be cut. When there are a number of different threads to be cut having different pitch, and also different angles of advance, several tools are necessary, or as is generally the case, the tool is ground each time to suit the thread being cut.

The device here shown is to overcome to some extent, the usual method of grinding the clearance, or to replace several tools formally used.

In place of the cutter C being held in a solid holder, it is held in a separate fork F, which is secured to the holder H by the bolt B.

Fig. 3 shows the cutter in a vertical position. When cutting a thread, the nut N is released and the fork F revolved on pin P to give the desired cutting angle to the cutter C.

Fig. 2 shows the cutter at an angle of 15 deg. (the limit of inclination in either direction). To determine the angle of inclination, Fig. 5, draw a horizontal line ab, from point b drop a vertical line bo, lay off the circumference of the bolt on the vertical line at bo, and on the line ab lay off the pitch b c ; connect oc. Then boc is the angle of inclination.

Example : Pitch cb equals .25"
Dia. equals ..... 1.5"
Circumference bo=1.05"×3.1416=4.7"

To find the angle:—

$$\text{Tangent} = \frac{\text{side opposite cb } .25}{\text{side adjacent bo } 4.7} = .05319.$$

From a table of trigonometric functions: Tangent boc equals .05319 equals tangent 3.05 degs. equals angle on inclination.

As this solution is somewhat theoretical and might not be understood by some of the readers a more simple method is here given. Proceed as in Fig. 5. With a radius or Fig. 3 describe the arc xy Fig. 5. Then the fork F must be revolved until the centre lines of the graduations are separated by the distance xy.

CORRESPONDENCE.

Comments on articles appearing in Canadian Machinery will be cheerfully welcomed and letters containing useful ideas will be paid for.

Information regarding manufacturers of various lines, with their addresses will be supplied either through these columns or by letter, on request. Address letters to Canadian Machinery, 143-149 University Ave, Toronto.—Editor.

Propeller Wheel.

Give the correct rule to find pitch of a propeller wheel.—Ontario Subscriber.

The "pitch" of a propeller is the distance in which any point in a blade, describing a helix will travel in the direction of the axis during one revolution, the point being assumed to move around the axis. The pitch of a propeller with a uniform pitch is equal to the distance a propeller will advance during one revolution, provided there is no slip. In a case of this kind, the term "pitch" is analogous to the term "pitch of the thread" of an ordinary single-threaded screw.

The following rules are given by Seaton and Rounthwaite for ordinary cases:

$$P = \text{pitch of propeller in feet} = \frac{10133S}{R\ (100-x)}$$

in which S=speed in knots, R=revolutions per minute, and x= percentage of apparent slip.

$$\text{For a slip of 10 per cent, pitch} = \frac{112.6S}{R}$$

Another formula for pitch, given in Seaton's Marine Engineering is

$$P = \frac{C}{R}\sqrt{\frac{3\,|\,I.H.P.}{D^2}},$$ in which C=737 for ordinary vessels, and 660 for slow speed cargo vessels with full lines.—Editor.

Addresses of Correspondents.

A number of questions have been asked without giving the name of the correspondent and his address. There have also been several articles for the "Methods and Devices" Department without the names of the contributors. The names should always be given though not necessarily for publication. —Editor.

Keying Locomotive Eccentrics.

We are running British locomotives and I find that those of the most modern tpye have the eccentric keyed in a different position to those of the older type. Those of the modern type are keyed almost parallel to the arm of the big end and those of the older type are keyed just the opposite. Can anyone say why?—Jos. Arthur.

POWER GENERATION AND APPLICATION

For Manufacturers. Cost and Efficiency Articles Rather Than Technical. Steam Power Plants ; Hydro Electric Development ; Producer Gas, Etc.

CARE OF PNEUMATIC TOOLS.*

By J. H. Simons.**

It is doubtful if any piece of machinery pays a greater profit on its investment or cost than a pneumatic hammer or a pneumatic drill kept in good working condition, yet it is equally doubtful if there is any piece of high speed machinery so much abused by neglect to properly clean, oil and renew worn parts, which condition retards the full admission of air to all the parts, interfering with free movement, and rapidly cuts down the efficiency and capacity of the tools. Pneumatic tools, like all other high class machinery, must receive proper care and lubrication to give the best results. One of the most important factors connected with their proper care is to keep them clean and well lubricated. All pneumatic tool companies should proportion and construct their pneumatic tools in such a way that none of the parts will break from actual service unless some part is defective and escapes the different inspectors' notice at the factory, which is liable to happen once in a great while in the most up-to-date and best regulated plant in the world, but if a wood boring drill, or a metal drill, is improperly applied ; that is, used on other work than for which it was designed and built, or overloaded by forcing it beyond its rated capacity, something may happen. For instance, if a drill is constructed to drill 1¼ in. holes and is used for drilling 2 in. or 2½ in. holes, then that something may happen.

It is reasonable, to expect, and it is a fact, that in pneumatic tools, as in all other high-speed machines, the rapidly moving parts will wear in time—the pistons, ball races, balls, throttle valves, etc., in pneumatic drills, and the throttle levers, bushings, valves, pistons and cylinders on pneumatic hammers, and when the wear is sufficient to prevent the full and free admission of air, or the escape of air by leakage past a worn part, it reduces the efficiency of the tools, and the part, or parts, should be removed. If this is done the machines will maintain their efficiency indefinitely.

Needs Lubrication.

The greatest abuse, therefore, to which pneumatic tools can be subjected is the failure to properly clean and lubricate them. An almost universal feeling seems to predominate on the part of operators that a pneumatic tool should run and develop its full power so long as all the parts are held together, without any regard to cleaning, oiling or tightening up. The cleaning and oiling of pneumatic tools should not be delayed until they stop working on account of dirt, rust or gummed oil. THEY SHOULD BE THOROUGHLY CLEANED WITH KEROSENE OR BENZINE ONCE EVERY TWENTY-FOUR HOURS, as the air taken into the compressor generally contains some grit or dust. It is almost impossible to prevent this foreign matter entering the working parts of the tool, thus causing the parts to become clogged and rendering the tool inoperative. A good plan in such cases is to thoroughly clean by pouring benzine or kerosene freely into the throttle handle. This dislodges all foreign matter and cuts the thick oil, which can be removed by blowing the air under pressure through the tool, then lubricate in like manner with a good quality of light body oil. Sewing machine oil or a winter strained lard oil is very good. Heavy oils should never be used on pneumatic hammers or piston drills, as they cause the tool to work very sluggishly, with consequent loss of power. However, heavier oils should be used on the rotary type of drills.

When Not in Use.

When pneumatic tools are not in use it is a very good plan to keep them immersed in kerosene. They should be suspended so that the dirt and foreign matter will settle to the bottom of the vessel and then be thoroughly blown out and well lubricated before being put into operation, as kerosene leaves them dry. It will well repay any user of pneumatic tools to keep the inside of pneumatic tools as clean and well-oiled as a sportsman would his gun. We advocate, especially where the air is usually laden with foreign matter, the use of strainers on the tool and filters in the pipe line, arranged so that they can be readily taken apart and cleaned. A good form of pipe line filter is two cast flanged pieces properly tapped and threaded to fit the pipe line, bolted together, with a piece of gauze or fine mesh wire screen between. This can be made in any railroad shop. There are also sundry makes of automatic oilers for pneumatic tools, which are placed in the hose line a short distance from the tool, and which can be refilled at any time without disconnecting the tool from the hose line. They are made in sizes to supply oil for from six to eight hours without refilling.

Use Proper Pistons.

Another abuse, especially with regard to pneumatic riveting hammers, is a rapidly increasing tendency on the part of operators, particularly where the hammers are used in construction of steel cars and in structural steel shops, TO USE PISTONS SHORTER THAN THOSE ADOPTED BY THE MAKERS AS STANDARD, THIS IS THE MOST FLAGRANT ABUSE TO WHICH A RIVETING HAMMER CAN BE SUBJECTED, and I cannot too strongly condemn this practice. The riveting hammers are designed with parts properly proportioned to meet the requirements of the various classes of work to which these tools are adapted. Workmen have discovered that a shorter piston than the one furnished with the hammer increases the number of blows per minute and for a time facilitates their work.

They usually make these pistons by grinding down a broken standard piston, thus removing the hardening in a large degree, and leaving the striking part softer than it should be. These short pistons have a tendency to crumble, and the broken parts cut the inner casing of the cylinder, and if it is not damaged beyond repair from this cause it is only a question of a short time when the cylinder will crack or the handle will be broken.

When cracked cylinders, broken handles and rivet sets are experienced hammer should be carefully examined to ascertain whether or not the workman has substituted a short piston and this can only be done when the hammer is in service, as it has been found that the workmen carry the short pistons with them and make the exchange after taking the hammer out of the tool room, replacing the proper diston when returning the hammer at the close of the day.

In some of the large manufacturing plants hammers have been discovered working with a short stub of a piston not more than two inches in length, ground conical on the striking end, and the managers of these plants have issued instructions making it an offense punishable by discharge where such

** Of Ingersoll-Rand Co., Toronto.

conditions are found. One of our largest industrial organizations, operating some eight or ten plants, inaugurated about a year ago a system for keeping a thorough inspection and record of pneumatic tools from the day of purchase until they had become obsolete or worn out. A record is kept of every item of repair made to a tool and a report is filed showing why the repairs are made necessary, that is, whether from abuse, lack of care, bad hose, natural wear and tear, or accident. The mechanical engineer in charge recently informed me that in looking over the report for first six months he was greatly surprised to find that about 30 per cent. of the causes of repairs could be directly attributed to neglect in cleaning and oiling and about 15 per cent. to the use of inferior hose.

Importance of Air Pressure.

Another important factor to be considered in the getting of the very best results out of pneumatic tools is the air pressure. We have found after a very careful and paintaking investigation that, so far as the air pressure is concerned, ONE SHOULD HAVE BETWEEN 90 AND 100 POUNDS OF AIR TO GET THE BEST RESULTS. THE CANADIAN GOVERNMENT WILL NOT ACCEPT STEAM TIGHT RIVETS DRIVEN WITH PNEUMATIC HAMMERS UNLESS THESE HAMMERS ARE OPERATED BY 110 POUNDS AIR PRESSURE. All pneumatic tools can be operated on less pressure, but you will find, as I say that 90 to 100 pounds of pressure will give the best results.

Suggestions.

In conclusion allow me to offer A FEW SUGGESTIONS APPLYING TO ALL MAKES OF PNEUMATIC TOOLS, WHICH, IF FOLLOWED, WILL INSURE YOU MORE AND BETTER WORK FROM YOUR EQUIPMENT and will obviate delays and annoyances and minimize the expense of maintenance.

First, see that the tools are well cleaned and oiled before putting them in operation.

See that the pipe lines are thoroughly blown out before connecting the tool.

Use the best quality of air hose. It is cheaper and more satisfactory in the long run.

See that your pipe lines are provided with filters or that strainers are used with the tools, preferably both.

With drills, adjust the ball-bearings, where they are provided, so as to take up the lost motion, and be sure that they are firmly held by the lock nuts to prevent working loose or tightening up and binding when in use.

With your pneumatic hammers be sure that the handle is always on tight, as the tools may be seriously injured by allowing this to work loose. This controls the joint between the handle in valve box and is of great importance.

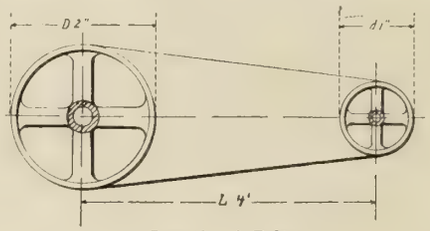
See that the operators hold their riveting and chipping hammers firmly against the work. If the die or chisel is allowed to play in and out of the hammer while in operation it will seriously damage the tool. Every blow should be delivered on the die or chisel and not on the forward end of the bridge of the cylinder in chipping hammers. With riveting hammers, which have no bridge in the cylinder, it often means the loss of the die and piston by being shot out of the tool. Besides, in structural work it makes it dangerous to pedestrians in streets and thoroughfares below. There is no way of protecting against injuries of this nature except by care on the part of the operator.

See that the chisel and rivet sets fit properly in the nozzles and are of proper length, otherwise there is an opportunity for loss of power and injury to the tool.

LENGTH OF BELT.

By S. H. W., Sackville.

A simple method of finding the required length of belt for open-running



Length of Belt.

pulleys not in position can be approximately obtained thus, where:

D=dia. of the large pulley in ins.
d=dia. of the small pulley in ins.
L=distance between shafts in ins.
B=length of belt in ins.

$$B=3\tfrac{1}{4}\left(\frac{D-d}{2}\right)+2L=12.875 \text{ ins., or } 12\tfrac{7}{8} \text{ ins.}$$

STEAM CONSUMPTION OF COMPRESSORS.

Suppose that a compressor is required to compress 500 cu. ft. of free air a minute, delivering to a receiver at 100 lb. gage. A two-stage machine of that capacity will require approximately 92 i.h.p. to perform the work. Now, while the best straight line compressors are furnished with Meyer valves, they are usually set by the operator to cut off constantly at about three quarter stroke, and with such setting they will require on an average 45 lb. of steam per horse power hour, while Corliss duplex machines with cross compound steam cylinders will do the work with 15 lb. of steam or less. There is not only thus a saving of two-thirds of the coal consumption, but also a corresponding reduction of boiler plant, and the labor and other cost of its operation.—Compressed Air Magazine.

OBITUARY.

General regret is expressed at the death of Miss Dorothy Hobson, daughter of Robert Hobson, general manager of The Steel Company of Canada, Hamilton. Her death was the result of an unfortunate automobile accident.

Hugh McCulloch, Sr., president of the Goldie & McCulloch Co., Galt, Ontario, died on Saturday, September 3. Mr. McCulloch was born in Scotland in 1826, and was in his 84th year. He came to this country when a boy, and had been a resident of Galt, since 1850. He started work for James Crombie in 1851 and in 1859, with the late John Goldie, they purchased from James Crombie the Dumfries foundry, a small institution employing 22 men. At first general foundry work was done, but as the business grew the firm went into the manufacture of boilers, engines, flour and sawmill machinery and wood-working machinery. Thirty-one years ago, the firm went into the manufacturing of safes and vaults, in which department great success was achieved. The advancement of the trade led to a joint stock company being formed in 1891. In 1896 Mr. Goldie died, and his son, A. B. Goldie, took his place, and is to-day manager of the works. He is survived by two sons and one daughter, Hugh McCulloch, Jr., vice-president, and R. O. McCulloch, secretary-treasurer of the firm, and Mrs. Shearson, of New York, and one brother, George, of Souris, Man.

George Archibald Bain, superintendent and a director of the Bain Wagon Works, died recently. The Bain Wagon Works were established in 1882 by George A. and his brother, John A. Bain.

PERSONAL

E. Crabtree, for many years a machinery representative of H. W. Petrie, Ltd., Toronto, leaves on Oct. 14 for England, on a business trip for the purpose of appointing agents for machine tools, etc., and for companies desiring foreign connections. He will also secure additional agencies for the H. W. Petrie Company.

Wm. Brown, for some years connected with the Canada Iron Corporation at Londonderry, lately as manager of the steel plant, has severed his connection, and is succeeded by Leo. G. Smith, formerly of the Bucyrus Steel Castings Co., Bucyrus, Ohio, and recently superintendent under Mr. Smith.

SAVING CENTS.

By R. Ewart Cleaton.*

There is an old English saying, "Look after the pence, and the pounds will look after themselves," and this as surely applies to cents and dollars, as to any other currency. The following little items will tend to effect econo-

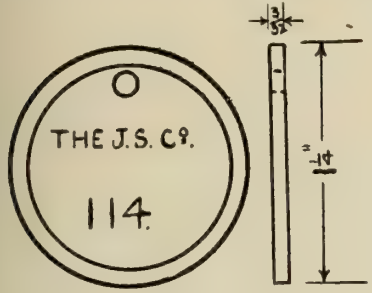


Fig. 1.—Saving Cents.

mies, which although perhaps not noticeable in a direct manner, will be very evident by the increased output, and efficiency, occasioned thereby. Doubtless there are many up-to-date plants where these ideas are in operation at present, but there are plenty of others where there is great need for improvement.

When a shop is run on the piecework or standard time system, a great deal of bad feeling and unnecessary irritation is caused if the men are obliged to wait about for work, between jobs, or for the necessary tools to perform that work. THIS CAN BE AVOIDED BY HAVING AN EFFICIENT ROUTING SYSTEM, AND A WELL EQUIPPED TOOL STORES, TO WHICH ARE ADDED DRAWING AND JIG STORES.

As the former has been dealt with to a great extent of late, I will confine myself to the three latter.

These should be situated in a central and accessible position ; articles should be issued only in exchange for a brass check (Fig. 1) with the name of the person and the number of the workman stamped upon it ; a list of the names, and numbers of the workmen being kept by the storekeeper, the tools, jigs, and drawings, already issued, can be easily located. In the case of small tools, gauges and drills, which are kept in sub-divided drawers, the checks are put into the division from which the article has been removed, whilst for those tools kept on shelves or racks, a black painted board or series of boards are used ; these have a number of hooks, on which the checks are hung, underneath the name and size of the tool, which are either painted on permanently, or temporarily written in with chalk. Jigs should be treated in a like manner, although in the case of large and heavy ones, it is preferable, when they are used by only one special machine, to leave them in some convenient place nearby, when not in use.

ALL JIGS SHOULD BE STAMPED WITH THE DRAWING AND PART NUMBER OF THE ARTICLE FOR WHICH THEY ARE INTENDED.

Drawings should be of standard sizes, and mounted on heavy cardboard, which, although pliable, will not buckle or crack.

The life of a drawing is lengthened by applying a coat of varnish or shellac, the latter is preferable as varnish is liable to become sticky.

As it is usual to place all parts destined for a similar purpose under the same group number, this, together with the number of the drawing, should be stencilled on the top back left hand corner, in large black letters on a white background, Fig. 2. If the drawings are then kept in their respective groups, and numerically arranged to stand on end in racks, it is a very easy matter

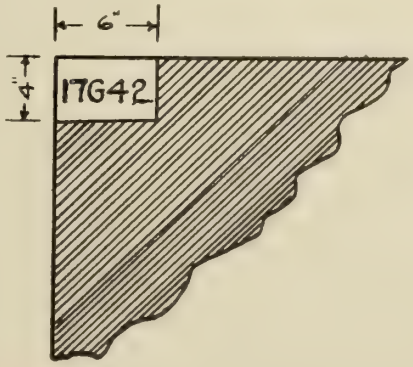

Fig. 2.—Saving Cents.

to quickly find the required one, after having ascertained by referring to the board that it is not already issued.

These matters may appear insignificant in themselves, but when taken as parts of a system will be found to be instrumental in saving innumerable cents (the dollars will look after themselves !) when the time saved by the storekeeper in issuing, and that of the user of the articles, is taken into consideration.

In order to turn out good work, accurate tools, such as calipers, squares, feelers, etc., are necessary, and to encourage and stimulate the possession of these by the workmen, an offer of a discount on the catalogue price will be found to be efficacious. This can be done without cost to the management, by the tool room foreman obtaining the shop agency for any well-known firm of small tool manufacturers ; the tools can then be supplied to the employe at the cost at which they are obtained from the makers. The latter will usually be willing to furnish a showcase containing an assortment of the tools made by them, which can be hung in a prominent place, in order that any intending purchaser may see exactly what he is ordering.

IN CONCLUSION, I WOULD LAY STRESS ON THE ADVANTAGE OF KEEPING THE STORES SPICK AND SPAN, AND THE TOOLS IN GOOD CONDITION, AND FREE FROM RUST OR DUST, which will not only have the effect of conveying a good impression to visitors passing through the works, but will also cause the employes to whom the issue is made to return the article for which he is responsible, whilst it is out on his check, in a condition similar to that in which it was given out, allowances of course being made for wear and tear.

ROUTING SYSTEM.

By F. H. M.

The system in use by the McLaughlin Carriage Co., Oshawa, for following up the various parts that enter into the make-up of an automobile, buggy, or cutter, is one that might readily be adapted to the sorting of machine parts that are made in large quantities.

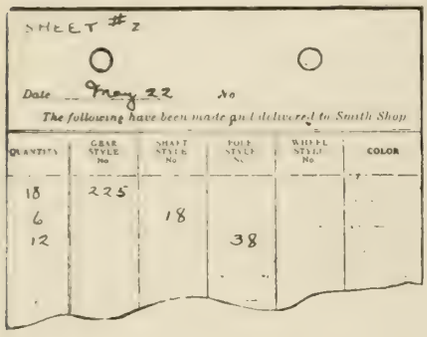
While the system is not exactly new, being somewhat similar to a couple of other systems in use on factories pro-

* Of the piece work and shop methods department, C.P.R. Angus shops, Montreal.

ducing similar lines, yet it contains points of such merit as to make a brief description of the system of interest.

The order, which first reaches the business office, has an abbreviated typewritten copy on plain paper, sent to the timekeeper's office, the order reading somewhat as follows: No. 275, black; red; meaning vehicle catalogued as number 275, black body, and red gear, shafts, etc. Now each numbered vehicle is made up of a certain number of standard parts, such as body, gear, etc., each with its own particular number, these parts being in many cases interchangeable in the different sizes of vehicles.

The clerk takes several of these business office orders, and figures up how many bodies No. 225 say, are required,



SHEET #2

Date May 22 No

The following have been made an Delivered to Smith Shop

QUANTITY	GEAR STYLE No	SHAFT STYLE No	POLE STYLE No	WHEEL STYLE No	COLOR
18	225				
6		18			
12			38		

and also all the rest of the body sizes as well as the other parts. As the body affords a typical example, it will be taken as an example. These quantities for body style No. 225 are entered under "Orders Received" on sheet No. 1, which is part of a loose-leaf book system. The respective colors are listed as shown.

At the same time that the orders are being subdivided as just explained, tags similar to the one shown are made out, the order number and color of the job being inserted on the tag at the top, and the style in each of the places shown. Orders in multiple are made, and sent, one to each foreman, while the wood-shop foreman in addition receives a set of tags, one for each body. As each body is made the workman attaches the tag, and tears off the lower right hand corner, and sends into the office all of those collected in a day with his time slip, thus giving the paymaster a check on each man's work. The foreman at the end of the day figures up how many had been made, and fills in sheet No. 2, which is sent to the office, and the embodied figures inserted on sheet No. 1, under "quantity made."

As the body progresses through the various departments, on the completion

Body No 35549 Style No 225 1st Color	Body No 35549 Style No 225 Rub Out Rough Stuff
Body No 35549 Style No 225 Last Rough Stuff	Body No 35549 Style No 225 Smith Dept
Body No 35549 Style No 225 Lead	Body No 35549 Style No 225 Wood Dept

of the various operations, a tag is torn off, and sent back to the office. Each night, the tags from the different departments are entered on sheet No. 3, giving the date each body completes the various stages of its progress up to the time it is shipped.

This in substance gives the system in use. The most valuable features of the system are the absolute records kept of the progress of the work, and the fact that at no time can a double charge be made, which is a desirable feature in a piece-work system.

This system with some changes might be used following up operations for such articles as cream-separators, type-writers, small gas engines, and other machines that are produced in quantities. According to the superintendent the system works to perfection.

SHELBY STEEL TUBES

An interesting catalogue of Shelby Steel Tubes has been issued by John Millen & Son, 321 St. James St., Montreal, in which the manufacture of steel tubes for various purposes is fully described as well as their applications.

Another part of the catalogue is devoted to Hoffman Steel Balls and their application to bearings. Coventry chains forms another interesting chapter.

The remainder of the catalogue of 150 pages contains valuable data on hoists, trolleys, steel poles, railway supplies, including trolleys, headlights, etc. This catalogue will be sent free to any address on request.

NEW COBALT MACHINE SHOP.

The machine shop, up till recently run by C. F. Bonsall, has been taken possession of by W. R. Sweet, of Midland, who foreclosed on the property. The intention is to enlarge the present plant, and add a foundry, and make a specialty of repairing mining and other machinery, as well as manufacturing a line of hoisting engines. Mr. Sweet's experience in the last three and a half years as mechanical superintendent of the Nipissing mines, and a year previously with the Canada Copper Co., Sudbury, and nine years marine engineering shop work, all make for a good beginning to this new venture.

Vol. VI. October, 1910 No. 10

THIS love of one's work is at the root of all success. The proportion of successes to failures in business life is in a very decided minority, and if we reckon the partial failures and the milk-and-water successes, the ratio dwindles. Success to a marked degree can only be obtained by the man who is really in love with his work. It is not sufficient to be content or fairly well satisfied with the returns of one's work, or to make just enough effort to keep out of trouble. Big dividends will never be made or big businesses built up if one regards work as a necessary evil, something to be endured and forgotten at the earliest possible moment or when the shutters are down. Show me the man who is really in love with his work, his business, his profession—his *job*—and you will point to the man who is bound to rise to success by reason of his enthusiasm, his vitality, his imagination, and his breadth.—*George H. Frost,* in the *Organizer.*

WORKMEN'S COMPENSATION

For a number of years Candaian Machinery has carried on a campaign for the protection of machinery and thus the elimination of a large number of industrial accidents. We recognize that accidents will happen, and, unfortunately, they are often attended by loss of life or limbs. If an employer was generous he made a position for the maimed workmen or provided for the widow and family. Sometimes the workman or his family made use of the courts but as companies with large capital at their back could appeal decisions and carry cases beyond the means of workmen, the final decision inevitably resulted in favor of the company.

In view of the above, therefore, it is gratifying to note that the Canadian Manufacturers' Association is taking cognizance of the workmen's claim for consideration and are trying to find a remedy for the conditions that now surround workmen. The Association suggests that

> "If the matter could be compromised by relieving from all further claims for compensation those employers who insure their pay roll up to the extent of a year and a half's wages, it would seem as though a solution of the difficulty could be reached that would be satisfactory to both sides, for in that event the cost of insurance could be accurately ascertained by the employer beforehand, and provision made for the same, while the employee in the event of an accident would receive the compensation to which he was entitled without having to have recourse to legal process. This arrangement, of course, presupposes that the employee would insure himself for an amout equal to that carried for him by the employer, so that in the event of fatality his family would receive the equivalent of three years' wages, which is generally conceded to be about right."

No doubt if an arrangement can be arrived at, it will help to remove any hard feelings existing between capital and labor on this account. A voluntary system of compensation might work satisfactorily in certain cases but in others, it would require the strong arm of the law to enforce workmen's rights. The question is one that could be dealt with by either the Provincial Governments or the Labor Department of the Dominion Government, to advantage.

ARE WE OVERDOING THE MERGER IDEA?

Canada will get no good from an undue development of the merging tendency. The last few years, and especially the last few months, have witnessed a remarkable increase in the number of industrial consolidations. Most of them will undoubtedly work to Canada's advantage but some of them are destined to have careers that will bring no particular credit upon this country. This does not imply that there will be failures of these amalgamations, but the progress of many of them is unquestionably to be very tedious and many shareholders both at home and abroad will be long disappointed before they begin to receive the returns expected.

There is of course nothing wrong with the merger principle. Important economies in managements, freight charges, selling costs and the like are usually achieved by the properly conceived and executed merger. The trouble at the present time is that in some cases it has been taken advantage of by certain promoters who are bringing industries together in a way and on terms which are utterly unjustified. The interests that bring about the consolidation sometimes have only their own profits in consideration. This leads to entirely too high prices being paid to the merging organizations, the new company becomes loaded up with capital obligations which for many years cannot be made to represent real assets. The Dominion has everything to gain from consolidations of its industrial interests which will enable them to meet the rapidly-growing needs at home and to compete vigorously for the business to be had abroad. It cannot afford, however, to mortgage its manufacturing and trade future through the multiplication of amalgamations for which there is no economic justification.

THE DOMINION'S FINANCIAL POSITION

The statement of the condition of the Dominion's finances as at August 31st, 1910, appeared in the Canada Gazette of September 10th. The loan accounts show a pleasing decrease of almost $18,000,000, in Funded Debt Payable in London, and of over $7,000,000 in temporary loans, as compared with Aug. 1909. The large volume of business being done in the country is reflected by a $11,000,000, or a 14 p.c. increase in Dominion notes in circulation, while the Bank Circulation Redemption Fund also reflects the same condition with an increase of some $200,000 over the corresponding period. The same tendency, as for a long time back, is shown in the position of the Government Savings Banks, which show a further decrease of almost $1,000,000 in a total of $58,000,000, as compared with August a year ago. It is evident that the public are becoming more and more aware of the fact that it is better policy to place their deposits with the chartered banks where the funds are available for the general commercial uses of the community. Miscellaneous and banking accounts are practically double last year's figures, which makes the gross debt practically $1,000,000 larger than a year ago, the total now being $472,141,823.88. On the Assets side, Sinking Funds are corresponding to the smaller Funded Debt, also very much lower than in August, 1909. The figures are respectively $15,200,000 and $39,200,000. The month just closed shows a decrease in total net debt of $1,270,000, the present net indebtedness of the Dominion being $327,345,552.16, or some $46 per capita.

The much larger volume of trade of the country is indicated by the Customs receipts, which for the month were $6,500,000, as against $5,300,000 last August, the total to August 31st being $29,566,000, against $23,283,000 for the first eight months of 1909. Excise duties are also about 25 p.c. higher this month, while in Public Works expenditure practically a similar increase is shown over a year ago. Capital Expenditure on Public Works, including railways and canals was for the month $3,200,000, or a total for the year to date of $8,500,000. These are in contrast with $2,450,000 for last August and $7,300,000 for the year to August 31st, 1909.

The total revenue for the month just passed is $10,174,930 or $1,705,082 more than for the same month in 1909, while the expenditure for the month is $66,000 less than last year. For the year to date the total revenue has been $45,830,370, against $38,500,000 last year, while the expenditure to September 1st this year is $27,546,017, which is only $1,192,838 more than for the same period last year and $18,284,353 less than the revenue.

SCIENCE AND INDUSTRY

At the British Association meeting, held recently at Sheffield, a paper was read by Mr. R. Blair, M.A., B.Sc. (Education Officer, London County Council) on "The Neglect of Science by Commerce and Industry," in which he brought forth several unsolved problems, the result of twenty-five years of research.

Mr. Blair contended that our locomotive engines are not designed or constructed upon scientific and economic principles; and that the "rule-of-thumb" positively prevails in that industry almost as much as in any other, to the danger of the general travelling public.

The "rule-of-thumb" methods are usually an evolution of some other methods previously used, no employe having the desire to work out for himself from a scientific standpoint the rules applicable to a particular case. Other unsolved or neglected problems were also presented by Mr. Blair which should receive the attention of manufacturers:

"The co-efficient of friction between the driving wheels and the rails being known, I do not think there is a living locomotive engineer or professor who can graphically and correctly determine the limit of an angle of repose of the driving wheel of an engine with, and without, trailing wheels.

"The scientific world has hitherto failed to produce a text-book showing how to determine the mechanical effect of the draw-bar pull upon the wheel-base of an engine and how it affects tractive effieiency.

"The vast industry of carriage and wagon building has not one practical or scientific man who knows how to graphically and scientifically suspend a vehicle upon its wheel-base. Although every builder knows full well that one vehicle runs much easier than another of the same weight, differently suspended, yet no one seems to know how to resolve and explain the responsible forces.

"The automobile—I do not know of the existence of any engineer who knows how to determine the limit of the angle of repose of the driving wheels of an automobile on different conditions of roads and grades, etc."

A remedy is suggested which, it is hoped, will increase the knowledge of forces, etc. "Teachers of elementary mechanics should begin to interest their young students by a clear and simple explanation of the mechanical and physiological forces which are brought into play in all their pranks and sports, for, when they become informed of all the forces which they themselves are exerting they will proceed to practical experiments, devising and constructing all manner of things according to their own views and abilities."

A good method for removing rust from steel is to first rub the object with sweet oil, and then after a day or two, rub it with finely powdered unslacked lime until the rust disappears. Then give it again a coating of oil with a woolen cloth, and put it in a dry place.

* * *

If a punch, reamer or other tool is to be hardened, and the color resulting from that process is undesirable, it may be removed by the following simple method: After the part is hardened, dip it into a glass filled with muriatic acid and allow it to remain for five seconds; then plunge it into a pail of water. In this way the polish of the steel will return and the temper will not be affected. This method is much quicker than obtaining a polish by the use of emery cloth.—Machinery.

* * *

The following recipe for a non-shrinking alloy was recently published in the Metal Industry: Tin, 50 pounds, and zinc 50 pounds, gives a tough, hard metal that runs well. It is improved by the addition of 2 pounds of bismuth. By the use of heavy sprues, and by pouring cold, the slightest shrinkage may be largely overcome.

* * *

According to a paper read before the Pittsburg Foundrymen's Association, large patterns made of concrete reinforced with wire have been successfully used in a foundry at Niagara Falls, N.Y. The cost of these patterns is very much less than that of ordinary wooden patterns.

* * *

According to the Brass World, an aluminum alloy containing an average of 96 per cent. aluminum, 2.5 per cent. copper, 0.75 per cent manganese and 0.75 per cent. silver can be rolled and drawn and is then much stronger than pure aluminum. The rolling may be done either hot or cold.

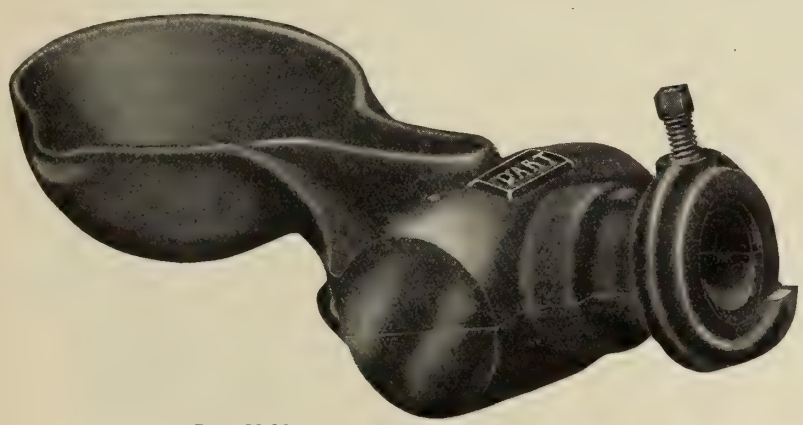
DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

DART HAMMER MOLD.

Every mechanical man knows how necessary a soft metal hammer is when working on particular work, and with the Dart hammer mold he can easily make his own hammer at practically no cost and avoid the risk of using a makeshift. The Dart hammer mold is of iron, with skillet attached, and molds a 3-lb hammer solidly to the handle. It is one of the handiest kind of tools to have in the machine shop.

The opening in the mold for the handle is the size of a half-inch gas pipe, which is best to use, as it is light and places the weight of hammer where it does the most good, although solid handles may be used if desired. Split one end of the pipe and spread it a little; it gives the metal a better hold; then plug the pipe at the split end, so as to prevent metal from flowing through the handle; something solid is the best, as it saves



Dart Mold for 3lb. Soft Metal Hammer.

doing again when a new head is molded on, for the same handle can be used repeatedly.

Place the handle in mold; clamping the mold on it with the little ring by tightening the set screw on top down snug.

Everything is now ready for the melting. When the metal is hot enough, slowly run it into the mold; do this by using the handle to tilt the mold. The little air-hole at side of run tells when the hammer is filled.

Do not let the mold proper be hotter than is absolutely necessary, as it will take longer for the hammer to cool. Under fair conditions a minute's time is all that is required.

This handy device is manufactured by the Dart Union Co., 93 Niagara Street, Toronto.

PORTABLE LIMESTONE PULVERIZER.

The accompanying illustration shows the mechanical features of a Jeffrey

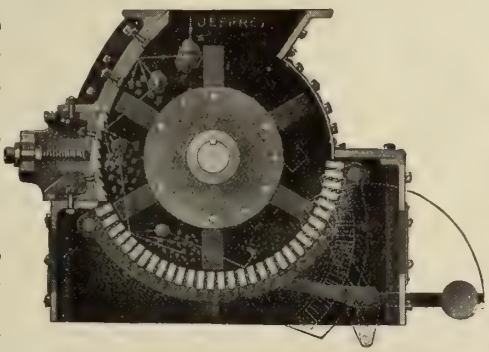


Fig. 2.—Inside View of Jeffrey Pulverizer.

portable limestone pulverizer. Fig. 1 shows the pulverizer complete, the interior mechanism being shown in Fig. 2. This machine has a capacity for reducing one ton of limestone per hour, ⅛ inch and finer. It is belt driven and connected to a small 15 h.p. gasoline engine. It is manufactured by the Jeffrey Mfg. Co., Columbus, Ohio.

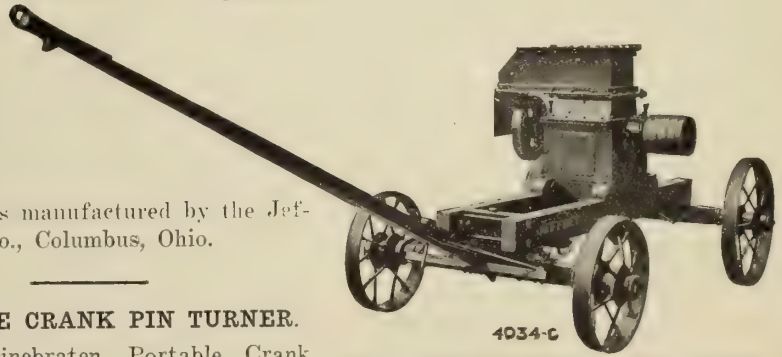

Fig. 1.—Jeffrey Portable Limestone Pulverizer.

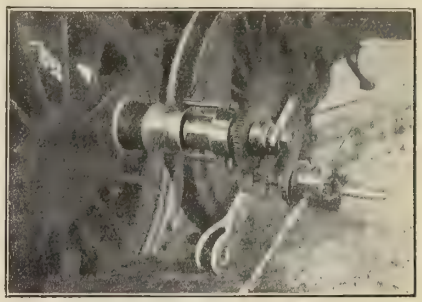
PORTABLE CRANK PIN TURNER.

The Schwinebraten Portable Crank Pin Turning Machine Co., Birmingham, Ala., are placing on the market a portable crankpin turner, shown in the illustration. The machine can be adjusted to any pin. Those being made now have the main bearing chased out to suit a 2½x8 thread gudgeon screw, but by a reducer or extension the machine can be fitted to any pin.

The machine consists of three parts, and fits tight against the end of the



Portable Crank Pin Turner.

crank pin. It will finish a crank pin in 1½ hours. As shown it is driven by a pneumatic drill. The total weight of turner is 80 lbs.

PRACTICAL ENGINEERS' POCKET BOOK.

The Magnolia Metal Co., 225 St. Ambrosie St., Montreal, have issued a special Magnolia Edition of the practical engineers' pocket book issued by the Technical Publishing Co., London. The book contains 680 pages and treats on over 2,000 engineering and mechanical subjects. It would be impossible in small space to give an idea of the subjects treated by this book, but such subjects as machinery and tools of all descriptions are taken up including gauges, power equipment, machine shop equipment, steels, power generation and transmission, water wheels, patents, refrigeration, lubrication, grinding, springs, rules for work, etc. A small charge of 40 cents is made, on receipt of which the book will be mailed postpaid to any address.

Recent Advances Made in Herbert Machinery

Some Methods Followed in the Alfred Herbert Shops, and Recent Improvements made in the Design of their Machine Tools.

The firm of Alfred Herbert, Ltd., was established in 1888 at Coventry, the business first engaged in being the building of light machine tools for the cycle industry. The firm now employ 1,500 men manufacturing a line of labor saving machine tools, including turret lathes, automatic screw machines, horizontal and vertical milling machines, etc.

The work is carried through on a strictly repetition system, the greatest possible use being made of jigs and fixtures. Owing to the large number of different sizes and types of machines which are built, it is necessary to put them in hand in batches of from 12 to 21, according to the size of the machines, this in order to ensure the different batches being repeated at fairly frequent intervals.

Piece work is employed on all operations except the final testing of the machines, and a very thorough system of fixing prices, and keeping track of the work in the shop is followed.

Testing.

When a new machine is designed, the first one is built and tested in an experimental department, which is entirely separate from the rest of the works. After a very thorough series of tests, any necessary alterations are made to the design, and a batch of the machines is then put in hand. The order for this batch goes to the stores, together with a complete list of parts, this latter being supplied by the drawing office. The stores then issue orders for the necessary raw material and issue same to the various departments in the works.

The piece work prices for every operation on every particular part are fixed by the piece work office, and are entered on process cards which are handed to the stores from the piece work office. The stores then issue the necessary piece work tickets, and inspection takes place at the finish of every operation, the workman being credited with the amount of work passed by the inspectors. The stores obtain from the foremen a date of completion of their department's work on the batch in question, and from these dates, a date for delivery of the complete machine is made out.

When all the machining is finished the parts are issued to the erectors together with such components as are carried in stock independent of batch orders for machines. These components represent articles which are common to a number of machines such as handles, collars, screws, lock-nuts, etc. These are known as stock parts, and are made to the storekeeper's order. The storekeeper has a book containing particulars of these stock parts with instructions as to the maximum and minimum number that are to be in stock at any one time. When his stock is getting low he sends an order into the works for the maximum number which is sufficient to enable the work to be done by the most economical method, usually on automatic screw machines.

Inspection continues during the process of erection, and when the machines are completed they are finally inspected for alignment and finish and are then handed over to the testing department, which is under the control of the selling department.

A large part of the firm's business consists in supplying machines equipped with tools and fixtures for producing specified work to sample, or drawing, the orders being accepted for such machines and outfits on condition that a guaranteed time or production should be fulfilled in the customer's presence before delivery, and such guarantees are carried out in the testing department above mentioned.

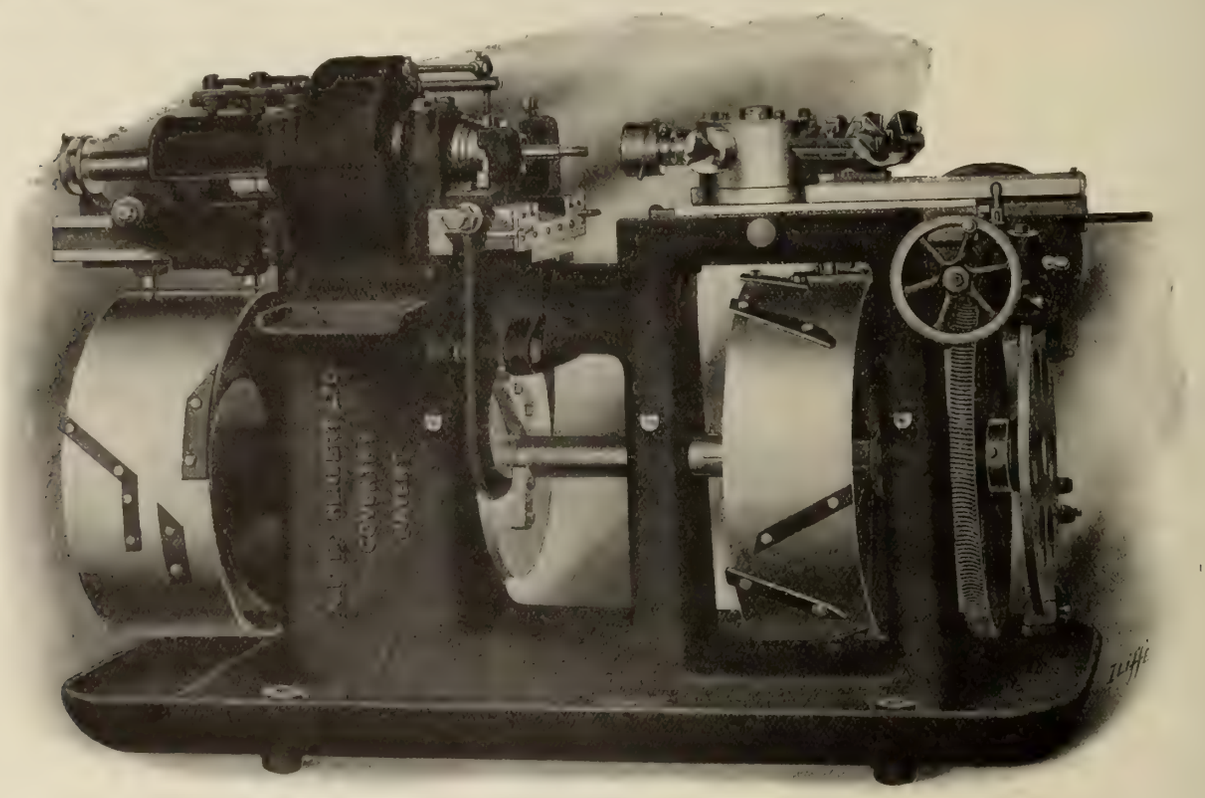


Fig. 1.—Automatic Screw Machine.

Special Screw Machines.

Fig. 1 shows an automatic screw machine of which the firm build eleven different sizes. They also make special machines for the production of copper stays for locomotives, condenser ferrules for marine condensers and double ended screwed studs.

In 1907 it was found necessary to build a works at Edgwick about three miles from Coventry, where is situated the foundry. These works are devoted to

the building of horizontal and vertical milling machines.

Fig. 2 shows the Herbert plain horizontal miller, which is built in three sizes having automatic longitudinal feed to table of 28-in., 34-in. and 42-in. respectively. It will be noticed that the design is compact and gives evidence of great power and rigidity. Two ratios of back gearing are employed, which enables the small step of the cone pulley to be kept large in diameter, ensuring efficient belt contact. The test out which the largest of the three plain millers must fulfill is as follows:

Material..... Cast Iron
Hardness..... 238 Brinell
Width of cut ..... 5-in.
Depth of cut ..... 5-16 in.
Feed per minute..... 12 in.
Metal removed per minute, 18.7 cub. ins.

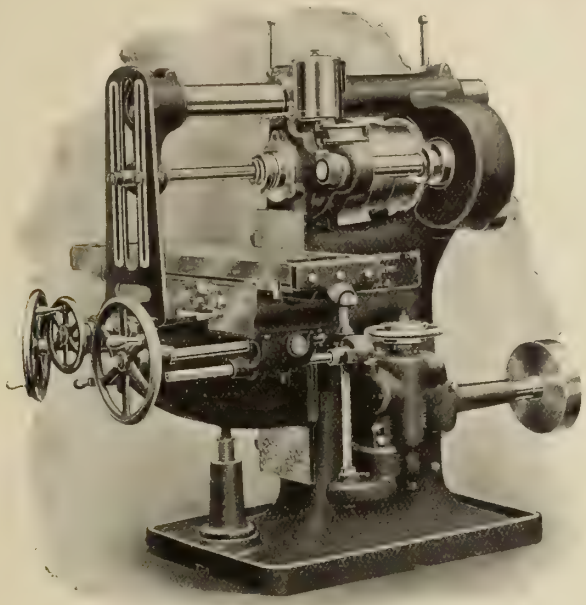

Fig. 2.—Herbert Plain Miller.

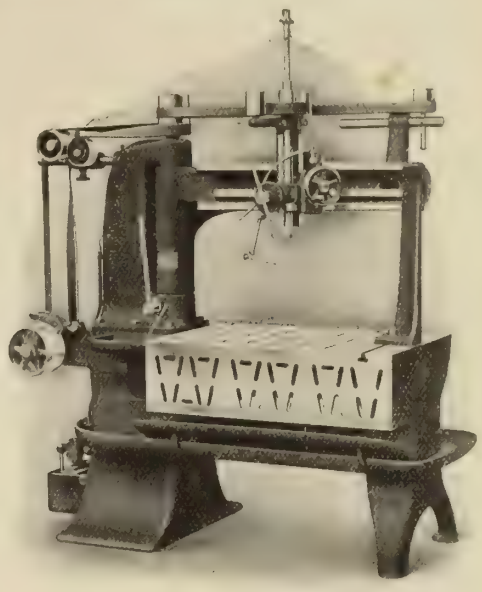

Fig. 4.—Ball Bearing Radical Radial Drilling Machine.

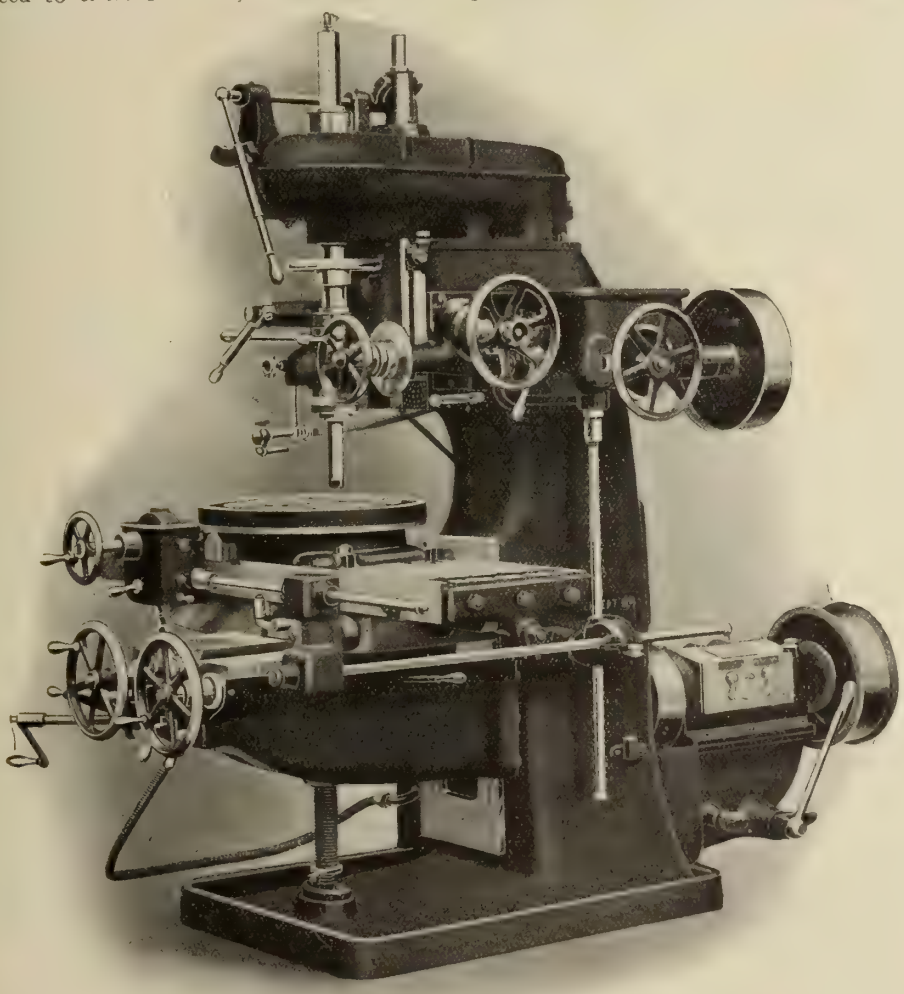

Fig. 3.—Recent Design of Vertical Milling Machine.

It will be noticed that the feed motion is driven by a single pulley. This may be either belted up to the spindle of the machine or driven direct from the countershaft. Messrs. Herbert strongly recommend the latter as it makes the feed of the table entirely independent of the feed of the spindle. The rate of feed is altered by simply rotating the hand wheel seen on the feed bracket. To this hand wheel is attached a dial on which are marked the different rates of feed in inches per minute when driven from the countershaft, or in inches per revolution when driven from the spindle. To obtain any desired feed, therefore, it is merely necessary to rotate the dial until that feed comes opposite a fixed pointer. This is believed to be the simplest feed changing mechanism on the market, and is applied to all Herbert's machines.

New Milling Machine.

Fig. 3 shows a recent design of vertical milling machine having a capacity of 18-in.x18-in.x26-in. This machine has constant speed drive through single pulley which by means of gearing running in oil, gives 16 speeds to the spindle. Automatic motion is provided to the longitudinal and cross movement of table, vertical feed of spindle head and rotary motion of circular table, all these feeds being reversible and controlled by the dial feed motion described above. The circular table can be

very quickly detached if it is desired to use the main table for long work.

Fig. 4 shows Herbert's patent ball bearing radial drilling machine, designed for drilling holes up to 1 inch diameter. The spindle, countershaft, and all idler pulleys run on single-track, dust-proof, oil-tight, ball bearings, and the spindle may therefore be run at very high speeds without wear or heating. No lubrication is necessary as the bearings will run for twelve months without attention. Owing to the high speeds that can be obtained, it is possible to run small drills made of high speed steel at their most efficient speed, which is not possible on the machines of the ordinary type. The advantage of the radial arm will be appreciated, as it enables large work to be bolted to

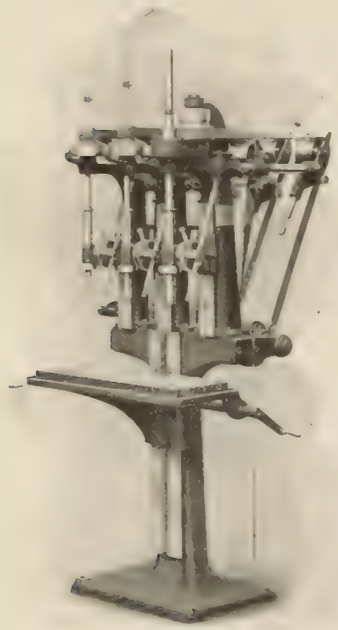

Fig. 5.—Ball Bearing Drilling Machine.

the table, and holes drilled in any part. It is found in practice that this type of machine will handle a large proportion of the work usually done on the ordinary geared radial drilling machine, and do it considerably cheaper.

Fig. 5 shows the upright type of Herbert's ball bearing drilling machine, which is built with one, two, three or four spindles. Any of the machines can also be fitted with a special geared spindle, as shown by the illustration, the advantage of the latter being that without sacrificing any of the advantages of the ball bearing construction, it enables holes up to 2-inch to be bored; tapping up to ¾ inch Whitworth can be done, and bosses can be conveniently faced. Fitted to multiple spindle drills, the geared spindle makes the machine capable of dealing with a much larger variety of work than is usual with this type of drill.

Fig. 6 shows Herbert's 9-inch centre capstan lathe for chucking work. This machine has a 3⅜-inch hole through the spindle, automatic feed to the capstan of 18 inches, and a saddle having automatic sliding and surfacing feeds. The machine is fitted with a patent chasing motion by means of which internal or external threads can be rapidly cut by means of a chasing tool.

This type of machine is employed for the finishing of castings, forgings, or blanks sawn from the bar, and is largely used on gear blanks, bushes, sleeves, pistons, and similar work found in petrol motors. There are nine rates of automatic feed to the sliding and surfacing motion in the saddle, and eighteen rates of automatic feed to the capstan, any desired feed being obtained instantly by rotating the hand wheel seen on feed box. This makes the machine suitable for a great variety of work. The drive is through extra large cone pulley and double gearing operated by friction clutches.

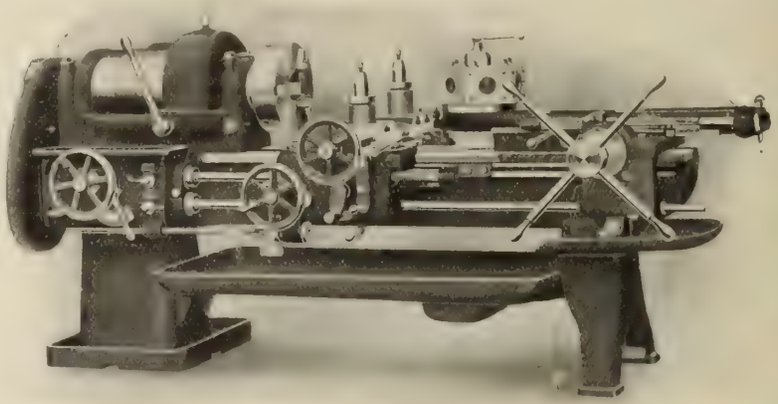

Fig. 6.—Centre Capstan Lathe for Chucking Work.

Bar Working Turret Lathe.

One of the machines to which Herberts have devoted considerable attention is the bar working turret lathe. Fig. 7 shows the 2¼ inch x 30 inch patent hexagon turret lathe. The machine is fitted with constant speed drive through single pulley, giving 16 speeds to the spindle in either direction. This makes it very convenient for driving, as any type of constant speed motor can be mounted on an adjustable base behind the machine as shown by the illustration. The turret is hexagonal, and has the various tools attached to its faces.

The patent roller steady turner is shown in more detail in Fig. 8. It will be observed that the cutter is of simple form, which can be ground up from a rectangular bar of steel without forging or machining, and is therefore very cheap to make and maintain. The cutter is carried in a steel holder which is advanced or withdrawn from the work by means of the handles shown, the position of the cutter being controlled by means of a stop screw. This stop is very sensitive in its action, and enables the cutter to be withdrawn and returned to its exact position any number of times. The rollers, which take the pressure off the cut are carried on pins supported on each side, which is absolutely essential when heavy work is to be done, the pressure of the cut tending to keep the roller firmly on the work, and obviate any tendency to cant. The rollers with their slides can be quickly withdrawn from the work and returned to the exact position previously occupied.

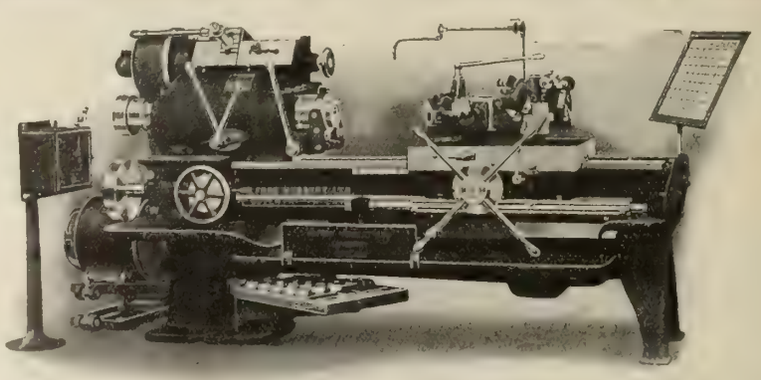

Fig. 7.—Hexagon Turret Lathe.

With this patent roller steady turner the limit of output is with the cutter itself, the following being a recorded test:

Reducing a mild steel black bar of 30 ton steel from 1½-in. to ¾-in. diameter at one cut.

Revs. per minute	470
Feed in inches per minute	23½ in.
Lbs. of metal removed per min.	8.8

The automatic turning machine, by means of which detached pieces such as castings and forgings may be machined in the most economical manner has recently received a considerable amount of attention on the part of Alfred Herbert. At Daimler Co.'s works at Coventry, where the new Silent Knight Engine is now being produced in large quantities, are twelve of Alfred Herbert's No. 6 automatic turning machines engaged in finishing gear blanks, wheel naves, back and front hubs, differential boxes, brake drums, and similar work. Several machines are attended to by one operator so that the labor cost of the product is naturally very low. The machines are automatic in all the operations except in the chucking, which is done by hand in the usual manner. The machine is then started up and performs its cycle of operations and stops. The operator then removes the finished work from the chuck, replaces it with a fresh casting or forging and starts the machine up as before.

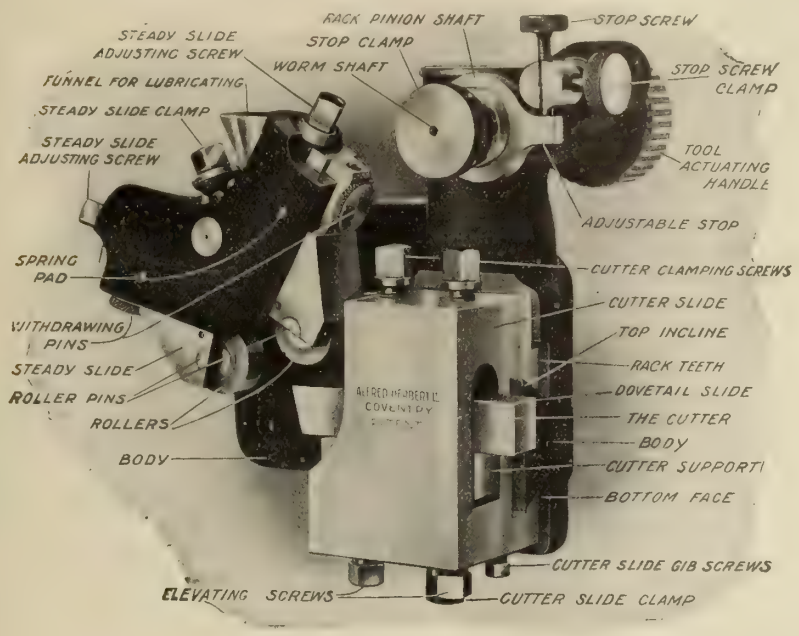

Fig. 8.—Roller Steady Turner.

Catalogues

Babbitt Metals.—Is the title of a small vest-pocket sized 4-page booklet gotten out by Factory Products, Toronto, and gives a short description of the nine different babbitt metals that they handle, as well as giving their varied uses. Among the kinds listed, users should be in a position to select a suitable metal.

Geometric Die Head.—"Geometric Screw Cutting Die Head, Self-Opening and Adjustable Style D," is the title of a neat 16-page brochure issued by The Geometric Tool Co., New Haven, Conn., descriptive of this small tool. The construction is dealt with in detail and its use exemplified.

Coal Punchers.—Form No. 5002 from the Ingersoll-Rand Co., New York, is a 24 page pamphlet descriptive of the New Ingersoll Coal Punchers, showing it in detail, and illustrating its operation in service.

Core Drills.—The Davis Calyx Diamondless Core Drill is described at length in Form No. 9001, issued by the Ingersoll-Rand Co., New York. The pamphlet, which contains 48 pages gives many illustrations of the uses to which this drill can be put, and shows the results in several cases.

Dart Unions.—Under the significant title "Dart Unions; What They Are, and What They Do," the Dart Union Co., Toronto, have just issued a small eight-page booklet descriptive of these unions. Their essential points are: an all bronze ball joint; heavy iron thread ends; and neat finished castings and full threads. Dart unions are made in both screwed (or nut) and flange types, and may be used on steam, water, gas or air pipes. The ball-shaped seats make a perfect joint either in or out of line; the bronze face prevents corrosion and rust; their heavy construction adds length of life; and the Dart has all the advantages of the all-bronze union with the additional strength of iron ends. Dart unions claim the advantages of saving in upkeep cost; elimination of trouble in making joints; assurance of tight joints, allowing joints to be made innumerable times without expense; and also allow the joints as well as the pipes to be covered. Every Dart union and flange is guaranteed. Several colored illustrations of both screwed and flanged unions give a good idea of what these goods are like.

Fire Brick and Refractory Material.—In catalogue No. 2, issued by the Detroit Foundry Supply Co., Detrot, its line of fire brick and refractory material for foundry use is illustrated and described. Numerous valuable tables are included which will aid the foundryman in lining his cupola, and tables of temperatures, weights, etc., are all given.

Smooth-On Instruction Book.—The Smooth-On Mfg. Co., Jersey City, N. J., has issued the ninth edition of its instruction book, which is replete with information regarding the use of Smooth-On products. This book contains 96 pages, is well illustrated, and many views are shown of the application of iron cements, sheet packings, etc., made by this concern.

Horizontal Boring Machines.—Webster & Bennett, Ltd., Coventry, England, devote section E of their Modern Machine Tool catalogue series, to this kind of machine, describing and briefly enumerating the principal points of a large number. It is a 16-page booklet, and numerous types of horizontal boring and milling machines are shown.

Book Reviews

Work, Wages, and Profit and Their Influence on the cost of Living—By H. S. Gantt, published by the Engineering Magazine, New York; size 5x7½ ins.; pages 194; illustrations 2; bound in cloth, price $2.

This book, written by an authority who has been connected with advanced work in labor management, deals with the possibilities of increasing production by scientifically training the workmen. Until within a few years, the mechanic was necessarily the source and conserver of all industrial knowledge, and on him, therefore vested the responsibility for training workmen. With the advent of the scientifically educated engineer, capable of substituting a scientific solution of problems for the empirical solution accepted by the mechanic, the responsibility of training workers naturally shifts to the shoulders of the engineer. If he accepts this responsibility, and bases training on the results of scientific investigation, the efficiency of the workman can be so greatly increased that the manufacturer can afford to give those that take advantage of this training, such compensation as will secure their hearty and continuous co-operation, thus making permanent advance toward the solution of the labor problem. The foregoing, is in substance the basis of the book. Most of the information contained is from various addresses delivered by the author before scientific bodies, and also from a series of articles published early this year in the Engineering Magazine. Dealing first with the application of the scientific method to the labor problem, the author proceeds to a discourse on the utilization of labor. Compensation of workmen is next discussed, dealing with day work, piece work, and task work with a bonus. Training workmen in habits of industry and co-operation and fixing these habits, is dealt with at length, with a final chapter on profits and their influence on the cost of living. To managers, superintendents, and foreman who are interested in business building, this book ought to be of especial interest.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

IRON CASTINGS: DEFECTS AND REMEDIES.*

By Robert Job.**

To many consumers an iron casting is an iron casting, and little thought or attention is given to its quality, apart from a general surface examination, to see whether it appears to be sound and if it is clean and of the desired dimensions.

In some cases, the casting must be machined prior to use, and the serious

Fig. 1.—

defect may develop that the iron is so hard as to turn the edge of the tool, or make the work of machining so slow that labor costs are high. If the casting cannot be machined, it must be rejected and delay occurs in getting replacement; and even when it can be slowly machined and finally gets into service, difficulty soon begins, for a casting of this type, though having a high tensile strength, is unfortunately brittle and fragile under impact, and, as a consequence, failure is apt to occur after a short service.

The cause of such hardness is generally excess either of sulphur or of manganese, due to defective quality of the cupola charge, that is to say, of the pig iron, or scrap, or coke, one or all. In some cases also the silicon is too low for the character of the casting. Sometimes, too, the moulding sand has been improperly tempered and the iron has been chilled, or, again, perhaps a poor grade or an excessive proportion of scrap has been used in the charge.

From this brief statement it will be evident that "hard iron" is not by any means a result of any one cause, but may be due to many widely differing conditions.

In order to find the proper remedy, the cause of the difficulty must, of course, be determined. Often an analysis of the iron will tell the story, or again, in some cases the physical condition of the casting will give the clue by pretense and appearance of blowholes, shrinkage-cracks and other characteristic defects.

If the hardness is caused by excess of sulphur or by otherwise incorrect composition, the inference is that proper care has not been used in the selection of the material, and purchase should be made under carefully arranged specifications, fixing the proportion of silicon, phosphorus, sulphur, and carbon to accord with the properties desired in the castings. For instance, if tough, strong easily machined iron is desired, the silicon, sulphur, phosphorus, and manganese should be limited and the quality of the coke should be carefully investigated in order to hold down the proportions of sulphur and of ash, for obviously it is a sheer waste of time and money to pay great attention to the quality of the pig iron and then accept and use shipments of coke which may contain thirty times as much sulphur as is present in ever a poor grade of pig iron. Under such conditions nothing but hard castings may be expected.

Sponge Iron.

Porous, spongy iron is another source of annoyance and loss to the consumer. Frequently a great deal of work will

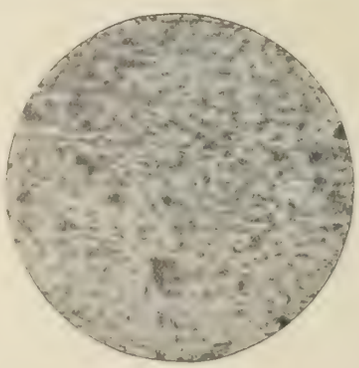

Fig. 2.—

be put upon a casting in the machine shop, only to have a large cavity finally develop, rendering the casting unsafe for the service intended. In such case, replacement must be made by the foundry, but the labor is lost and the delay which occurs in replacement often causes great inconvenience. Frequently the surface of the casting shows no indication of this defective condition.

Porosity is frequently due to blowholes in the iron, as for instance, when gas has been trapped in the casting owing to failure to provide proper vents. In some cases, the iron may not have been fluid enough when poured into the mold, and in consequence, the small bubbles of gas could not escape before solidification occurred, and an unsound, honey-combed casting is the result.

Every foundryman knows well the importance of "hot iron"—that is to say, iron which is at such a high temperature when poured into the ladle it is almost as fluid as water. Such iron fills the molds thoroughly, and many of the foundry troubles which otherwise are apt to result are avoided. To secure it, one must pay special attention to the cupola charge. A sufficient proportion of coke must be used, and its quality must be carefully regulated. The proportion of sulphur and of ash must be low, and dust and small pieces which would tend to check the draught and thus prevent free-burning must be absent. A sufficient air pressure must be maintained, and the cupola practice so regulated that a quick melt will be secured. Other things being equal, the shorter the time in the cupola, the better the chance to get good castings.

Shrinkage Holes.

Shrinkage holes or cracks are apt to occur with hard, high sulphur iron, and this condition due simply to the fact that iron of this character contracts to a much greater extent than does a softer iron containing a large proportion of graphitic carbon. Shrinkage holes are a fruitful cause of failure, and they are particularly objectionable owing to the fact that they frequently do not appear upon the surface, and hence the weakness may not be suspected until failure occurs. The remedy for such condition, obviously, is to keep at a minimum the proportion of sulphur in each constituent of the foundry charge, and take proper precautions to keep the iron soft.

Typical Defects.

Defects of castings are, unfortunately, of so many varieties that any attempt

Fig. 3.—

to cover the subject even in a brief description, would weary your patience, and I have, therefore, confined myself to

* Read before Canadian Railway Club, Montreal.

** Vice-Pres. Montreal Harbor Co., Montreal.

a few of the typical cases which are seen all too often in service. "Strong as iron" is an axiom, but frequently the appearance of the metal belies the truth. As an instance of this, we have in mind, a heavy, massive cast iron base weighing many tons which supported a large shop tool. After a short service cracks began to develop, necessitating the removal of the tool and the replacement of the base.

A careful investigation was made to determine the cause of failure and it was found that the proportion of phosphorus and of silicon in the iron were excessive, causing the metal to be exceedingly weak, and hence resulting in fracture. High phosphorus is particularly objectionable when the casting is subjected to impact, as for instance, in wheel-centres, cylinders, columns, etc., and unluckily for the consumer such iron can generally be obtained at a considerably lower cost than can a stronger, tougher, grade, and consequently, unless each shipment is systematically tested before use the better quality cannot be expected. Many cases have come under our observation in which wheel-centres and cylinders containing about one per cent. of phosphorus have cracked after a service of only a few weeks, or even days, while with the phosphorus reduced to about one-half of one per cent. and with the other elements properly proportioned the castings would give good service for years under the same conditions.

In cylinders, radiators, and other castings, a very close texture is essential in order to avoid leakage. Often there is little or no indication to the eye that holes exist in the iron, and yet under test the pressure gauge falls, showing that the iron is porous. Such character may be due to the presence of slag and oxide in the casting, or, in other words, the continuity of the iron may be broken up by fine particles of foreign matter. This condition may be caused by over-blowing the iron in the cupola, or it may result from the impurities in the scrap, and in order to remove it thorough deoxidation is essential.

From what has been said, it will be readily understood that radical differences exist in the structure of the metal of castings, and within recent years great strides have been taken in the development and microscopic study of the characteristic forms, and it has become possible to identify many causes of difficulty by the appearance of polished or etched sections cut from the castings. As examples, we will, in closing, throw upon the screen a few photo-micrographs, the originals being magnified fifty diameters—showing typical forms which may make or mar the service. All of the sections were cut from the sides of automobile cylinders where the metal was about one-quarter inch thick. The metal is polished, but not etched.

Figure 1 shows a very open structure with large areas of graphite. A structure of this kind is relatively weak, and not well adapted to withstand impacts.

In Figure 2 the iron is porous and contains considerable oxidized metal, a consequence of defective foundry practice.

In Figure 3 the metal as a whole has a close texture, and is strong and well adapted for the service intended. The iron is largely free from slag and oxides and the graphite, although present in even larger proportion than in Figure 1, is distributed in fine lines throughout the metal, greatly increasing the strength. The analysis of this iron showed that the constituents had been carefully selected, and its structure proves that correct methods of foundry practice have been used.

A Young President of a Large Malleable Industry

The Smith's Falls Malleable Castings Company Elect New Officers—Description of their Plant, Including their New Foundry.

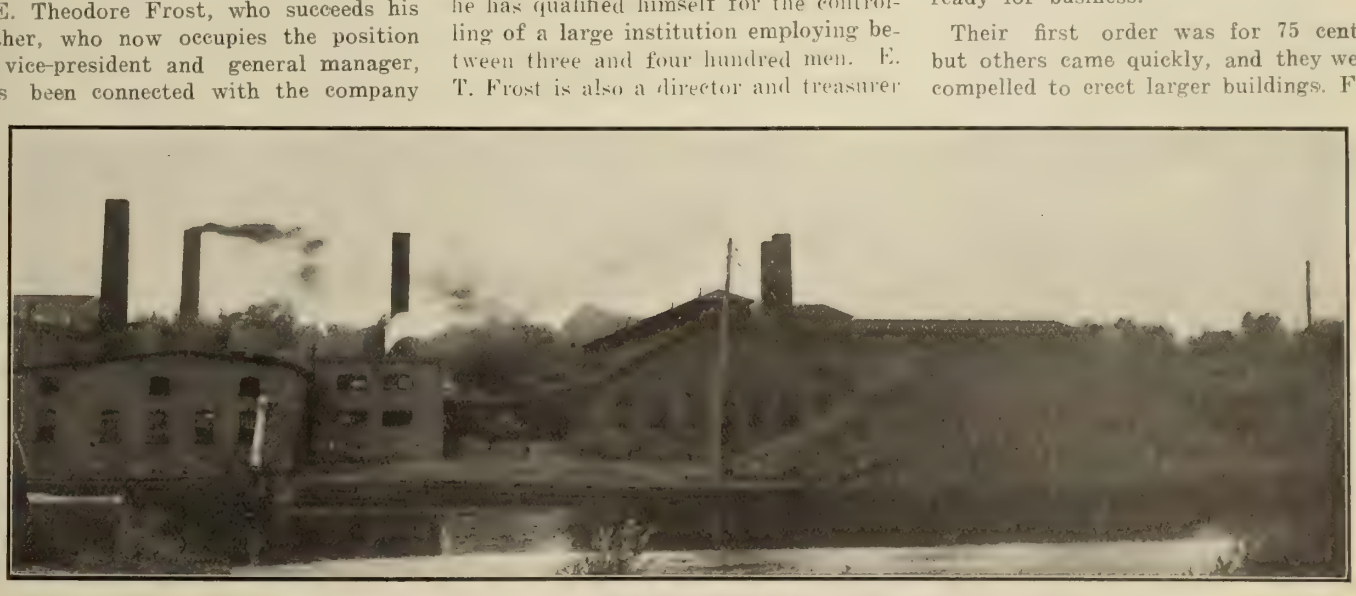
With the rapid industrial growth of Canada the younger men are coming to the front and assuming the positions of responsibility and trust formerly occupied by those more advanced in years. This was demonstrated at the recent annual meeting of the Smith's Falls Malleable Castings Co., Smith's Falls, when Ebenezer Theodore Frost, second son of W. H. Frost, was elected president and treasurer.

E. Theodore Frost, who succeeds his father, who now occupies the position of vice-president and general manager, has been connected with the company for several years. He received his education at the Smith's Falls public and high schools, but soon left these institutions to obtain his education in the broader field of life's experience.

He spent some time in the banking business and afterwards entered the office of the Malleable Co. He worked diligently at the business until he was familiar with every detail including the buying and selling. Thus at twenty-five he has qualified himself for the controlling of a large institution employing between three and four hundred men. E. T. Frost is also a director and treasurer of the Smith's Falls Electric Power Co.

Thirty-two years ago W. H. Frost and Charles Jones conceived the idea that they could find a good demand for malleable castings if a suitable place could be procured. They started with a capital of $2,500 in a small brick building 30x60 ft., situated on the water front. At first they employed one molder in addition to themselves and built a one ton oven. They were then ready for business.

Their first order was for 75 cents, but others came quickly, and they were compelled to erect larger buildings. For



No. 1 Plant of Smith's Falls Malleable Castings Co.

this purpose they bought in the surrounding land along the river front until they have in that part of the town about 2½ acres almost completely housed in.

In 1903 the company was incorporat-

EBENEZER THEODORE FROST.

President and Treasurer of the Smith's Falls Malleable Castings Co.

W. H. FROST.

Vice-Pres. and General Manager S. F. Malleable Castings Co.

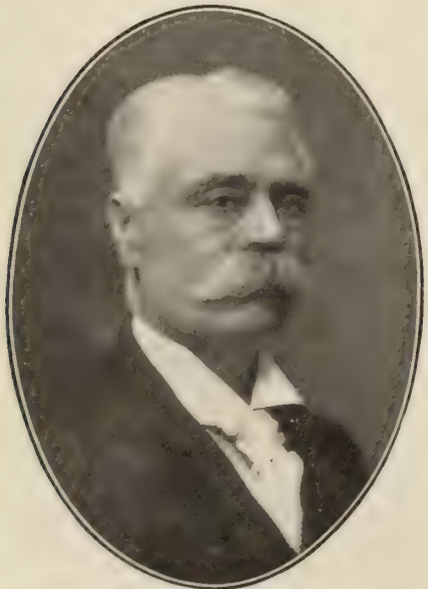
J. EDWIN FROST.

Secretary S. F. Malleable Castings Co.

ed, but was still in control of W. H. Frost until this year when E. T. Frost was elected president.

Plant No. 1.

The larger plant is situated on the the Rideau River and is connected to the C.P.R. by a siding. This plant consits of one large building 360x90 ft.



H. H. KIRKLAND.

General Supt. S. F. Malleable Castings Co.

in which is housed the annealing room, rumbling room, shipping room and power plant; a foundry and pattern shop 250x60 ft. with a wing 125x60 ft., a core room 40x60 ft., sand sheds, etc.

In the annealing room are two double annealing oven with a capacity of 160 tons, 2 single of 40 tons, and 3 single of 20 tons capacity. In the foundry are two 15 ton air blast furnaces. The total capacity of the No. 1 plant is 5,000 tons per year.

In the power plant is a 75 h.p. E. Leonard engine. The coal supply is brought by water from Sodus Point. The coal is mined at Westmoreland, Pa., and 4,000 tons are required annually.

Plant No. 2.

The illustration shows the No. 2 plant which is almost wholly devoted to railroad work, the specialty of the company being railroad castings though large quantities of automobile and agricultural castings are also turned out.

The No. 2 plant, located on a ten-acre plot in the north end of the town, is L-shaped, all the departments being under one roof. The main wing is 91x220 and contains the annealing room and foundry, core room, etc., while the other wing 91x70 ft, contains the shipping room, power plant, etc.

Coal is brought from Westmoreland by rail and a C.P.R. siding facilitates the receiving of supplies and shipping of castings. Over 2,000 tons coal are required yearly at the No. 2 plant.

In the power plant is a 60 h.p. Inglis engine which drives 8 tumbling barrels, suction fan, blower, and wood-working lathe. Chapman double ball bearings have been installed throughout.

The capacity of the No. 2 plant is 3,000 tons per year. The furnace has a 15-ton capacity and there are two 40-ton annealing ovens. The stack at the left of the illustration is at the power plant, the centre at the annealing ovens and the one at the left is at the foundry furnace.

Officers.

At the recent annual meeting the following officers were elected:

Ebenezer Theodore Frost, President and Treasurer.

William H. Frost, Vice-President and General Manager.

J. Edwin Frost, Secretary.

Directors—E. T. Frost, W. H. Frost, B. H. Frost, J. E. Frost and Henry Kirkland.

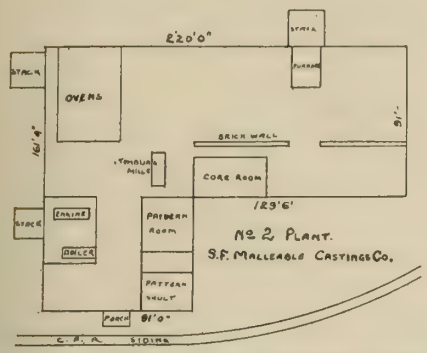
BURTON H. FROST.

Director S. F. Malleable Castings Co.

The general superintendent is Henry Kirkland. The assistant superintendent is Walter Stewart, who is in charge of the No. 2 plant.

Improvements Contemplated.

In order to make conditions better for the men in No. 1 plant, a heat ex-



No. 2 Plant of Smith's Falls Malleable Castings Co.

hauster will be installed. Waste heat from the furnace will be used to heat the building in winter and the heat and gases will be exhausted to atmosphere in the summer.

The offices of the company are at No. 1 plant. A convenient site has been purchased at the corner of Water and Bay Sts., and large new offices will be erected. Other improvements include a complete new power plant. Eleven additional acres have been purchased on the river front about a mile east of No. 1 plant and it is expected that a large new industry will soon be erected on this situation.

RUPERT G. BRUCE CO.

On another page appears an adv. of a new firm just organized in Canada with headquarters at Toronto, of particular interest to the foundry and electro-plating trades. The manager, Rupert G. Bruce, who has been associated with Frederic B. Stevens, organized this firm to manufacture in Canada a lot of material that up to the present time has been imported exclusively from the United States and England.

The new organization has taken out a charter under the name of Rupert G. Bruce Co., Limited, and have located their factory at 96-98 Queen St. East, with a large warehouse for raw materials at the head of Macdonell Ave. on the C. P. R.

They will manufacture foundry supplies, also electro-platers' supplies, buffing compositions and cotton buffs.

Their superintendent is a man of very wide experience, having been in this line for the last 25 years in the different parts of the United States.

The directors of the new firm are Charles S. Murray, of the W. A. Murray Co., and R. L. Kleiser of the Albert Kleiser Co., Frank C. Foy, of the New York Central Railway, and Rupert G. Bruce.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

WELLAND.—United Motors, Ltd., will build an automobile factory in the township of Crowland. The directors of this concern are Frederick [illegible] Lefroy, E. A. Eagles, Toronto; W. L. [illegible], Niagara Falls; and L. C. Raymond, and F. [illegible], of Welland. The capitalization is $200,000. The construction of the proposed works will be commenced at an early date.

MONTREAL.—A. H. Huff, sales manager, J. [illegible], secretary-treasurer, and F. Moseley, superintendent of the pipe mill of the Montreal Water & Power Co., have resigned, and will establish a rolling mill to manufacture iron pipe.

MEDICINE HAT.—The Alberta Iron Rolling Mills will erect a $100,000 plant.

OTTAWA.—A. W. Henderson, of Bruton, Sovereign, Eng., has secured a site on McKay Street, 100 x 155 feet, as the location for his proposed axe factory.

PRINCE RUPERT.—The Grand Trunk Pacific Railway Co. will erect at Prince Rupert a dry dock with a lifting capacity of 20,000 tons at a cost of $1,500,000, and a marine depot at a cost of $250,000.

COLLINGWOOD.—Major J. A. Currie intends to establish a screw and bolt factory here. A two-storey mill building will be erected at once, and $50,000 will be expended on plant and machinery. From 80 to 100 men will be employed when the works are in operation.

HAMILTON.—The Hamilton Bridge Works Co. have been out a permit for the erection of an addition to their factory here, to cost $10,000.

ORILLIA.—The contract for the office and main building of the Canada Smelting & Refining Company's plant, has been awarded to E. Webb.

PORT HOPE.—The International Tool Steel Co., have definitely decided to locate at Port Hope, and will at once commence the erection of four buildings. Fifty men will be employed at the start and $75,000 will be expended on machinery and plant. Twenty furnaces will be installed at first, to be increased to fifty later on.

SAULT STE. MARIE.—The directors of the Lake Superior Corporation have decided to expend the sum of $12,000,000 during the present year on extensions to the steel plant, railway construction, as well as on the company's mines and forests.

ST. BONIFACE.—The C.N.R. is reported to have completed arrangements with the Council of the City of St. Boniface, Man., for extensive improvements there within the next two years, including a large roundhouse, storehouses, coal trestles, freight sheds, the union depot to be erected by the G.T.P., and a new traffic bridge to be built across the Red River from Winnipeg. The total improvements will cost over $1,000,000, and the company has signed a bond guaranteeing the completion of the work within two years.

HAMILTON.—The Canadian Westinghouse Co., Hamilton, has arranged for another addition to its plant, and will build a brick and reinforced concrete extension to its detail building, and a new shop at a cost of $22,000.

LONDON.—The Willys-Overland Co., Toledo, O., automobile manufacturers, will establish a branch house at London, having secured a [illegible] building on Dundas St., which is being remodelled in accordance with its plans.

PETERBORO.—The Lindsay Shovel & Tool Co. will erect a new plant here.

WATFORD, ONT.—The Andrews Wire & Iron Co. will erect a plant here.

MIDLAND.—Fire broke out in the foundry of the Midland Engine Works Co., recently, damaging the south side of the building and contents. The loss is estimated at $12,000, with an insurance of $10,000.

CAMPBELLTON, N.B.—The I.C.R. Board of Management has decided on the plans for extensive new railway buildings to replace those destroyed by the fire of last July. The total cost will be about $200,000.

TORONTO.—The C. A. Dunham Co., Marshalltown, Iowa, with offices in the Continental Life Bldg., propose erecting a plant here for the manufacture of heating and power plant specialties. The building will be 40 x 80 ft. and will cost $11,000.

SMITH'S FALLS.—Negotiations are being carried on to consolidate the malleable casting industries in Smith's Falls, St. Catharines, Galt, Brantford and Walkerville.

LONDON.—Geo White & Sons expect to be in their new plant this month. The machine shops are 350 x 142 ft., shipping room is 250 ft. square, the separator dept. 200 x 100 and the office 120 x 40. Hydro-electric power will be used. The shops are located on the C.P.R. and G.T.R.

LONDON.—The C.P.R. has purchased the land between Quebec and Elias Sts. and will erect a new roundhouse and machine shop. The roundhouse will accomodate 25 locomotives, and modern coal chutes, ash pits, etc., will be erected. The machine shop will be up-to-date in every respect.

BELLEVILLE.—The roundhouse which is being erected by the Grand Trunk here is the second largest on the system, having stalls for 42 locomotives. It is of concrete, and a quarter of a mile in circumference. The walls are 19 feet high, 22 inches thick at bottom, and nine inches at the top. The roof is of steel, covered with asbestos. A new machine shop, 50 by 200 feet; office and storeroom, 30 by 80 feet, are also being erected. The work, on which 350 men are employed, was begun on August 10, and is expected to be completed by Nov. 1.

MONTREAL.—Plans and specifications for the new building to be erected for the National Acme Mfg. Co., Ontario Street east, may be seen in the office of Mr. E. L. Baugh, 107 St. James Street.

WALKERVILLE.—The general contract for the 3-storey, 80 by 90 feet, factory for the Ford Motor Car Co., has been awarded to Wells & Gray Co., Toronto; cost $21,000. Albert Kahn & E. Wilby, Detroit, Mich., architects.

PRESTON, ONT.—Clare Bros. & Co. intend to enlarge their factory considerably, the adjoining property having been purchased. Work may not start until next spring.

PRESTON.—A by-law to give certain privileges to Bantz Bros., formerly of Galt, will be submitted to the ratepayers on October 10th. A large factory will be erected.

NEW WESTMINSTER.—Work has been started on the wire nail factory, to be erected for G. W. Laidlaw, formerly of Hamilton, Ont. It is being built about a half a mile below the Lulu Island bridge, inside the city limits. About one hundred men will be employed. Wire nails and fencing will be manufactured at present, but a galvanizing plant will probably be added next year.

CALEDONIA.—The Paris Plaster Co. are spending $50,000 on their works.

BERLIN.—A new industry, the Dominion Shoe & Slipper Co. is locating here.

WELLAND.—The Hamilton Tube Co., which came from Pittsburg to Hamilton two years ago, and manufactures butt joint, welded and structural tubing, have decided to locate here.

HAMILTON.—The Hamilton Bridge Works Co. announce the purchase of ten acres of land in the manufacturers' annex, for an open air stock yard. A ten-ton traveling crane will be built and switches from the G.T.R. and T.H. & B. run in. The plant will cost $10,000, and if the company's business warrants it, an extension of the west end plant will be built there.

MONTREAL.—Two prominent English firms will shortly locate branches here. The George Anderson Co., manufacturers of cranes and stove machinery, will build a large factory at once, and expect to occupy it by May 1. They also expect to build shops in some western Ontario town. The second concern is the Cleveland Bridge & Engineering Co., of Darlington, England, which will locato shops here.

VANCOUVER.—A. D. McRae, of the Canadian Northern, annouoced to-day that car building shops for the entire system with 5,000 men employed will be erected at Port Mann.

ST. JOHN, N.B.—George McAvity, president of T. McAvity & Sons, Ltd., said that his firm would establish a large iron or brass foundry in Port Arthur, Ont., to take care of the firm's western business. It is also probable that they will establish a branch of the large St. John works in Montreal.

WALLACEBURG.—The Wallaceburg Brass Works, which has been carrying on business in the town hall property for the past four years, intends erecting a permanent factory in the near future, provided the town gives some concessions. The concern now employs 60 hands and will require 100 when the new factory is completed. The board of trade has recommended that the company be granted a fixed assessment of $5,000 for ten years for school taxes, exemption from other rates, and if a town waterworks is established, free water for the same period. A by-law to this effect will be submitted to the electors in January.

KINGSTON.—The organization has been completed for the Hawthorn Silver Iron Mines to develop iron ores around the K. & P. R. The company has 20,000 acres, will ship ore and manufacture pig iron. A plant with a capacity of 2,000 tons will be built.

LONDON.—The McClary Mfg. have taken out a permit for a one-storey concrete building on Adelaide Street, to cost $5,000.

The Cleveland Bridge and Engineering Co., of Darlington, Eng., are considering the erection of a large plant here in the near future.

GUELPH.—The Gilson Mfg. Co. has commenced work on the erection of an addition, 100 x 60, doubling the size of its present plant.

CHATHAM.—The International Harvester Co., Chicago, have secured control of the Chatham Wagon Co., and intend to extend the plant considerably.

MONTREAL.—The general contract for the erection of the extensive shops of the Street Railway Co. has been awarded to J. B. Pauze & Co.

WINNIPEG.—The C.N.R. have a permit to construct coach shops in the west yard, at $42,000. The contract has been let to the Carter-Halls-Aldinger Co.

EDISON, ALTA.—The contract for the construction of roundhouses, machine shops, and passenger station here, the first divisional point on the G.T.P. west of Edmonton, has been awarded to the May Construction Co., at a price approximating $75,000. Work is to be commenced at once on the new buildings.

Municipal Undertakings.

WINNIPEG.—The City Council last night let the contract for forty-six thousand feet of cable for the power plant transmission to the Canadian-British Insulated Cable Co., of Montreal. The price was $51,500.

TORONTO.—The F. H. McGuigan Construction Company, of Toronto was awarded the contract for the construction of the Queen Street East high level bridge at $193,000.

PRINCE ALBERT.—A by-law will be voted on to expend $12,000 for a filtration plant.

VERDUN, QUE.—The town council will extend its water dyke, at an expenditure of $200,000.

SOURIS.—The J. L. White Co., of Sioux Falls, S.D., will instal a waterworks system.

MEDICINE HAT.—Proposes replacing all wood pipes by iron pipes in its waterworks and sewage systems.

ST. CATHARINES.—Engineer Kennedy has submitted a report for the improvement and extension of the waterworks at a cost of $52,000.

FERNIE.—A by-law will be submitted to raise $27,000 for the construction of a sanitary sewer east of Crow's Nest Southern Railway.

MONTREAL.—Tenders addressed to L. N. Senecal, secretary, Montreal Board of Commissioners, will be received for steel pipe, dredging work and concrete pier in connection with the new intake for the waterworks.

MEDICINE HAT, ALTA.—The ratepayers have approved by-laws to raise $50,000 for the installation of an electrical plant, $45,000 for waterworks extension and $18,500 for industrial sites.

DAUPHIN, MAN.—The contract for putting in the waterworks and sewerage system was awarded to Flanagan & Murphy. The cost of the system will be $250,000. Wood pipe will be used for the gravity system, which is nine miles from the Riding mountains to the town.

Orillia.—At a recent meeting of the council it was decided to spend immediately $10,000 in improving the power plant. A by-law will be submitted to the ratepayers asking them to authorize the expenditure. The installation of a new unit and greater wheel capacity must, however, follow within a year or two, and this will entail a probable expenditure of from $25,000 to $30,000.

MEDICINE HAT, ALTA.—The city recently invited tenders for two d.c. gas-engine-driven 125 k.w. alternating current units for the power plant. The following bids were received :—Gorman, Clancy, Grindley, generator, $5,675 ; Canada Foundry Co., engine and generators, $21,050 ; Canadian Fairbanks Co., engine $13,922, generators, $5,903 ; National Meter Co., engines, $13,495, generators, $6,500 ; Turner, Fricke, Pittsburg, engines, $16,706.80, generators, $7,851 ; Chapman, Walker, Co., engines, $17,060, generators, $5,630 ; Drummond, McCall & Co., engines, $13,500 ; E. Leonard & Sons, engines, $13,974, generators, $11,100 ; Kilmer, Pullen & Burnham (1) engines, $14,500, generators $8,776, (2) engines, $17,500, generators, $8,776 ; Siemens Bros., (1) engines, $14,500, generators, $4,255, (2) engines, $17,500, generators, $4,255 ; Allis-Chalmers-Bullock, Ltd., engines and generators, $24,215 ; Canadian Westinghouse Co., engines, $20,600, generators, $5,690 ; Canadian Boving Co., (1) engines, $14,500, generators, $4,255, (2) engines, $17,500, generators, $4,255 ; Vandeleur & Nichols, (1) engines, $14,500, generators, $3,050, (2) engines, $17,500, generators, $3,200.

REGINA, SASK.—Six money by-laws, authorizing the issue of debentures totalling $196,000, were carried recently. The money will be distributed in the following improvements :—Pavements, $132,000 ; fire protection, $16,000 ; sewer and waterworks extension, $20,000 ; sidewalks, $59,000.

OTTAWA.—The cost of the scheme to get the city water from McGregor's Lake, in the Gatineau District, some 12 miles north of the city, is placed at approximately $2,000,000. The by-law for this may be submitted to the ratepayers at the next election.

Simplified Stills for Industrial Alcohol

We are builders of portable stills. We build and install plants large or small. 5 to 500 gallons, and we solicit trade of those who fully recognize the value of safety. Our FOOL PROOF SAFETY STILL is a still that an unskilled laborer can operate after one day's instruction. This is our small 5-gallon still.

We have features in our SIMPLIFIED STILLS that place them far ahead of other stills for speed, efficiency, simplicity in setting up, and cheapness of operation in the production of industrial alcohol from shavings, old or green sawdust, and vegetable waste, at a cost of from 8 to 12 cents per gallon.

Brought down to dollars and cents, a 5-gallon tax-free still, capacity 20 to 25 gallons daily, 26 days in a month, at say 20 gallons a day—520 gallons, price 50c. per gallon, = $260.00. Less cost of labor, fuel and material, say 12c. per gallon, or $62.40. Net monthly profit, $197.60 This is the way the 5-gallon still figures out. The cost of the 5 gallon tax-free still complete and ready to set up is $135 00. Freight prepaid if cash accompanies order.

If the said 5-gallon Tax-free Still fails to produce alcohol at a cost of 12c. per gallon or less, we will cheerfully return to you the money paid us.

75 to 100 gallon plants, installed under guarantee, cost $950.00, payable as follows : $500.00 with order and $450.00 in sixty days.

One ton of corn at the price of 40c. per bushel will cost $14.28 ; coal cost, labor, etc., to convert one ton of corn into alcohol will cost $6.40 ; total, $20.68, less value of slop of $11.60 per ton of corn, making net cost of material $9.08 per ton One ton of corn will yield 98 gallons of 188 degree alcohol at a cost of $9.08, or $0.0916 per gallon. This is from official statistics.

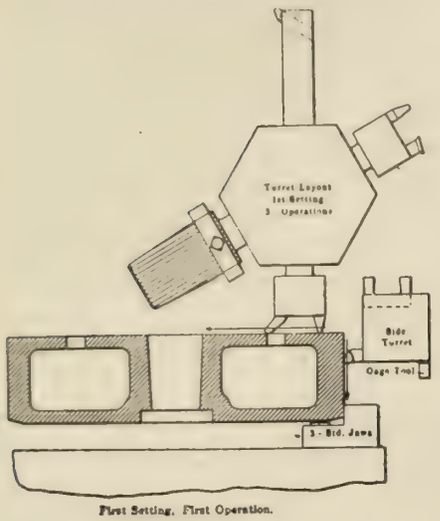
Do you know that there is a trust in stills? We know we can save you money and seek to prove it. Won't you kindly consider our proposition when we SHOW YOU IN DOLLARS AND CENTS just what our stills will do for you? May we hear from you to-day—now?

Yours very truly,

THE WOOD WASTE DISTILLERIES CO. Inc., 1204 McColloch St., Wheeling, W. Va.

Side Head of the Vertical Turret Lathe

A Big Factor in Reducing the Cost of Production of Many Kinds of Face Plate Work.



First Setting, First Operation.

Perhaps the greatest productive difference between modern and pre-modern machine tools is the doubling up or "tripling" up of cutting tools. One cut at a time is no longer sufficient to get competition-meeting results, and it was the realization of this fact that led to the designing of the Bullard Vertical Turret Lathe.

Besides the main turret head this machine has a side head which enables the operator to take simultaneous cuts on various surfaces. It does not interfere in any way with the operation of the main head.

The illustration herewith shows a job on which the Vertical Turret Lathe made a new record of 90 min.

The piece is a 27½ in. piston on which simultaneous cuts with the Side Head cut 30 minutes from the best previous time.

The Vertical Turret Lathe has two heads—a turret head and a side head—which allow two or more tools to be used at the same time.

All the tools needed for a whole series of operations are held in instant readiness.

In a word the Vertical Turret Lathe is a unique combination of the good points, the advantages of the vertical boring mill and the horizontal turret lathe.

Its vertical construction allows many a piece to be finished before it could be chucked ready for work on a horizontal turret lathe. For modern work—especially for duplicate pieces—the Bullard Vertical Turret Lathe is an innovation. It is a tool you must know about.

The entire sequence of operations on the piece shown here and other pieces is graphically illustrated in our new catalogue, which is free for the asking. Send for catalogue C-15.

The Bullard Machine Tool Co.

Bridgeport, Conn., U.S.A.

WELLAND.—The ratepayers will again vote on a by-law for waterworks extensions. The total cost of the proposed scheme is $52,000, and includes the following items: Plunger pumps, etc., $11,000; waterwheels, $2,300; cast iron pipe, $9,100. Wm. Kennedy, Jr., is the consulting engineer.

NEW WESTMINSTER.—The Municipal Construction Co., Vancouver, has secured the contract for laying the new steel main to Coquitlam Lake which will supply water here and to the municipality of Richmond. The 25 inch pipe line will be fourteen miles in length and is calculated to discharge 250,000 gallons of water every 24 hours. There is already a 14 inch main tapping the lake connecting with two reservoirs in the city, the high level one being at an elevation of 410 feet, and the low level one at 250 feet. The tender price for hauling and laying the new line is 125,000, and the total cost to the city $360,000.

Electrical Notes.

ST. THOMAS.—At the meeting of the council, Alderman Price and Alderman Chant were authorized to continue the negotiations with Port Stanley in regard to the furnishing of that municipality with power.

STELLARTON, N.S.—The Acadia Coal Co., Stellarton, N.S., are contemplating the installation of a 2,200 kilowatt electric plant at what is known as the Allan Shaft in Stellarton, to be used in driving their machinery and for general lifting purposes. Should the plan mature this will prove the largest electric plant east of Halifax.

ST. THOMAS.—The tender of the Canadian General Electric Co. for supplying new transformers and purchasing 132 old ones for the local hydro-electric distributing plant was accepted, it being the most favorable of three others. The amount involved is about $15,000.

PORT CREDIT.—William Stewart has secured the contract for the erection of the transformer station of the Hydro-Electric Power Commission. The contract price is $14,000.

OTTAWA.—The civic commission has awarded the following contracts for the new conduit from the power station in Hull to the distributing station on Laurier Avenue: For transformers, Canadian General Electric Co., $12,000; cable, British Insulated Cable Co., Montreal, $16,246; conduit pipe, Eadie-Douglas Co., $2,704; manhole covers, J. B. Maclaren, Ottawa, 2¼ cents per pound for cast iron, and $35 per ton for rails.

BERLIN.—The formal test at the Hydro-Electric Commission's transformer station made recently was satisfactory. The town is the first in Canada to have its streets illumined with electric power generated at Niagara Falls and conveyed over the municipality owned and operated transmission lines. The power comes here at from 110,000 to 130,000 volts to the transformer station, where it is stepped down to 13,200 volts, to the town's plant where it is again transformed to suit local conditions—550 volts for street railway purposes and 500 for the street arc lights.

MONTREAL.—A second power station of the Shawinigan Water and Power Co. will be situated near the present generating plant at Shawinigan Falls, on the St. Maurice river, about 85 miles from Montreal, and will be designed for a capacity of 75,000 horsepower, as against 55,000 horse power in the case of the existing station. The company's transmission lines, which are of aluminum carried on wooden poles, exceed a total of 400 miles. For transmission to Montreal the current, which is generated at 2,200 volts, is transformed up to 50,000 volts; 3,000 horsepower is supplied to the Montreal Street railways, and 15,000 horsepower to the Montreal Light, Heat and Power Co. The Shawinigan company supply 25,000 horsepower of water power—undeveloped—to the Northern Aluminium Co., and 14,000 horsepower of water power to the Belgo-Canadian Pulp and Paper Co.

British Columbia Portland Cement Co., Princeton, B.C.; capital, $500,000; to manufacture cement. Incorporators, R. P. McLennan, Vancouver; L. W. Shatford, Hedley, and Reuben Cross, Spokane, Wash.

The Dorchester Peat Co., London; capital, $75,000; to manufacture peat fuel. Incorporators, John McWilliams, J. M. McEvoy, London, and Jas. McLean, Dorchester.

The Dominion Stove and Foundry Co., Penetanguishene; capital, $250,000; to establish a foundry for manufacturing stoves of every description, furnaces, boilers and other heating apparatus. Incorporation has been granted by the Ontario Government. The provisional directors are Chas. Beck, D. A. Lahey, C. E. Wright, Chas. McGibbon and Dr. P. A. McDonald, all of Penetang.

Edward Partington Pulp and Paper Co., St. John; capital, $950,000. The company will control the A. Cushing and company sawmills as well as the present large pulp mill.

Canadian Materials Co., Montreal; capital, $50,000, to manufacture railway supplies and general supplies of every class. Incorporators, Pearl Robert Diamond, Thomas Allen Hays.

The Modern Power Co., Winnipeg; capital $25,000. Directors, William Lloyd Williams, and Victor Clark Parker, both of Winnipeg.

Winnipeg Steel Culvert Co., Winnipeg; capital, $60,000. Directors, Percy S. Joel, Cecil L. Hamilton, and Roy T. Picard.

The Ivel Motor Co., Winnipeg; capital $300,000. Incorporators, James S. Stewart and Edmund L. Taylor.

Canadian Railway Materials Co., Montreal; capital $50,000. Incorporators, Pearl R. Diamond, Wm. P. Robertson and Darley Burley-Smith, all of Montreal.

Montreal Hydro-Electric Co., Ltd., Montreal; capital, $10,000,000; to carry on the business of an electric light, heat and power company in all its branches.

Wilson Auto Co., Ltd., Montreal, capital, $50,000; to manufacture steam and other engines, agricultural implements, boiler makers, and conveyances of every description, iron founders, electro platers. Incorporators, Louis Anthanase, and Henry Johnson Elliott.

Building Operations.

MONTREAL.—Canada Sugar Refining Co., a factory on St. Patrick Street, $18,000; Piper Light & Heat Co., an establishment on St. Remi Street, St. Henri, $18,000, and Jas. Robertson, a factory on Shannon Street, $5,500, are industrial permits granted recently.

TORONTO.—Ideal Woman's Wear Co., alterations to factory, 662 aad 664 King Street W., $15,000, and the Robert Simpson Co., wagon, storage and harness shop, Dalhousie Street, $53,000, are recent factory permits granted.

MONTREAL.—The Canadian Rubber Co. will erect a five-storey steel and concrete building as an addition to their plant.

MONTREAL.—The Catholic School Board have taken out a permit for the erection of a new school on Visitation Street, to cost $105,000.

CALGARY.—$61,000 will be spent for new exhibition buildings.

SASKATOON.—The proposed hospital extensions will cost about $108,000.

LETHBRIDGE.—The ratepayers passed a by-law to spend $75,000 to build another new school.

SUMAS, B.C.—A large brewing company is soon to commence the erection of a $150,000 brewery.

HALIFAX.—The Halifax Cold Storage Co. have awarded a contract for erection of a new warehouse building on Lower Water Street, to L. B. Fader, and H. R. Silver & Co. They are also having a storehouse erected on Upper Water Street.

CALGARY.—The excavation for the new $100,000 I.O.O.F. building, has been commenced.

TORONTO.—The Nasmith Co., will erect a two-storey factory here, to cost $60,000.

WINNIPEG.—Stobart & Sons have secured a permit to erect a factory to cost $45,000.

BROCKVILLE.—The Canada Carriage Co. is erecting a building at a cost of $10,000, for the manufacture of automobiles.

MONTREAL.—Messrs. Jas. Robertson & Co., are erecting a factory building on Shannon St.

MONTREAL.—Messrs. H. L. Piper & Co., are erecting a three storey factory building on St. Remi Street.

NEW WESTMINSTER.—The B. C. Packers' Association of Vancouver, are contemplating the erection of a $40,000 addition to their plant here.

Planing Mill News.

ALBERNI, B.C.—The recently formed merger of four of the largest lumber companies in this province, known as the Canadian Pacific Lumber Co. (capital, $5,000,000), it is stated, will erect at New Alberni a large mill upon the completion of the E. & N. Railway extension from Nanaimo. The following companies are included: Canadian Pacific Lumber Co., of Port Moody, the Barkley Sound Cedar Co., of Port Alberni, the Anglo-American Lumber Co., Vancouver, and the Gibbons Lumber Mills, Arrow Lakes.

MONTREAL.—Fire broke out in the planing mills of H. Mathieu & Co., 14 St. Charles Borromee Street, recently. The loss was not heavy.

OWEN SOUND.—The McDonald-Rowland Lumber Co. have recently purchased the sawmill and equipment in the town of Gore Bay, Manitoulin Island, formerly owned by Mr. Brett.

ST. JOHN, N.B.—The Cushing sawmill property has been purchased by the Edward Partington Pulp & Paper Co. H. W. Schofield is secretary-treasurer of the purchasing concern. The mill will be used in connection with their pulp manufacturing business.

MONTREAL.—Hodgson's Lumber Mill and 400,000 feet of lumber were burned at Como on the Ottawa River yesterday, causing a loss of $50,000, with only $20,000 insurance.

VANCOUVER.—An important timber deal is reported from Prince Rupert, the vendor being A. F. Sutherland, of Vancouver, who has sold to a syndicate of British and Canadian capitalists headed by W. Gamble, barrister, of Ottawa, ninety-three timber limits for $490,000. The timber is on the Naas and Kitsumkalum rivers, and is said to be of excellent quality, comprising red cedar, spruce, larch and pine of high grade. It is presumed that the new company intends to take advantage of the opening up of Northern British Columbia, by erecting a sawmill in the vicinity of Prince Rupert.

POWELL RIVER, B.C.—M. J. Scanlan, of the Brooks-Scanlon Lumber Co., of Minneapolis, states that the plant of the Powell River Paper Co., at Powell River, will be completed, and in operation by July 1 next. Invested in the enterprise will be about two million dollars, and the payroll of the company will be about $500,000 per year. The buildings are being made of reinforced concrete, and about one thousand men are engaged in construction work at the present time. Newspaper and wrapping paper will be the first products of the company, but later the finest grades for commercial use will be produced. The market of the company will be in the Orient, Australia, New Zealand and along the Pacific Coast of this continent.

TRENTON.—The cooperage mills here were destroyed by fire on the 8th inst. Loss, $15,000.

COMO, QUE.—Hodgson's lumber mill and 400,000 feet of lumber were destroyed by fire on the 14th inst. Loss, $50,000.

GRANBY, QUE.—The sash and door factory owned by M. Bruneau was destroyed by fire on the 18th inst. Loss about $50,000.

NEW WESTMINSTER.—The Walsh Sash & Door Factory are planning the erection of a large factory, with a capacity of 1,000 feet per

When writing advertisers kindly mention having seen the advertisement in this paper.

day. A small sawmill will be operated in connection.

AYLMER, P.Q.—Bailey's lumber mill was destroyed by fire last month at a loss of $10,000. The cause of the fire is attributed to incendiarism.

BLACKVILLE, N.B.—McLaggan Bros.' sawmill was destroyed by fire last month. The mill was equipped with rotary, shingle and lath machines, and the loss is estimated at about $10,000, with no insurance.

GRACEFIELD, P.Q.—Messrs. Campbell & Stearns have purchased the limit belonging to Charles Lowe, and have started building operations on a sawmill at that town, which will cost in the neighborhood of $35,000.

WOODSTOCK.—The Canadian Lumberman Machine Co., a branch of an industry established at Muskegon, Mich., capitalized at $105,000, has decided to locate here. It will manufacture dovetail, glue and jointing machines for making scrap ends of lumber into full-sized boards. The machines cost about $4,000 each.

SAULT STE. MARIE.—Recent incorporations include the Stone Lumber Co., Limited, with a capital of $100,000. The incorporators include John A. McPhail and S. G. Stone, both of Sault Ste. Marie, Ont.

FORT FRANCES.—The Fort Frances Lumber Company's sawmill, together with three cars of lumber, was destroyed by fire last month at an estimated loss of $60,000. The fire is attributed to a spark from a locomotive.

BERTHIER, QUE.—Fire caused $30,000 loss to Mr. J. D. Chenard's saw mills.

Trade Notes.

HAMILTON.—The London Machine Tool Co., Hamilton, have received the following orders for the Western Drydock Co.: 5-60" punch, 2-48" shears, 1-60" x 60" planer and 1-18' x 10" lathe, all motor driven.

GALT.—The Goldie-McCulloch Co. report the following large order for the new Springfield shops of the G.T.P., at Winnipeg:—3-750 h.p. cross compound Corliss engines, to be direct-connected to 500 k.w. generators; 1-375 h.p. single cylinder Corliss to be direct-connected to 1-250 k.w. generator; and 1-225 h.p. engine, to be direct-connected to a 150 k.w. generator, all of these to run at 150 r.p.m. For the 75 k.w. exciters, 2-11 x 12 side crank Ideal engines are being supplied. In addition, they have an order from the town of Weyburn, Sask., for the new municipal electric plant including 1-15 x 30 x 30 cross compound Corliss, to be direct-connected to 1-250 k.w. generator, and 10 and 17 x 15 condenser. In addition there is the piping and steel smoke stack.

MONTREAL.—The British Insulated Cable Co. have recently closed two very large orders, one with the city of Ottawa and the other with the City of Winnipeg, for the entire supply of transmission cable in connection with their municipal systems.

MONTREAL.—In the construction of the new Windsor Station it was necessary to provide for the safe and rapid transfer of both passengers and baggage from floor to floor. As the building will be 200 ft. or more high and of immense area, this meant the installation of a large number of elevators, and the C.P.R. has just awarded the contract to the John McDougall Caledonian Iron Works, and they will be built in Montreal. They include eight passenger, two baggage and one kitchen or freight elevator and constitute the largest single elevator contract ever awarded in Canada. These eleven elevators will be of the hydraulic plunger type. In the early history of the elevator business it was considered that plunger elevators, though highly desirable in many respects, were impracticable for lofty buildings. The elevators were designed by Thure Larsen, of Worcester, Mass., formerly chief engineer of the Plunger Elevator Co. and afterwards of the Standard Plunger Elevator Co.

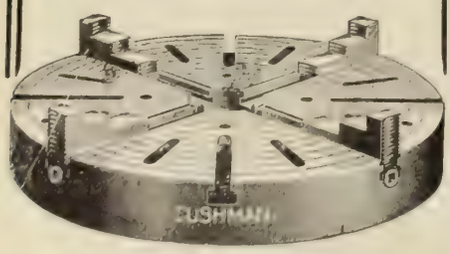
"CUSHMAN" CHUCKS

For general machinists' use. Strong and durable and designed for hard service.

Our catalogue shows many styles and sizes and is sent free. : : : : : :

The Cushman Chuck Co.
Hartford, Conn., U.S.A.
Established 1862



The John McDougall Caledonian Iron Works Co., Limited, have made arrangements with Mr. Larsen for the exclusive use of his patents and inventions in Canada, and he is now at the Windsor Hotel preparing plans.

DRUMMONDVILLE, P.Q.—Joseph A. Gosselin has received patent papers for a steam engine slide valve through Marion & Marion, patent attorneys, Montreal.

HAMILTON.—The Smart-Turner Machine Co., Ltd., report the following recent pump orders: E. Long Mfg. Co., Orillia; T. J. McCutcheon, Dunnville; James Cornhill, Chatham; Randolph McDonald Co., Norwood; Evans Co., Sudbury; Monarch Knitting Co., Dunnville; Mr. Nairn, Bartonville, Ont.; St. Joseph's Convent, Toronto; Niagara Trand Spray Co., Burlington, Ont.; Great Lakes Dredging Co., Port Arthur; Ontario Iron and Steel Co., Welland; and S. C. Allen, Alliston, Ont. The pumps are of various kinds.

MONTREAL.—The Jeffrey Mfg. Co., office and works, corner Cote and Lagauchetiere Streets, Montreal, also having a Toronto office formerly in the Dineen Bldg., 8 Temperance Street, has removed the Toronto office to more commodious quarters at 174 King Street East. Mr. H. W. Scott, mechanical engineer, formerly connected with the home office of this company in Columbus, O., is now in charge of the Montreal office and works. The Jeffrey Mfg. Co. are an old established concern, making a specialty of elevating and conveying apparatus for handling all kinds of materials in lumber camps, mines, quarries, as well as conveying apparatus for handling materials from the docks, loading to vessels. New machinery has been installed at the Montreal works for more economical production. This company also has nearly 100 branch offices situated in the leading commercial centres all over the world.

POWELL RIVER.—The Powell River Paper Co. have awarded a contract to the John McDougall Caledonian Iron Works Co., Montreal, for 11 Worthington Centrifugal pumps varying in size from 3 inches to 12 inches at the discharge outlet. Two of these pumps, each having a capacity of 4,200 gallons per minute and driven by electric motors, will carry ground wood stock from the grinders to the screens. Two others, having a capacity of 4,000 gallons per minute each, and direct connected to water wheels, will carry ground wood stock to deckers. The remaining pumps will be used in connection with bearers and digesters and for boiler feed and general purposes. These 11 pumps will have an aggregate capacity of 37,000,000 gallons daily, which is nearly equal to that of the city of Montreal water department, and will be built in the works of the company on William St. The Powell River Paper Co. is backed chiefly by Minneapolis capitalists, and the mill is now being erected on the Powell River, a few miles from Vancouver, B.C.

Standard Engineering Co. Secure Large Contract.

The Provincial Steel Co., Cobourg, are making considerable enlargements to their rail mill and will install a new rail mill and a continuous steel heating furnace with a daily capacity of 100 tons of rails and other shapes. The contract for this equipment has been placed with the Standard Engineering Co., 47 Wellington St. East, Toronto.

Large New Cedar Mill.

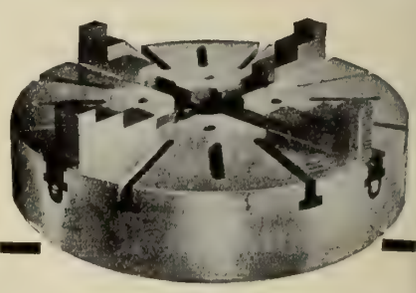
The Western Canadian Lumber Co. is starting to erect a new mill exclusively for cedar, just east of its present big plant at Millside, New Westminster. This large company, which has recently been formed, has at its head such well-known financial men as Col. Davidson, A. D. McRae, Wm. Mackenzie, D. D. Mann and Edward Swift. The new plant will cost about $300,000, and will have a capacity of 75,000 feet every ten hours. The planing mill, which is part of the new project, will have a capacity of 1,000 doors per day. Three hundred new hands will be employed, and it is expected that the planing mill and sash and door factory will be in operation within three months, and the cedar mill will be ready early next season.

Large Industry for Welland.

Negotiations have been concluded by which a million-dollar plant will be erected at Welland to employ 1,500 hands, by Deere & Co., Moline, Ill. The products of the Welland factories will be harvesters, waggons, plows, carriages, grain drills, harrows, disc harrows and other articles. The company will be granted no bonus, but have been promised a few concessions in respect to electric street railway, water, drainage, water service, etc. The capital of the company is $40,000,000. Their plant at Moline is the largest of its kind in the world, employing 7,000 hands and shipping 50,000 carloads of machinery yearly.

Activity at Port Mann, B. C.

The officials of the C.N.R. are busy marking the boundaries of their new terminal townsite, Port Mann, on the Fraser River, opposite New Westminster. A wharf is to be constructed immediately where material for railway construction can be unloaded. The officials of the railway state that it is the intention of the company to offer every inducement to manufacturers, elevators and industrial enterprises generally, to locate at this point.



A UNIQUE OFFER!

We have not the slightest doubt in our own minds about the superiority of the

"GLOBE" TIME RECORDERS

are made in Canada by expert mechanics. They are accurate, simple in construction, strong, and of good chaste appearance. They will record with absolute accuracy the arrival and departure of your employees (TO THE MINUTE), making you pay for what you get and no more. All lates and short time marked in red, regular time in green. The small cut at the top illustrates the WEEKLY MODEL, an entirely automatic recorder requiring no attention whatever during the week, as all changes, etc., occur automatically (DONE BY CLOCK WORK). The DAILY MODEL is shown in the cut at the bottom. This recorder is being used mostly in large shops, etc., where a large number of hands are employed. With the "GLOBE" TIME RECORDERS only one operation is required as against five with most others.

Inspection may be made through the glass sides of the case, but tampering with records is impossible, no danger of having soiled, torn or lost records when same are unfavorable, as is the case with all CARD CLOCKS. We are now manufacturing over 224 DIFFERENT TIME RECORDING CLOCKS, and are in a position to meet the requirements of any business. Write us about your needs and let us suggest what will best meet with your requirements. WE SOLICIT YOUR ENQUIRY.

FILING CATALOGUES.

The article on "Filing Catalogues to Secure the Greatest Benefit," in the Business Management department of the September issue, was written for Canadian Machinery by Adam Smith, of the Office Specialty Co., Toronto, a specialist in factory filing systems.

LONDON MACHINE TOOL CO. ENLARGING

The London Machine Tool Co., Hamilton, have decided to increase the capacity of their plant by the installation of a number of special machines. Among the new machines, orders have been placed for special and standard high grade tools for the manufacture of interchangeable parts on standard machine tools. In connection with the extensions, the services of C. H. Overkamp, formerly of the Triumph Mfg. Co., and American Tool Works, have been secured as works manager.

Mr. Overkamp is familiar with the Canadian field. Recently he visited the works of the London Machine Tool Co., Hamilton, and was so impressed with prospects for business in Canada that he decided to throw in his lot with the above company. He is confident that Canada has a great future before it, and predicts that Canadian tool builders will, in the near future specialize in certain lines of manufacture.

C. H. Anderson, for the past five years with the Hans Renold Co. has joined the staff of John Millen & Sons, Montreal, to look after their sales for the Coventry Chain Co.

John W. Gerell, manager of the Toronto shipyards, which have been bought by the Polson Iron Works, Toronto, has accepted the position of manager of the Polson Iron Works.

Charles F. Kenworthy, until recently with the Engineering Department of the American Brass Co., and formerly of the Kenworthy Engineering Co., has been engaged by the Rockwell Furnace Co., to represent them in the New England States and Canada. Mr. Kenworthy has devoted his entire time for the past eighteen years to the design and construction of furnaces and fuel apparatus, and brings with him a large acquaintance among the builders and users of this line.

The British government has appointed Leonard P. Morgan, assistant smelter and refiner of the United States mint at Philadelphia to take charge of the new refinery at the Ottawa branch of the royal mint. Mr. Morgan must become a British subject.

We build nine sizes of Stokers, capacity from 25 to 2000 lbs. coal per hour.

Write Now!

Our Furnaces Heat Steel with the Cheapest Fuel on Earth—

SOFT, SLACK COAL

They are all fired with "American" Mechanical Stokers, which burn bituminous slack coal automatically and without smoke, and give a clear, steady, soft, non-scaling flame. You get increased production, at about one-third to one-half the operating cost of oil or hard coal. This is a fact. If you burn money to heat steel why not burn less of it, and write us at once?

ENGLISH FIRM of high class machine tool makers requires services Canadian representative to work on commission. Apply Box No. 27, CANADIAN MACHINERY, 88 Fleet St., London, England. (8)

PATENTS.

THE PROPRIETOR of the Canadian Patents, Nos. 119683 and 114649, "Improvements in Multiple Cylinder, Internal Combustion Engines," and "Improvements in Reversible Valve-Gear for Internal Combustion Engines, Steam Engines, Air Compressors and the like," is desirous of entering into arrangements by way of license or otherwise for practically working the patents. For particulars apply KLAUSER & CO., 9 Friedrich St., Berlin, Germany. (6)

MISCELLANEOUS.

A BOOK-KEEPING STAFF IN ITSELF — doing the work with machine-precision and accuracy, the National Cash Register. Write us for demonstration literature. National Cash Register Co., 285 Yonge St., Toronto.

A BOON TO EVERY ENGINEER — A perfectly reliable fountain pen is to be found in the Beaumel "Rival" Pen. Easy to fill, non-leakable, and writes with exceptional smoothness. Gold nibs of thicknesses to suit every style of handwriting. Guaranteed in every respect. Sold by all stationers. A. R. MacDougall & Co., Canadian Agents, Toronto.

ANY MAN who has ever lost money in the mails has had occasion to learn by painful experience that the only proper way to remit money is by Dominion Express Money Orders and Foreign Drafts. If lost or delayed in the mails, a prompt refund is arranged, or new Order issued without further charges. (tf)

ACCURATE COST KEEPING IS EASY if you have a Dey Cost Keeper. It automatically records actual time spent on each operation down to the decimal fraction of an hour. Several operations of jobs can be recorded on one card. For small firms we recommend this as an excellent combination—employees' time register and cost keeper. Whether you employ a few or hundreds of hands, we can supply you with a machine suited to your requirements. Write for catalog. International Time Recording Company of Canada, Ltd. Office and factory, 29 Alice Street, Toronto.

EGRY business systems are devised to suit every department of every business. They are labor and time savers. Produce results up to the requirements of merchants and manufacturers. Inquire from our nearest office. Egry Register Co., Dayton, Ohio; 123 Bay St., Toronto; 258½ Portage Ave., Winnipeg; 308 Richards St., Vancouver.

GET THE BUSINESS—Increase your sales—Use Multigraph typewritten letters. The Multigraph does absolutely every form of printing. Saves you 25 p.c. to 75 p.c. of your printing bill. Multigraph your office forms, letterheads, circular letters. Write us. American Multigraph Sales Co., Ltd., 129 Bay Street, Toronto.

KAY'S FURNITURE CATALOGUE contains 160 pages of fine half-tone engravings of newest designs in Carpets, Rugs, Furniture, Draperies, Wall Papers and Pottery with Cash prices. Write for a copy—it's free. John Kay Company, Limited, 36 King St. West, Toronto.

PROBABLY the most talked about machine in Canada is the Hainer Book-keeping Machine. It combines in one machine the cash and credit register, time recorder and account register. Representatives wanted everywhere. Write for our proposition. Book-keeping Machines, Ltd., 424 Spadina Ave., Toronto.

SAMPLES FREE—Write us to-day for free samples of our new two-color Counter Check Books—white and yellow leaves. We make Check Books endfold and sidefold, single and triplicate pads. Lowest prices. Dominion Register Company, Ltd., 100 Spadina Ave., Toronto.

SHOP AGENT WANTED.

WE want an agent in every machine shop in Canada where fifteen or more men are employed, to take subscriptions to this Journal. Subscriptions are easily obtained and the work can be carried on by giving a few minutes to it in the noon hour. Liberal commissions allowed both for new subscriptions and for renewals. Write for terms. Agents' Dept. CANADIAN MACHINERY, 10 Front St. East, Toronto.

STRETCHING THINGS

I am mighty careful not to stretch the facts in these publicity efforts.

You see, I base all my statements from information received from practical foundrymen, who know the subject.

I have reports from more than fifty progressive Foundrymen who say my KING KORE KOMPOUND is a new era in economy, in investment of money, in time-saving and in saving of castings. If there is now any one whose detail differs from the majority, I make it to fit his case.

It's the same way with GENUINE EAST INDIA PLUMBAGO, the only Lead any foundryman can afford to use.

With the Core Compound goes STEVENS' CARBON BLACKING, the ideal core-wash; there is no trouble, when making hollow castings, with this combination.

I manufaoture FOUNDRY FACINGS, FOUNDRY SUPPLIES, BUFFING COMPOSITIONS and PLATERS' SUPPLIES.

PETERSON'S CORE OIL

The Strongest Core Binder on the Market

Peterson Core Oil is the one oil that is fully equal to the best linseed oil for all core-making purposes.

It has the additional advantage of costing considerably less than high-grade linseed oil.

We do not expect to convince you by a mere assertion. We request the opportunity to demonstrate its truth to your utmost satisfaction.

A communication with us will probably lead to a great saving in your core-room. Write us to-day.

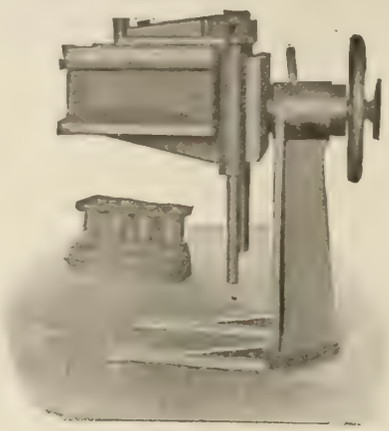
Crucibles of Quality

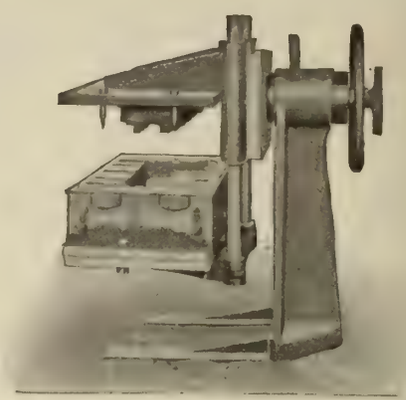
Grimes Roll-Over Molding Machine



No. 1

This is a simple, standard machine, requiring small floor space.

It is perfectly balanced, requiring no counter-balancing mechanism, as centre of gravity is centre of rotation.



No. 2

By means of small hand wheel shown in cut, one man can turn largest flask smoothly and without jerk.

Pattern is drawn by absolutely straight gravity drop.

This machine is adjustable for deep flasks and can readily take care of flask 24 in. x 36 in. and 4 to 12 in. in depth, with maximum pattern draft of 12 in.

Positive adjustable pins at four corners of clamping device, Fig 2, compensate for unevenness of floor boards.

PRICE, f.o.b. cars Windsor, $125.00

HIGH GRADE CASTINGS are not made with low grade materials. Think this over when you see a poorly finished casting in your cleaning room, and remember, if you please, if you wish to place the pattern in the high grade class, our No. 48 Plumbago will do it, also that the saving in cleaning room expense would pay for three times the necessary No. 48 Plumbago to have made it high grade.

Another vital point is that you have a core wash which will peel clean and not run before the metal. Try our Eureka Blacking, the best core wash on the market.

WINNIPEG SHOPS

THE Board of experts appointed by the National Transcontinental Railway Commission to enquire into the merits of the several propositions which were put before them in the way of Fuel Oil Furnaces for the shops in Winnipeg unanimously decided in favor of the KING Fuel Oil Furnaces.

This is the largest individual order that has ever been placed in Canada, and all the material and labor required for the construction of same will be Canadian, which means that all of this money will go to the benefit of Canada.

This should serve as an object lesson to some who are still under the impression that they must go to the United States for equipment of this kind.

We append herewith facsimile of this contract, which shows the large variety of Furnaces specified, showing conclusively that Fuel Oil Furnaces can be adapted for all classes of work.

CONTRACT

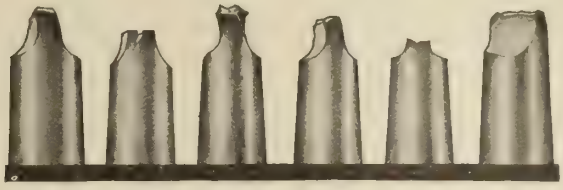
What are Your Twisted off Tangs costing you

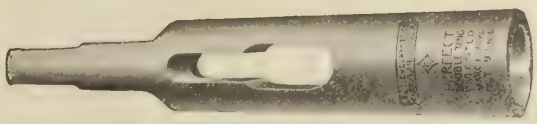
The broken tang was only .312 inches in thickness

Good for the Scrap-heap



Have you ever considered what it is costing your shop to throw away taper shank tools with tangs twisted or broken off? It is a great waste of good material that *should be saved* and *can* be.

Patented Mar. 26, '01



Patented Oct. 9, '06

The new tang is .500 inches in thickness.

Ready for the Drill Press

"PERFECT Double Tang SOCKETS

not only prevent the tangs on your new drills twisting off, but also make your tools with broken tangs stronger and better than they were when new.

Simply grind a second and stronger tang on the shank below the original one. It is 25% to 60% thicker than the original tang according to the size of the shank. The Double-Tang Sockets do the rest.

Fit any Drill Press or Lathe Spindle
Made in Ordinary Styles and Sizes
Ordinary Drift Removes Drills

Send for "S.C." Circular and Discounts

BUTTERFIELD'S TAPS

Are used by all DISCRIMINATING users of taps.

We have been making taps for over thirty years and we know HOW.

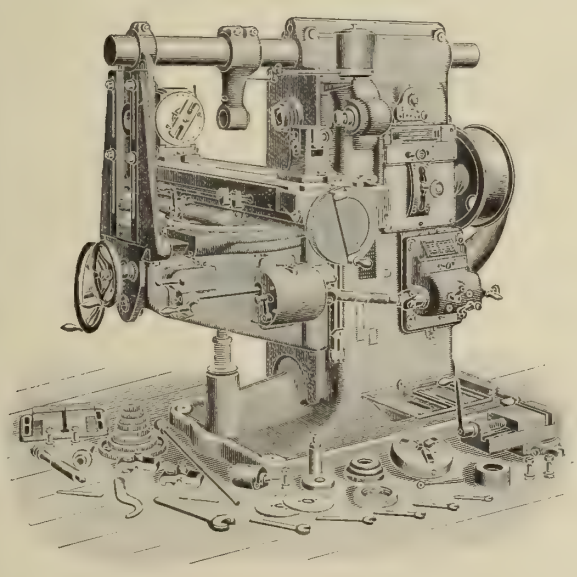
We use nothing but the best steel that money will buy. Our hardening and tempering process is the result of thirty years' experience Our men are experts each in his particular line.

We believe our Taps are as near perfect as it is possible to made them.

A trial will convince YOU of the justice of our claim.

Butterfield & Co.

ROCK ISLAND Quebec — DERBY LINE Vermont



The unusual rigidity in construction is secured by the careful design of the individual parts of

B. & S. Milling Machines

In laying out the machines the greatest care is taken in the design of the separate parts to see that each is fully capable of sustaining all strains to which each may be subjected. It is only by taking care in this particular that rigidity can be secured

See Our General Catalogue for Full Line

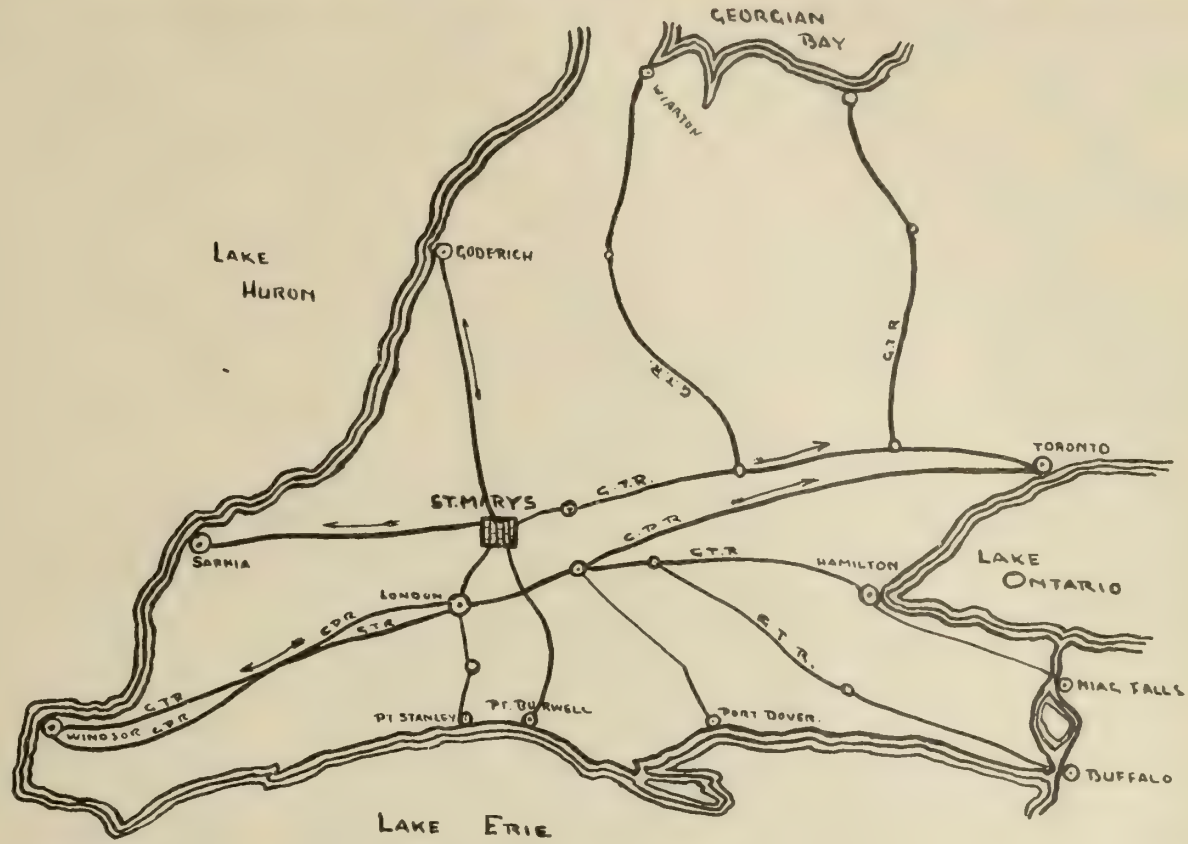
Town of St. Mary's, Ont.



MR. MANUFACTURER:

Are you looking for a location where you may establish your factory?

St. Mary's is looking for you.

Please take time to consider its advantages.

Located in the heart of the finest agricultural district in Canada. Niagara power always on tap. C.P.R. and G.T.R. One million population within a radius of one hundred miles. Splendid water. Healthy surroundings. Beautiful. Good schools and churches. Abundance of labor. Get in touch with T. M. CLARK,

Secretary Industries Commission.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

To Our Readers—Use this directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

To Our Advertisers—Send in your name for insertion under the heading of the lines you make or sell.

To Non-Advertisers—A nominal rate of $1 per line a year is charged non-advertisers.

HARBISON-WALKER

The Standard *of* Quality

Fire Brick for Boiler Settings

Look up, **not** your prices per thousand Brick but your **costs** for repairs per thousand H.P. per hour.

Remember the costly shut downs when every H.P. was needed. It all shows up on the cost sheets.

It's on the cost sheet basis we want to take it up with you. A postal will bring catalog and any data you wish.

HARBISON-WALKER REFRACTORIES COMPANY

PITTSBURGH, - PENNA.

THE BEST FIREBRICKS

ARE

GLENBOIG AND GARTCOSH

MADE IN SCOTLAND

and BEST RESULTS can only be got by using these brands, as they will stand the highest heat without melting.

Are also largely used for building purposes where a handsome appearance is desired.

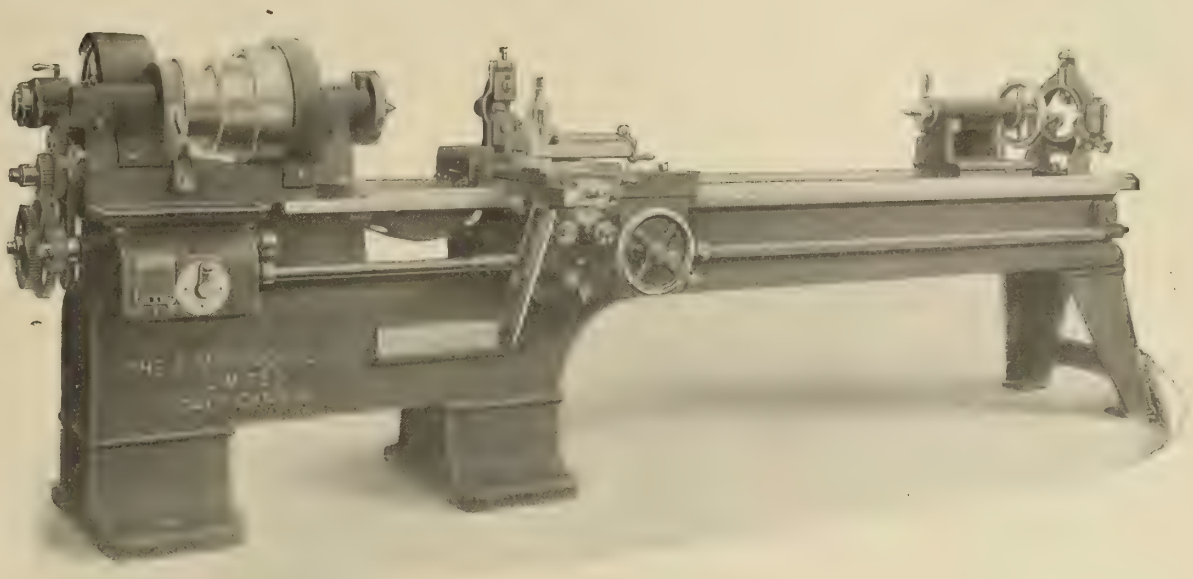
MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe-Screwing Machines



GAP LATHES—16, 18, 20, 24," in any length of Bed.

A Gap Lathe for a Jobbing Shop is an almost absolute necessary Machine Tool.

The improvements embodied in our Lathes made for absolute solidity and steadiness of cut.

The Brace under Carriage allows Gap diameters to be turned at High Speeds with resultant work as good as can be done on ar Engine Lathe of large swing.

Double Back Gears give a range of Spindle Speeds which are all found useful.

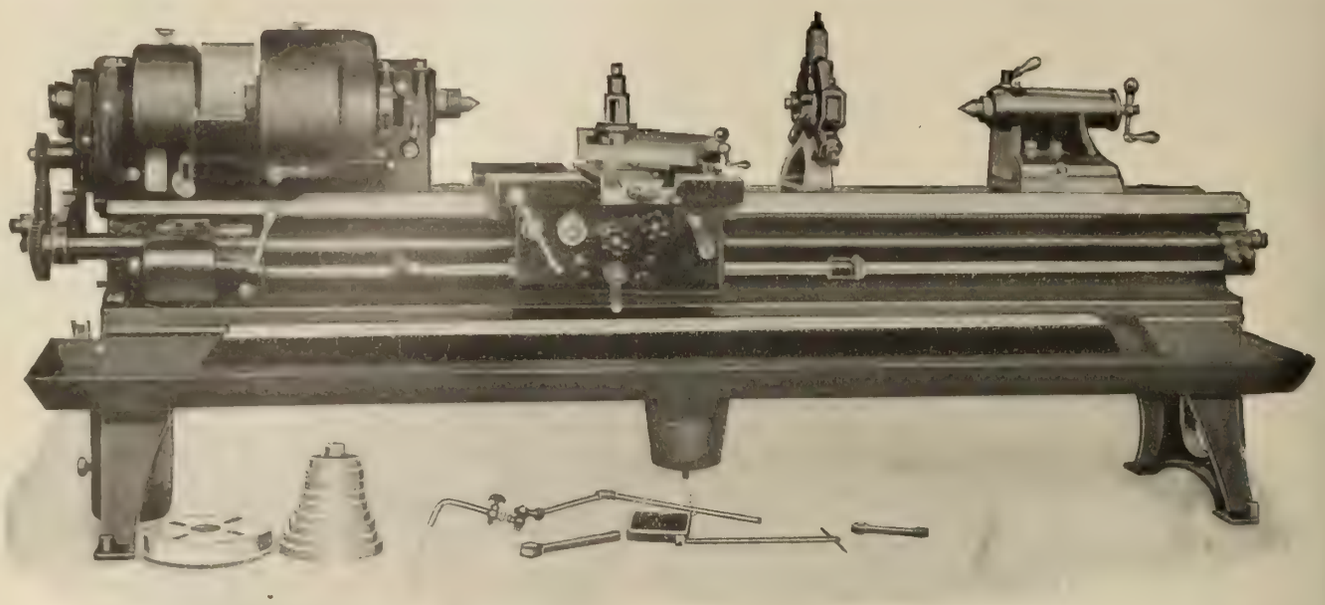
Our extra large belt surfaces, combined with specially heavy spindles, ensure highest efficiency both in quantity and quality of work

We invite the closest scrutiny of materials, workmanship and finish, and have adapted Highest Quality as standard from which we will not deviate.

Particulars, yours for the asking.

The R. McDougall Co., Limited

The Canadian Fairbanks Co., Sales Agents. GALT, CANADA



The Springfield High Power Rapid Reduction Lathe

might be used as a model of modern lathe construction. It is one of the most powerful and rigid machines ever put on the market. The operator has full control at all times. Six variations of speed are instantly obtainable. The compound rest is of new design, countershaft particularly simple and every convenience for operating incorporated in the general plan. Try it when accuracy means money.

This Lathe under severe test has proven to be remarkably steady under the heaviest cuts—the carriage traveling steadily along, due to its most excellent design, and the proper distribution of metal—thus doing away with chattering, and jerky motion, so often found in so-called Rapid or High Speed Lathes.

With the number of speeds and feeds possible, together with its high power, accuracy and ease of operating, we confidently place this Lathe on the market, as representing the highest type of design, excellence, and accurate and careful manufacturing.

We also supply for Prompt Shipment:—Engine Lathes, Turret Lathes, Brass Finishers' Lathes, Automatic Machines, Horizontal or Vertical Boring and Turning Mills, Planers, Shapers, Slotters, Bolt and Nut Machinery, Cutting-off Machines, Drilling Machines, High Speed Cold Saws, Velos High Speed Steel and Twist Drills, Special Steel for all Purposes, Pneumatic Tools, Woodworking Machinery, Chain Hoists, Electric Traveling Cranes, Etc.

Full stock now carried of Velos U.R. High Speed Twisted Drills

Rapid Bar Production

in Exact Duplication

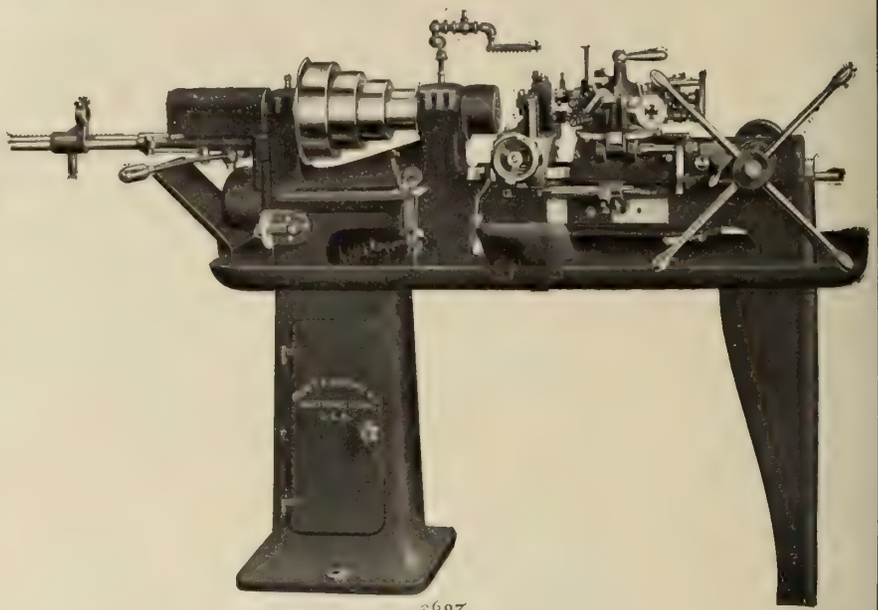
The P. & W. Turret Lathes

A series of bar machines that are capable of a class of work in accuracy beyond that which it has been supposed or known could be produced on turret lathes. To obtain this end it has been necessary to make liberal use of many refinements of construction not generally employed in other machines of this class.

A number of exclusive features have also been introduced to promote convenience and rapidity in operation, facilitate making ready for given work and enable the machine to be economically used for the production of small lots as well as large lots of work.

Tool equipment is adjustable to a very wide range of work to meet the ever-changing manufacturing demands.

Six Sizes:—$\frac{5}{8}$ x $4\frac{1}{2}$, 1 x 10, $1\frac{1}{2}$ x 18, 2 x 26, $2\frac{1}{2}$ x 26 3 x 36.



2697

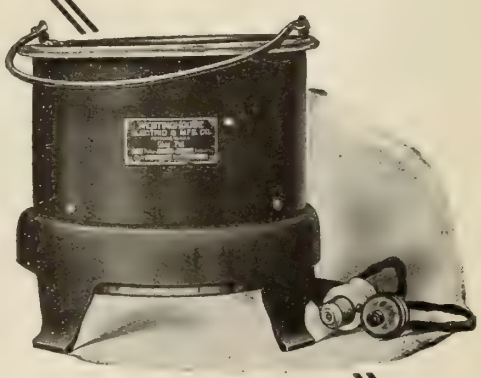
We can make them as small as you like and as large as 12 inches wide.

A Difference of 50%

between the amount of glue consumed and the amount put to actual use is nothing uncommon where the old methods of cooking and heating are still in vogue, to say nothing of the risks of fire, and other antiquated and unsanitary conditions.



Westinghouse

Electrically-Heated

Glue Pots and Glue Cookers

avoid the leaky pipe connections required for both gas and steam-heated types of glue pots, and at the same time eliminate the fire risk inseparable from the use of a partially exposed gas flame. The convenience and safety of the Westinghouse electrical methods of heating for use on apparatus surrounded by inflammable materials and materials subject to damage by the drip from pipes, or the gases from flames, make these glue pots a most desirable utensil for bookbinders, cabinet makers, leather workers, pattern makers, piano builders, etc.

20-inch x 36-inch Gap Lathe

Swings over bed, 21½ inches
Swings over carriage, 14½ inches
Swing in gap front of Face Plate, 12 in.
Takes between centres 8-ft. bed—4 ft. 0 in.
Maximum Cone diameter, 13 inches
Belt on Cone, 3 inches

Diameter Front Bearing, 3¼ inches
Length Front Bearing, 5½ inches
Hole through Spindle 1 9-16 inches
Diameter Tailstock Spindle 2⅜ inches
No. Taper Spindle Centres, No. 4 Morse

Gap Lathe swings in gap 39½ inches
Countershaft Pulleys, 12x4½ inches
Countershaft Speeds 125 and 175 R.P.M.
Weight, 4,800 lbs.—8-foot bed
Extra per foot, 200 lbs.

In the design of these Lathes the following points have been given the greatest consideration:

POWER ACCURACY DURABILITY CONVENIENCE

In the manufacture the parts are carefully inspected, and before leaving the works the machine is thoroughly tested under working conditions

THE SPINDLES are made of high grade crucible steel; after being bored, they are accurately ground in wet grinder, making the spindles absolutely round.

THE BEARINGS are all of ample dimensions. They are made of bronze, and spindle is accurately fitted into place, making a perfect bearing. Ample means are provided for lubricating, the bearings being supplied with oil cups with grooves for carrying the oil to every part of the spindle. Thrust is taken up by ball bearings of large dimensions working between hardened and ground steel washers.

THE CONES are of large diameter and wide face, three steps being provided' By means of Double Back Gears and large diameter cone, this Lathe is enabled to take extremely neavy cuts at high speeds on all diameters of work. By means of Double Back Gears there are nine changes of speed provided forward and nine reverse, or eighteen forward, as may be desired.

THE CARRIAGE has a long bearing on bed, to which it is accurately scraped. Carriage can be locked to bed at any point by clamp screw.

THE APRON is secured to carriage by means of dowels and screws. All pinions are of steel; all shafts are of high grade steel, wet ground and hardened when necessary.

THE CROSS SLIDE is of exceptional width and well scraped into V's on carriage. Cross Slide has power feed.

COMPOUND REST is graduated, well secured to rest, and is provided with micrometer attachment.

THE TAILSTOCK is of heavy construction, of the cutaway type, and provided with setover for turning tapers if desired.

THE BED is wide and deep, and well tied at close intervals by braces of box form.

LEAD SCREWS are of ample diameter, accurately cut from master lead screw.

THE GEARS are all cut from the solid on accurate gear cutting machinery.

FEEDS---Three instantaneous changes of feed are provided, which with change gears give a very wide range of feed.

COUNTERSHAFTS are double, and are of the friction type, being provided with very powerful friction, with ample means for lubrication and adjustment.

EQUIPMENT. Each Lathe is furnished complete with full set of train gear, steady rest, follower, wrenches three face plates, and one chuck plate.

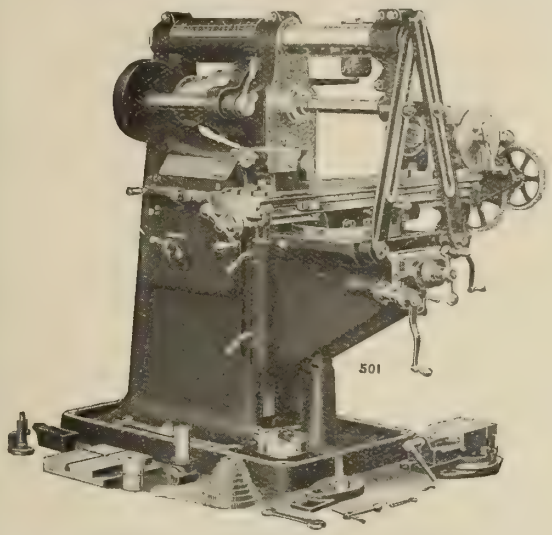
The A. R. Williams Mach'y Co., Toronto
Williams & Wilson - Montreal

The advertiser would like to know where you saw his advertisement—tell him.

The New Cincinnati Cone-Driven Miller

In every shop there is some work on which the cutting is light that can be milled to best advantage on a modern Cone-Driven Machine. To meet such requirements we have redesigned our line of Cone Type Millers, Plain and Universal. They have many important features far in advance of other Cone-Driven Millers. The COLUMN is a complete box of rectangular form. The FEED MECHANISM is a single unit, assembled complete by men who are specialists on this work. When in place, it is an integral part of the machine. It is located high above the floor—the operator need not stoop to reach the levers. The feed changes may be made within the practical limits of milling while taking a cut, without inconvenience or injury to the gears, because they all run at moderate speeds.



The FEED INDEX is direct reading—no chance for confusion or doubt as to the proper lever movements. It is the simplest index used on any machine tool.

All these features make this type the ideal machine for manufacturing small parts and for toolroom use.

We make a complete line of newly designed millers:—Plain, Universal, Vertical—Cone-Driven, High Power.

Ask for our catalog.

A GREAT AUTHORITY'S OPINION

Great Scientists as well as the mechanical world have placed their seal of approval upon Magnolia Metal and we consider the following letter among our valuable assets.

Mason College, Birmingham, England

Gentlemen:—

This is to certify that I have made a series of tests of your Magnolia Metal in a machine specially designed to reproduce as nearly as possible the practical working condition of machine bearings. I have also made a series of exactly similar tests in the same machine on the best quality of Babbitt and gun metal.

A detailed report of these tests was forwarded to you recently. The experiments were made on three diameters of journal, four different lengths, four different speeds, and five different pressures. In all between three and four hundred tests were made, in each of which the temperature of the bearings and friction were carefully measured. The numerical results are set forth in the detailed report in fourteen tables and a number of diagrams.

I am pleased to state that your metal is proved by these tests to be much superior to either Babbitt "Genuine" or gun metal. It produces less friction, it keeps the bearing temperature lower, requires less lubrication and possesses greater durability. This characteristic of durability is a most important one. Within the wide limits of condition covered by my tests, it would be true to say that the longer the Magnolia Metal Bearing is used, and the more severe the duty imposed on it, the better becomes its conditions.

It is satisfactory to note that the elevation of bearing temperature above that of the surrounding air is, under all ordinary conditions, extremely low. With prolonged use the temperature shows no tendency to rise, and the surface becomes more and more smooth and glassy.

The general conclusion at which I have arrived from these experiments is that Magnolia Metal is a very excellent material for bearings; that is, special good qualities appear more particularly when it is subjected to *intense pressure*, such as could not be borne by other metals without firing or melting, and that under very trying circumstances the Magnolia Metal may be trusted to remain cool; that is, at a temperature that does not interfere with good working.

I am, Gentlemen, Yours truly,

Professor of Engineering, Am.I.C.E., M.I.M.E., etc. ROBERT H. SMITH

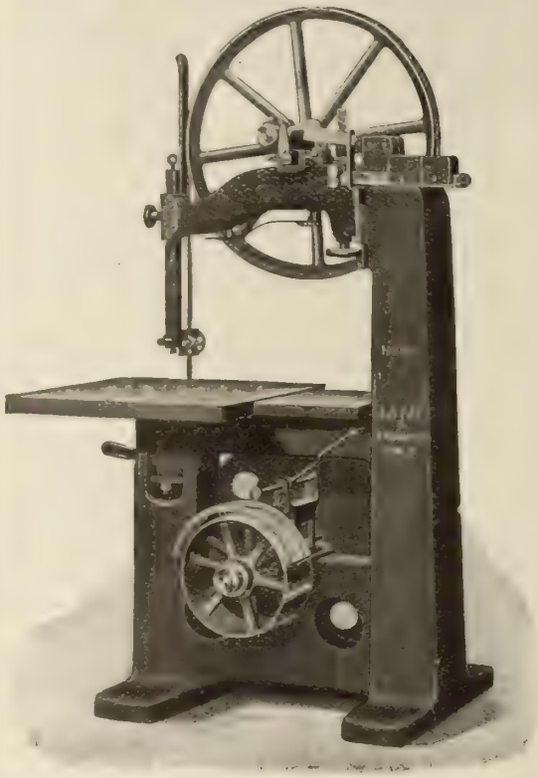
Our No. 50 represents the acme of perfection in our line of

BAND SAWS

for all kinds of plain and intricate scroll sawing, making it especially adapted for use in pattern shops



No. 50 Patent Special Band Saw.

For Pattern Shop work, we arrange the table with a tilting device having micrometer adjustment, which enables the operator to instantly adjust the table to any angle up to 45 degrees to the right and 10 degrees to the left. This device combines a quick and accurate angling of the table, which will be found of great importance to the Pattern Maker.

Some of the things which have contributed to its favor among Pattern Shops are its Square Form of Column, Solid Lower Wheel, Roller Guide and Knife Edge Strain.

The above features, among many others, are fully described in our large illustrated circular. WRITE FOR IT TO-DAY.

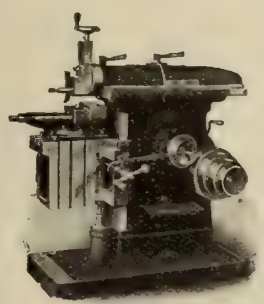
BLISS

BLISS No. 225 GANG SLITTER

This machine presents many valuable features for your consideration. It cuts absolutely true, clean cuts in decorated or plain stock. The solid housings and 3-inch diameter cutter shafts insure permanent alignment of cutters. Cutter shafts have thrust bearings, eliminating all lateral motion. Cutters are one-half inch thick, ground both sides and reversible, giving twice the amount of wear of ordinary cutters. These are a few of the features. Write for the others.

E. W. BLISS CO., 20 Adams Street, BROOKLYN, N.Y., U.S.A.

London Office, 114 Queen Victoria Street, London, E.C., England



The Shaft Bearings in **STEPTOE SHAPERS**

never wear out. They are provided with bushings that can easily be replaced if necessary, and Ring Oilers keep the bearings constantly flooded in oil, thereby preventing the shafts from getting hot and cutting. The Bull Gear Bearing has a chain oiler, and a number of other features (which we cannot explain here) make STEPTOE SHAPERS "just a little better."

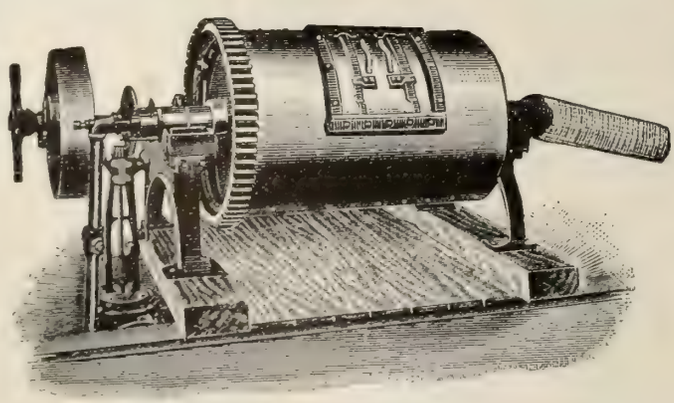
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

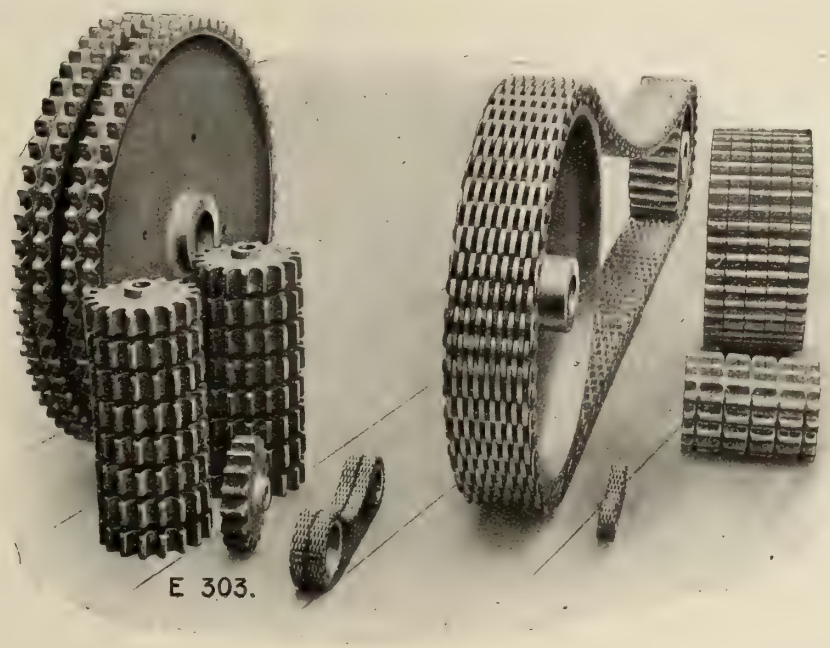
We also manufacture leaning Mills Dust Arresters, Sand Blast and Foundry Equipment.

THE W. W. SLY MFG. CO., CLEVELAND, O.

A FEW POINTERS ON

Coventry "Noiseless" Chain Gearing

It can be applied when the conditions are unsatisfactory for either belts or spur wheel gearing.
It can be run up to a speed of 1400 feet per minute.
It is practically silent even at its maximum speed.
There is no initial tension, therefore the journal pressure is considerably reduced.
It can be run quite satisfactorily in a heated or damp atmosphere.
The speed ratio is positive, the efficiency is high and constant.
It is therefore economical to use it.



The two large double wheels on the left are for Coventry Roller Chains, 1¾ inch pitch. Each drive is to transmit 60 h.p. at 480 feet per minute.

The large drive on the right is a 1¾ inch pitch 7 x 8 combination "noiseless" type, for transmitting 58 h.p. at 975 feet per minute.

To all Machine Users

It will pay you to learn something about this system of power transmission.
If you are not getting the best out of your machines, through belt-slipping or jarring gears, consider the claims of chain driving. Tell us your troubles and we will be glad to help you out.

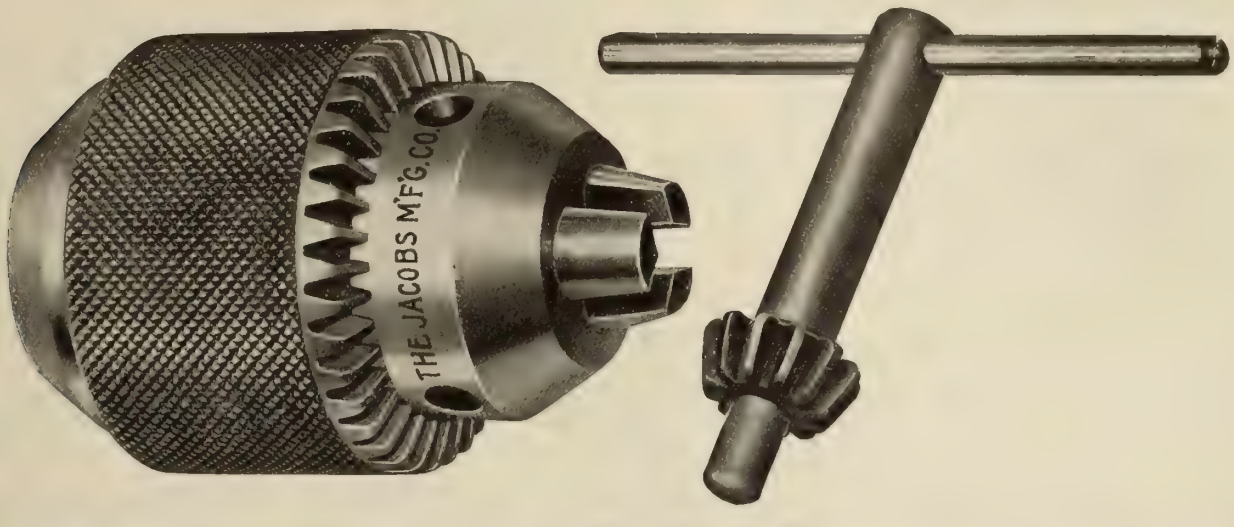
The High Degree of Utility In The Jacobs Improved Drill Chuck Has Won For Us Phenomenal Success



THE phenomenal success attained by The Jacobs Manufacturing Company in the Drill Chuck business is convincing evidence of the HIGH DEGREE of UTILITY in the Jacobs Improved Drill Chuck, and that this UTILITY embodies CONVENIENCE, EFFICIENCY, ACCURACY and DURABILITY.

The fact that we have, in the seven years we have been in business, sold more than 90,000 Jacobs Improved Drill Chucks to the largest and most progressive dealers and manufacturers in the world, and that, without the employment of a salesman in the past three years, the year just past has been our best year, is the most positive proof of the recognized HIGH DEGREE of UTILITY in the Jacobs Improved Drill Chuck.

Our imitator boasts of his "thirty years' experience." He has made and abandoned three styles of alleged "perfect Chucks" in the past five years, which have been "weighed in the balance and found wanting." We have no such record, but we are proud of our record, and that our phenomenal success was attained, not by imposing upon the public and trying to sell inferior imitations, but because of the HIGH DEGREE OF UTILITY in the Jacobs Improved Drill Chuck.

Don't be imposed upon with another inferior imitation. Insist upon having the Drill Chuck that has, in the past seven years of service, proven its HIGH DEGREE OF UTILITY. Inspect every Chuck you purchase. See that it bears the following imprint: "THE JACOBS MFG. CO.—HARTFORD, CONN., U.S.A.—PATENTED SEPT. 16, 1902."

Buy the Belt that stretches least!

because it will save the time spent in taking up slack, and save the money thrown away in cutting the belt to keep it taut.

GOODHUE BELTS

stretch less (by 15% to 25%) than any others.

And the reason is not far to seek:

We take more care in stretching before the belt is made up, and none of the unstretched parts are used in the make up.

According to the conditions in which the belt has to be used, we recommend our "EXTRA," "STANDARD," or "ACME WATERPROOF" Belts.

They are the most reliable and economical belts on the market!

It's worth your while to get our details and prices.

LEATHER "CLIMAX" BELTING

OLD SAM SLOAN, who used to be foreman at Pratt & Hillyer's big machine shop, would never consent to use any belting but "Climax." Some people said he was prejudiced—so he was, and thereby hangs a tale. "One fine summer evening, many years ago, a genial individual made Sam's acquaintance in the bar of the King William Hotel. First go off he handed Sam a fragrant smoke, and later on he handed Sam a very plausible line of talk about the Goldy-Brickey line of belting, for which he was a traveling salesman. The upshot was that Sam gave a big boost to the G.-B. line with the purchasing agent. The purchasing agent was only too glad to give the G.-B. people the next order, because they quoted about a cent a foot less, and he thought it was a good buy. Well, sir, instead of being a good buy it was almost GOOD-BYE for poor Sam. We won't go into the harrowing details, but Sam's friends said that G.-B. stuff almost drove him crazy. To his dying day the smoothest salesman alive couldn't pry loose Sam's faith in 'Climax'—once was enough. He preferred the belting that he KNEW would make good."

You see, we Guarantee Every Foot of "Climax" Belting!

HUBBELL LAMP GUARDS

Lock Your Lamps in—Lock Lamp Thieves Out

HUBBELL LOCKING LAMP GUARD

It locks with a key. Grips the socket securely. Makes the lamp safe from breakage and theft.

No. 5685 for 16 C. P. Lamps, for 25 and 40 Watt Tungsten Lamps

No. 5635 for 32 C. P. Lamps, for 40 and 60 Watt Tungsten Lamps.

Don't take any chances. Because a few lamps were not broken in your plant yesterday, is no sign they won't be broken to-day, to-morrow or the next day. Wherever there's action there are bound to be accidents. The man who is intent upon turning out a good piece of work for you isn't going to stop the swing of his hammer to see if it will clear the lamp hanging over his head. If he breaks it, another takes its place and you pay for it—for all of them, present, past and future. To get down to dollar sense, isn't it cheaper to forestall this breakage? Isn't it better to know your lamps are safe than to think they are? You'll be surprised to find how little it will cost to equip your lamps with HUBBELL GUARDS.

THE ONLY ELECTRICALLY WELDED GUARDS

Wires are welded at every contact point. The weld is as strong as the wire it holds.
No part of the lamp is touched by the guard. Vibration is carried to the socket, not to the lamp.

Simple, strong, neat in appearance. Nothing to obstruct light—no parts to collect dust and dirt.
Quickly adjusted, sure to stay secure. Impossible for the Guard to drop down on the lamp.

Mammoth Railway Shops of the Grand Trunk Pacific

Buildings to House Car Construction, and Locomotive Repair Equipment Nearing Completion—Layout of Plant, the Floor Space of which is Seventeen Acres.

By L. C. Harkness.

THE mammoth railway shops of the Transcona, about four miles from G. T. P., which are located at Winnipeg, are rapidly nearing completion. The first concrete was poured on July 14, 1909, and since that date, about 500 men including foremen, iron workers, concrete workers, and carpenters have been working on the elaborate details of the plans. The railway has acquired a piece of territory one half mile wide, and two miles long, on which the shops are being erected, and the total floor space of the shops which are already planned will total seventeen acres.

The entire construction is designed to care for the general repair of 1,800 miles of railway. Neither locomotives or cars will be built at Transcona, but the equipment will be such as to make it possible to manufacture certain parts. This will mean that the shops will be a very important industrial centre, and it is for this reason that the buildings are all planned on a large scale and with provision for 100 per cent. extension, if necessary. The structural material also is of the very best available, and has been erected with the greatest care possible to ensure a long period of permanent service. With the exception of these buildings, namely, the storehouse, oilhouse, and stores platform, all buildings are of steel construction, with self-supporting steel frames, concrete foundations, and concrete walls up to the windows; the super-structural masonry being of brick. The buildings mentioned are altogether of re-inforced concrete and brick construction. The equipment and power used in all the shops will also be the most complete and efficient that can be secured and when the whole is completed one of the greatest machine shops on the Continent will be in operation.

Buildings.

The total number of buildings in the shops is eighteen and the names with dimensions are as follows:

Locomotive, machine and erecting shop, 170 x 612 feet x 47 feet high. Boiler tank shop, 185 x 210 feet x 47 feet high. Stores and scrap shop, 40 x 220 feet, x 47 feet high. Forge shop, 100 x 269 feet, x 47 feet high. Grey iron foundry, 130 x 200 feet, x 47 feet high. Power house, 110 x 150, x 49 feet high. Cleaning room, 48 x 80 feet, x 25 feet high. Locomotive carpenter and pattern shop, 70 x 100 x 42 feet high. Stores, 60 x 200, x 18 feet high. Wheel foundry, 92 x 135 feet. Engine house, 170 feet radius, 1,068 feet circumference. Freight car shop, 200 x 600 feet. Paint shop, 100 x 325 feet. Coach shop, 125 x 250 feet. Planing mill, 100 by 300 feet. Lumber shop, 60 x 115 feet. Dry kiln, 40 x 50 feet.

Departments.

The entire plant is divided into three departments namely, locomotive shops, car shops, and the power house. These are not given distinct locations, but are built according to the convenience of power distribution, and trackage facilities. To this end the general plan of the shops is systematically arranged on either side of the spacious midway which runs north and south across the entire property. The various buildings are served by a series of standard gauge service tracks branching off from the

Fig. 3.—No. 3 of Panoramic View Showing Locomotive and Machine shop.

Fig. 4.—Steel Frame of Locomotive Shop.

The Roundhouse in Connection with G.T.P. Shops.

Illumination.

The interior illumination will be provided by Cooper-Hewett lamps and all the buildings will be heated by direct and indirect radiators installed by Canada Foundry Co., Winnipeg. High and low pressure steam, water, compressed air, and sprinkling water will be throughout the various buildings with numerous outlets. Oil will be distributed under pressure from the storage tanks to the furnaces in the boiler shop, while an accumulator provides pressure for operating the various hydraulic machines. The electric travelling cranes through-

G.T.P. Power House, Where 1,000 H.P. is Generated and Current Sent to Yards.

out the plant are equipped with alternating current motors and are operated directly from the three-phase circuits. A wide cement floor spiked to sleepers bedded in bituminous concrete is used in most of the shops.

Locomotive Shop.

The locomotive, machine and erecting shops consist of three bays each 612 ft. long and respectively 70, 60 and 40 ft. wide. The 70 ft. bay is designed for 25 engine pits. Spanning the 70 ft. bay is a 120-ton crane for handling locomotives and under it is a 10-ton crane for general work. Two 10-ton cranes span the 60 ft. bay in which will be installed the heavy machine tools and also the flue department.

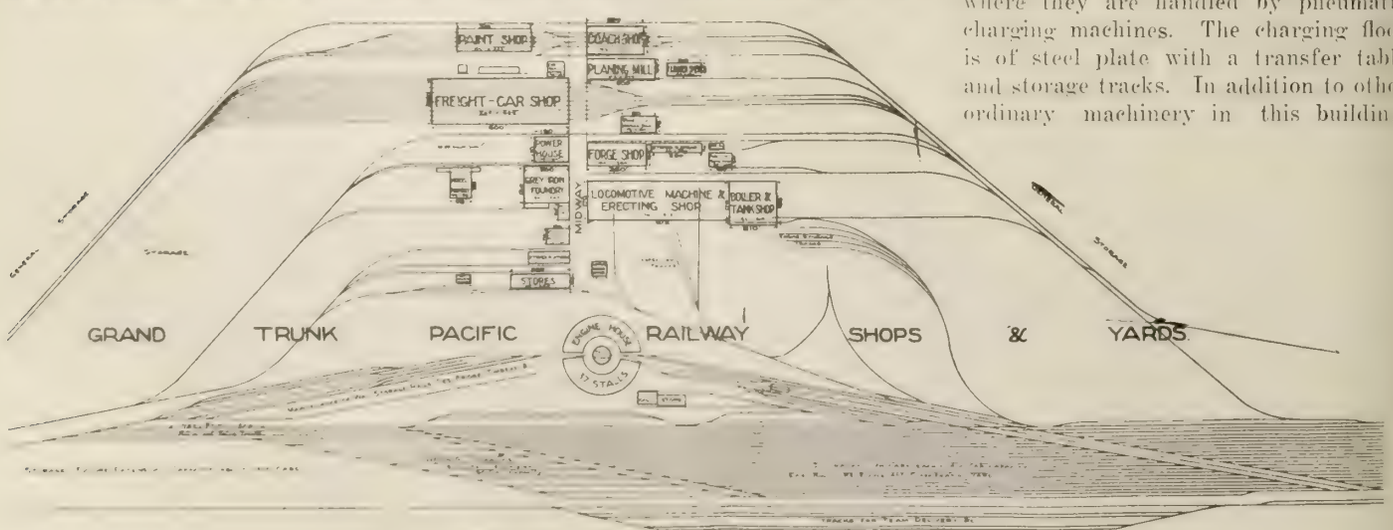
The lighter machines will be installed in the 40 ft. bay where the work on bolts, side rods, links, etc., will be accomplished. At the east end is the riveting tower served by a twenty-ton crane. Overhead in the 40 ft. bay is a balcony running the whole length of the bay on which are located the heating equipment, lockers, brass department, etc.

The boiler shop is laid out in four departments, which are equipped respectively with a 20, 30, 10 and 5-ton electric travelling cranes. The 10-ton crane is in a 50 foot bay devoted to heavy machinery which is driven by both individual and group motors. In the forge shop the machinery is all driven by three 40 H.P. motors carried on wall brackets. A motor driven blower furnishes the necessary blast for the furnaces through underground and overhead piping. The steam to the hammers and exhaust return, the oil, and hydraulic piping are carried in concrete ducts through the shop and to the various machines. The spring department is in one end of the forge shop and handles the spring work for both cars and locomotives.

The frog and track shop is designed to handle repairs for all frogs, switches and interlocking plants. It is spanned by a 10-ton crane, and is equipped with saws, light hammers, drills, planes, etc., also two groups of small machines driven from line shafts for the lighter rod and bolt work.

The Foundry.

The Grey Iron Foundry which will supply both the locomotives and car departments, is 130 ft. x 200 ft. with a cleaning room annex 60 ft. x 80 ft. and is equipped with five cranes of various capacities. There is also a 5-ton auxiliary hoist for handling light material, and several small job cranes for handling flasks. The scale room for weighing charges is in this shop, and loaded cars after weighing are taken by a pneumatic elevator to the charging room, where they are handled by pneumatic charging machines. The charging floor is of steel plate with a transfer table and storage tracks. In addition to other ordinary machinery in this building,



Plan of the G.T.P. Ry. Shops and Yards, Transcona.

there will be a brake-shoe, and a gravity molding machine installed on the mold floor.

On the south side of the building is the brass foundry equipped with brass furnaces. There is an equipment of tumplers, grinders, etc., in the annex to the main building.

Car Department.

In the car department the coach repair shop is the largest building, having accommodation for twelve standard coaches and a 16 foot balcony extends along both sides. The north balcony is devoted to cabinet work and is equipped with light tools such as scroll and band saws, lathes, drills, etc., all being driven from a line shaft. The south balcony is devoted to upholstering, transmiting and finishing and is equipped with a small brass shop, containing lathes, planes, drills, tow buffing machines and a lacquer oven. On the main floor is the wood working machine and nickel department.

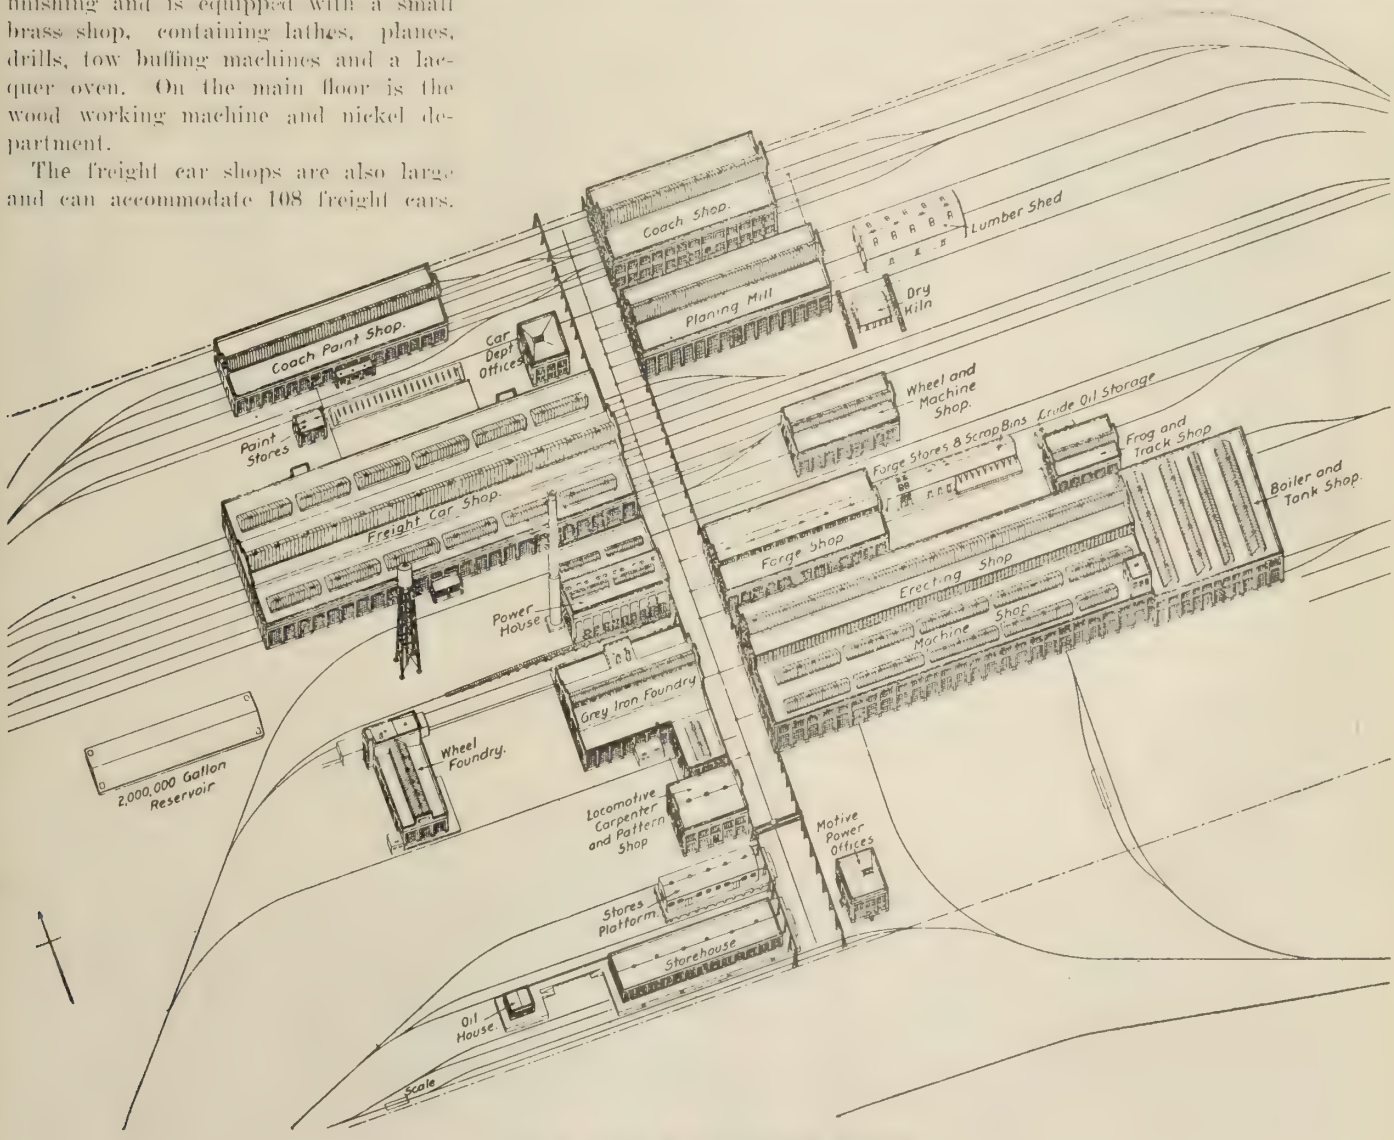
The freight car shops are also large and can accommodate 108 freight cars. material can be run in and unloaded at the machines. One side of the building is devoted to mill work and the machines are to be managed so that the material goes through without doubling back.

The wheel foundry is laid out on the straight line floor principle with four floors of 25 wheels each, giving a capacity of 100 wheels a per day. The wheel and machine shop proper is equipped with a 10-ton crane, wheel boring mills, axle lathes, wheel press, wheel lathes, and tire furnaces for the wheel work, and for car shop machine work there will be arch bar drills, lathes, planes, drills, grinders, etc.

Power House.

The power house is equipped with ten water tube boilers in units of about 400 generators one driven by a simple engine, the other by a motor. There are two exciter units driven by a simple engine, and a 1,500 cu. ft. capacity Corliss engine, driven by air compressor.

The details of the construction were prepared under the supervision of Frank A. Walker, M.B., who is also supervising the entire construction. The general constructors are Hanley, Quinlan and Robertson. The steel construction was in charge of P. T. Farelly, most of the steel being secured from the Manitoba Bridge and Iron Co., Winnipeg. The total cost of the construction and equipment of the shop in the neighborhood of $3,000,000, and when in operation will employ about 3,000 men. It is expected that the entire plant will be



G.T.P. Shops, Transcona, Near Winnipeg.

A 20-ton crane 65 feet long at a height of 30 feet handles the heavy material in this building. The large crane is also equipped with a 5-ton auxiliary. The planing mill is placed so that cars of h.p. each. There are three 500 k.w. a.c. generators, driven by direct connected cross compound Corliss engines, one 250 k.w., a.c. generator driven by a simple engine, and two 150 k.w., d.c. ready for operation by May 1, 1911, at any rate the railway construction work and transportation will have progressed to such an extent as to require the use of the shops by that time.

Mechanical Features of St. Andrew's Dam and Locks

First Structure of its Kind in the Western Hemisphere, Employing Several Interesting Mechanisms in its Operation.

The St. Andrew's dam has been erected at St. Andrew's Rapids on the Red River, Manitoba. The structure retains a head of 21 ft. and 800 ft. in length. A feature of the dam is that it can be put in place in the spring and removed in the fall. The type of dam is known as the Camere Curtain Dam and is the first to be constructed in the western hemisphere. There are only two other similar dams in the world, these being operated by the French Government on the Seine River, France.

At the St. Andrew's Rapids the Red River is about 800 ft. across. At this point heavy concrete piers have been placed in the river 133 ft. 8 ins. centres. Running between those piers and embodied with them is a heavy concrete submerged dam, extending 7 feet 6 inches above extreme low water, its top providing a seat for the castings carrying the foot of the curtain frame girders.

The supporting framework of the dam consists of a series of steel truss bridges resting on these piers. Fig. 1 shows the normal position of the dam during the summer months. Each truss span supports 46 curtain frames and 15 sets of curtains. At the end of the season of navigation and before the ice forms, both curtains and frames are removed, after the gradual lowering of the head of water. This is done by gradually rolling up the curtains.

Curtains.

The curtains each consist of 50 wooden laths 7 ft. 7 ins. x 3 ins. and a thickness of 1 21-32 to 3 5-32 ins. Lath No. 1 is designed to accommodate the casting carrying the links and attachments for the supporting chains.

Copper links connect the laths and are designed, and are machined with great care. The copper is composed of 88 parts copper, 10 parts tin and 2 parts zinc. The tensile strength of the links is 20,000 lbs. per sq. in. The pins connecting the links are phosphor bronze with an ultimate tensile strength of 140,000 lbs.

The curtains have for their base a rolling cast iron shoe of the form of an archimedean spiral, and they are rolled by means of a travelling windless. The curtains have any lateral travel limited by guides on the supporting frames.

The lock is situated at the west side

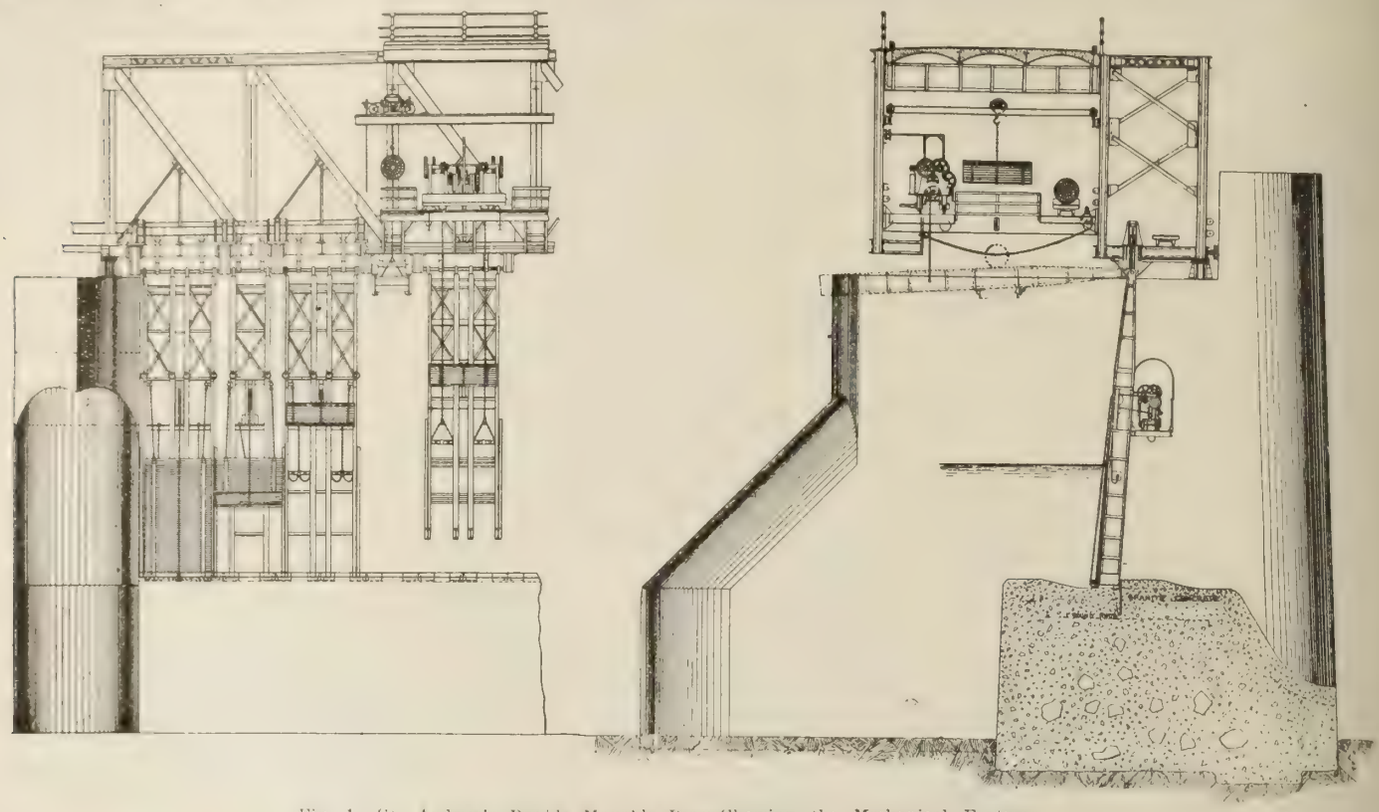


Fig. 1.—St. Andrew's Rapids Movable Dam Showing the Mechanical Features.

Fig. 2.—View of Dam, With Curtain Frames Raised, Also Upper End of Lock Chamber.

of the dam. The lock chamber is 215 feet long between hollow quoins 45 feet wide and with walls 34 feet in height above the lower sill. The walls have a total length of 290 feet, including wing walls.

At the upper end the lock is fitted with a pair of gates 28 feet long and 37 feet high from bottom of gate to floor of foot bridge. The lower gates are 28 feet long and 23 feet high from bottom of gate to floor of foot bridge.

The filling and emptying valves are located above and below each set of lock gates and are automatic cylindrical valves, adapted from the Fontaine cylindrical valve used in France. These valves are of special interest inasmuch as the working parts are not subject to pressure due to head and the valve will be therefore easy to manipulate under the maximum head of 21 feet.

Machinery Equipment.

The control of the frames and curtains by means of travelling electric cranes, operated from the service floor of the bridge is the leading mechanical feature of the structure. There are four steel tracks running the entire length of the dam, on which may be run the cranes, which control the frames, and which may be used to effect necessary repairs in the future.

Four cranes are employed for hoisting the curtain frames. Two are each equipped with a 20 h.p. and a 2 h.p. C. G. E. motor. The two smaller cranes are equipped with 10 h.p. motors but are moved by hand. There are three cranes for handling the curtains, each equipped with a 2 h.p. motor. There are also six travelling overhead cranes, four 4-ton over the working floor of the dam, one 2-ton in the repair shop and one 2-ton crane in the dynamo room.

Repair Shop.

The building is 90 ft. x 40 ft. and houses the boiler and engine rooms. In the boiler room is one C. G. E. boiler with 735 sq. ft. heating surface and a Champion forge. In the engine room is a Robb-Armstrong engine direct connected to a 40 k.w., 250 volt., direct current generator, one motor generator set, 60 h.p. motor and 40 k.w. generator, 2,080 volts, and switchboard.

In the repair shop is a specially designed saw for cutting laths, rip saw, 12 in. molder, planing a lath complete in one operation, and one wood boring machine.

The Use and Advantages of Steel Balls in Machinery

The Increased Use of Steel Balls in Bearings has Resulted in the Elimination of a Large Amount of Friction and the Consequent Saving of Power.

THE application of steel balls to many different bearings is resulting in a great saving of power. In order that the possible benefits may be obtained the steel balls must be absolutely alike. In their manufacture a variation of one ten thousandth part of an inch is sufficient to reject it. In the manufacture of Hoffman steel balls a Newall measuring machine, Fig. 1, is used in keeping gauges standard. In gauging, the ball and gauge are immersed in a thin oil, such as paraffin, and are allowed to remain there until both are the same temperature.

For light loads such as are met with in cycle construction, steel balls stand well between conical cups and cones of the usual type, but for the loads that have to be carried in the usual run of engineering and automobile work, it is essential that the balls are supported in races having two points of contact with the ball only, which points of contact must be directly in line with the load, that is to say, for journal bearings at right angles to the axis, and for thrusts parallel with the axis. Where both journal and side thrust have to be provided for, separate rows of balls should be provided. All ball races should be accurately ground and polished. Highly polished steel balls are extremely susceptible to rust if exposed to a damp atmosphere. It is, therefore, of great importance to see that they are stored in a dry place, are handled as little as possible in assembling, and are thoroughly well greased as soon as they are put into the bearing.

Fig. 2 shows a very good application of ball journals and double thrust washers to a typical gear box. The short driving shaft has, first of all, a journal bearing with a parallel hole, slipped on to it, then the double thrust bearing, which has previously been properly adjusted and locked upon its sleeve, then a small journal bearing, and the outer sleeve which is used to clamp the thrust bearing in position. A nut screwed on the shaft at the end then firmly clamps and locks all these bearings in position. The propeller shaft is mounted in a very similar way. It, however, has a small journal bearing at one end of it, which should be a tight press fit on the shaft, and locked in position by means of a screw in the end of the shaft, the head of which projects over it. This bearing should be a sliding fit in the enlarged end of the short driving shaft.

The two shafts are then dropped into the bottom half of the gear box, the top

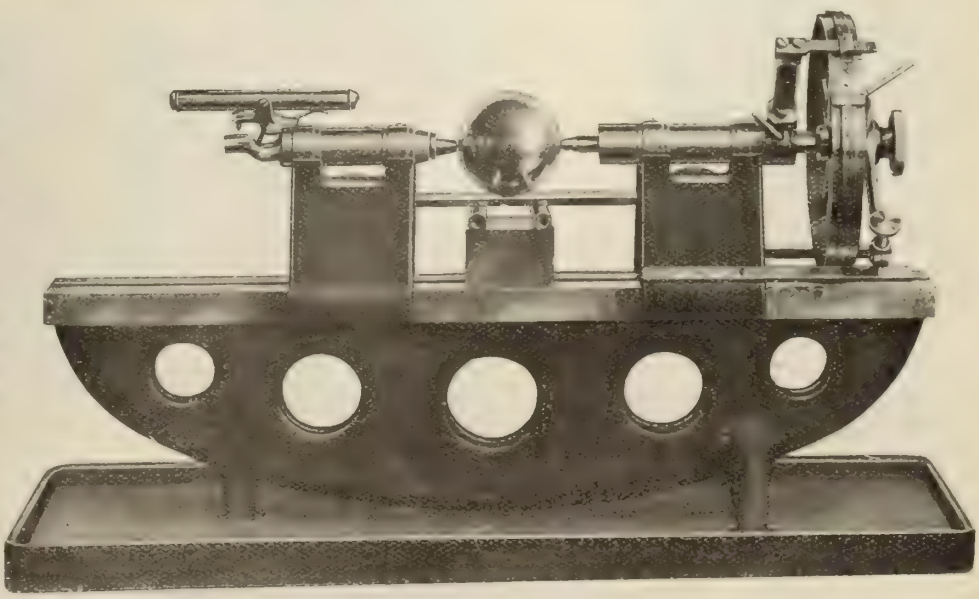

Fig. 1.—Newell Measuring Machine.

bolt put on, and the end caps, which carry leather dust washers, screwed home, clamping the centre races of the double thrust washer in position against the gear case. It is important to see that the faces of the gear case against which the centre races of the double touring cars, however, it is found sufficient if two hardened steel plugs are inserted at each end of the gear case, which abut against hardened steel plugs in the end of the shaft. In both cases the outer ball races should be a sliding fit in the housing.

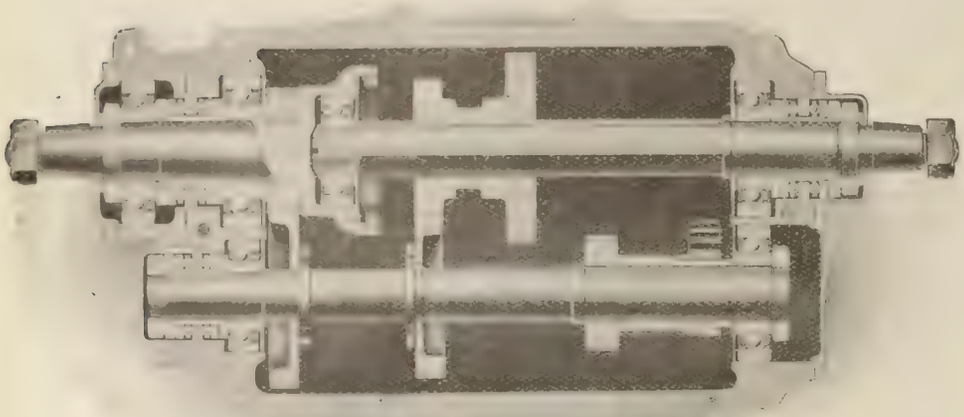

Fig. 2. Application to Gear Box of a Motor Car.

thrust bearings fit are perfectly true, and at right angles to the axis of the shaft. The countershaft is also shown mounted with a double thrust washer. This is an absolute necessity in the case of heavy cars, such as motor busses, lorries, etc., and in all commercial cars where the duty is high. For lighter

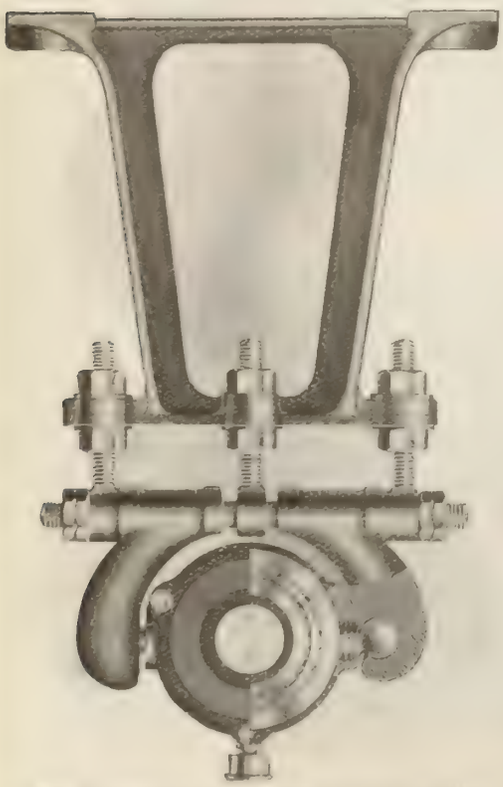

Fig. [illegible] Application to Hoffman Line Shafting.

Thrust Bearings.

Fig. 3 shows the application of steel balls to hanger for line shafting. Fig. 4 shows a single ball thrust bearing. To prevent access of grit, dirt, and moisture to the bearing, it has been found the most suitable method is to employ two leather dust washers side by side, one turned inwards and the other outwards, the loose edges of which rest upon the shaft. A piece of felt butting against the shaft is not so good, as it does not give to the shaft as these leather washers do. These washers not only prevent dirt and moisture getting into the bearings, but also help to retain the grease in the bearing.

In cases such as a worm gear driving a single acting pump, or where the load is constantly being thrown on and off by means of clutches, or varies in amount, if only a single thrust bearing be used, the spring in the framework and gear when the load is released is generally enough to allow the balls to get out of contact with their races, and consequently permits them and their races to drop slightly out of their true position of concentricity and to be violently forced home when the load comes on again. This is very detrimental to single thrust bearings, and they cannot be expected to withstand such shocks and jars. By the use of a double ball thrust bearing the shaft is held firmly in both directions, and all shocks and jars from the above cause are prevented, not only in the ball bearing itself, but also in the worm and other gear in connection therewith. The life of the latter is therefore very much increased, and a smooth running gear is the result. Where the end thrust of a long screw, such as is used in planing machines, or of a worm, has to be taken in both directions, two single thrust bearings, one at each end, should not be used, as the variation in the length of shaft, due to heating or other causes, often puts an enormous overload on the bearings, and when the shaft is again at its normal length, admits of a certain amount of slack, allowing shocks and jars, which, for the reasons stated are very detrimental.

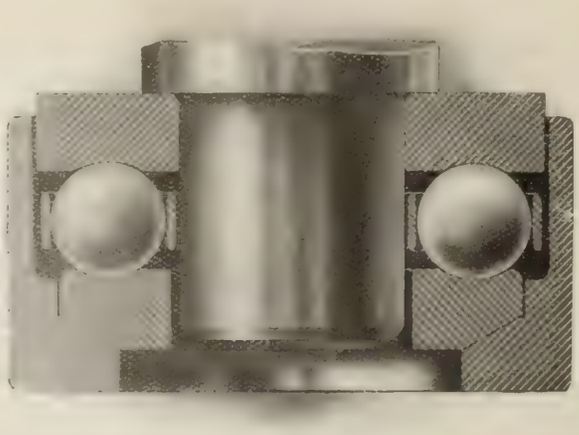

Fig. 4.—Hoffman Single Ball Thrust Bearing.

Ball bearings have been successfully applied to electrical machinery, machine tools, pivots of cranes, turntables, fans, etc. They are used for carrying loads

of from 1 to 500,000 lbs., and at speeds from 1 revolution to 30,000 revolutions per minute.

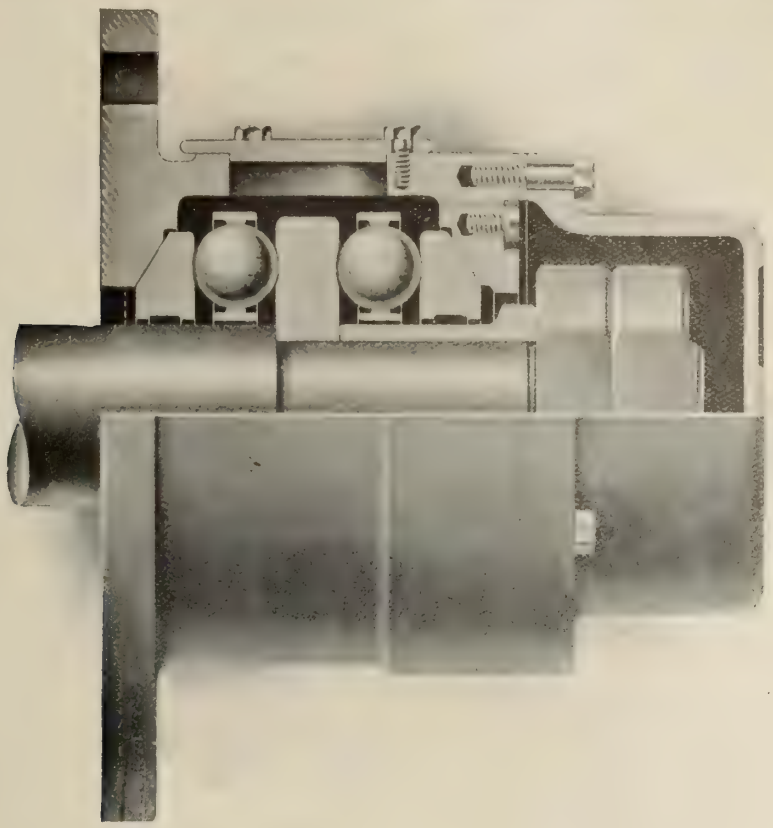

Fig. 5.—Hoffman Double Ball Thrust Bearing.

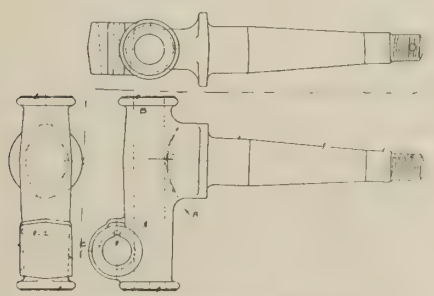
The illustrations show applications of Hoffman Steel Balls, John Millen & Son, 321 St. James St., Montreal, being the Canadian agents.

DROP FORGINGS.

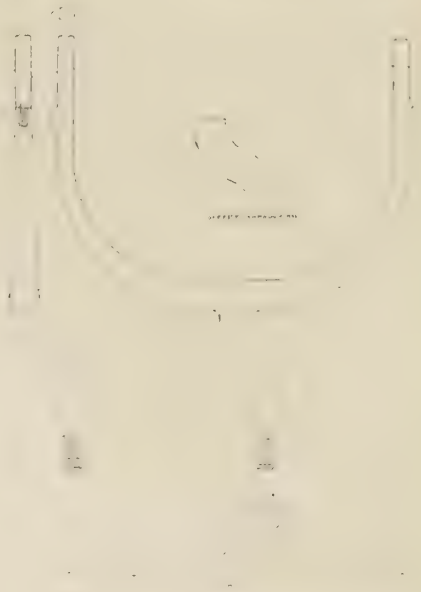
The illustration shows two interesting pieces of drop forging work, as done by the Canada Cycle and Motor Co., West Toronto, in their automobile factory.



Automobile Steering Knuckle.

Nothing of an intricate nature, such as the front automobile axles, which are drop-forgings, is attempted, but merely the smaller details, examples of which are given herewith.

Of the two pieces, the steering knuckle is the more interesting from its irregular shape. The stock bar is 2¼ inches round, heat-treated carbon steel, which is about half as large again as the largest diameter of the vertical portion of the knuckle. The end of the bar is first swaged under one side of the drop hammer on a plain anvil, to conform approximately to the axle taper and size. Succeeding this operation, the bar, thus tapered and attenuated, is bent approximately right angles, in a roughly formed die at the side of the main die block. This same die, which strikes from direction A, forces the metal up to form the top projection B, so that the stock is roughly in shape, and can next be placed in the dies under the drop hammer. The stock projects from C, and a ¾ inch flash space all around the die allows for the usual expansion. When roughed down still further, forming a considerable flash, it is hot-trimmed under a couple of cast iron dies, cast to shape. The forging is then completed under the hammer in the dies. All this is done at one heat.



Automobile Lamp Bracket.

The lamp bracket form a somewhat different piece of work to produce. The stock bar, which is 1¾ x 1, is first split down the necessary distance to give the two prongs, by first cutting, and then bending the two arms away from each other and perpendicularly to the larger face of the flat piece. The manner in which the cutting dies operate, leaves the projecting arms in nearly the required shape. The piece, then put under the dies, is formed as shown.

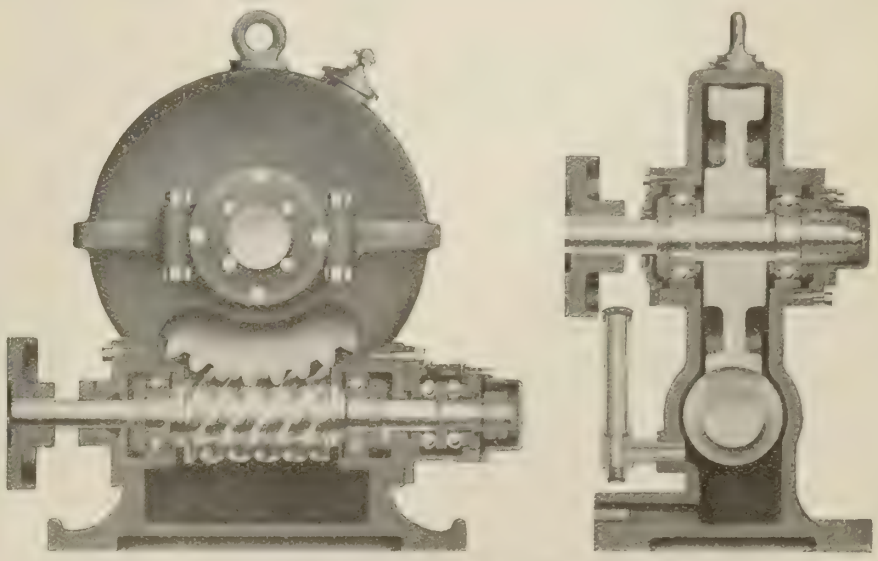


Fig. 6. Application of Hoffman Double Ball Bearings to Worm Gear.

Speeds and Feeds for Gear Cutting; and Grinding Data*

Useful Data on Rates of Feeds and Speeds for Cutting Steel and Cast Iron Gears—Desirable Limits for Grinding, Shrinking, Forcing and Running Fits.

By Luther D. Burlingame. **

The data sheet, Fig. 1, gives data for commercial work in cutting 16-pitch cast-iron gears with ordinary carbon-steel cutters, high-speed steel cutters, and with and without an air blast. The gears cut when these records were made are all gears that passed inspection and were put into use. The last gear of each group cut before sharpening the cutter was preserved, also samples of chips from each cut.

It will be noted that the use of the air blast adds materially to the rate of production, as will be seen by comparing the feed in inches per minute of Nos. 1 and 3, where a gain of nearly 70 per cent. is made when using the air blast with carbon cutters, and by comparing Nos. 2 and 4, where a gain of 40 per cent is made when using the air blast with high-speed cutters.

The high-speed steel cutters with the air blast give an increase of production of almost 4 to 1 over the carbon cutters without the air blast. In cutting cast-iron gears of coarser pitches the gain is in about the same proportion. Even under the fastest cuts the gear teeth show surprisingly little tendency to break out at the back, although cut without being supported.

Fig. 2 shows the matter of applying the air blast. A Sturtevant blower was used, the air being supplied from a tube 1¼ inches diameter at a pressure of about 1½ ounces per square inch, this being sufficient to cool the cutter and keep the chips cleared away.

Cutting Steel Gears.

The following records are of commercial work done in the gear department of the Brown & Sharpe Mfg. Co. In the first example three finishing cutters were used in a gang, finishing three teeth at once. In the second, better results were obtained by using a stocking and finishing cutter together than by using two finishing cutters. The data for these examples are as follows:

(a) Gears of steel castings, 70,000 pounds tensile strength, 3 pitch, 5 inches face, 67 teeth; cutter, 6 inches diameter, 1¾ inches hole, 52 revolutions per minute, 81 feet surface speed per minute, 2 9-16 inches feed per minute; feed, 0.049 inch per revolution of cutters. The three cutters cut three gears in 67 minutes each, without sharpening the cutters which were than in good condition and could have cut several gears more.

(b) Gears of steel castings, very hard, 3 pitch, 5 inches face, 51 teeth; the cutters, 6 inches diameter, 1¾ inches hole, 28.61 revo'utions per minute, 45 feet surface speed per minute, 1 3-16 inches feed per minute; feed, 0.042 per revolution of cutters; cutting time, 5½ hours. Oil was used as a lubricant.

The roughing cutter used in the second example was a new design of stepped stocking cutter shown in Fig. 3.

Roughing Out Gear Teeth.

The following record was made with the new design of stocking cutter in roughing out gear teeth:

Gear blanks of machinery steel, 65,000 pounds tensile strength, 4½ inches diameter, 6 inches face; cutter, 3-pitch stocking, 5¼ inches diameter, 1½ inches hole, 90 revolutions per minute, 124 feet cutting speed per minute, 7 inches feed per minute; feed, 0.078 inch per revolution of cutter. Cut 15 teeth, 0.749 inch deep; total number of inches cut, 90.

GRINDING LIMITS FOR CYLINDRICAL PIECES.

Note.—These limits should be followed under ordinary conditions. Special cases should always be considered, as it may be desirable to vary slightly from the tables.

Cutter in good condition at end of cut. Test made with old 7½-horsepower motor belted to countershaft of the machine. Efficiency of motor, 78½ per cent. Gross horsepower used, 5.089. Net horsepower, 3.99—110 volts, 40 amperes.

Grinding Data.

The examples of commercial grinding given in Fig. 4, illustrate what is being done under actual working conditions in commercial work on the variety of pieces indicated, which are of various materials and are both soft and hard. A reversal of the usual rule, where economy is gained by having one man operate more than one machine, is shown in example 6 where work is most economically produced by having two men run one machine, that is, having one man operate the machine and a helper drive the work on and off the arbor. All other data are based on one man to a machine.

These pieces passed inspection within the limits given. The average loss from work of this class coming below the required limit or being otherwise spoiled is less than ¼ of 1 per cent.

Grinding Limits.

The limits given in the table can be recommended for use in the manufacture of machine parts to produce satisfactory commercial work. As there emphasized, however, there must be individual consideration in each particular case to determine whether special conditions exist so as to require different limits from those given in the table.

Following such a table blindly may lead to more unsatisfactory results than to have no table at all. It is intended to be used only in the manner above pointed out.

To Increase Output and Decrease Production Cost

Possible Economies where Large Numbers of Duplicate Parts are to be Machined. Some Examples of Work that is being done on Automatic Machinery.

Canadian industries are growing to such an extent that they find they have to turn out a great amount of duplicate work. In a number of industries automatic and semi-automatic machines have been installed, these greatly increasing the output, producing the small duplicate parts at a low cost. Among the machines found in Canadian industries are the Potter & Johnson, Cleveland Automatic, National Acme, Jones & Lamson, Brown & Sharpe and Fellows' gear shapers, etc. These are used in the manufacture of small screws, the many small parts used in the construction of an automobile, agricultural implements, etc., cream separators and a number of other lines manufactured in Canada.

A few months ago the manufacture of the Magnet Cream Separator, was described in Canadian Machinery. This Separator is made by the Petrie Mfg. Co., Hamilton, Ont., and a number of automatic machines are used in turning out the parts such as gears, bar work, etc., these cutting the cost of machine work.

Among the machines used by the Petrie Mfg. Co. are one Fellows' gear shaper and two of Brown & Sharpe's five Cleveland automatics, three Potter & Johnson's turret lathes, six Jones & Lamson turret lathes.

In the illustration No. 1 are two examples of bar work machines on the Cleveland automatics. There are twenty shapes, the time required for each depending on the amount of machine work. The time required to set up the machine for one of these shapes is three-quarters of an hour.

No. 2 shows a steel forging which is made on a Potter & Johnson automatic. Nine operations are performed on this forging with two settings. One man looks after the three Potter & Johnson machines.

Machining Gears.

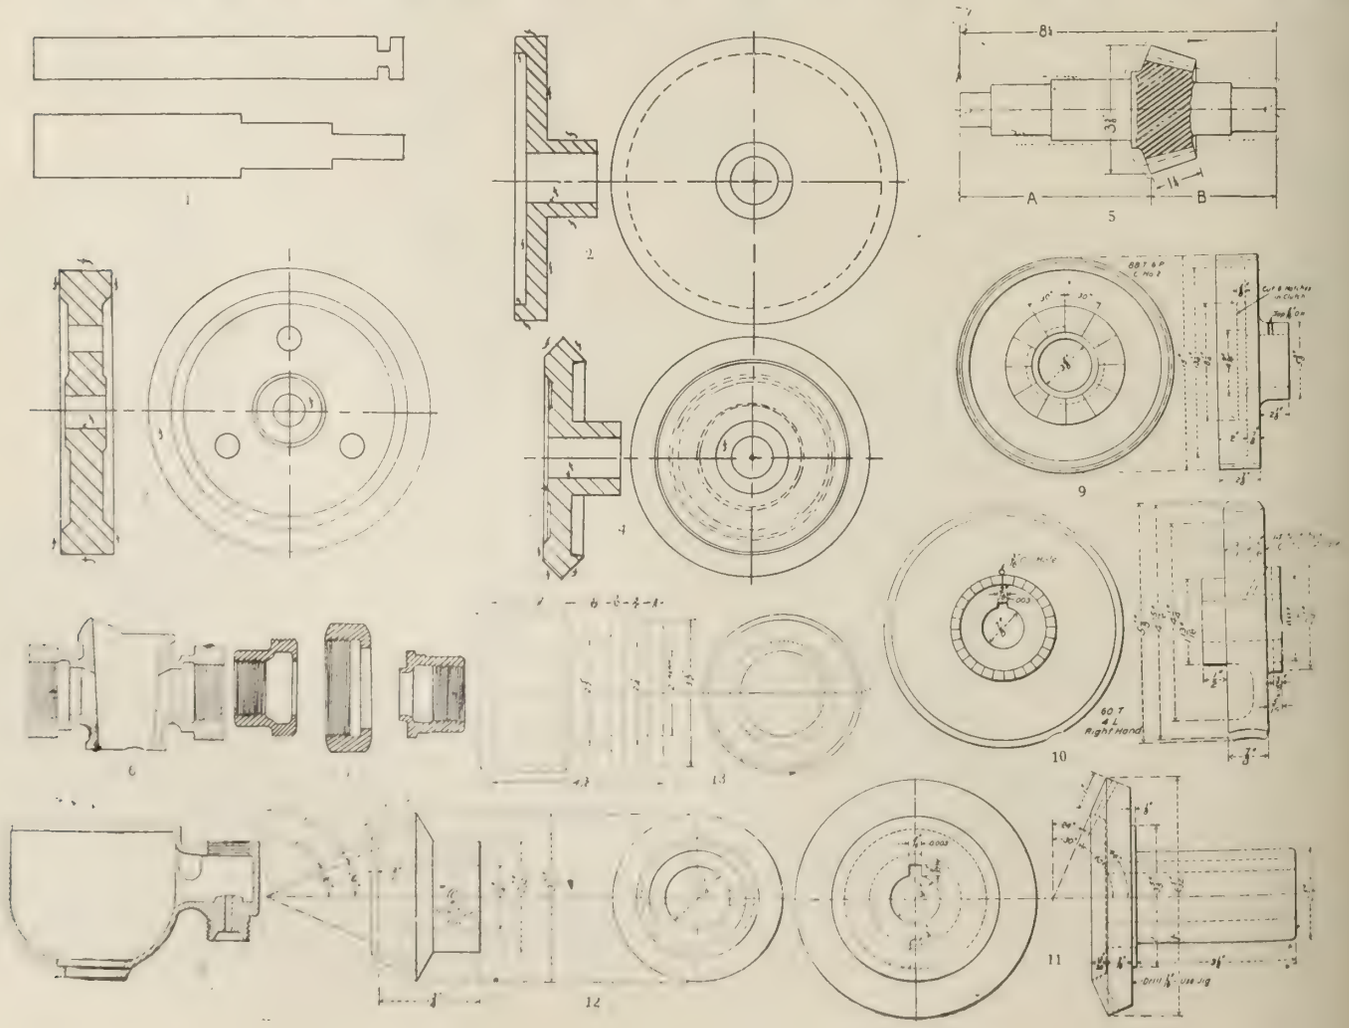
The other two of these machines work on gears, the two styles Nos. 3 and 4 being made. On each style there are seven operations performed at one setting of the tools. The following are the operations: bored and reamed, faced on both sides of rim, faced on the perphery, faced on both sides of hub. Forty gears are turned out per day, the tools being ground once in three weeks. The time required to set up the machines for gear blanks is two hours.

The gears are cut on the Fellows' gear shapers and on the two Brown & Sharpe's. All the work is very accurate as the gears of the separator run at 7,500 revolutions per minute.

Many Shapes Automatically Machined.

No. 5 is an automobile main driving pinion machined in two operations on a Fay automatic. One man can attend two lathes and turn out 60 pieces per day. The work is held in the lathe centres. In the first operation the back tool roughs back end of teeth, the carriage turns diameters shown between dimension lines A, and finish turns back end of teeth. In the second operation the back tool turns face of teeth, the carriage turns diameters shown between dimension lines B, and turns front end of teeth.

No. 6 shows a $\frac{3}{4}$ inch valve machined on a Prentice automatic. The taper



hole was rough and finish bored, 240 pieces per hour. The two pipe ends were bored, faced and tapped simultaneously in a double head machine, 280 pieces per hour.

No. 7 and 8 are also pieces machined on Prentice automatics. No. 7 is a ½ inch union swivel, nut and screw of malleable iron; 150 ends or 50 complete unions, without the threads are machined per hour.

No. 8 is a carburetor bowl, ½ inch size made of bronze and is finished in two settings in a six spindle double-head machine. At first setting large end of bowl is bored, faced and seated; small end is bored and faced. At second setting the regulator end is turned, faced, drilled and threaded outside; bored, faced and tapped inside. The production is 100 complete pieces (all four ends per hour).

The clutch gear, No. 9, is machined on a Davis automatic. The hole is bored and reamed, and the clutch is turned on the inside as well as the outside, the time required per piece being from 45 to 50 minutes.

A 5⅛ inch worm wheel is shown in No. 10 as also are Nos. 11 and 12. No. 10 is finished in one setting. The wheels are machined in lots of 200 and require an average of 20 to 25 minutes each.

No. 12 is a cast iron bevel gear, the time required in large lots being 25 minutes. No. 13 is a bevel pinion and requires about 15 minutes per piece.

The steel spool for an automobile clutch, Fig. 13, was machined on a Gridley automatic turret. It is chrome-nickel steel and was finished in 28 minutes.

Advantages.

The chief advantage of the automatic or semi-automatic is the increased production at low working cost. In the case of automatic machinery, one operator can look after as many as twelve machines depending altogether on the nature of the work.

In some cases an automatic can be used for two or three months during the year and save sufficient to more than offset its rest from service during the other months. This is the case at the Canada Cycle & Motor Co. where a large number of automatics are in use. A National-Acme is used for some special work which keeps it in service about half the working year. Its use for this work has been found to pay overhead charges and yield a large profit.

Of course there must be a certain amount of duplicate work to make the automatic pay for itself. Otherwise a great deal of time would be spent in changing tools and cams, making it much cheaper to produce the work in some other manner or purchase them.

In connection with this article on automatics and semi-automatics, it is interesting to note that the National-Acme Mfg. Co. have established a branch in Montreal for the manufacture of their automatic screw machines, cams, tools, etc.

English Practice in Machining Crank Shaft Webs

Manner in which English Methods Differ from those in this Country; Machining Crank Webs, showing Operations and Special Appliances

By Horace Howard.

The methods and tools described in this article are the best in use on the north-east coast of England, and are not taken from only one shop, but represent practice in some half a dozen shops, and are a combination of special methods therein used.

The webs for triple crank shafts come from the rolling mills in rough oblong slabs of an average size of 4 x 2 x 8 inches. They are first faced on the planer, where the special tool shown in Fig. 1, does the work. 22 are the tool-holders pivoted at 33. A spiral spring behind the holder keeps them in position. With a double tool like this it is essential that the planer run at the same speed each way. This proves economical both in saving time, and lessening the wear and tear on the machine from the absence of the quick return motion.

After planing the web is scribed as shown in Fig. 2 from steel templates kept for that purpose, and it is then sent to the band saw to be sawn around the outer edge.

The sawing operation is very interesting, and is shown by Fig. 3, which is a rough sketch of a band saw operating on a web. C is a 1 inch thick plate covering the right half of the table and projecting beyond it, on which are 1 inch steel balls B, in rough steel rings E, made from pipe, to prevent their escape.

On placing ready for sawing, a small wooden wedge A, is tapped in taking the strain off of the steel ball at that corner. The self-acting gear will feed the web into the saw. As the cut must be circular, only short straight cuts can be taken after which the web must be reset. Two to three inches straight cuts can be taken. The plate C is placed on the table to prevent the balls from falling into the slots. It should be of the same length as the table and about half

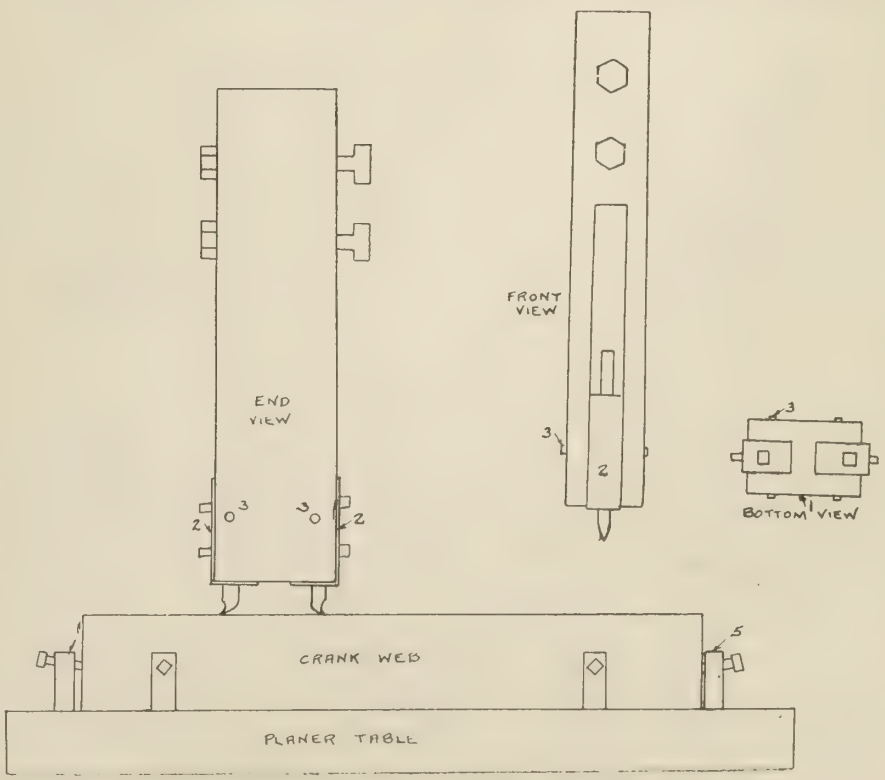


Fig. 1.—Planer Operation on Crank Web.

as wide again, and held down by two countersunk bolts D placed in the first slot as shown.

The two holes FF, Fig. 2 are made in the drill-press for aligning the webs when machining pairs later on.

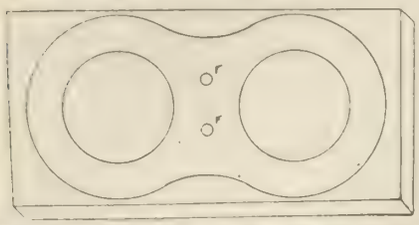

Fig. 2.—Web Sawing Rack for the Band Saw.

Fig. 4 shows the boring or ripping tool used to remove the web centres. G is the boring machine spindle; I, the tool block in which are two oblong holes to hold tools KK, and packing pieces JJ, which are for placing tools at various diameters. In setting the tools K, great care should be taken to set perpendicularly, and to give them the drag shown at L. If the tools were placed in tool block without this drag, they will always have a tendency to dig into the material, owing to the length of tool standing out, but, with drag, the tendency to dig is entirely obviated. It will be noticed that one is a round nose, and the other square, the round nose removing the centre, and the square nose the corners of the cut. Half the cut is made from each side, the web being turned over for the latter part of the operation.

This method is a double labor saver as it not only cuts the hole for shaft in crank web more expeditiously then by drilling, and then boring it in the usual way, but it saves forging, as these round pieces as ripped out, are taken to the lathe to be bored and threaded, and then milled hexagon for piston rod nuts, or taken to the saw to be cut into three or four washers, thereby saving labor and material.

The next operation is slotting, shown in Fig. 5. The full set of six webs are placed on the slotter table in pairs, pins F aligning each pair. The oblong false table R is placed on slotter, which is marked by a tool mark to ascertain if it is central, and then bolted down by bolts T, of which there are four. This false table is drilled to receive pins S, in ring parallels, at the top of which is a spigot the same size in diameter as the web bore. The first pair of webs are placed in parallels, then the ring parallels placed between these and the second pair of webs, and so on with the third pair the whole being bolted to the false table by two bolts as shown. By using these parallels with a spigot the size of bore in web, the webs require no setting but merely placing in position. After slotting the first end, it is only necessary to crank the table over for the other end. When both ends are slotted, the whole is moved over and set for the concave radius, in machining which the false table proves of value.

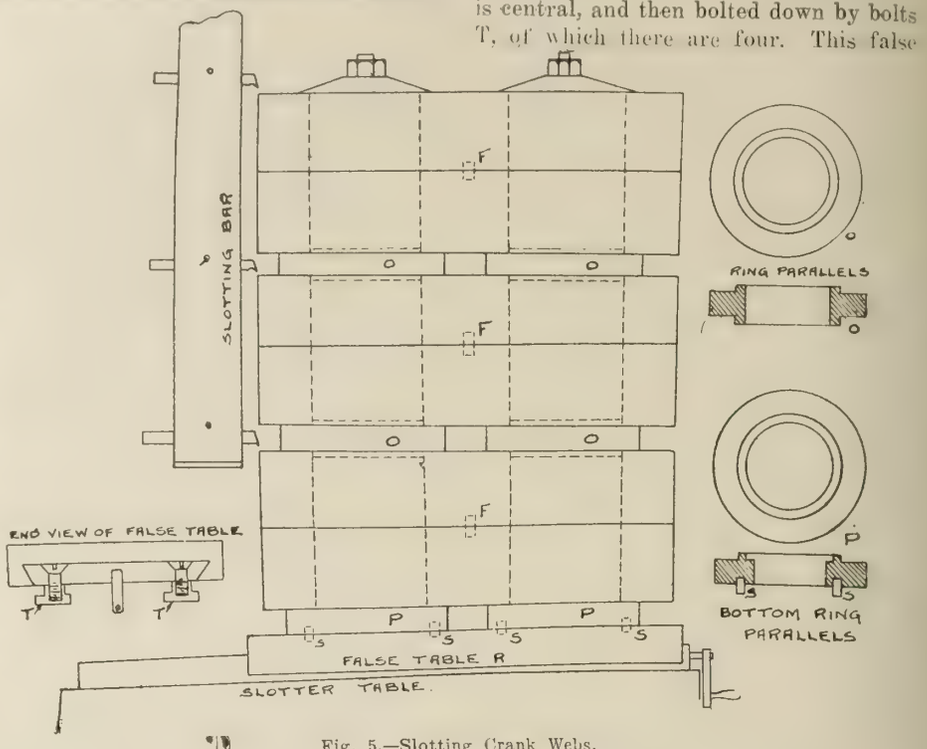

Fig. 5.—Slotting Crank Webs.

After slotting the webs are removed in pairs to a double horizontal borer to be finished to gauge size, an operation that requires no comment.

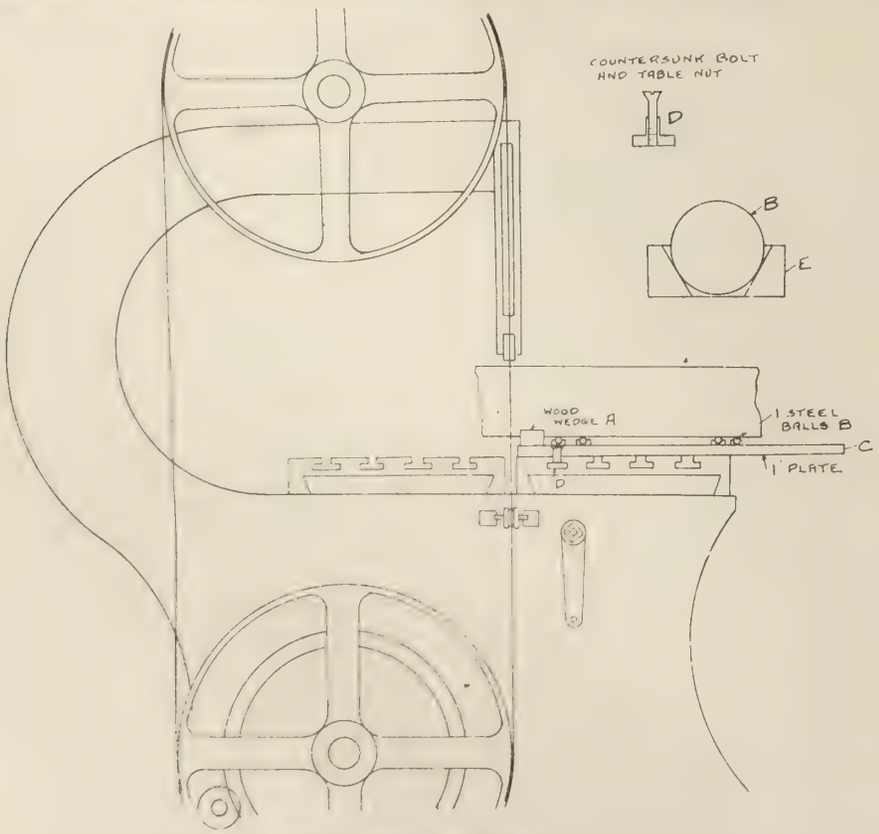

Fig. 3.—Band Saw Operation.

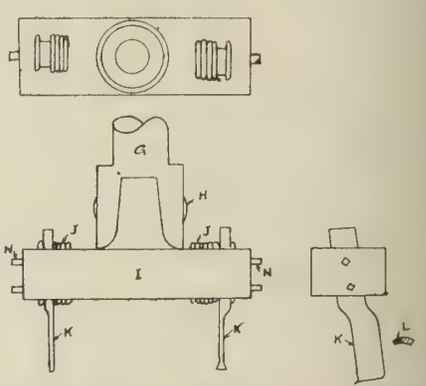

Fig. 4.—Boring or Ripping Tool for Crank Webs.

MACHINE SHOP METHODS AND DEVICES

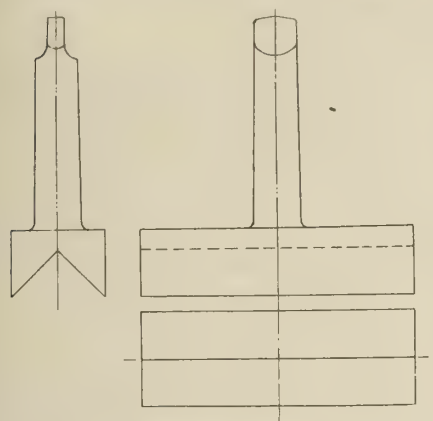
Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

CENTRING DEVICE.

By George Ringer.

The accompanying illustration shows a simple centring device that can be used on a lathe for drilling holes in a shaft or jig post.

The device has a V-shaped groove at an angle of 90 degrees. The length is immaterial and can be made to suit the work. A length of ten or twelve inches would be a convenience. The shank is



Centring Device.

tapered to fit the tail stock. The jig must be made with utmost care so that the bottom of the V will centre on the head of the lathe.

To centre the shaft, place it in the V-slot, run the tail stock up to the face plate. The shaft will then be centred on the plate and can be clamped in place. For a short shaft the device must be shorter than the shaft to allow the shaft to be clamped to the face plate while the device holds it in position.

PRACTICAL METHOD OF OBTAINING PITCH OF PROPELLER.

By R. Ewart Cleaton.

There are numerous formulae for obtaining the pitch of a propeller which can be used when the various factors forming them are known quantities, but it is often necessary to have the information before the vessel has undergone her trials, and the following method has been found to be quick, and sufficiently accurate for practical purposes. The apparatus required is in no way complicated, is inexpensive to make, whilst the necessary calculations are extremely simple.

Referring to the sketch, the boss A from which the shaft B projects, is bolted to a wall or supporting column, in any convenient manner, and upon this the propeller is mounted; having a slight taper it will accommodate any size of propeller within certain limits, although the fit must be fairly good to prevent slipping.

The propeller being in place, the quadrant C and the arm D are slid on to the shaft B, and held in position by the setscrews, as shown.

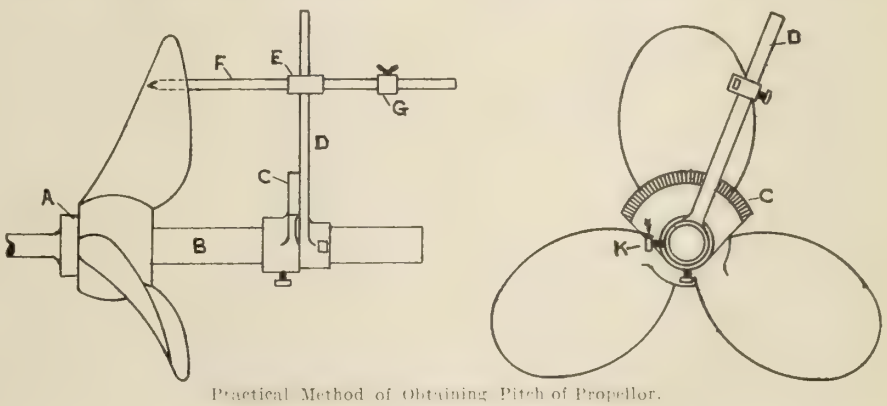
The quadrant forms part (approximately one-third) of a circle which is divided into 100 parts.

The arm D is also divided into equal distances along its length and has attached to it, a sliding socket E, in which, in turn, moves a hardwood batten F, provided with a brass pointer. On the latter there is a movable stop G.

The method of procedure is as follows:

The propeller having been set in such a way that the center lines of the quadrant C, and one blade approximately coincide, the quadrant is then bolted at a distance from the forward edge of the blade, about equal to two-thirds the length of the pointer F, and the arm D is brought hard up against it.

The arm D is then set at such an angle that the pointer touches the blade one inch from the extremity of the after edge and the edge of the arm should then be exactly opposite one of the divisions on the quadrant; should it be between two of the divisions, the quadrant is moved around until a division coincides. The



Practical Method of Obtaining Pitch of Propellor.

stop G is next brought up and clamped against the socket E, and the position of the arm on the quadrant is then noted; this completes the first operation. The arm is next loosened on the shaft by unscrewing the setscrew K, and swung round to the other edge of the blade, until the pointer is at a distance from the latter approximately equal to that in the first operation, and the edge of D coincides with one of the divisions on the quadrant; the second reading of the quadrant is then taken, in order to ascertain how many divisions, or 1-100ths of a turn have been passed through.

It will now be seen, that owing to the advance in the blade the pointer has been pushed backwards, and the stop G no longer rests against the socket E.

The distance moved by G will then be the same fraction of the pitch, as the number of graduations passed through on the quadrant are of 100.

Hence $d : P :: g : 100$

where d = Distance between E and G in feet or parts of a foot.

P = Pitch of propeller in feet.

g = No. of graduation on quadrant passed through.

$$\therefore P = \frac{d \times 100}{g}$$

These operations are repeated at different heights of the blade, by moving the socket up or down on D, an equal distance each time, and the pitch is finally obtained by taking the average of the resultant readings. The other blades are pitched in the same manner, the propeller being swung round until the next blade is in position.

A simple method of finding the area of a blade, is to lay a sheet of brown paper over it, and by tapping round the edges with a hammer, cut out a template the exact size and shape. The area is then found by dividing the template into an even number of parts, by the use of an even number of ordinates, and applying Simpson's Rule.

$$a = \frac{y}{3} - (E \times 48 \times 2m)$$

Where a = Area in square inches.

y = Distance between ordinates.

E = Sum of the extreme ordinates.

S = Sum of the even ordinates.

- Sum of the odd ordinates.

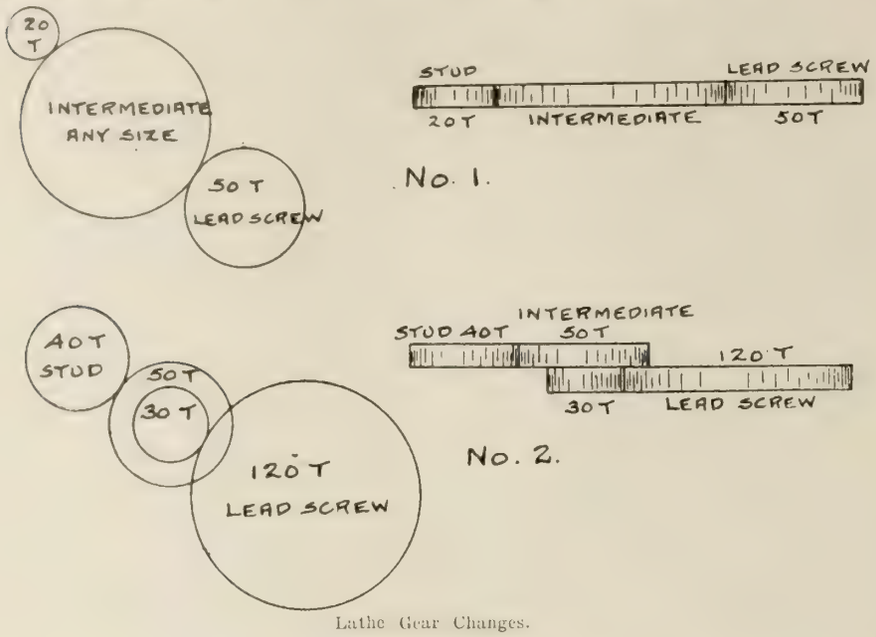
RULE FOR LATHE GEAR CHANGES.

By W. Oelschlager.

In calculating the change gears of a screw cutting lathe, the rule to be given, is intended to teach the beginner how to use the gears as supplied with a lathe, and for general use where tables either never existed, or have been lost. It is the simplest and easiest rule in print, to remember.

Consider first simple gearing, proceeding as follows:—Multiply both the number of threads per inch in the lead screw and the thread to be cut, respectively by the ratio of the gears belonging to the lathe. The product of the first is the number of the gear to be placed on the stud, and the product of the latter, that to be placed on the lead screw. The intermediate gear may be anything, as it merely acts as a distance piece.



Lathe Gear Changes.

Example.—Let it be required to find the proper gears to cut 10 threads per inch on a lathe having a lead screw pitch of 4, and change gear ratio 5.

4 threads on lead screw $\times 5 = 20$ tooth gear.

10 threads to be cut $\times 5 = 50$ tooth gear.

The 20 tooth gear is placed on the stud, and the 50 tooth gear on the lead screw, as per sketch No. 1.

Now consider a lathe with a coarse 2 pitch lathe screw, and it is desired to cut the same number of threads as in the former example, viz.: 10 per inch. It is unlikely that there will be a large enough gear. Proceed as before, by multiplying the pitches of the lead screw and article to be threaded, respectively by the lathe gear ratio.

2 threads in lead screw $\times 20 = 40$ tooth gear.

10 thread to be cut $\times 20 = 200$ tooth gear.

If no 200 tooth gear exists, proceed as follows: For the first driven, take any gear, say a 50. Dividing 200 by this $\frac{200}{50}$ gives a ratio of 4. Then select any gear for the second driver, and multiply into the ratio 4, just determined. Thus, assuming a 30 gear, the second driven would be $30 \times 4 = 120$, the gear to be put on the lead screw, with the other gears as shown in sketch No. 2.

Take another example. Let the lead have pitch 4, and the screw to be cut 32. The simple gears would then be 20 and 160. Select any gear for first driven, say a 60, and divide into 160, i. e., $\frac{160}{60} = 2\ 2\text{-}3$. Then select any gear for second driver, say a 30, and multiply by 2 2-3, giving $30 \times 2\ 2\text{-}3 = 80$. Therefore, the arrangement would be 20 into 60, and 30 into 80.

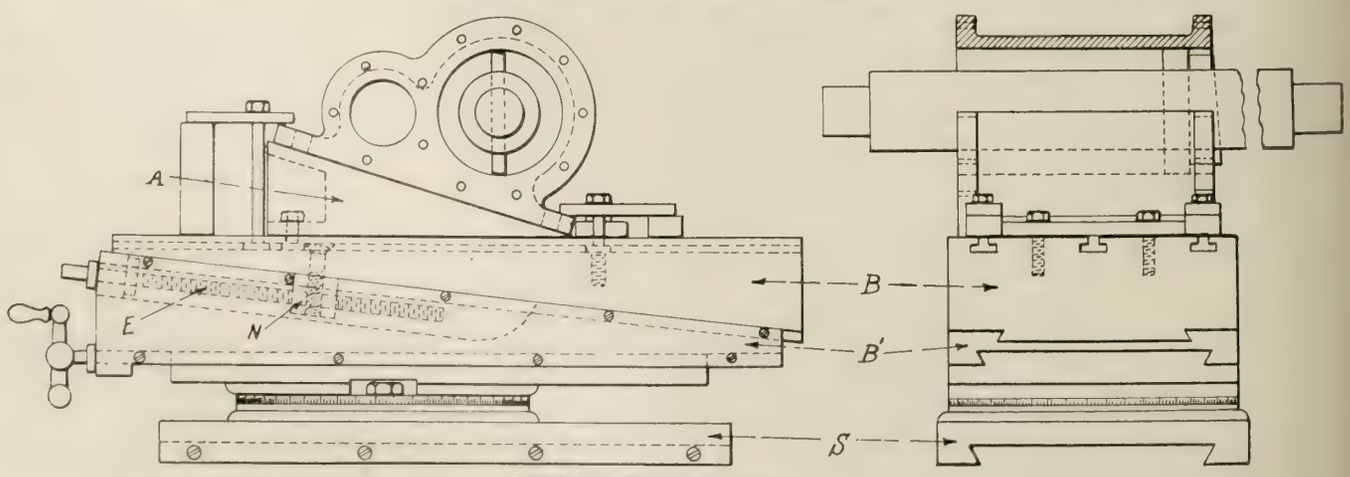
PARALLEL BORING ON LATHE.

By J. H. R., Hamilton.

The accompanying sketch shows an attachment placed on a lathe for boring two or more cylinders in the one casting at practically one setting, having their axis parallel with one another. The compound rest is removed from the cross slide S, and the attachment placed on and secured with bolts similar to the compound rest.

The tapered block A is planed to an angle so as to bring the centre line of the cylinders as near as possible to a horizontal position. Any error of adjustment in vertical setting can be taken up by moving block B along block B' with the screw E; the nut N being secured to table block B. By the use of the graduations the table can be moved to any desired angle in the horizontal plane.

By the use of small centre heads (similar to those on a milling machine) and other jigs many small jobs often met with in a small repair shop can be successfully handled.

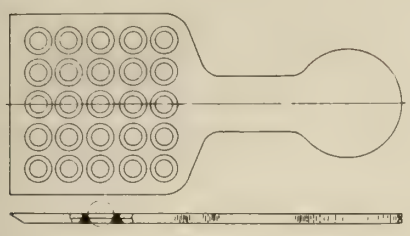


Parallel Boring on a Lathe.

By fitting the lower block B' directly to the saddle in place of slide S, the attachment could be made much heavier for larger work.

BALL BEARING COUNTER.

Ball-bearings, while presenting very few difficulties in counting, when in large numbers, take a lot of time, if counted in the usual method by hand. Being smooth and slippery they have a great tendency to drop from your hands, spoiling the count.



Ball-Bearing Counter.

The London Machine Tool Co., Hamilton, use a large number in their thrust bearings. As necessity is the mother of invention, one of the men devised this simple little device, by which they can be counted very expeditiously. The counter is a soft steel plate, riddled with countersunk holes, located as closely together as practicable. when scooped into a dish of balls, the holes become filled, one in each. While the surplus run off, the holes being of such a depth that no good resting place is provided for the surplus balls. As there are 25 holes, each scoop means 25 balls, so by counting the dips, a rapid count is made, as well as making the operation easier for the mechanic, as nothing is so monotonous as a long slow count such as is necessitated by the usual method.

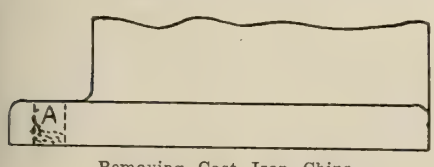
Different sized counters are provided for the various sized balls, as the holes are made but slightly larger than the balls for clearance.

Brass would be a peferable material for the counter as no damage to the balls could possibly result.

REMOVING CAST IRON CHIPS.

By M. E. D.

I was watching a mechanic instal an engine recently, and saw him make good use of a magnetized pocket knife. The



Removing Cast Iron Chips.

little kink may be used conventiently by other mechanics or engineers, when there is a blind hole to be drilled and tapped.

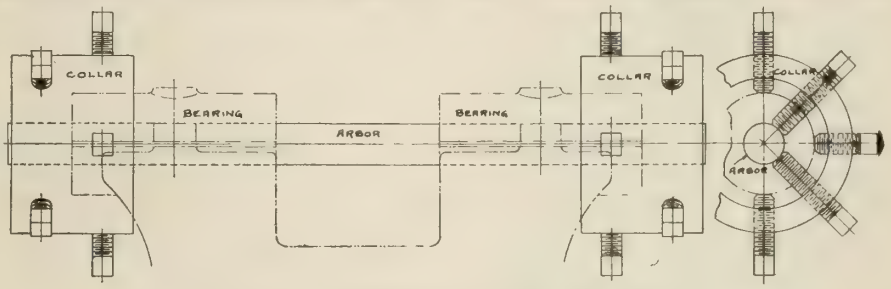
In reaming out the hole as shown in sketch, the chips of iron collected at A. Without stopping for explanations the mechanic drew his pocket knife, which had previously been magnetized, from his pocket, and quickly removed the chips from the hole.

As it is an easy matter to have a knife magnetized, this fact can be made of general use. For instance in drilling the holes for the stud bolts for engine bearing the kink could be used very conveniently.

JIG FOR ACCURATELY BABBITTING BEARINGS.

A large Canadian wood working machine company manufacture a grinding machine for sharpening cutter heads, etc., and which has an adjustable table much the same as a vertical miller, with the exception that the shaft rises and falls in front of the shaft instead of at right angles as in a miller.

To be correct, the shaft must be parallel to the face of the adjustable table and also to the face on which the table rises and falls. Thus, the shaft must be adjusted correctly in two planes. This would be a simple matter if the bearings were bored in a mill, but as they are of babbit, with no machining, the babbitting arbor must be set to correspond to the final position of the shaft. This is accomplished as shown in the cut, by attaching collars to the outer ends of the bearings with set screws, and adjusting the arbor with another set of set-screws. Adjustment into any desired position can be made, the extent of the adjustment being determined by a surface gauge on the table, and also on the table slide. It is a very useful appliance, and might be adapted to other work equally well.



Jig for Automatically Babbitting Bearings.

REBORING CYLINDERS.

Barkey Bros., Stouffville, are frequently called upon to rebore traction engine cylinders, and as it was a big job to remove the cylinders to machine them in a lathe, a cylinder boring bar was designed which greatly faciliated the work. By using it, it is not necessary to remove the cylinders from the boiler, and a cylinder can be bored and the engine made again ready for service in three hours.

Referring to the drawing, A is the feed screw threaded at 44 threads to the inch. This runs in the casting B which is threaded the same. At 1, this casting is turned the size of the piston rod, while at 2 it is turned the size of the packing gland. When it is inserted into the piston rod end of the cylinder, the stuffing box is crowded on.

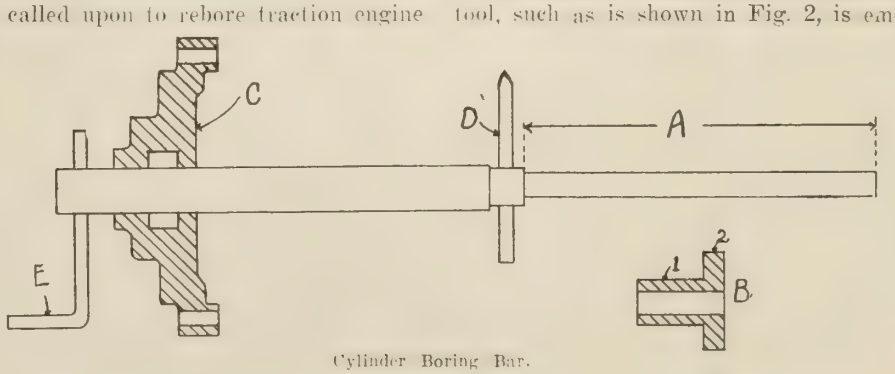
The casting C slips on the rod, fits closely, and is bolted to the cylinder head, taking the place of the cylinder head. The tool is fastened at D, a straight tool being used for the main body of the cylinder, and an offset tool for recessing the ends of the cylinder. E is the operating handle.

HEADING TOOL.

For the large Bucyrus shovels that they make, the Canada Foundry Co., Toronto, require many feet of heavy chain such as is shown in Fig. 1, which is made of standard pieces cut from ¾ inch x 2 inch wrought iron flat bar. The pins are from ⅞ inch iron bar stock.

These pins are cut the requisite length; and then riveted over with an ordinary machinist's hammer which, of course, gives a very rough finish.

To finish up in better shape, a special tool, such as is shown in Fig. 2, is em-



Cylinder Boring Bar.

...oved. This consists essentially of a steel body containing steel rollers on a pin. The body fits the spindle of a drill, so the work can be put on the drill table. The steel rollers which are hardened are pressed down on the roughly riveted pin, and thus smooth the surface down by rolling. Pressure is exerted from the drill feed mechanism. As the rollers turn in opposites directions, a thin brass washer is inserted between

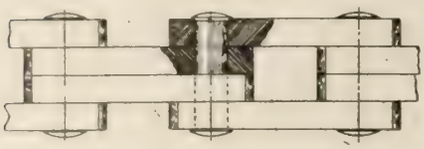


Fig. 1.—Dredge Chain.

them. All the pressure is upward and outward and to prevent undue friction from the latter balls in ball races on either side are used. The pin on which the rollers turn is hardened to take up the wear.

The tool is put together by first filling one ball race, then introducing the corresponding rollers, turn over, fill the other race, introduce the other roller, and next place in washer, finally putting through the centre pin.

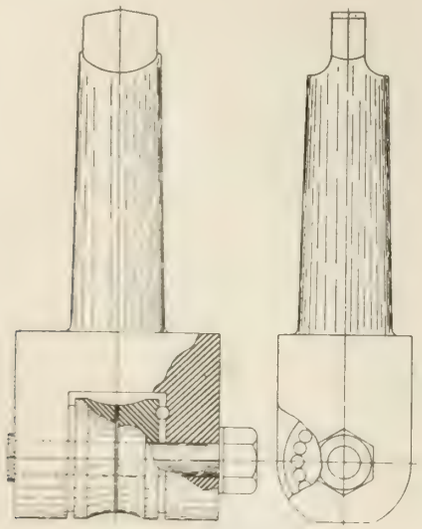

Fig. 2.—Heading Tool.

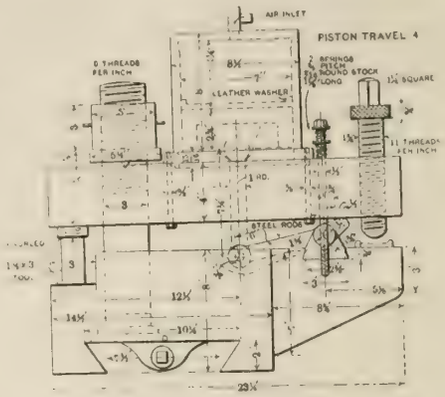
Results from the use of this tool are excellent, but the wear and tear on the drill, is very great, causing the spindle to run hot most of the time.

PNEUMATIC TOOLHOLDER.

The C. P. R. have successfully applied a pneumatic tool to Bertram lathes for turning car and truck wheels. In turning wheel tires it is necessary to change the tools three times for each tire and two men were required to operate the tools. With the tool shown, one man can operate them, the necessary champing and setting be accomplished almost simultaneously.

The toolholder shown was used on a 36 in. lathe. Forty pounds air pressure, in connection with the leverages in the toolholder, holds the tools rigidly. High



Pneumatic Toolholder for Bertram Car Wheel Lathe.

speed steel tools 3 x 1½ in. were used and a surface speed of 17 ft. per min. with a cut ½ in. deep and ½ in. feed per revolution.

PROTECTED ROLLER BEARING.

Sheldons, Ltd., of Galt, have an especially good brick car, metal construction throughout, as shown in Fig. 1. The major part of the car is composed of standard steel shapes.

The journals form the most interesting feature, for not only are they roller bearing, but they are so constructed as to be protected from the dust, which is so injurious to machinery around brick plants.

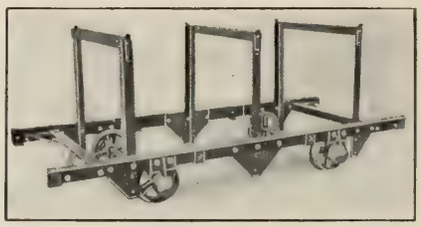


Fig. 1.—Steel Brick Car.

From Fig. 2, it will be seen that the journal consists of a large cast iron shell, secured to the running gear of the truck by bolts, within which is a chilled cast iron bearing, which holds the rollers for the shaft. On the shaft is a collar, flush with the chilled cast iron ring, thus completely closing the rollers from dirt and grit in a very effective manner.

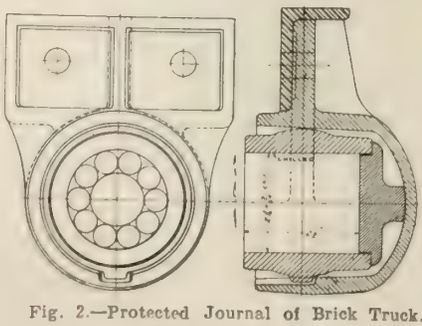

Fig. 2.—Protected Journal of Brick Truck.

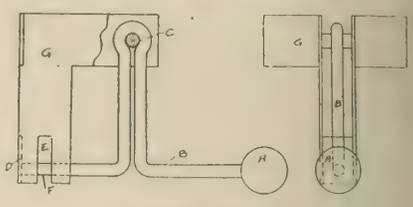
HANDY HOOK.

By F. J. Deegan.

A handy quick action hook is here shown, and is an idea that should be found very useful. The writer devised it for hanging up time check boards.

The device consists of a weight A, on the end of an arm B, the latter pinned at C. A stop block D prevents this rod B dropping back too far, keeping it level. Any object to be suspended is placed in slot E, first lifting A so that



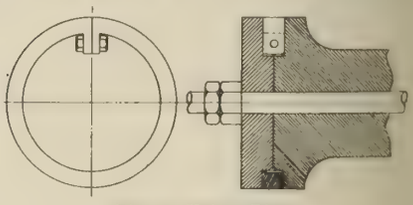
Handy Hook.

pin F may be inserted in the article. Weight A must be sufficient to more than counterbalance the weight of the suspended article. The bracket G for holding the device can be made of almost any material.

ADJUSTABLE PISTON VALVE RING.

The engine at the McLachlin Mills, Arnprior, has a piston valve, made by the engineer, Geo. H. Johnson, which is worthy of notice, from the fact that precautions have been taken to look after the natural wear.

The piston valve, a section of half of which is shown in the cut, consists of



Piston Valve Ring.

three sections—the body and two end pieces, the latter, with the main body, forming the annular grooves for the piston valve rings. This ring is unique in construction, as shown by the end view, as it consists of a single piece, bolted together at the top, the bolt flange fitting into a similar recess in the piston valve.

The idea of the split and bolted construction is, that the ring, after becoming slightly worn, may have paper or tin shims placed in the cut, and clamped in position, the ring then assuming a practically circular form again. Satisfactory operation seems to have resulted from its use.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

GARVIN MILLING MACHINES.

About two years ago the Garvin No. 14 vertical milling machine was described in Canadian Machinery, but several recent improvements on this miller, as well as some of their others will be of interest to our readers. The improved No. 14 miller is shown in Fig. 1.

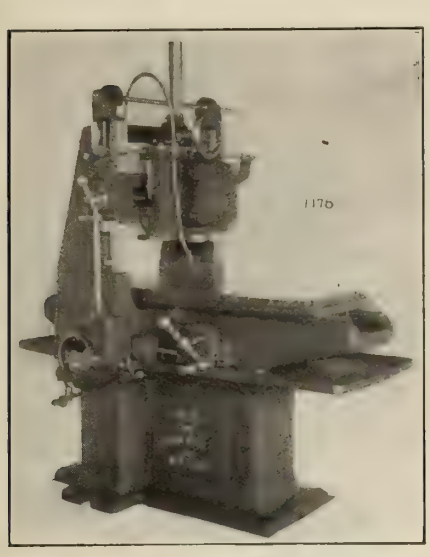


Fig. 1.— No. 14 Garvin Milling Machine.

The standard rotary feed box used by the Garvin Machine Co. on their milling machines, has been adapted to the requirements of the No. 14 vertical spindle milling machine. This gives twelve changes in geometrical progression, with the addition of a reverse, so as to change the direction of the feed. This feed box carries both direct to the head on the rail, or to the table feed. Should the feed for one need to be different than the other, the quick turning of the crank while the machine is in operation will bring the desired feed into play. The table and rail feed are automatic in both directions. The automatic trip to both is of a character, in which the feed is thrown out a trifle before the positive stop is reached, so that there can be absolutely no breaking down of the feed works by carelessness in setting trips.

The change of back-gearing in the spindle head is now made by one lever, throwing the gear through as in automobile practice. There are three positions for this lever; two for the back-gearing ratio and one neutral, and when in this neutral position the universal joint drive shown on the back-gear shaft can be disengaged and attached direct to the spindle, giving high speed without gearing.

On the No. 1½ has been added a motor mount shown in Fig. 2. The feature of this is to have a mount that can be attached to a machine in stock, thus avoiding the expense and delay in covering the motor drive requirements.

The motor can be mounted, as shown in Fig. 2, or on a bracket at the rear of the machine—preferably the latter, as it makes the entire outfit portable. The impresion that the power of the machine is deficient on account of the short center distance between cone pulleys, is erroneous. The high speed, narrow belt drives on to a two speed cone, which back-gears to the main cone through a double back-geared system, giving eight changes each of speed by belt or gears, totaling sixteen changes of speed. Both overhead cone pulleys run on a stationary shaft stud, that is made hollow to allow of supplying the lubricant from grease cups at both ends. This shaft is keyed to the eccentrics, one of which has a segment worm gear under control of a crank. This scheme is used to give the proper tension to the belt, allowing of easing it off for shifting purposes. No other lock is necessary to retain the belt tension. It is this point of belt tension that keeps the machine up to high productive ability. The feed from the spindle to the rotary feed change box is by chain, and other points of the machine have been clearly set forth in our columns in the year past.

The weight of this machine is 2,450 lbs.

The attachment shown in Fig. 4 was designed for general work in milling pieces that require a quartering index. The illustration shows the attachment holding what is known as a lathers' hatchet, where the head is grooved at right-angles, producing a checkered face. It is also adapted for squaring shanks of taps, reamers, bolts, studs, and similar work.

As shown for milling hatchets, the work is inserted into the fixture, under the height gauge. It is a four division index fixture, locking by means of a bolt. After the hatchet is put under the gauge, and clamped by means of a binder, it is revolved one-quarter of a revolution, and passed under the cutters. After having passed once, it is revolved another quarter of a turn, and passed under the other cutter, these two passes completing the squaring operation. Once the fixture is loaded with four hatchets, each passage completes an operation.

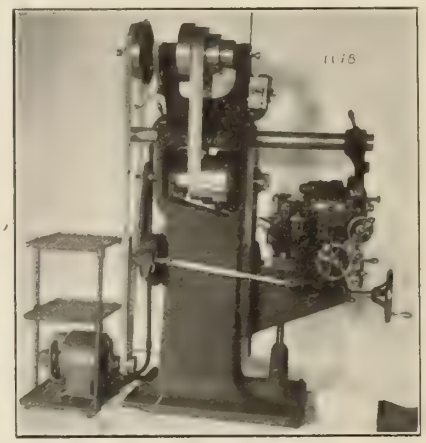

Fig. 2.—No. 1½ Universal Milling Machine Motor Mount.

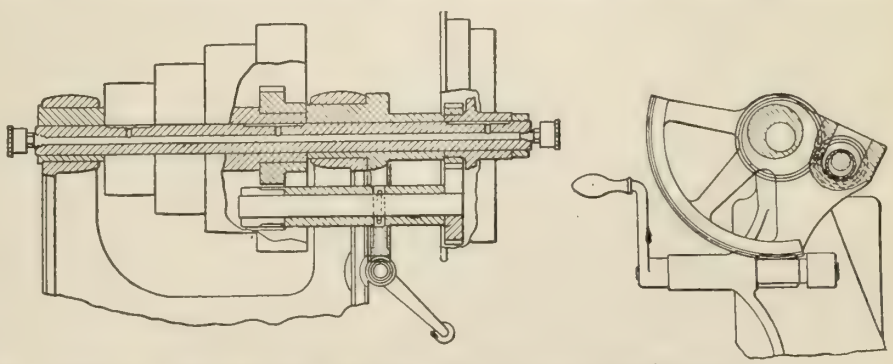

Fig. 3.—Detail of Drive and Belt Lightener, Garvin No. 1½ Milling Machine.

For squaring shanks of taps, reamers, etc., the half-bushings for holding the work are interchangeable and quickly removed; and in all cases, it will be noticed that the cut is against the fixture, the clamp just holding the work

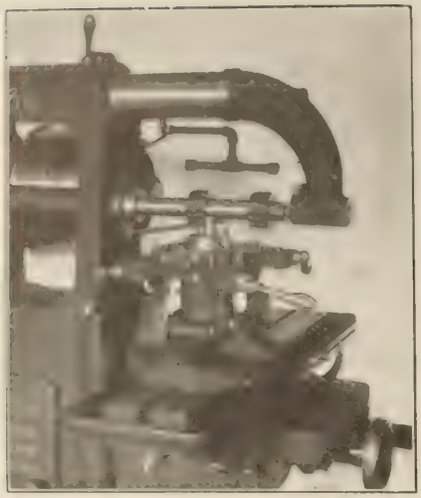

Fig. 4.—Attachment for Milling Pieces Requiring Quartering Index.

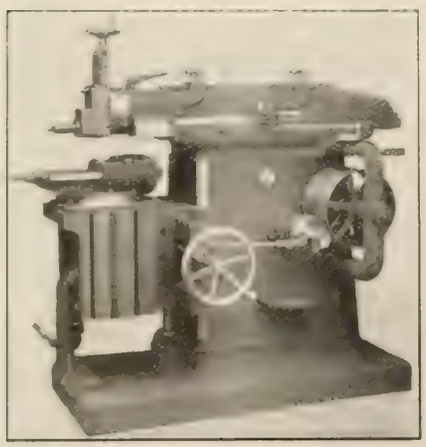
date the base. The index ring is of large diameter, and the locking bolt is a long well-fitted bolt, operated by the handle on top of fixture. The entire fixture swivels on a standard that has a fit to the extreme top. The rotating casting fits over this standard in such a way that chip troubles are entirely eliminated.

The attachment is shown on a No. 21 back geared milling machine. The weight of the fixture is 125 pounds; and it is of such design as will easily go onto any medium sized milling machine.

These milling machines are manufactured by the Garvin Machine Co., Spring and Varick Sts., New York.

TRIPLE GEARED SHAPER.

The accompanying illustration shows a new 26 inch triple geared shaper. The ram of the shaper is driven by two rack gears of large diameter, and the rack is cut from the solid steel bar. The teeth in the rack are staggered, thereby avoiding the excessive jarring at each end of the stroke, and giving an even pushing strain on both gears. The use of two gears permits the passing of bars through an opening in the top of the column for key-seating, which cannot be done where only one large gear is used.



Steptoe Shaper.

The plate for shifting the belt has eccentrical slots so arranged, that one belt is shifted before the other, thereby avoiding excessive squealing.

The head can be very quickly loosened and swiveled to any angle by pushing the lever at the back of the head, and can again be instantly fastened by pulling the lever toward the operator.

The shifter dogs are placed on top of the ram in a very convenient position, and thereby permits a ram of larger and stronger dimensions.

The table support is provided with a roller, which slides on a plane surface under the table, and can be very quickly adjusted by means of the lever shown.

This machine is geared at the rate of about 42 : 1, and is made to take very heavy cuts with high speed steel. The column, ram and base are very heavily ribbed and braced, and all bearings are made very heavy.

The vise has a graduated swivel base, which is turned at any angle of thirty degrees, so that it can be easily read by the operator. The upper jaw of the vise grips firmly around the lower jaw, thereby preventing the upper jaw from raising when the work is being tightened in the vise. Two additional clamping bolts are provided which project through the upper jaw of the vise, and which can be fastened where extreme accuracy is necessary, as these bolts will overcome the tendency of the upper jaw to raise when the work is being clamped.

This shaper is manufactured by the John Steptoe Shaper Co., Cincinnati, Ohio.

NEW DRIVE FOR FLAT TWIST DRILL.

The questions connected with using and driving twist drills, forged or twisted from flat bars of high speed steel, are probably receiving more attention from mechanics at the present time than any others connected with the use of tools. Although attempts to solve the problem of drive have been numerous—more or less complicated chucks have been designed to hold and drive the rough end of the flat bar of steel; the shank ends of the bars have been spirally twisted and machined to form taper shanks fitting regular taper sockets; more or less cumbersome taper shanks have been soldered or riveted to the shank ends of the flat twist drills—none of these methods has seemed to settle the matter beyond the possibility of further question.

The Cleveland Twist Drill Co., of Cleveland, Ohio, have recently applied for patents on a new device for driving

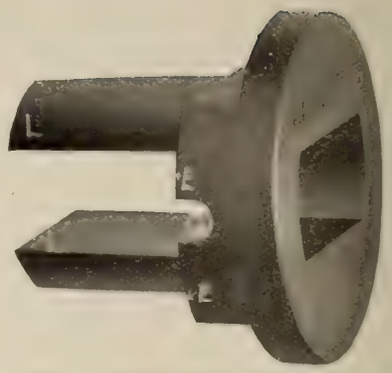


Fig. 1.—Hard Service Drill Socket.

flat taper shanks that are tapered both on the flat sides and round edges. These shanks are regularly furnished on this company's "Paragon" flat twist drills, and are driven by sleeves or sockets in-

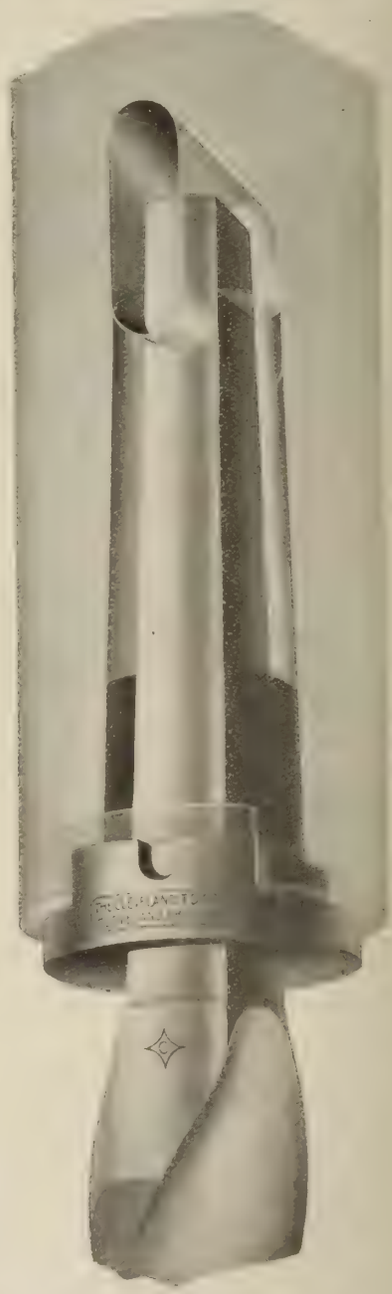

Fig. 2.—Shank, Collet and Spindle in Combination.

ternally equipped with flat taper holes accurately fitting the shanks and externally tapered to fit standard taper sockets or spindles. In the case of large diameter flat twist drills having No. 6 shanks this drive was found to have certain disadvantages, as it made necessary the use of cumbersome extension reducing sockets to adapt the large shanks to the drill press spindles which seldom have a taper hole larger than No. 6. To overcome this difficulty, as well as to provide additional driving strength, is the twofold object of the new device.

To this end both the No. 5 and No. 6 "Paragon" blanks have been redesigned the same length as regular taper shanks, the taper on the round edges being regular Morse taper as formerly. When therefore this modified shank is inserted directly in the spindle the upper end of the shank is received and driven by the flat slot in the spindle just as is the tang of an ordinary taper shank drill. This alone would constitute a strong and practical drive but for the lack of support the shank would have on its two flat sides at the lower end of the spindle. To provide against the resultant possibilities of vibration and wear between the shank and spindle, and to furnish a powerful additional drive at the lower end of the shank where its cross section area is greatest, a new and original type of socket, called the "Paragon" collet, has been evolved.

As shown in Fig. 1 the collet consists of two lugs (L,L) projecting upward from a flattened disc, through which is cut a rectangular hole to receive the "Paragon" shank. The lugs have rounded outside surfaces ground to standard taper and flat inner surfaces tapered to fit the flat taper shank. The grove (g) is provided to receive the point of a drift key in case the collet should stick in the spindle. When the collet is on the shank the combination i practically an interchangeable taper shank with unusually long tang.

Fig. 2 shows the shank collet, and spindle, in combination. The additional drive is provided by means of an extension (E) projecting (upward—in the case of vertical drilling) from the circular base of the collet. This projection mortises into a slot cut across the end of the spindle conforming to the standard slots now being put in the spindles of heavy duty drill presses by several well known manufacturers. That this tongue-and-groove drive at the large end of the shank is very much stronger than any drive on the tang could possibly be, is made evident by a single glance at the figure. The collets without this extension will fit any spindle or socket, and will be furnished to those whose spindles are not fitted with slots, when this requirement is plainly specified, but they will, of course, not have the aditional driving strength otherwise afforded. With the extension they make what would seem to be an almost ideally perfect drive for the large sizes of flat twist drills.

"HARD SERVICE" DRILLS AND REAMERS.

The illustration presented herewith shows one type of "Hard Service" electrically operated Drills, manufactured by the Electrical Department of The Van Dorn & Dutton Co., of Cleveland, Ohio.

This company, in view of the extensive adoption of electricity for power and lighting, early realized the demand for portable electrical tools that would stand the abuse of rough handling which machines of this character usually receive in the hands of inexperienced workmen. In response to this demand they brought out the first types of "Hard Service" drills and reamers. In detail these from time to time have been improved as the opportunity was afforded. Final simplicity, of course, is only reached by a process of elimination.

"Hard Service" machines are now built in six sizes, scope 0 to 2 in., and may be had for direct current either 110 or 220 volts.

A four pole straight series motor entirely form wound which is in reality a miniature railway type motor, designed to stand up under the varying loads and overloads which are bound to obtain, is employed. A feature worthy of notice is the large commutator which is proportioned three bars to each of the armature coils, which are composed of three single coils, This ample commutator service distributes the current so evenly that there is no sparking even under extreme load. The use of this construction insures the maximum production from the drill operator.

In view of the increased demand in Canada for an efficient tool of this kind, The Van Dorn & Dutton Co. have recently selected as their Canadian Representative, Mr. R. E. T. Pringle, located at Eastern Townships Bank Bldg., Montreal, P.Q..

Vol. VI. November, 1910 No. 11

ROOSEVELT'S RULE.

It is not the *critic* who counts—not the man who points out how the strong man stumbles, or where the doer of deeds could have done them better. The credit *belongs to the man who is actually in the arena, whose face is marred by dust and sweat and blood;* who strives valiantly; who errs and comes short again and again, because there is no effort without error and shortcoming, *but who does actually strive to do the deeds; who knows the great enthusiasm, the great devotions;* who spends himself in a worthy cause; who at the best knows in the end the triumph of high achievement and who at the worst, if he fails, at least fails while daring greatly, so that his place shall never be with those cold and timid souls who know neither victory nor defeat.—*Theodore Roosevelt.*

A SUBTLE FORM OF DISHONESTY.

From time to time there is in evidence a peculiar form of dishonesty which is the more dangerous in that it does not by law constitute an indictable offence. This particular breach of probity consists in accepting a salary for filling one position, while surreptitiously using a part of the time which should be devoted to the interests of the one employer to do work for and receive payment from another. A case in point is brought to mind by the newspaper notices respecting the firm of C. D. Sheldon. This man was accustomed to employ as stool-pigeons, men in responsible positions in various businesses, from government departmental employes in Ottawa, it is said, to men in financial institutions in various financial centres. It is entirely unnecessary to comment upon the ethics of the tempter. The serious question is with respect to the lack of business honor which permits a man to sell his whole time to an employer, accepting a substantial yearly salary for same and then to steal part of this time for the purpose of increasing his income.

Where a man can, without lessening his value to his employer, devote his evenings to extra work, one cannot take exception to this method. The point in question involves a form of dishonesty which is often practiced by men whose integrity so far as actual cash or even finer points of honesty are concerned, is unexceptional. Cases of this sort come up more often than is generally realized and it is indeed time that steps were taken to protect an employer against petty and sometimes serious thefts of this sort, as against the more overt forms which involve the actual handling of cash. The government at Ottawa is endeavoring to prevent it, but the law is not yet of sufficient breadth to cover the ground.

A divided attention means lessened power of concentration and the opportunities of taking off a few minutes, or hours, of course increases with the responsibility of an employe's position. Should a man realize that by thus dividing his time and attention he is seriously lessening his earning power and consequently his value to his employer, selfish reasons alone would doubtless prevent much of such action.

THE BOSS WANTS TO KNOW.

If the boss wants to know, can you show him? If you are offered an advancement can you say you are ready. Are you taking advantage of the available opportunities? You can sit down on a stool and say you haven't the advantage of Technical Schools like the German or United States' mechanical men, that there was no apprenticeship system in the shop where you worked, etc. Do you think that will have any weight with the boss?

Are you reading your technical paper? Are you reading technical books on work which you are interested? Are you putting down on paper what you see in the shop, thus familiarizing yourself with shop methods? Are you trying to do a little more than you are paid for, or a little less? Ask yourself the question—"If the boss wants to know, can I show him?" Resolve to answer yes.

REPLACING OLD TOOLS WITH NEW ONES.

With the present developments in high speed steels and machine tools to use them, there is a greater output possible in great number of cases with machine tools of recent design than those of a few years ago. No doubt many plants are making money using less efficient and far from modern machinery. The product of a plant such as this, may have an excellent reputation and be in a class by itself. The output may be easily sold, the proprietors being content with large sales and small profits. It must tax the genius of the superintendent and foremen almost to the limit at times in some shops to keep the balance on the right side of the books. An observer cannot help but see how much more profitable it would be if the obsolete machinery were replaced by that of recent design.

If the management take the trouble to investigate where there is a large leak they will often find, that, by installing a modern machine, designed for the work it is to do, the machine will pay for itself in a few months. This has been revealed by fires, where old established plants have been wiped out and a new plant equipped with the latest design machinery erected.

It has been demonstrated in certain cases that the installation of a simple machine has reduced the cost very materially to even one-half or one-quarter of the previous cost. It has disillusioned the manager installing the machine of the idea of keeping in service a worn-out machine in cuttin down costs. It will pay to make a comparative study of the capacities of the two machines, the old and the new. In this way it will be found which is the more economical and whether it will pay to retain the old machine or install a new one.

WASTEFUL ECONOMY

It is possible to be wasteful even in economy. A certain firm was some time ago persuaded to employ a system of accountancy which was guaranteed to prevent dishonesty on the part of employees. After due consideration the system was adopted and two additional men employed at a salary of $700 a year.

At the end of the year it was found that one item amounting to $5.75 had been saved. In other words they had spent $1400 to save $5.75.

System is necessary but system that saves at the spigot and wastes at the bung hole is an evil. It is system gone mad.

System is designed to economize and facilitate, not to waste and hinder.

THE RECIPE BOOK.

An alloy of 95 per cent. of copper and 5 per cent. of aluminum is the nearest imitation of pure gold of any of the known alloys.

* * *

According to the Foundry, the proper proportions of a copper alloy for soldering irons, copper hammers and all copper castings which do not require high electric conductivity, are obtained by mixing 96 pounds of copper and 4 pounds of zinc. Two tablespoonsful of salt should be added to the copper when first charged. The zinc should be added after the copper is melted. The mixture is thoroughly stirred and the metal is allowed to superheat for a few minutes before being cast.

* * *

An ingenious process of finishing high-speed gears has been proposed, its theory being that low spots in mating gears will be built up as the gears are run together. The method proposed is to electroplate the teeth with copper while running them in a suitable plating tank. The process is the direct opposite of the wearing-down process which, as every gear expert knows, is not conducive to the best results.—Machinery.

* * *

Experiments have now demonstrated the fact that the cause of the rapid rusting of steel and iron in the form of sheets, wire rods or tubing, is caused by the presence of impurities. By the elimination of manganese and other foreign elements in the iron, it has been found that it will withstand corrosion to a far greater degree.

* * *

The best lubricant for lathe and grinder centers is a mixture of powdered red lead (oxide of lead) and lard oil. When using this lubricant, if the oil dries out the centers do not cut, but simply take on a high polish. This mixture also works well for thread cutting, and a much smoother thread can be cut in tool steel than with plain lard oil.

In a parsimoniously conducted shop, the management refused to furnish lard oil for cutting purposes. The men discovered an efficacious substitute in the machinery oil that had been through the line-shaft bearings. The old oil which was removed from the drip cups proved an excellent lubricant for threading, etc.

* * *

To make a wax for metal patternmakers' use: Rosin, 11 part; beeswax, 1 part; plaster of Paris, 1½ parts. Heat the wax and rosin and stir in the plaster of Paris, then add lampblack to make the desired color. Apply this wax with a heated knife. After taking an impression of a casting with plaster of Paris, by pouring molasses water around the edges, the plaster will be loosened so that the cast can be removed without injuring it. The molasses water will cause the plaster to stick to itself and not the pattern.—Scientific American.

* * *

The following formula will be found very handy for coloring brass a deep blue: Copper carbonate, 6.4 ounces; ammonia hydrate, 3,200 cubic centimeters; water, 1,600 cubic centimeters. The brass parts must be cleaned and freed from all grease. A good way to clean them is to dip them in gasoline. When clean, dip the brass into the solution, and let it remain therein about ten minutes. Then take it out of the bath and rinse in clear water. The brass will have a deep blue color, which will not tarnish or rub off.

* * *

Cast nickel-bronze gears are, according to Castings, employed in certain cases in which cast-iron gears have not the necessary strength and toughness, and cast-steel gears are unsatisfactory on account of their lack of uniformity. The alloy for these gears consists of 86 per cent of copper, 10 per cent. of tin, 3 per cent. of nickel, and 1 per cent. of 5 per cent. phosphor-tin. The nickel is melted with about 25 per cent. of the copper, after which the rest of the copper is added. Then the tin is added, and finally the phosphor-tin, the mixture being well stirred.

* * *

This lubricates the rams and valves and prevents packing from becoming hard:

Secure a clean, empty barrel. Into the empty barrel place 5 pounds sal soda (the addition of 5 or 10 gallons of hot water will readily dissolve the soda), then fill the barrel half full of water, agitating same, so that the soda and water will be thoroughly mixed and dissolved. When done, and not before, add 3 gallons of mineral lard oil. This mixture will turn white, resembling milk; then fill balance of barrel with water, mix well, and the solution is ready for charging the hydraulic system.—American Machinist.

* * *

In a paper presented before the American Society for Testing Materials, dealing with cupro-nickel steel, it is noted that alloys carrying from 5 to 20 per cent. copper, which without nickel would be extremely hard and brittle become, by the addition of nickel in proportion of 20 to 50 per cent., highly ductile and easily machineable.

* * *

To anneal steel having hard and soft spots, remove the scale, and heat slowly and evenly to a little above a dark red. Immerse in fresh water until almost cool. Heat immediately to a dark red and anneal in the usual way.

POWER GENERATION AND APPLICATION

For Manufacturers. Cost and Efficiency Articles Rather Than Technical.
Steam Power Plants ; Hydro Electric Development ; Producer Gas, Etc.

What the Hydro-Electric Means to the Power User

Turning on the Power at Berlin, October 10, Marks the Beginning of Government Distribution of Power in Ontario--Power Equipment Exhibition at Berlin.

THE celebration at Berlin on October 11 marked the beginning of government distribution in Ontario. Among those present were Hon. A. Beck, chairman of the Hydro-Electric Power Commission; General Green president of the Ontario Power Co.; and F. H. McGuigan who had the construction contract.

The following municipalities have contracted for power in Western Ontario: Windsor, 15,000; Toronto, 10,000; London, 5,000; Guelph 2,500; St. Thomas, 1,500; Woodstock, 1,200; Galt, 1,200; Hamilton, Stratford and Berlin, each 1,000; Waterloo, 685; Preston, 600; St. Marys, Paris, Ingersoll, Brampton and Tillsonburg, each 500 ; Hespeler, 400 ; Mitchell and Seaforth, 300; New Hamburg, 250; Norwich, 150; and Sebringville 100.

Niagara Transmission Station.

The Hydro-Electric Power Commission have built the necessary transmission station at Niagara Falls for the distribution of this power. This transformer house is about half a mile back from the transmitting station of the Ontario Power Co., from whom all their power is obtained. The building measures approximately 45 ft. by 184 ft., and, as at present constructed, will accommodate half the contemplated final installation. This necessitated the erection of slightly over half the projected building, as the controlling end is complete, with one wing built north from it. A similar wing is to be built at some future date. The present building will accommodate 36,000 k.w.

Power is transmitted at 12,000 volt from the Ontario Power Co.'s transmitting station, through a tunnel, through oil switches in the basement, from which it is led to 3 banks of three 3,000 k.w. transformers delta connected on the low, and star connected on the high. These transformers raise the voltage to 63,000 volts across each phase, and as this high side is star connected, a line voltage of 110,000 volts is produced.

The centre of the distributing system is at Dundas seven miles from Hamilton. The total length at present installed is 290 miles.

Five districts will be served with hydro-electric power by the Hydro-Electric Power Commission. In addition to Western Ontario, there are Port Arthur in the north-west; Ottawa in the east; Prescott and Morrisburg in the east, and Belleville, Port Hope, Trenton, Napanee and Kingston in the central district.

"Cheap Power."

This has been the result of the campaign for cheap power in Ontario. Power will be supplied at cost to the various municipalities. A favorable manufacturing region of about 18,000 miles has been created in Western Ontario.

Exhibits at Berlin.

At the "turning on of the Niagara Power" at Berlin, were a number of exhibits of electrical machinery and supplies, the companies exhibiting being Chapman Double Ball Bearing Co., Canadian General Electric Co., Factory Products Co., G. C. Royce, Death & Watson, Holman Electric Sign Co., Federal Engineering & Supply Co., A. H. W. Joiner, Simplex Co., and Northern Electric & Mfg. Co., Toronto; Onward Mfg. Co., Berlin; and Canadian Tungsten Lamp Co., and Canadian Westinghouse Co., Hamilton.

Clutches Reduce Power Consumed in Machine Shop

By Using Clutches, Belts not Under Load Remain Idle, Loose Pulleys not being Necessary---They Reduce Consumption of Power, as Departments can be Disconnected when not in Use---Other Advantages.

MANUFACTURERS and their superintendents, master mechanics, and foremen, are finding that clutches result in a great many cases in a large saving of power. When not under load, the belts remain idle, and eliminate the continual stretch and contraction of belts while travelling around loose pulleys and their drivers.

They greatly reduce the consumption of power, as machines or departments can be disconnected when not in use, or shut down for repairs, without interfering with other parts of the plant.

They enable shafting or machines to be instantly stopped in case of accidents, and reduce the risk of accidents, by enabling all equipment not in use to remain idle, thereby improving the conditions of employes, and so assisting the employer to secure the most valuable help.

They enable motors and gas or gasoline engines to pick up their speed before the application of the load.

Lost Energy.

One of the important items of overhead expense in connection with every manufacturing establishment, is the annual power bill, and a large percentage of power is often expended on useless or lost energy.

Many machines consume more power in themselves than in the actual work they do, and these machines are not always provided with even loose pulleys. The friction between the loose pulleys and the shaft consumes power, and belts, as they pass around the loose pulleys and their drivers, consume more power. The resistance of the air to the rotation of the pulley arms consumes a much larger amount, and lastly the power consumed to overcome the friction between the shaft and the bearings is approximately 10 per cent. of the total con-

85 h.p. Clutch Made by Positive Clutch and Pulley Works, Toronto.

sumption. A manager would probably be astonished at the total of these items, and the cost of a clutch to disconnect that entire department from the main shaft would appear as a very small fraction of that grand total.

Again referring to the idle department; the loose pulley sleeves wear away and must be renewed, while the combined weight of shafting, pulleys, belts and belt tension shorten the life of the bearings. These repairs and renewals cost money for both labor and material, and very often necessitate shutting down the entire plant until they are completed. Then again all this running equipment requires lubrication whether in use or not. These are important matters, and the saving which would be effected in the upkeep and maintenance of plant is well worth the price of a clutch or two.

Positive Clutch.

The clutch shown in the illustration is one recently shipped to W. J. Baldwin, Aurora. It is an 85 h.p., running at 100 r.p.m. A similar one has been installed at the works of the Gendron Mfg. Co., Toronto. The gas engine is allowed to pick up its speed before the load is applied through the clutch.

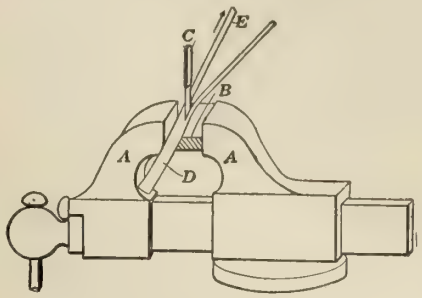
The "Positive" clutch is a combined jaw and friction clutch. The load is gradually picked up by friction, the jaw giving a positive drive under load. The jaws are so constructed that in movement they are free from sliding contact and bear only when engaged, which also enables them to be freely withdrawn. When it is desired to disengage the clutch, the frictions take the load from the jaws before they commence to disengage. By means of springs the frictions and jaws are prevented from engaging or disengaging except by the use of the operating lever, while at the same time the springs are arranged to operate the jaws when the clutch is being engaged and disengaged. All parts of this clutch which run on the shaft are provided with permanent graphite lubrication. The pulley sleeves are made to standard diameters to correspond with the standard bores of pulleys and all parts made interchangeable, which enables a pulley clutch or clutch coupling to be converted into the other, or used on different sizes of shafts.

CUTTING BELT LACES.

By A. D. Scott.

Here is a little kink on splitting belt laces from the hide, or cutting a narrow lace from a wide one. In the sketch AA represent the jaws of a vise. B is a piece of board with knife blade C firmly driven in at a distance from the vise jaw equal to the width of lace required. D is the lace being cut.

The end of the hide, or lace, is first cut for three or four inches, as at E, then placed over the knife blade as shown, and pulled in the direction of the arrow, while the edge of the lace is



Cutting Belt Laces.

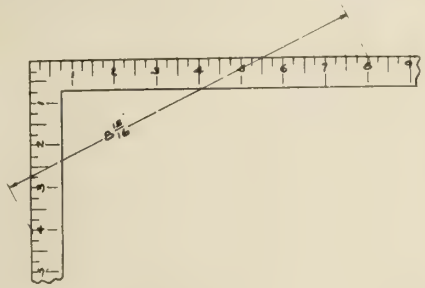
guided along the vise jaw. It, of course, requires two persons to do this.

Anyone who uses the lace-cutting device which slips over the fore-finger, and when in use nearly disjoints that member, will find this knife a real blessing.—American Machinist.

SIZE OF PIPE.

By W. Oelschlager.

An easy method to ascertain the size pipe required to unite two pipes into one, so that the one shall have the same



Size of Pipe.

area as the two. Say it is desired to unite a 4-inch and an 8 inch, take an ordinary carpenters' square, measure diagonally across with a rule from the 4 inch mark on the one blade to the 8 inch mark on the other blade, which will be about 8 15-16 inch or 9 inch pipe.

SAVING ELECTRICITY.

Tungsten lamps are coming to the front because they save electricity. In appearance, their only difference from the ordinary carbon filament incandescent lamp is that the filament is constructed of tungsten instead of carbon. But in actual use, it has been proved that they use only about one-third as much current as a carbon lamp to produce a light of the same illuminating power. True, their first cost is greater (approximately three times as much), but this is counterbalanced by the saving in current effected. They have one weak point, however. That is the ease with which the delicate tungsten filament is broken. On this account great care has to be exercised in installing them, and it is for this reason, too, that they cannot be economically used as portable lamps. Yet, when carefully handled, they have a long lease of life. In England, where they are used much more extensively than here, it is quite common for them to last 3,000 hours, and one instance is on record where a tungsten lamp burned continuously for over 15,000 hours. Even when allowance is made for more frequent breakage, the tungsten lamp shows a saving over the carbon of about fifty per cent. That is an economy not to be despised and points to the much greater use for stationary lighting purposes.

BRAZING WITH KEROSENE.

By Frank C. Perkins.

The construction and method of operation of a kerosene oil torch designed for light brazing, wiping joints and similar heating operations may be noted in operation in the accompanying illustration. This portable blow torch is very efficient, producing an intense clear flame. It will be seen that the burner

Brazing a Cup Joint With Kerosene Lamp.

is mounted directly on top of the tank and was designed for the use of kerosene oil as a fuel.

The pump is fitted inside of the tank and the flame may easily be regulated. This torch is said to be more suitable for general shop work than the gasoline device and has an oil consumption of ½ pint per hour, with a capacity for 4 hours' service. A similar torch of a capacity of one gallon for greater heating service, has an oil consumption of three pints per hour.

Essentials of Success in Machine Tool Advertising

Selecting Mediums, Getting Inside the Shop, Filling Space, and Answering the "Whys"---A Careful Consideration of Machine Tool Advertising.

By T. S. Bentley *

It has been said that however good an article may be, three things are essential to secure its success, viz., 1st, Advertise, 2nd, **Advertise,** 3rd, ADVERTISE.

This forms a good example of the old proverb "there is many a true word spoken in jest." The words sound flippantly epigrammatical, but they embody a truth that has been proved times without number, and which must never be lost sight of by those who would secure and retain a leading place in any line of trade.

The subject of advertising is so vast and complex that whole books might be written about it without exhausting all its manifold phases. Such a treatise would be too elaborate to appeal to the ordinary advertiser, and its circulation would be very limited; nevertheless, a few practical remarks on this subject, addressed to the manufacturer and specially referring to the class of goods in which he is interested, may well prove both timely and suggestive.

The makers of machinery—and more particularly of machine tools—form such an important manufacturing class as to have literature all its own, with subdivisions which circulate for the most part in comparatively distinct and well-defined circles. This fact has an important bearing on the question under discussion, as it produces conditions entirely different from those which apply to general advertising in ordinary periodicals, or the daily press.

It will therefore be well to consider carefully some of the more important aspects of machine tool advertising, with a view to securing the best possible return for the money expended.

Selecting the Mediums

There are many considerations which influence, to a greater or less degree, the selection of the advertising medium that shall be employed; and it is of the most vital importance that their true relative value should be clearly recognized. Comparative cost is sure to weigh heavily in such deliberations—it is a matter which cannot be ignored—but it must not be allowed to overshadow other things which are really more essential to the advertiser's interests. It should never be forgotten that, whatever may be the case in other connections, in the matter of advertising it is pretty certain to be the patrons of the bargain counter who are ultimately "sold." "The real worth of anything," says the proverb, "is just as much as it will bring:" and in the long run this dictum will be found to be very near the mark. Certainly, in the matter of payment for advertising space, the price charged generally bears a close relationship to the true value of its potential results. Thus it will be found that in this more than in almost anything else, "the best is the cheapest," and the apparently cheap is in reality "dear at any price."

Having decided to select one of the best—and, therefore, most costly—advertising mediums, the question arises as to which of the leading journals shall have the preference.

Naturally, one with a large circulation will be favored (and this point is always made the most of by the advertising managers of the various journals;) but the essential thing is not the mere number of copies issued, but the number carefully read by those who are likely to purchase the tools offered. A paper with a large circulation among manufacturers and employers of labor, therefore, fulfills one of the essential conditions; but this is not all.

Getting Inside the Shop.

It must be borne in mind that there are many men in factories and workshops who, while never likely to be purchasers of machinery themselves, have a very considerable influence as to which of a number of competing makes shall be chosen for installation in the shops with which they happen to be connected. A journal which is not only popular in the office, but is also diligently studied by the workers in the shop is, therefore, of double value as an advertising medium. The number of publications which fulfill both of these conditions is so limited that the decision should be an extremely simple affair.

When the choice has been made and the space booked, the next thing is to study how to make the best use of it, so as to secure the maximum result from the outlay involved. Naturally, the conditions vary in every case, and each must be considered individually and on its merits. The kind of tools to be pushed; whether a single specialty or a line including some amount of variety; whether the goods offered are such as to call for a continuous demand from such as use them, or things which are bought once for all and seldom require to be duplicated in ordinary cases. All these things must be considered in the advertising.

The first object of an advertisement is to arrest attention. Unless it catches the eye readily, it will reach only a portion of those at whom it is aimed, and

THROW ON THE LIGHT

YOUR business principles may be right; your goods the best; your service to customers faultless

BUT THE PUBLIC HAS GOT TO KNOW

Keep always your talking points before the public. Get in the glare of favorable publicity. Make known the merits of your proposition.

Success comes by focusing the diverging rays of public opinion--centering buyers' choice on what you have to offer.

Make your ability, your commodity, your service KNOWN.

THROW ON THE LIGHT

* Of Charles Churchill & Co., Ltd., London, in Selling Magazine.

fail of its purpose with regard to all the rest. It must be so striking that it cannot easily be passed over. This may be achieved in a variety of ways, and the choice will depend on circumstances.

Filling the Space.

Some prefer to utilize the bulk of their space by inserting a large and striking block showing some typical specimen of their product. In many cases this is a thoroughly good policy, as it serves to catch the eye and also to give at a glance a general idea as to the principal characteristics of the machine referred to. As a general rule, this course is far preferable to filling the space with a lot of closely-printed matter which—however good in itself—seldom draws much business, as it is read by few

Naturally, the kind of treatment adopted must depend largely on the amount of money which can be devoted to this purpose. It is often a question of choice between a small space in a first-class journal and a larger space in one whose rates are cheaper.

Now, while the decision must be made in each case by those most concerned, as a general rule it is preferable to choose the better paper and its larger and more promising circle of readers rather than to be led away by the apparent bargain offered by the cheaper rate per inch without duly considering the difference in circulation, both as to extent and value.

Answering the "Whys"

"Why should I advertise?" says one. "My trade is good, orders are plentiful, my factory is working under full pressure; I have all the business I can take care of." Quite so, but the boom will come to an end and a reaction will follow—then you will want all you can get. During the rush, machine tools have been eagerly sought and ardently desired. At such a time personal predilections are largely put aside, and purchasers are willing to consider the claims of unfamiliar makes which they have hitherto ignored. Here is the opportunity to extend your connection and obtain valuable business. On the other hand, if your name is a "household word," advertising has made it so; and if you fail to persevere, you give your rival just what he has been so patiently waiting for—the opportunity to usurp your envied position in the glare of the limelight.

Presently the slump comes. "I must reduce advertising expenses—can't afford to keep it up," says another. But can you afford to stop? Especially now, of all times, when the competition for all the trade which is going is keener and more determined than ever. Money spent in judicious advertising is not thrown away.

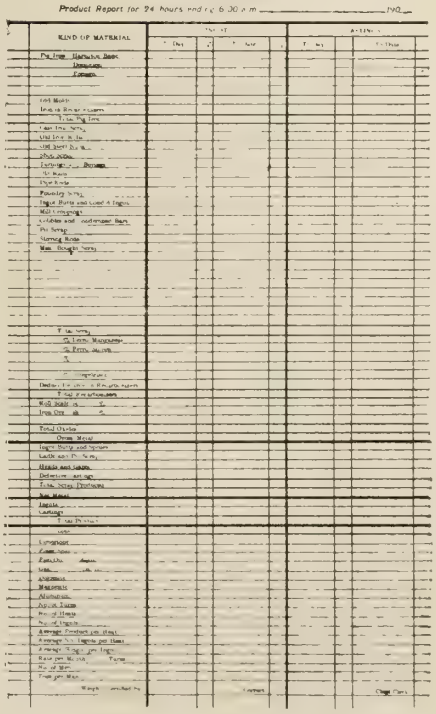
"What is the good of attracting more orders than I can fill?" This is a matter that concerns the present in that it allows you to pick your customers; to avoid bad debts and doubtful chances; and retain those buyers who order freely and pay promptly. It also concerns the future, when the pressure shall have relaxed and demand is on the ebb. It is human nature to desire anything the more ardently if it is in such request as to be almost unobtainable This will not only result in putting a premium on the article at the time, but will predispose those who failed in their attempt to obtain it then, to take advantage of the opportunity if it should arise again. —Advertising and Selling.

OPEN HEARTH REPORT SHEET.

The Ontario Iron and Steel Co., at their Welland plant, have the only basic open hearth steel mill in Canada. Being a large concern, everything is well systematized, the accompanying cut showing the system used in recording the constituents entering the steel composition.

As shown, the same sheet is used for both foundry and steel mill for recording the composition of the castings and the ingots produced.

It will be noticed that under both "Ingots" and "Castings" there are four columns, the first giving the actual weight of the particular ingredient, and the second column, the percentage that that ingredient is of the gross metal. The next pair of columns are for similar entries for the weights and percentages to date for that month. A similar double entry is made for castings.



ONTARIO IRON AND STEEL CO. LIMITED
OPEN HEARTH
Product Report for 24 hours ending 6.30 a.m. _____ 1912.

Looking down the columns, it will be noticed that the constituents are grouped. The first group is of the basis of the mixture of the steel,—the pig irons. Various kinds of pig iron are used, their names being entered after the pig iron in the spaces left. In this group is entered the iron in the recarbonizers referred to later. Summing these entries gives the total pig iron, and the percentage that it bears to the gross metal for both the day and the month.

A similar grouping is made for the steel and wrought iron ingredients, which are also totaled and the percentage taken.

In like manner are the recarbonizers and scale products introduced. The sum of all these groups gives the gross metals.

The following group represents the losses incidental to pouring, etc. This metal is counted out for each pour, but, as it is still good, the next day it will be introduced again. This is shown in the second group where such entries as "pit scrap" etc., corresponding to the column under discussion. This scrap, deducted from the gross scrap, gives the net metal or the effective pour.

The last group contains figures incidental to any heat, such for example as the Limestone and Fluor Spar used as fluxes in the basic process. The fuel consumed, gas consumed, and such fluxes as Dolomite, etc., are also given, and various other observed data in connection with each run.

This system of recording gives an excellent count on the product.

SOLVING IDLE MACHINE PROBLEM

Production was greatly increased in one factory by having a man go through all departments of the plant every hour to make notes of every idle machine at that time. The machines were all numbered, and as those who were responsible for keeping the belts on the tight pulley knew that hourly reports were made to the manager and scheduled, stops were minimized.—"Factory."

The Dominion Government has appointed Charles McDonald, of Guelph, to succeed Mr. Fitzmaurice on the Quebec Bridge Commission. Mr. Fitzmaurice, an eminent English construction engineer, has resigned because of continued ill-health. Mr. McDonald was chief engineer of the American Bridge Co., and has had to do with some of the largest bridge contracts carried through by that corporation.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

HAND WHEEL PATTERN.

By H. J. McCaslin.

While visiting a neighboring pattern shop recently, a 15-inch dished hand wheel pattern, similar to that shown in

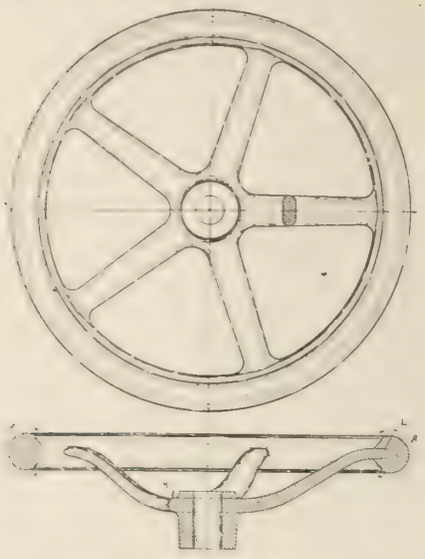


Fig. 1.—Handy Wheel Pattern.

Fig. 1, and which had just been completed, was noticed. In answer to an inquiry as to the length of time the job required, I was informed that 22 hours were expended in its completion. Remarking that I thought the time was a little excessive, attention was called to the manner in which the rim was glued

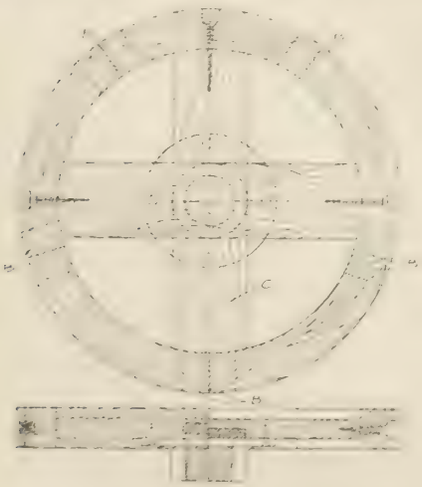

Fig. 2.—Handy Wheel Pattern.

up in three courses of segments, and the arms built in during this operation, and the time it took in completing the contour of the rim between the arms, that could not be turned.

Now, the man who put up the job was evidently a clean workman and put that much time upon the pattern, but did the job justify an expense of about $8.25?

The incident left that impression that should a similar job come my way (which did sooner than was expected), it would not take as long a time to deliver the casting to the assemblers.

Cutting the Time.

My calculations did not go amiss, for a total of 17 hours was required in delivery and placing the wheel upon the shaft.

Nine hours were consumed in making the pattern, three hours in getting it through the foundry, and five hours facing and boring the butt and turning and polishing that portion of the rim shown at A, and smoothing up the arms.

This was not a break-down, or break-neck job to see what could be done, or by how much the other fellow could be beaten.

The job went through in the usual way, but with a little judgment and forethought in the making of the pattern, the before mentioned results were obtained, without any exertion.

As we made the pattern in 13 hours less than the case quoted an inscription as to how the job was handled might interest some of your readers.

Procedure.

First the rim was glued up, there being five arms and a similar number of segments. These segments were made the usual way and fitted together. Their abutting ends were then passed over the rip saw and scarfed for the insertion of a 1"x1½" tongue, as shown at B, Fig. 2.

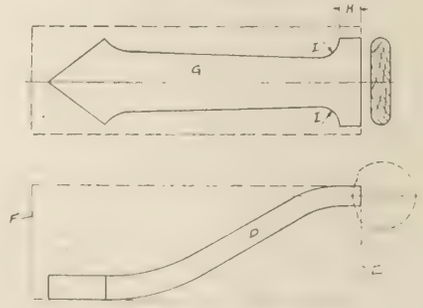

Fig. 3.—Handy Wheel Pattern.

The cross C shown in Fig. 2, was next roughly checked and glued together and put aside to dry, when the arms and hub next received our attention.

A full size plan and radial section of an arm and the rim, was next laid out upon ⅛" stock, which was subsequently cut out and used as a templet for laying of the shape of the arms upon two faces of the blocks shown in Fig. 3. The elevation lines D, Fig. 3 of the arms were first sawed out, the sawed off material E and F lightly braded back in place, and the plan G of arm sawed out, leaving about a ½ inch tenent, as shown at H, for securing the arm into the rim.

With the exception of the filet I, the arms were rounded over and the cope and drag hub turned and the turning of the rim followed in order. The cross was carefully marked from the rim material, and so sawed that it would snugly enter the inner diameter of segments, in which position it was glued and a screw inserted from the outside, as shown at J, Fig. 2.

The advantage of using a cross in this way is that it permits the turning of practically the entire contour of rim without rechucking. For when the finished surface of rim has been extended from the front to the back of the cross the screws through the rim were removed and the turning continued by cutting into the cross. But before doing so, about ½-inch of the rim contour between two arms of the cross was completed with the aid of a knife and templet. It will be readily seen that this finished section of rim, acted as a guide eliminating the stopping of the lathe to try a templet.

Now by following this pass or completed surface and alternately turning a little from one side and then the other, the rim was practically completed and separated from the cross.

Mortises were then marked off and cut into the rim as shown at L, Fig. 1, to receive the arm, by boring holes and cutting away between.

With that portion of hub shown at K blocked up to suit the disk of arm, the rim was centrally located about it and braded down.

The arms were then fitted into place one at a time, being glued into the rim and also together at the centre.

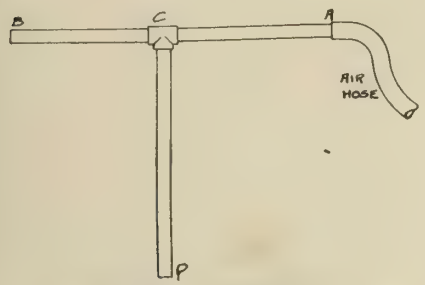
The last arm acting somewhat as a key to secure the spider in place.

The balance of the hub was next attached the fillets I worked into the rim and our job was ready to be varnished.

CLEANING MOLDS.

The accompanying sketch shows a simple device used in the steel foundry of the Ontario Iron and Steel Co., Welland, for blowing out dust, etc., from deep molds, which cannot be very well reached by the ordinary molding tools, owing to inaccessibility.

The device consists of three pieces of ¾ inch pipe, united by the T connection shown at C. The end A is connected to an air supply, and the ends B and D are left open. The arm ACB forms the handle, and the arm CD projects into the mold.



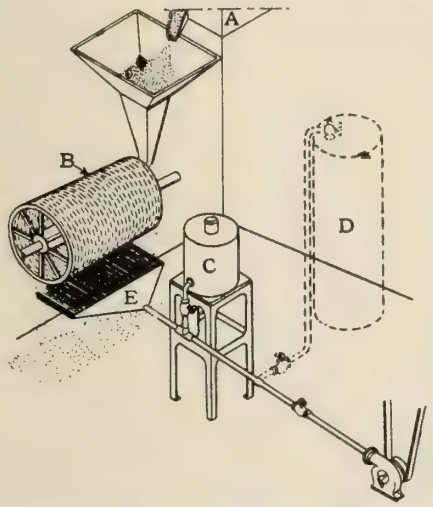
Apparatus for Cleaning Molds.

Either a blast or a suction can be created at D by proper manipulation at B. If air be allowed from A into the piping, it will rush across, through C and out B, creating a vacuum at D, the extent of which depends on the pressure at A, which is controlled by a valve. This will lift ordinary dust and small particles through D, and eject them at B. To remove particles in the mold by a blast, placing the hand over end B, diverts the flow of air, and sends it out D instead of B. The intensity depends on the extent of closure at B.

PREPARING CORE SAND

A new process of preparing core sand with a liquid binder has been developed by Jacob S. Robeson, of the Robeson Process Co., manufacturer of glutrin, Grand Mere, P. Q., and Au Sable Forks N.Y. Core sand mixtures, as generally prepared, lack uniformity and to effect a more intimate mixture of the liquid binding agent with the sand, the apparatus shown in the accompanying illustration is used. It will be noted that A is a sand drying chamber, fitted with a spout discharging into a hopper, from which it is delivered through a funnel-shaped spout to a rotary screen, B, which sifts the sand. This screen is so located that the liquid binder, in a finely divided state, may be discharged against and through the material as it leaves the screen. The tank containing the liquid binder is illustrated at C, and is provided with a pipe which delivers the binder to a discharge pipe connected with a blower. The discharge pipe has a flaring nozzle, E, through which the liquid binder, under the desired pressure, is discharged in a fine stream or atomized condition, in a substantially horizontal plane, against and through the falling sand as it is delivered by the screen. Instead of a blower, steam may be delivered to the discharge pipe from a steam boiler, D, which is indicated by dotted lines.

The spraying of the liquid binder in a finely divided condition, either under air or steam pressure, results in such an intimate admixture of the binder with the sand that a smaller amount of the binder is required than in ordinary practice, and in addition, better results are obtained. Every grain of sand receives a coating of the binder, and the mechanical bond produced by this treatment of the sand is greater than that produced by adding the binder in the old way, and the saving in the amount



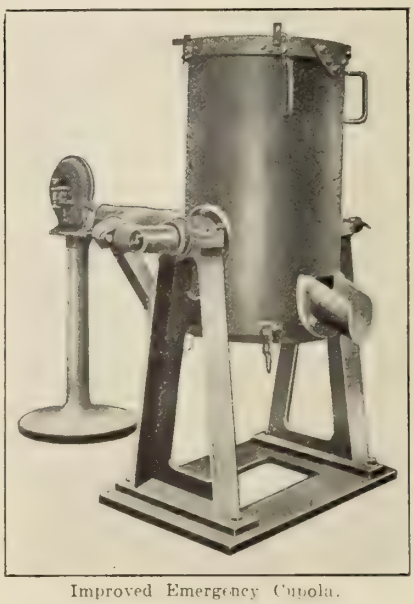
Apparatus Used in Preparing Core Sand.

of binder required approximates 30 per cent. Furthermore, a greater quantity of old sand may be used with such a mixture. While compressed air is preferred as the means for separating the binder and for mixing it with the sand, it may be possible, under some conditions, to use the binder in a denser state and to employ steam, under pressure, as the means of discharging it against the sand. This steam will carry such a content of water as will provide a given quantity of binder with an amount of moisture equal to that supplied in bulk, when compressed air is employed as the medium for discharging the binder against the sand. The difficulty, however, of determining this water content of the steam, and the danger of adding from such steam an excess of moisture which would seriously affect the adhesive quality of the binding agent, and consequently the character of the core, has led the inventor to prefer the use of compressed air. In most foundries both air and steam are accessible, and under the most favorable conditions, steam might be employed. The patent granted Mr. Robeson not only covers the process as relating to the preparation of material for the manufacture of cores, but also for the manufacture of briquettes from coal, or other fuel, iron or other ores, etc.

IMPROVED EMERGENCY CUPOLA.

George Green & Co., foundry engineers, of Keighley, Yorkshire, England, have introduced a small cupola for melting from 1 to 10 cwts. of iron per hour. This cupola has already been taken up by a considerable number of foundrymen who desired to commence iron-founding in a small way, or wished to have at hand a small cupola which will cope at little expense with small heats of iron varying from 1 to 10 cwts. Ordinary foundry coke is used for fuel, and the furnace will produce molten iron at the spout about ten minutes after setting on the blast. The "emergency" cupola is very useful for test mixtures, and also for engineers who carry out repairs.

Mine managers will find it a great convenience in the event of a breakdown in machininery which needs immediate repair, in order to avoid disturbance of work and consequent loss. A mine is often situated a long distance from a foundry, and in such cases the "emergency" cupola is of special value, as it provides at small cost, coupled with



Improved Emergency Cupola.

great efficiency, the means wherewith to make a casting for repair work on the spot, without delay. The Taquah Mining and Exploration Co., Ltd., of West Africa are amongst the users of this cupola.

IMPROPER GATING OF COPPER CASTINGS.

We are making copper castings by the use of silicon-copper, and cannot get them clean, as dirt shows when the scale is machined off. We use ingot cop-

per, with two per cent. of silicon-copper and pour the metal hot. The castings are quite heavy.—Inquirer.

The dirt is caused by improper gating, and the fact that there is scale on the castings shows they are being poured too hot. Copper containing silicon is very fluid and does not need to be poured as hot as when zinc is used. It is very similar in casting properties to alloys containing aluminum, and has to enter the mold with extreme quietness to avoid the formation of dross. As we do not know the shape of your castings, it is difficult to advise as to how they should be gated. The following rules, however, can be applied in all cases: The metal should enter the mold at the lowest possible point and should always rise, never drop. The gate at which it enters can be quite small, the heavy portions of the casting being fed by risers, and sometimes the latter will have to be placed directly on the castings, as in the case of steel. A flat heavy slab, for instance, should have the mold steeply inclined, the metal being poured in at the lowest end, so that it gently rolls up hill and into a heavy riser, which feeds the casting and receives any dirt. Never gate such castings with two or more gates in such a manner that the streams of metal impinge. Therefore, change your method of gating and pour the metal cooler.—Foundry.

SPECIMENS WANTED FOR RESEARCH.

Knowledge of the true cause of globules in gas cavities, solidly encased shot iron, hard streaks or spots in castings, and white iron inside of gray or soft iron, is greatly required. The theories and suppositions of the past do not satisfactorily explain causes, nor tender positive remedies. A collection of samples containing the above defects accompanied with the following details of conditions, to enable a thorough investigation of the subject, which should prove of much value in assisting to obtain more accurate information than exists, are solicited by Thos. D. West, 10,511 Pasadena avenue, Cleveland, Ohio. Samples of defects and information requested as below will be gladly received from foreign countries as well as the United States up to the end of this year.

In forwarding any specimens information is desired upon the following points as far as practicable:

First, character of the pig and scrap, fuel and any flux used in melting the mixture, also state if anything unusual occurred or was observed during the heat. Grade of the iron produced in being soft, medium or hard, or better still an analysis of the casting.

Second, a rough sketch of the castings showing its form and thickness of the different sections as far as feasible, also marking the location of the sample that is forwarded.

Third, whether the mold was green-sand, skin-dried, dry-sand or loam, and a description of the gating and pouring.

Fourth, whether the metal at the time of being tapped, as well as being poured into the mold, was "hot," medium or "dull," and any other information as far as convenient that might be thought of value in assisting an intelligent modern research of the subject.

The results of this investigation will be given to the trade through the medium of a paper to some one of our foundry or engineering societies.

PRACTICAL USE OF ABRASIVE WHEELS IN FOUNDRIES.*

The principal factor in the successful adoption of an abrasive wheel is a knowledge of the practical operating conditions under which these wheels should run for economical results.

The first essential in the successful adoption of a grinding equipment of any size is the disposition on the part of the management making the installation to operate under conditions to produce practical results.

Safety Collars.

The method of controlling the factor of safety to the operator should be determined, whether by safety collars, which are tapered if possible on the concave side $\frac{3}{4}$ inch to the foot, so that the wheels may be tapered convexly accordingly. In this case, where the nature of the work will permit, the maximum amount of wheel exposed beyond the edge, or rim, of these collars should be 2 inches and the collars changed as the wheels wear; or by the use of substantial hoods in cases where it is necessary to use wheels with straight sides, owing to the nature of the work to be ground, or by the use of both hoods and collars. Wherever possible, the general results will be more satisfactory, when the safety collars are used. If a wheel breaks in service, these collars, which should be at least $\frac{3}{4}$-inch thick and made from cast steel for wheels 24 inches in diameter, will hold the pieces together.

Grinding Stands.

After determining the size of the wheel, it is necessary to have machines solidly set on good foundations with a heavy spindle in long bearings that can be kept well lubricated, having all vibration eliminated when carrying the load of the wheels with the additional weight of the heaviest safety collars that are to be used. For a 24x2 inch wheel, with these safety collars, the spindle should be at least $2\frac{1}{4}$ inches between the flanges where the wheel is mounted, and for 24-inch wheels heavier than this, the spindle should be at least $2\frac{1}{2}$ inches diameter and the bearings not less than 12 inches long. This applies to floor stands for foundry practice, especially where the work is of a heavy nature. In addition to this, in all steel foundries, excepting crucible plants where nothing but very small castings are made, and many malleable iron foundries where there is sufficient work of a heavy nature, the most economical machines that can be installed are swinging frame grinders. These machines should be driven with flat belts, having a spindle at least 2 inches in diameter, for carrying 18, 20 or 24 inches wheels. The wheel spindle should be driven by at least a 4-inch double belt.

Power.

After investing in this equipment, ample power for driving these machines should be provided to keep the wheel operating under the proper speed, while it is at its highest pressure of service. On the floor stand, operating two 24-inch wheels, where two men are working, 10 horse-power should be provided, and on a swing frame grinder, operating one 20-inch wheel, 2 or $2\frac{1}{2}$ inches face, if driven by belt power, the countershaft should be driven by a 6-inch belt. In operating one of these machines, with a motor connected to the countershaft, which must drive the belt and absorb the friction necessary, not less than a $7\frac{1}{2}$ horse-power motor should be used, preferably 10 horse-power; but where the motor is mounted on a bracket at the elbow of this machine, the belt being connected direct from the motor pulley to the pulley on the wheel head, a $7\frac{1}{2}$ horse-power motor is ample, and in some cases 5 horse-power has proven entirely satisfactory.

Operating Speeds.

To the adoption of the safety collar is accountable economical operating conditions more than to any other factor, in that it has enabled the adoption of speeds which bring results with safety. The practical safe limit for running abrasive wheels with straight sides is 5,000 feet per minute peripheral speed, and even then it is quite hazardous unless these wheels are carefully protected with hoods. With the safety collars properly used, one can operate more safely at 6,500 feet per minute peripheral speed than to operate the straight wheels at 5,000 feet, with the additional advantage of an increased output. Those operating in accordance with these suggestions will secure the highest degree of efficiency obtainable in foundry work, and the writer's experience has been that 6,500

* Abstract of a paper presented at the October meeting of the Pittsburg Foundrymen's Association.

feet has proven to be the most economical speed at which to run.

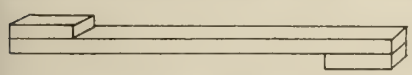
Cup Wheels.

The use of cup wheels, sometimes called tub wheels, should, at all times, be avoided. They are the most dangerous of abrasive wheels and in their stead, where it is necessary to do face grinding, a good substantial chuck should be used, with a cylinder wheel which has no back. It is apparent that a cup or tub wheel, which, for instance, may be 12 inches in diameter, 6 inches high, with 2 inches, or more, thickness of rim and a back 1 or 1½ inches thick, that the centrifugal strain of this heavy rim pulling on lighter binding point, compels the running of these wheels very slow to keep within any reasonable lines of safety. Were this made without the back, and the cylinder completely surrounded with an adjustable chuck whereby the wheel can be fed forward as worn, a higher speed might be maintained with perfect safety. A cup wheel should not be run more than 3,500 or 3,800 peripheral feet per minute, depending on the thickness of the rim, whereas a ring wheel may be run approximately 5,000 feet per minute.

PATTERNMAKER'S SAWING CLEAT.

By K. Campbell.

Sometimes a pattern maker does not find it convenient to use a vise. In some



Patternmaker's Sawing Cleat.

cases a pair of patternmaker's sawing cleats will be found very handy. The cleats can be made of any convenient size and consist of one board on which are blocks, one at each end on opposite side of the board.

At the foundry of the Fort Wayne Electric Works rain water in a closed piping system is circulated through the water jackets of the air compressors by a plunger pump driven from the compressor shaft, replacing a constant flow of city water. The circulation starts when the compressor starts and stops when it is shut down. Tubular automobile radiators keep the water cool.

As a matter of cold fact, pending patent applications are the only valid excuse for withholding from publication the description of anything new. When there is no element of this kind involved a manufacturer's attempt at secrecy almost always indicates either that he is pitiably small-minded and conceited or that he is afraid to submit his designs to the critical consideration of the engineering public.—Power and the Engineer.

MODERN SAFE & VAULT PLANT.

The Dominion Safe & Vault Co. have located at Farnham, P. Q., where they will manufacture the Herring-Hall Marvin safes and vaults. This is a branch of the Herring-Hall Marvin Safe Co., Hamilton, Ohio, a company established 75 years ago.

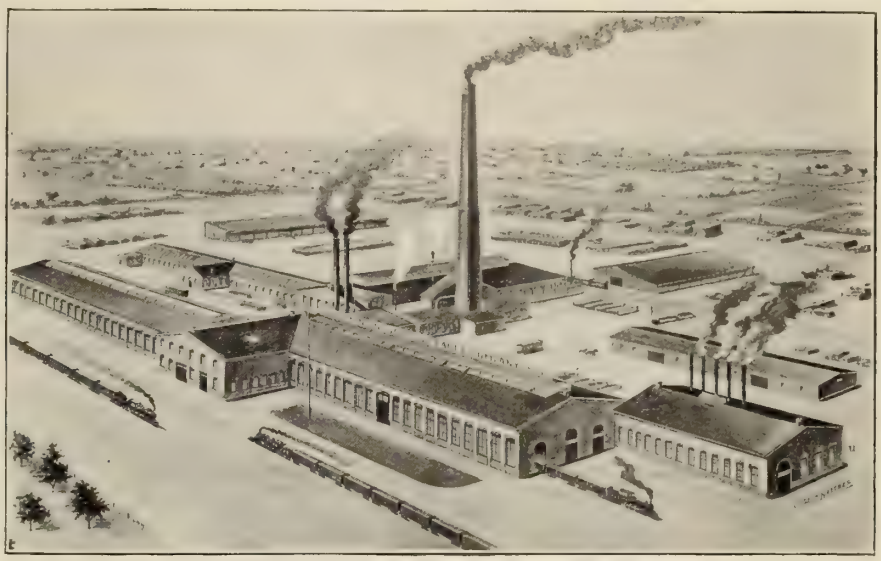
It was originally intended to erect a plant especially adapted to the manufacture of safes, but the company finally decided to take over the C. P. R. shops at Farnham, Que. These shops formerly employed 450 men. Owing, however, to the desire of the railroad company to centralize their various repair shops in one large shop at Montreal, the Farnham shops were no longer necessary, and they were vacated accordingly.

The plant is equipped with complete power plant. There is a 150 H. P. Corliss engine, a small engine and generator issue of $100,000 to accomplish this. It will take about one year for them to be in a position to deliver power.

The accompanying illustrations show layout of the plant, which will be given over to the manufacture of fireproof safes and vault doors, burglar proof safes and vault linings, and such other goods as can be manufactured in conjunction therewith. The designs and styles will be those of the Herring-Hall Marvin Safe Co., of Hamilton, Ohio.

The arrangement of the building is especially suited to the needs of the Safe Co., and will take care of a considerably larger output than is at present contemplated.

The shops are all well lighted, and everything is provided necessary for the comfort of the men. The machine shop is 200 feet long by 66 feet wide, and in this shop the various angles, plates and castings entering into the construc-



Plant of Dominion Safe and Vault Co., Farnham.

for ligthing, air compressor, line shafts, heating appartus, air lines and fire protective apparatus. The C. P. R. tracks pass through all of the buildings, and the Central Vermont touches the property line on the south side, and will put in a siding free of expense, giving direct connections with the two largest railroad systems in Canada—the Central Vermont being a subsidiary company to the Grand Trunk.

A contract has been entered into with Farnham, whereby they agree to give exemption from taxation, with the exception of school taxes, free water, and electrical power delivered on the secondary side of the transformers at $20 per H. P. per year for 24 hour power, with a minimum of 75 H. P., and with a maximum of 400 H. P. In order to do this it will be necessary for them to develop the water power on the Yamaska River, and they have authorized a bond

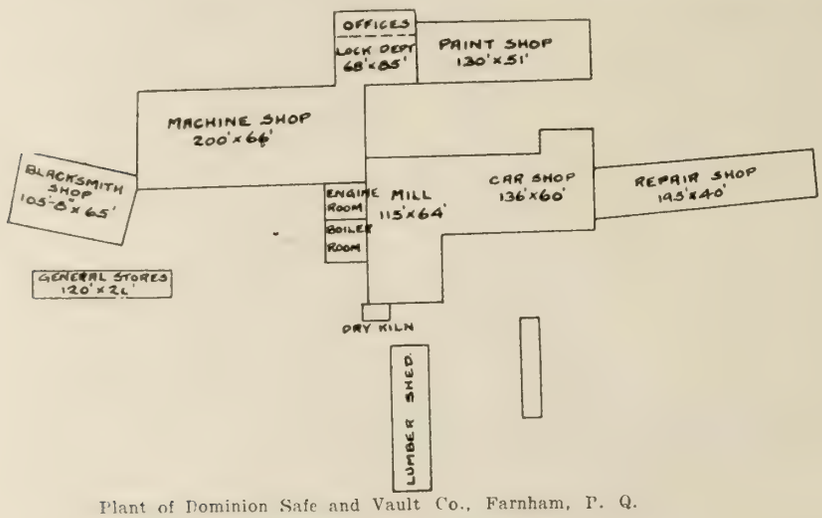
tion of the safes, will be machined. The blacksmith shop is a building 105 feet long by 65 feet wide, containing all the necessary forges and furnaces, and here will be made the solid hand welded angle hoops which are a feature of the Dominion Safe & Vault Co.'s Safe. The forging and welding of the various parts of vault linings and burglar proof safes will also be taken care of in this shop. The paint shop is an exceptionally fine building, with sky lights and large windows, and here the final work of finishing the safes will be done. The erecting and fitting of the interior of safe cabinets will be done in the mill, 115 by 64. Directly in the rear of this shop is the dry kiln and lumber sheds, where the oak and other lumber used will be prepared and stored. The lock dept., where the most skilled labor is required, is situated in rear of the office. Combination safety deposit box locks and the num-

cross other locks required in the manufacture of safes and vault doors, will be made and fitted here.

A contract has been entered into with the Canadian Fairbanks Co., Limited, of Montreal, St. John, N.B., Toronto, Winnipeg, Saskatoon, Calgary and Vancouver, whereby they will sell the entire output of the factory.

Following is a statement of the organization of the company:

Incorporated under Dominion charter, February 21st, 1910., capital $525.000.00. President, Henry J. Fuller; vice-president, A. W. Wheatley; sec-treas., C. W. Baker, C.A.; Works Manager, M. H. Pursell. Directors: Wm. McMaster, C. W. Colby, F. W. Gilman, Thornton Davidson, C. U. Carpenter, A. W. Wheatley, H. J. Fuller



Plant of Dominion Safe and Vault Co., Farnham, P. Q.

CARBORUNDUM FILE.

The Carborundum file is a solid block of carborundum, 13 inches long, 1½ inches wide, and 1½ inches thick. One end is rounded, and the other fitted with a durable wooden handle. For filing castings, or soft metals, it does the work very quickly; for touching up case hardened parts and removing the scale from the harder metals, it is very efficient. The Carborundum file removes material which would otherwise remain on the casting.

Carbonundum File.

Carborundum is one of the hardest and sharpest of abrasive materials. Every little grit or grain in the carborundum file is as hard, and as sharp as a diamond, and they cut fast, without allowing the file to fill or glaze.

In general machine shop work the carborundum file assists in quick production, consistent with good workmanship. It is made in a convenient size and shape, and of just the proper grit to be efficient in all around work. The Carborundum File is manufactured by The Carborundum Co., Niagara Falls, N. Y.

TRAVELLING MACHINE SHOP.

The value of a travelling machine shop in the railroad service can hardly be estimated. Several of them have been made use of in connection with construction work on the G.T.P. railway. Ordinarily box cars are used, equipped with lathe, drill, grindstone and sometimes a shaper. The power is furnished by 6 h.p. Fairbanks' gasoline engines, belted to a line shaft.

The advantage of having these cars in making light repairs is readily seen. Were it not possible to make repairs in this manner, hundreds of miles would have to be travelled at times to keep the construction equipment and locomotives in repair.

A similar travelling repair shop is used on the North Coast Ry., between Spokane and Seattle, Wash. This is a self propelled car in which the following equipment has been installed: one 23 in. engine lathe, one 16 in. shaper, one 1½ in. bolt cutter, one 6 in. pipe threading machine, one 22 in. vertical drill press, and one emery wheel.

The tools are driven by a 12 h.p. Fairbanks-Morse gasoline engine. The engine is also connected through a friction clutch and chain gear to the wheels, which enables the car to move under its own power at about 12 miles per hour.

NEW USES FOR BOLT HEADER.

The uses to which the bolt header can be put, are varied, judging from the articles produced on this machine, which in many cases is revolutionizing forging work. Two applications of the machine to articles previously made in a different manner, recently came under the writer's notice and are worthy of note. The new bolt header forging takes the place of a casting in one case, and of a drop-forging in the other. Both instances were observed at the Canada Foundry Co., Toronto, the idea of doing the work in this manner being due to Mr. Loach, general foreman of the machine shop.

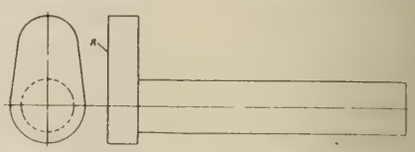


Fig. 1.—Valve Rocker for Small Pumps.

Fig. 1 shows a valve rocker arm for a small feed pump, which was previously made of cast iron, but great difficulty was experienced in obtaining castings of this size free from sand holes, with the result that they frequently failed at the shoulder of the crank arm and shaft. As feedpump building is one of the C. F. Co.'s specialties, large quantities of the rockers are required, so the idea occurred of making dies for the bolt heading machine and making them of wrought iron, which was tried and adapted. An exactly similar method to that followed in bolt heading is used. The red hot stock is first cut off the correct length by the movable cross die, which car-

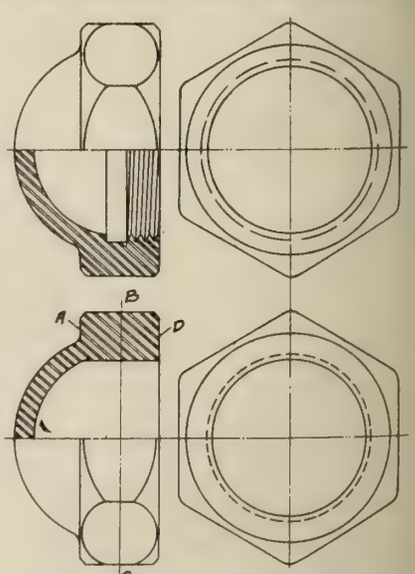

Fig. 2.—Flexible Staybolt Nuts.

ries this stock over against the stationary die. The next move is from the lengthwise die, on the end of which is a die the shape of the rocker end, and which compresses the hot stock to fill the corresponding cavity in the stationary and moving crosswise dies. The operation leaves a very slight flash along the edge A, but other than that no finishing of the non-rubbing parts is necessary, so perfect is the resulting work. Upwards of 2,000 can be turned out in a ten-hour day.

The flexible stay bolt nut shown in Fig. 2, is another piece of work slightly more complicated than the rocker, which is made in the bolt header. The upper figure shows the nut finished and the lower as it comes from the header. Formerly, as before mentioned, these were made by drop forging, which left a rough line about half way up the hexagon, where the flash is trimmed, so the hexagon surfaces were not flat.

Several special dies are required for this operation in the header. First, a flat red hot bar, which passes from side to side through the machine, has a hexagon blank punched out by a die, hollowed out to conform in shape with the rounded top of the nut. This die, bearing against the flat blank, bears only on the outer rim A, and shoves the blank up against the outer of a double die, this latter die being hexagon, of the same cross section as the finished nuts through BC. Thus the lower side of the nut bears against the annular face D. The first die bearing on A and holding the blank up against D, remains stationary, while the inner of the double die which has a rounded end, shoves the metal into the cupped end of the first die, forming the hollow of the nut. The nut is then completed, the operation being repeated for the second nut. Upwards of 3,000 can be manufactured per day by this method, and so successfully has it been in operation, that the Flannery Nut Co., a firm in the United States, specializing in this line, are making over all their machinery to make the nuts this way instead of by drop forging.

STOCKBRIDGE 16 INCH SHAPER.

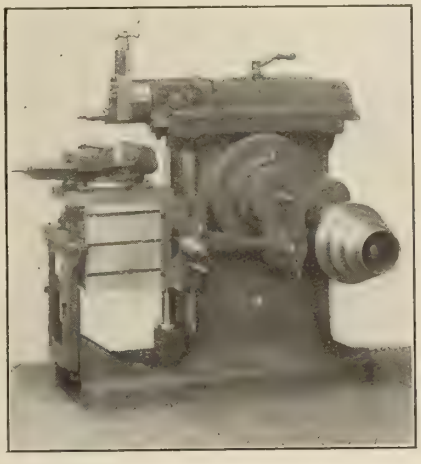
The 16 inch back geared Stockbridge patented two-piece crank shaper shown is for tool work and productive shop work. This shaper contains some new features designed to add materially to its productive capacity.

Among these is the column ways on which the cross rail slides. The method of attaching cross rail to column is new to shaper practice, though long employed in milling machine design.

With this construction one gib is cast solid with the cross rail, besides adding to stiffness, it prevents possibility of rail tipping away from the column when the adjusting gib, which is on the working side of shaper, is loosened. With this construction no time is lost in going around machine to tighten and unloosen binder bolts, everytime the cross rail is lowered or raised. By simply tightening gib binder screws, on working side of shaper, cross rail is locked to column, the construction being just the same as on a milling machine.

The rocker arm is of special design. Slide ribs are cored U-shape making an exceptionally strong construction. The slot in the rocker arm is of unusual depth and width to provide ample surface for crank block.

From the dimensions given it will be noted that this machine is particularly heavy and of unusual capacity for a 16 inch machine. It has been designed to meet all the requirements of a manufacturing tool, requiring strength and accuracy.



Stockbridge 16-in. Shaper.

Actual length of stroke, 16¾ inches. Vertical travel of table, 14¾ inches. Horizontal travel of table, 23 inches. Minimum distance of ram to table, 2½ inches. Maximum distance from ram to table, 17 inches. Feed to head, 6½ inches. Top of table, 14¾ inches x 13½ inches. Sides of table, 14¾ inches x 13¾ inches. Ram bearing in table, 30 inches. Length of ram in column, 36 inches. Width of ram in column, 10¼ inches. Poppit takes tool, ⅞ inch x 1¼ inches. Takes shaft for keyseating, 2¼ inches. Vise opens, 12 inches. Size of Vise jaws, 12 inches x 2½ inches. Tight and loose pulleys on countershaft, 14 inches x 3½ inches. Speed of countershaft for cast iron, 300 revolutions. Fin. Wt. of machine, 2,850 lbs.

These shapers are manufactured by the Stockbridge Machine Co., Worcester, Mass.

FACTORY FIRES.

The Witness, of Montreal, recently published suggestions on fighting fires in large structures, which is of excellent value. It suggests the designing of a card outlining the buildings, each building to have such a card located in a known place for the benefit of the firemen. This card would show at a glance the location of trap doors, elevator shafts, stairways, heavy materials, valuable stock, dangerous or explosive stock, safes or vaults, gas cocks, electric switches, engine or power plants, and all other information needed in fighting a fire in the building. It would enable the salvage corps to do quick and intelligent work, and would enable the fire fighters to direct their efforts more intelligently, without having to search for the information—a difficult thing to do with a structure full of stifling smoke.

The card should be revised whenever there was a change in the position of the stock or fixtures, and in any event should be corrected twice a year. Several copies of the card should be provided, one to be left at some place in the building, one to the department of building inspection and one to the factory inspector, in cases of factories. Variations of the plan could be worked out to fit different structures, but the plan has the nucleus of a valuable suggestion.

UTILIZATION OF SCRAP.

There is in Cleveland a concern that makes a business of blanking metal for other firms that do stamping. Now anybody who knows anything about the stamping business knows that there are hundreds of jobs a year which leave scrap from which many other stampings could be made if the firm happened to get the order for the smaller pieces. But it may not get such an order for months and to store the scrap from the first job until the second comes, would cost more than buying new sheets for the second. But suppose somebody could make a business that did nothing but blank, suppose somebody could go to a lot of other stamping concerns and get their blanking work? The variety of pieces for which many concerns had orders would be such that the blanking concern could often use scrap twice or three times. The Cleveland man who started the blanking business got the idea by simply asking himself, "Why cannot better use be made of scrap steel than selling for scrap?"—Silent Partner.

The great thing is to make a start, even if you start on the wrong road.

Progress is doing a little better today than we did yesterday.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

COLLINGWOOD, ONT.—An agreement satisfactory to the Board of Trade has been submitted by representatives of the New Iron & Steel Co. which proposes to establish works for the manufacture of wrought iron directly from the ore by a new process. The agreement must next be adopted by the town council and after that ratified and financially provided for by the ratepayers.

BRANTFORD.—Brantford city council has granted fixed assessments for a term of ten years to the Ham and Nott, Crown Electric, and Brantford Emery Wheel Co.

OTTAWA.—The Ottawa Car Co. secured permit for factory, Albert Street, $10,000.

PARRY SOUND.—The C.N.R. will establish a repair plant and shops at Parry Sound.

AMHERST, N.S.—The carriage factory of S. Fillmore, Southampton, 20 miles from here, was destroyed by fire on the 11th inst. Estimated loss $35,000.

OTTAWA.—Publicity Commissioner, H. W. Baker, announces that three industries are about to locate in Ottawa. There will be an automobile factory, a structural steel works, and a factory for the manufacture of fibre boards out of sawmill waste.

OSHAWA.—Steam Fittings, Ltd., have under construction a new shipping room 180 x 250 ft. The old shipping room will be used as a tapping room.

LONDON.—Geo. White & Sons are equipping their new shops complete with Chapman double ball bearings.

TORONTO.—The Chapman Double Ball Bearing Co. have secured an order for 369 of 2 15-16 inch. double ball bearings for the N.T.R. shops at Transcona near Winnipeg. The shipment is to be made in December.

MONTREAL.—A report has been current in one or two trade newspaper that Geo. Anderson & Co., manufacturers of stone cutting machinery, Carnoustie, Scotland, are about to erect a factory in Montreal. Mr. Clark, their Canadian manager, speaking to Canadian Machinery stated that the rumor was news to him. The firm already have a small plant there and it is true are contemplating the erection of a larger factory in Canada, but Mr. Clark states that they will undoubtedly locate in some more Western point such as Winnipeg or Port Arthur.

WELLAND.—The Canadian-Billings & Spencer Co. intend enlarging their machine shop at an early date.

WINDSOR.—The Penberthy Injector Co., Detroit, is preparing to build a large addition to its Windsor plant.

MONTREAL.—It has been stated to Canadian Machinery by a reputable manufacturer, of Montreal, that there is a good opening in that city for a manufacturer of dies for punching brass, metal, etc. He claims that a lot of this business goes over to die manufacturers in the United States from machinists who have not the facilities for making satisfactory dies for their own use.

HAMILTON.—A deal for the merging of the Baynes Carriage Co., this city, the American Road Machines Co., of Canada, located at Goderich, and a group of Detroit automobile men was completed recently. The merger will be known as the Acme Motor, Carriage and Machinery Co., capitalized at $1,000,000. The chief business of the company will be to manufacture autos and the present site of the Baynes Carriage Co. is to be utilized for the erection of a large factory. It is understood that the plant at Goderich will be abandoned.

PETERBORO.—The Peterboro Lock Mfg. Co. has been granted a fixed assessment of $25,000 for ten years. The company is spending $40,000 in improvements, and 40 additional employes have been added this year.

SYDNEY, N.S.—The Dominion Iron & Steel Corporation are calling for tenders for the construction of the following additions to their plant:—Boiler house, machine shops, foundry, warehouse, oil house, carpenter shop, repair shop and finishing mill. Cement, brick and structural steel are the materials to be used.

WINNIPEG.—The Canada Metal Co. will establish a plant in this city. They have purchased the present premises of the Ontario Wind Engine & Pump Co. for $26,000. The latter Co. will erect a new building.

VICTORIA, B.C.—Commencing Nov. 7th examinations for the position of inspector of steam boilers and machinery will be held at the parliament buildings this city.

SASKATOON.—The J. I. Case Co., of Racine, Wis., will build a large warehouse in Saskatoon this fall.

WINNIPEG.—The Otis Fensom Elevator Co. proposes to erect a machine shop in Winnipeg for manufacturing and adjusting elevator parts.

HAMILTON.—The Dowsell Co., Hamilton, which manufactures wringers, washing machines and kindred articles, has changed its name to the Cummer-Dowsell Co. and increased its capital stock from $75,000 to $250,000. Extensions of its plant are projected.

DUNDAS, ONT.—The Chapman Engine & Mfg. Co. has received incorporation under Ontario laws, the capital stock being $200,000, and the head office being at Dundas, Ont. It will manufacture engines and machinery.

TROUT MILLS, ONT.—The reduction and smelting works at Trout Mills, Ont., which have been closed down of late, are shortly to become active under new auspices.

TORONTO.—The Toronto yards of the Canadian Shipbuilding Co. have been taken over by the John Inglis Co., which will make use of them in connection with its machine and engine works in their vicinity.

TORONTO.—The Steel & Radiation Co., of Canada, with a capital stock of $5,000,000, is announced as the latest Canadian merger in the steel and iron group. Two Toronto companies are named—the King Radiator Co. and the Expanded Metal & Fireproofing Co.—among those to be embraced. The works of these two concerns, in which nearly 300 men are employed, will be enlarged.

MONTREAL.—The Quebec government will give a grant of $15,000 towards the construction of an iron bridge over the Chaudiere river to cost $33,000.

MEDICINE HAT, ALTA.—The McDermid Co., contractors, of Winnipeg, have erected a new machine shop adjoining the C.P.R. roundhouse. The building, which is 82 ft. x 70 ft., is of brick on a concrete foundation and will be equipped with the most up-to-date machinery.

MEDICINE HAT.—E. C. Darche and W. R. Penland are conducting the garage and repair shop formerly owned by G. M. Johnson. Besides the automobile livery and repair shop they will be agents for the leading cars, featuring the McLaughlin-Buick, E.M.F., and Winton makes.

WINNIPEG.—Sealed tenders have been asked for by the Transcontinental Railway Commissioners at Ottawa, for the centrifugal pump and motors required for the sewage pump house at the Winnipeg shops.

WINNIPEG.—The roof, most of the machinery and a considerable part of the building of the Western Iron Works were damaged by fire recently.

LONDON.—The name of the Scott Machine Co. has been changed to the London Gas Power Co.

TORONTO.—Edward Gurney, president of the Gurney Foundry Co., Toronto, tendered a complimentary dinner to W. H. Carrick, president and general manager of the Hamilton Stove & Heater Co., Hamilton, at the National Club, Toronto, on Friday, Oct. 7, in appreciation of his 38 years' service with the Gurney Foundry Co.

LAKE SUPERIOR JUNCTION, ONT.—Sealed tenders have been asked for by the Transcontimental Railway Commissioners at Ottawa, for machinery required for a roundhouse at Lake Superior Junction.

REGINA.—The Burridge Cooper Co., of Winnipeg, dealers in gasoline engines, pulleys, shafting and machinery of all kinds, will open a Saskatchewan agency in Regina where they have purchased warehouses.

HALIFAX.—The Silliker Car Works have been sold to a group of financial men in Halifax, Amherst and St. John, headed by J. R. Douglas and J. R. Lamy. The industry will be carried on as formerly with the addition of a steel underframe department.

GUELPH.—The Louden Machinery Co. were awarded the gold medal at St. John, N.B., for the best exhibit of farm hardware.

WOODSTOCK.—The Tobin Arms Mfg. Co. has purchased the plant, patents, tools, materials, manufactured products and other assets of the Caldwell Bit and Tool Co., Port Rowan, Ont. Extensions are being made by the Tobin Co. in their present factory to accommodate the new plant.

MONTREAL.—Nathaniel Curry, president of the Canada Car and Foundry Co., has been elected to the directorate of the Travelers' Life Assurance Co., of Canada. Mr. Curry is also a director of the Bank of Nova Scotia.

Electrical Notes.

QUEBEC.—The Shawinigan Water & Power Co., at Shawinigan Falls, on the St. Maurice River, Quebec, is about to increase its power producing capacity by 75,000 h.p. This involves the cutting of a section out of the side of the intake canal 1,000 ft. long, and the erecting of a concrete and steel bulkhead at an angle of 60 degrees to the existing bulkhead. From this extension five steel penstocks, each having a capacity of 15,000 h.p., will be carried to the power house to be erected on the lower level, to which there will be a head of 150 ft. The power house is to contain five units, consisting of turbine water wheels directly connected to an electrical generator.

TORONTO.—Tenders are invited for the purchase of the plant, raw material, real estate, etc., of the Reeder Electrical & Mfg. Co., 15 Saunder Avenue.

LONDON.—Mackenzie & Mann are stated, on good authority, to be taking steps for the acquiring of the London Street Ry., and also the London & Lake Erie Traction Co.

Quesnel, B.C.—Lacal interests are agitating for an electric light system and power plant.

WINNIPEG.—Plans are being prepared for the central power sub-station. The building will cost about $60,000 and the work will be let this fall. It is to be completed by June 1911.

MONTREAL.—The acceptance of a 10-year contract with the Montreal Light, Heat & Power Co. for street lighting has been recommended to the city council.

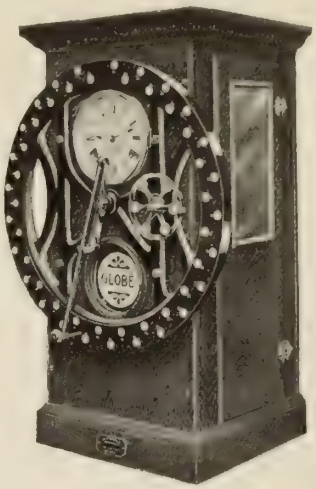
"GLOBE" TIME RECORDERS

are made in Canada by expert mechanics. They are accurate, simple in construction, strong, and of good chaste appearance. They will record with absolute accuracy the arrival and departure of your employees (TO THE MINUTE), making you pay for what you get and no more. All lates and short time marked in red, regular time in green. The small cut at the top illustrates the WEEKLY MODEL, an entirely automatic recorder requiring no attention whatever during the week-as all changes, etc., occur automatically (DONE BY CLOCK WORK). The DAILY MODEL is shown in the cut at the bottom. This recorder is being used mostly in large shops, etc., where a large number of hands are employed. With the "GLOBE" TIME RECORDERS only one operation is required as against five with most others.



Inspection may be made through the glass sides of the case, but tampering with records is impossible, no danger of having soiled, torn or lost records when same are unfavorable, as is the case with all CARD CLOCKS. We are now manufacturing over 224 DIFFERENT TIME RECORDING CLOCKS, and are in a position to meet the requirements of any business. Write us about your needs and let us suggest what will best meet with your requirements. WE SOLICIT YOUR ENQUIRY.

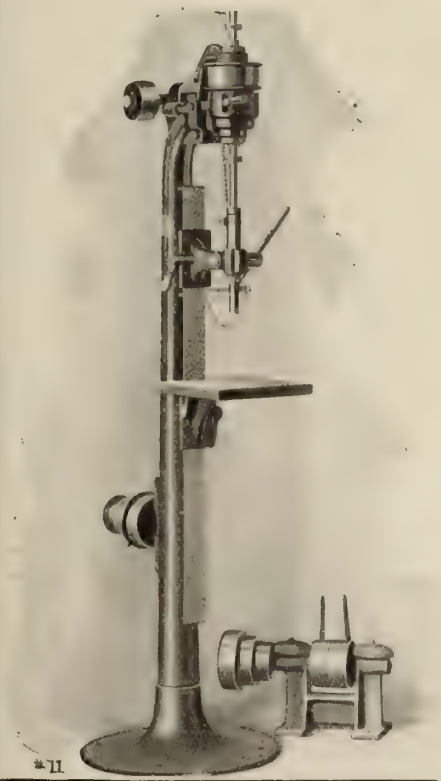
Barr Combined Drilling and Tapping Machines Do Save Money



No. 11

It would pay you to sell your separate drilling and tapping machines and get a Barr Combined Machine that will do the work of both better and quicker.

A Barr Combined Drilling and Tapping Machine saves time, labor and floor space

No. 51 weighs 550 pounds, drills up to ¾-inch holes and taps up to ½-inch holes in cast iron.

No. 11 weighs 275 pounds, drills up to 9-16 inch holes, and taps up to 7-16 inch holes in cast iron.

We can give you power feed, lever feed, and tappers in any combination to suit your requirements on machines having from two to six and seven spindles.

AGENT WANTED

FOR WESTERN CANADA

An Energetic Selling Agent can make good money selling Barr Machines in the Western Ontario and Western Canada Territory. Hundreds of shops **should** be using these machines and **will** use them when shown their absolute supremacy.

Write me for full particulars.

MONTREAL.—The proposed merger of the Montreal Light, Heat & Power Co. and the street railway system is expected to effect economies in management and a concentration of interest which will be beneficial to the general public.

DUNSMUIR, B.C.—The Canadian Collieries is making preliminary surveys near Comox, B.C., for a large hydro-electric plant on the Puntledge river. It is estimated that 50,000 horsepower can be developed, which will be used to furnish power for a system of compressed air haulage in the mines for operating machinery in various plants and for operating a 14-mile railroad connecting the Comox coal fields with Union bay.

PRINCE ALBERT.—C. H. Mitchell, Toronto, has been authorized by the town to prepare plans for city power developments at Lacelle Falls. It is planned to develop 10,000 horsepower at a cost of $1,000,000.

TORONTO.—The tenders of Chapman & Walker Co., storage batteries, $2,870; Canadian General Electric Co., transformers, $15,800; Lancashire Dynamo & Motor Co., motor generator sets, $2,262, were accepted by the Board of Control for the Hydro Electric department.

KINGSTON.—The Seymour Power Co. offer to supply Kingston with electric energy at $25 per horse power.

GALT.—The municipality has asked for tenders for debentures to cover the cost of a plant to distribute Hydro-Electric power in the town; the cost is $66,000.

BROCKVILLE.—Construction work for power plants on the American side of the St. Lawrence river is to be commenced and it is expected the Canadian government will investigate to ascertain if the flow and levels of the river on the Canadian side will be materially affected.

CHESTERVILLE, ONT.—A by-law has been passed providing for the establishment of an electric light system.

THE CLEVELAND WIRE SPRING CO.
Cleveland, Ohio.

VICTORIA, B.C.—The immense electrical generating plant at Jordan River is being completed by the Vancouver Island Power Co. Of a total expenditure of $600,000 to date only a small proportion has been for machinery.

COLLINGWOOD.—The material for an up to date power house is now at the yards of the Collingwood Shipbuilding Co. The plant throughout is run by electic energy and the new equipment will provide power to thrice the present capacity. A producer gas plant may be installed.

NIAGARA FALLS, ONT.—It is reported that the Symmes Construction Co., of this place, will shortly commence work on a power plant at Sandy Falls, Myosoni river, in the Porcupine district, the plant to develop from 6,000 to 8,000 h.p.

COMOX, B.C.—Surveys are being completed for the big power plant to be erected by the Canadian Collieries on the Puntledge river in the centre of the Comox coal field. About a year will be occupied in completing the work and the cost will be in the neighborhood of $1,000,000.

VANCOUVER.—Law & Von Dohlen are organizing a company to manufacture the Grey Automatic Electric Water Heater. The capital stock is $150,000. Other electric utilities will also be manufactured.

WATROUS, SASK.—The municipality proposes to instal an electric lighting system and a car line.

Municipal Undertakings.

MOOSE JAW, SASK.—On Nov. 5th, the city offers for sale by auction at the power house a second hand well-boring plant. Terms cash, subject to a reserve bid.

WINNIPEG.—The hospital committee will submit two by-laws at the civic elections, one for $400,000 for the General Hospital, and one for $400,000 for the Municipal Hospital.

MONTMAGNY, QUE.—Tenders will be received until the 1st of December by the municipality for the erection of an iron bridge over the Riviere du Sud.

MONTREAL.—Plans for the new power station at the drop off power are being prepared. This new plant will generate an extra amount of power equal to that now furnished the city, viz., 3,000 h.p.

MONTREAL.—The contract for the new aqueduct intake at Point St. Charles has been awarded by the Board of Control, to Lemoine & Son, and L. A. Desy; the price is $155,500. The work will be rushed this season.

MONTREAL.—Plans and specifications for the remodelling of the emergency hospital are being prepared, same to include new drainage, plumbing and heating.

PRINCE ALBERT, SASK.—Plans are being prepared and contracts will be let next May for the erection of a 10,000 h.p. plant at Leslie Falls. Cost to be $1,000,000.

WINNIPEG.—The tender of the Canada Iron Corporation for the supply of 10,000 feet of six-inch water main was accepted by the board of control. The price is $57.50 per ton, which is much lower than that quoted in the next lowest tender.

PRINCE ALBERT.—The tenders for the filtration plant were as follows: One at $14,000, anothes at $11,000, and Wm. Knox's tender at $6,985 (accepted.)

BIGGAR, SASK.—$15,000 will be expended on waterworks and fire protection.

CALGARY.—Tenders will be received by W. D. Spence, city clerk, up to November 7th, for the erection of steel bridges, one across the Elbow river at 12th Avenue and the other across the Elbow river at Second Street East. Also for supplying to the city rails, cars, equipment and overhead material for extensions to the municipal street railways.

NEW LISKEARD, ONT.—A waterworks extension by-law was carried here last month.

NANAIMO, B.C.—Sewers costing about $70,000 will be installed by the municipality.

ESTABLISH A MODERN TAX-FREE ALCOHOL DISTILLERY
We have a Good Proposition for Motor Mfrs.

Having exported our Stills in large amounts for many years, and already having several far Eastern agencies we are now open to establish additional agencies and invite correspondence to that end, looking after our old customers and prospective buyers by special successful demonstrative methods for making Alcohol, Apple Jack, Aguardiente, Mescal, Teguila, Peach Brandy, Whiskey, etc. Most modern and simple. All sizes, 5 to 500 gallons daily capacity distilling apparatus.

ARE YOU LOOKING FOR information relating to INDUSTRIAL or DENATURED ALCOHOL DISTILLING APPARATUS and the amazing possibilities of the utilization of waste farm products and wood waste by superheated steam distillation, the distilling apparatus as used by us; the principle involved, also the methods of chemical control and disposal of the product and by-products? We will gladly say to you:

Denatured Alcohol to-day is of the greatest untold benefit to the American motor people. It opens an absolutely new field for investment for progressive paper pulp and chemical fibre mills, paint, varnish, soap and candle makers, gardeners, farms and garbage plants, saw-mills, lumbermen and canneries. The Automobiles and the Navies of the world clamor for this new tax-free cheaper industrial alcohol. May we expect some encouragement from the more patrotic pioneers for this new American Industry? The field is new and profitable, and you can practically have the business your own way by starting now. We are makers of an apparatus for the production of this denatured or industrial alcohol; we build and install plants—large or small. The initial cost of a plant is small; the financial risk—if any—is trifling. The equipment is such that it can be added to at any time without disturbing the original installation. Address

JOSEPH DIXON CRUCIBLE COMPANY
JERSEY CITY, ... N.J., U.S.A.

GLEICHEN, ALTA.—R. B. Owens, the provincial health officer, has been consulted regarding a new waterworks system.

OAKVILLE, ONT.—By-laws have been passed issuing debentures for $20,000 with which to extend the present waterworks system.

OTTAWA.—It has been recommended that the city purchase an incinerator plant of the Heenan-Froude type. The estimated cost is $34,000.

GUELPH.—The money and the franchise by-laws in connection with the People's Railway were carried on Sept. 26th. The contract calls for completion of the entire system by July 1912 when radial connection will be maintained between Guelph, Berlin, Elora, Fergus, Arthur, Hespeler and Puslinch Lake.

BRANDON.—The work of laying the mains for the new steam heating plant at the Electric Light Co.'s central station is completed as prescribed in the contract. Connecting the service to the different buildings is being rushed; there are 65 blocks to connect with the heating plant. Everything has worked perfectly and the system commenced operation last month.

FORT WILLIAM.—Among a large number of public improvements submitted to the vote of the ratepayers on Sept. 21st, the following will be carried out:—Extension of waterworks, improving fire halls and cemetery, erecting a new police station, building a swimming pool and improving the streets. Proposed improvements to the city hall and the giving of a gas franchise were voted down.

PENTICTON, B.C.—Having purchased the irrigation system from the Penticton Water Supply Co., Penticton will install a complete domestic water, electric light and power system. The municipal engineer has been requested to prepare a preliminary report upon the cost of installation.

ROLEAU, SASK.—A loan of $45,000, with which to install a water works system, is being negotiated by the municipality.

NORTH BUXTON, ONT.—The municipality is in the market for a new pump house, a wheel, a boiler and an engine.

DAUPHIN, MAN.—Work has been commenced on the contract for 13 miles of waterworks mains and 13 miles of sewers in this town. The work is to be completed within two years at a cost of $350,000. J. J. Flanagan, of Fort William, is the contractor.

General Manufacturing News.

HAMILTON.—Charles Reed & Sons, manufacturers of paper boxes on a large scale in Hamilton, Ont., have bought a site in Winnipeg. They will build a warehouse there next year at a proposed cost of $300,000.

QUEBEC.—It is expected that Dominion Government will have constructed at the Davies dock at Quebec this winter a vessel to be used as a transport between Quebec and Levis in connection with the N.T.R. This is to serve in the interim between the completion of the railroad and the completion of the bridge. The cost is to be between $300,000 and $400,000.

KINGSTON.—Coward's Boat Works have been very busy this season, 308 boats having been built there since the beginning of the year. Contracts have just been secured for 20 family launches for a Toronto engine company and for several boats for private parties.

DUNCAN, B.C.—North Cowichan will install an electric plant, the necessary by-law having been carried. The electricity will be generated by steam power.

BERLIN.—Baetz Bros. & Co. have commenced building their new furniture factory. The Wonder Furniture Co. are erecting a large addition to their plant.

THREE RIVERS.—The contract for the pulp mill of the Union Bag & Paper Co., at Cap de la Magdaleine, Three Rivers, P.Q., Canada, has been awarded to Frank B. Gilbreth, No. 60 Broadway, New York. George F. Hardy, No. 309 Broadway, New York, is the engineer.

SIMCOE, ONT.—The Penman Mfg. Company, whose product is knitted goods, proposes to add to its existing Canadian factories one in Simcoe, Ont.

When writing advertisers kindly mention having seen the advertisement in this paper.

LONDON.—J. K. and D. H. McDermid, of this city, have purchased the plant of the C. R. Somerville Paper Box Co.

BRANTFORD.—The Ham & Nott Co., of this city, will take over the Niagara Bedstead Co., of Buffalo, and locate it in the new building to be erected near their present factory.

FORT WILLIAM.—The Seaman-Kent Co., manufacturers of hardwood flooring and finishings, commenced operations in their new plant here on Sept. 23rd.

GODERICH, ONT.—The building, plant and stock of the Goderich Organ Co. was destroyed by fire. Estimated loss, $100,000. Local manager, A. Saunders. It is stated the mill will be rebuilt at once.

NANAIMO, B.C.—The Red Cliff Brick and Tile Co. has been incorporated for the purpose of erecting a brick making plant with a capacity of 40,000 daily.

EASTERN ONTARIO.—The Hawthorne Silver & Iron Mines, an American company, will develop the iron ore deposits in the counties of Lanark and Frontenac.

CHICOUTIMI, P.Q.—The Canada Paper and Pulp Co., recently granted a federal charter, propose establishing a giant plant for the manufacture of a paper, pulp and carbide on the Saguenay river, near Lake St. John. The opportunities for obtaining water power at that point are held to be excellent.

NELSON, B.C.—The establishment of a zinc smelter is being considered. A representative of French's Complex Ore Reduction Co. was here and formed a favorable opinion of the location.

SYDNEY.—Following a conference with the president and secretary of the Dominion Tar and Chemical Co., manager Walsh announced that new machinery will be installed to handle the increased output. The present force of fifty men will be augmented fifty per cent.

ST. JOHN, N.B.—The Wilson Box Co. have converted the plant of the Dunn Pork Packing Co., which they purchased, into a box factory and will employ fifty men. The Box Co. have also bought the Crawford sawmill at Westfield and will operate it in connection with their St. John factory. The officials of this new company are:—T. H. Estabrooks, Pres.; Stanley E. Elkin, vice-pres.; W. I. Fenton and John Galey, directors; Alex. Wilson, managing director.

PORT ARTHUR.—The Port Arthur Wagon Co., a new concern, has taken over the Speight Wagon Co., of Markham, which will, when the new factory is erected at Port Arthur, be removed there.

Planing Mill News.

VICTORIA, B.C.—Iowa people who hold a timber tract at the mouth of the Skeena river may build a mill. To report on the situation, A. C. Voss, of Cedar Rapids, made a trip recently to look over the ground.

EVANS CREEK, B.C.—Mr. G. C. Poulin, of St. Johns, Que., is opening the lumber mill at Evans Creek, B.C.

ESPRIT, QUE.—Guertin & Fils, saw mill proprietors, Grand St., Esprit, Que., are reported to have assigned.

PARRSBORO, N.S.—O. J. O'Brien, lumber manufacturer, of Noel, N.S., has sold his stationary mill and about 1,200 acres of timber lands at Noel, to McDonald Bros., of Parrsboro.

ORFORD, QUE.—Fire at the Doughterty Mill, Orford, Que., recently resulted in the total destruction of the mill, which was owned by the Fletcher Lumber Co. The loss will be over $10,000.

STRATHROY, ONT.—The Strathroy Furniture Co. are erecting a drying kiln. The new building will have a capacity for drying 500,000 feet of lumber.

NORTH BAY.—The council received a communication from J. Darrell, chairman of the Industrial Committee of the Board of Trade, asking the council to take action in regard to the proposition of D. A. Leach, of Sunbridge, who of-

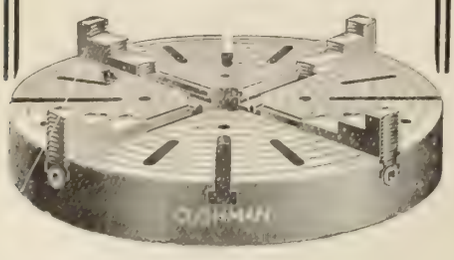
The Cushman Chuck Co.
Hartford, Conn., U.S.A.
Established 1862



'ers to establish veneer plant, basket factory, sawmill, stave and hoop mill. Estimated cost, about $25,000.

NEEPAWA, MAN.—A match factory is to be erected here, to employ 25 hands. Construction will begin at once. Business men of Neepawa have subscribed $40,000 of the capital. The names of the promoters have not yet been made public.

SOLDEN, B.C.—The wreckage of the Columbia River Lumber Company's mill at Golden, B.C., which was destroyed by fire in July last, has been cleared away and rebuilding commenced. It is expected that the new mill—which is to be second to none in the mountain country—will be ready to commence cutting when the season opens next spring.

CLAYBURN, B.C.—The Maple Grove Lumber Company's saw mill near Clayburn, B.C., has been destroyed by fire, the plant being a total loss. The loss will be about $10,000, with very little insurance. The capacity of the mill was about 10,000 feet.

PRINCE ALBERT.—The Shell River Lumber Co. is building a mill at the west end of Prince Albert, Sask. It will have a capacity of between 30,000 and 40,000 ft. per day.

NEW WESTMINSTER, B.C.—The Lincoln Sawmill Co., of Langley Prairie, has secured one of the largest lumber cutting contracts ever given out in the province. It has undertaken to cut and dress 30,000,000 feet of lumber for Michigan capitalists, owners of valuable timber land.

ROCHE POINT, B.C.—The Imperial Car, Shipbuilding and Drydock Co. will erect and operate a sawmill here with a capacity of 100,000 feet per day.

CANFORD, B.C.—A sawmill with a daily capacity of 40,000 feet, and modern machinery is to be erected here; estimated cost $25,000.

VICTORIA, B.C.—D. E. Smith, manager Jordan River Lumber Co., has announced the intention of the company to erect a sawmill in the early spring. A site has not yet been chosen.

NEW LISKEARD, ONT.—C. B. Matthews will build a mill. Recently a by-law to grant Mr. Matthews assistance was defeated.

MASSET, B.C.—Negotiations for the erection of a mill here are well under way. Victoria capital is identified with his enterprise.

EASTVIEW, ONT.—W. Leger will enlarge the planing mill he recently purchased here.

TRENTON.—Gill & Fortune are erecting a new planing mill in connection with their large lumber yards. A building 35 x 75 ft. is completed and machinery installed. All pulleys and shafting are underground, leaving the full floor space for machinery and work.

Building Notes.

BRANTFORD, ONT.—The Verity Plow Co., have let contracts for additions to its works costing $60,000. The Penman Mfg. Co., of the same city, will commence shortly upon additions to its works to cost $80,000. It will employ 400 additional hands.

TORONTO, ONT.—The Norcross Bros. Co. has been awarded the contract for the construction of the head office building of the Bank of Toronto. The cost will be about $1,000,000.

LEVIS, QUE.—Plans have been filed with the Public Works Department of the Dominion Government for the $4,000,000 dry dock and ship repairing plant here.

WINNIPEG, MAN.—Wood, Vallance & Co., wholesale hardware dealers, Hamilton, have purchased a site for a building in Winnipeg, the price being $115,000.

SASKATOON, SASK.—The new warehouse of the Canadian Fairbanks Co. is almost ready for use. Plans are being prepared for a new 4 storey building 50 x 90 ft. to house Fairbanks-Morse manufactured goods and to include a machine shop for the repair of motors and machinery.

REGINA, SASK.—The Sawyer-Massey Co. is establishing western headquarters in Regina and work on their $40,000 warehouse has been commenced. The concrete work is to be finished this fall and construction will proceed early next spring.

REGINA, SASK.—Plans for the erection of two large buildings, in connection with the Saskatchewan Methodist College, to cost $250,000, have been approved.

HAMILTON, ONT.—The Canadian Westinghouse Co. will build an $18,000 addition to their foundry.

The Canada Steel Co. will locate their plant on the west side of Sherman Ave., at an estimated expenditure of $400,000.

HAMILTON, ONT.—A. Hewitt, of Grimsby, is said to be contemplating the erection of a large modern hotel at Main and Hughson Streets.

VANCOUVER.—The B.C. Telephone Co. will erect a $50,000 branch exchange for the accommodation of business in Mt. Pleasant district.

VICTORIA, B.C.—A new building to supplement the Royal Jubilee Hospital is being considered.

SASKATOON.—The Gray Carriage Mfg. Co., and the Campbell Fanning Mill Co., of Chatham, Ont., will erect one of the largest and most up-to-date distributing warehouses in Western Canada. The cost will be about $50,000.

NELSON, B.C.—$150,000 is the price at which W. Sharp & Son secured the contract for the erection of a C.P.R. summer hotel at Balfour, Kootenay Lake, 20 miles from Nelson.

WOODSTOCK, ONT.—The Linderman Dovetail Glue Jointing Co., and the Fibreboard Folding Package Co., are to erect buildings in Woodstock.

New Companies.

The Western Steel & Iron Co., Winnipeg; capital, $300,000. Incorporated by leading business men of Winnipeg.

Clinton Motor Car Co., Clinton, Ont.; same directorate as Canadian Flax Mills, but interest taken by Toronto capitalists.

Joliette Steel and Iron Foundry, Joliette, Que., capital, $250,000; to manufacture steel, iron, brass and aluminum products. Incorporators, S. Vessot, A. Durand and E. Hebert, all of Joliette. 6

National-Acme Mfg. Co.

The National-Acme Mfg. Co., Cleveland, Ohio, has commenced the erection of its new plant in Montreal, and has about completed the building of a four-storey addition to its Cleveland plant, 40 x 185 ft. This latter will be used for store and stock rooms, case hardening department, etc., and will enable the company to make considerable rearrangement of its present plant.

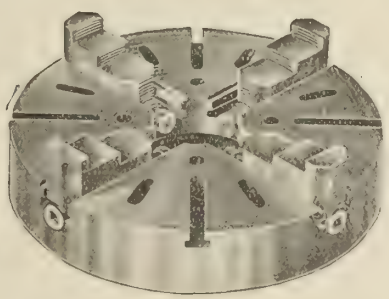
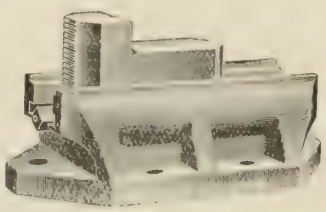
STRENGTH AND POWER



21-INCH STEEL CHUCK

The S. E. Horton Machine Co.'s New Four Jaw Independent Chuck is not only the strongest, the most powerful, but the most durable lathe chuck of its class. Extra strong screws, large bearing surfaces, wider jaws and a careful distribution of metal are features of the improved design which count largely in effective service. We make a full list of sizes, and for exceptionally severe conditions steel castings can be furnished for the larger chucks.



Our New Pattern Face Plate Jaws have a wider range and better attachment facilities than any others.

WRITE FOR THE SPECIAL FOLDER.

The S. E. Horton Machine Company
WINDSOR LOCKS, CONN.
(NOT THE E. HORTON & SON CO.)

[illegible] equipment will be [illegible]. The company reports that it is still [illegible] and that its plant is running at full capacity. They report that prospects for business are very bright, a [illegible] of their automatics having been [illegible].

Norton Company's Canadian Plant.

The Norton Co., Worcester, Mass., manufacturers of grinding wheels made from aluminum [illegible] opened a small factory at Chippewa, for the manufacture of crystals of silicon abrasives. The plant will probably be the nucleus of a Canadian industry to supply the Canadian trade. The main plant is at Worcester, Mass., where [illegible] stones, oil stones, sharpening stones in [illegible], glass cutting wheels, razor hones, [illegible] are made. Besides the abrasive plant the Norton Co. have operated an electric furnace at Niagara Falls, N.Y., the material being shipped [illegible] there to Niagara. In keeping with the growth of the company and the establishment of a small Canadian plant, it is of interest to note that a European plant has been put into [illegible] at Wesseling, near Cologne, Germany.

Nova Scotia Steel Co. Absorb Harris Forge Co.

The Harris Forge Co., Ltd., which has carried on a large business at New Glasgow, N.S., has been absorbed by the Nova Scotia Steel & Coal Co., New Glasgow.

C. P. R. London Shops.

The C.P.R. has purchased a great deal of property in the north end of London. The houses are being removed and contractors are already at work on the many improvements.

To Manufacture Automobiles in Hamilton.

Cabinet Commissioner Mulliss announces that another big industry has been secured for Hamilton. It is the Acme Motor, Carriage & Machine Co., and will be capitalized at $1,000,000 to manufacture automobiles, taxicabs, carriages and road machinery. The new concern is a merger of the Baynes Carriage Co., of Hamilton, and the American Good Roads Machinery Co., of Goderich, and some Detroit automobile men, and the plant of the Baynes Co. will be greatly enlarged and the products made in Hamilton. They will specialize on a car that will be known as the Canada 30. The work of building the additions to the factory will be gone on with at once. The Baynes works will be extended in order that the bodies may be built in the factory. The new concern will employ about 150 men, and the proposed directors are: S. Jones Phillips, Kennet Square, Pa.; E. W. Wood and R. F. Mantill, of Goderich, representing the American Road Machinery Co.; M. W. Best and D. P. Perry, Detroit, representing the automobile interests, and W. Southam, H. N. Kittson and P. D. Crerar, K.C., representing the Baynes Carriage Co.

New Industry for Medicine Hat.

The Alberta Iron Rolling Mills Co. has been organized at Calgary with the intention of supplying the Alberta trade. The capitalization is $[illegible] of which $[illegible] will be spent in erecting buildings, $10,000 in machinery and $80,000 in plant.

$10,000,000 Pulp Mill at Soo.

The prospects are bright for the establishment at Sault Ste. Marie of a ten million dollar pulp mill by a syndicate of American newspaper proprietors, including owners in Chicago and San Francisco. The Hearst interests, it is understood, are among the chief backers, and they may make a deal for the present mill of the Lake Superior Corporation.

New M. S. R. Shops.

Work has been started on the new construction and repair shop for the Montreal Street Railway Co. The works will be situated at Youville, north of the Villeray district. They are to be used for the construction and repair of street cars. The new works will be of large dimensions, the roof space alone of the main building having an extent of 115,000 square feet, in addition to which there are other erections with several miles of tracks.

The stores department situated to the west of the main building, will measure 148 feet by 55 feet, and the fact of its being cut off from the main part of the building will be of inestimable advantage in the case of fire.

The shop's outfit will include every up-to-date appliance and all modern equipment. The buildings will be of Laprairie brick and Montreal limestone. The general lines to be followed in the construction are plain, solid and fire proof.

Duponts Invade Canada.

VANCOUVER.—A $10,000,000 merger of all the powder companies in Canada, with the exception of the Giant Powder Company, branch factory at Telegraph Bay, has just been effected. This deal marks the advent of the Dupont interests into Canada. It is understood that the interests of the Nobels and the Duponts in the holding company will be equal.

Duckworth-Boyer Co.

Aurelien Boyer, vice-president of the Duckworth-Boyer Engineering & Inspection Co., Montreal, has been named a director of l'Ecole Polytechnique, the applied science branch of Laval University. Mr. Boyer, whose grandfather, by the way, was the first superintendent of Education for Lower Canada, has always taken a good deal of interest in the cause of education. He will represent on the Board the graduates of the above named school, which shows the esteem in which this distinguished member of the profession is held by his confreres. It is interesting to note that the Duckworth-Boyer Engineering & Inspection Co., are the Inspecting Engineers for the steel work entering into the construction of such large buildings as the New Windsor Street Station Extension, the Place Viger Station Extension, the Dominion Express Co.'s New Building in Montreal and the New Bank of Montreal Building in Winnipeg, Man.

Manufacturing Tool Steel.

The Canada Forge Co., Welland, manufacturers of iron and steel forgings, announce that they have taken up the manufacture of tool steel in addition to their regular line of forgings. High grade tool steel for every purpose will be produced by them.

Western Canada's Commercial Development.

Canada, commercially considered, is making rapid progress. Roughly speaking, the East manufactures and the West consumes. The farms of Western Canada are producing a gross income of $250,000,000 annually and the men who make the farms produce this large sum of money, are free spenders of their income. They buy heavily of all lines of manufactured goods from farm machinery down to wearing apparel and nearly all of these goods are brought in from Eastern Canada, Great Britain and the United States. This producing and purchasing power of the West was strongly impressed upon the two hundred manufacturers from Eastern Canada who recently passed through the western provinces on their way to the annual convention of the Manufacturers' Association at the Coast. They saw the great progress the west is making and the great opportunities the country offers for large increase of a traffic which is already enormous and highly profitable.

In the West, cities and towns are bidding for new enterprises by the establishment of municipal leagues and bureaus through which advertising campaigns are being vigorously pursued. Winnipeg, Manitoba, is an example of what can be accomplished by united efforts of this nature. Four years ago that city formed an official institution composed of representatives of several business bodies, headed by the city council. Board of Trade, Bankers' Association, etc., entitled the Winnipeg Development and Industrial Bureau. It is a perfect organization, that now has representatives of sixteen business bodies on its Board of Directors, having 8,700 affiliated members, 425 of whom are business firms who contribute to its financial requirements. These firms pay annual membership fees of $20 and every year they appoint a delegation to wait upon the city council and ask for a sum they deem to be essential outside of members' contributions, to carry on the work of advertising for the current year. They get it too. In 1906, the city grant was $1,500; in 1907, it $3,000; in 1908, $6,000; in 1909, $10,000, and in 1910, $25,000.

In welcoming the Canadian Manufacturers' Association to Winnipeg on September 13th, Mayor W. S. Evans in his remarks, directed attention to the growing importance of Winnipeg as a manufacturing city. Mayor Evans pointed out that in 1900 the value of the manufactures produced in Winnipeg was $8,686,000. In 1905, it reached $18,983,248 and, according to a census taken by the Civic Bureau, the annual output has now reached $38,500,000. 14,000 hands are now employed who receive a monthly wage exceeding $750,000, and $20,000,000 is invested in industrial enterprises. Mayor Evans pointed out to the four hundred guests at this banquet, that there was room and opportunity for all, as the wholesale houses of Winnipeg handled in addition to the local manufactured output a total of over $100,000,000 of goods made elsewhere during the year. Winnipeg has under construction one of the largest and best equipped power plants on the continent that will cost, when completed, $3,500,000. The Dominion Government has in the past month officially opened St. Andrews Locks on the Red River, thus placing Winnipeg in direct water communication with Lake Winnipeg.

Our Furnaces Heat Steel with the Cheapest Fuel on Earth—

SOFT, SLACK COAL

They are all fired with "American" Mechanical Stokers, which burn bituminous slack coal automatically and without smoke, and give a clear, steady, soft, non-scaling flame. You get increased production, at about one-third to one-half the operating cost of oil or hard coal. This is a fact. If you burn money to heat steel why not burn less of it, and write us at once?

Machinery Wanted and For Sale

AGENT WANTED.

AGENT WANTED by old established London firm for the sale of Electric Passenger and Goods Lifts in Canada. Must have recognised business and good connection. Box 20, CANADIAN MACHINERY, 88 Fleet St., London, Eng. (11)

FOR SALE.

FOR SALE—Waterloo Iron Works, in town of Waterloo, Quebec, in centre of the Eastern Townships. Plant comprises foundry, machine shop, stove mounting and wood shops, and boilerhouse brick buildings, galvanized iron roofs—all in good repair. Canadian Pacific and Central Vermont Railways run through the town—works situated only a few rods from former. Splendid opportunity for any who wish to engage in manufacturing. Terms reasonable. Address, Waterloo Iron Works, Waterloo, Quebec. (8)

FOR SALE.—Jobbing Machine Shop and Foundry Business, located in Western New York, established over 50 years. Has large and very profitable trade. 75 % of the capital stock can be bought for $65,000.00, worth $100,000.00 at least. Fine equipment of tools and well organized working force. This is not a debt encumbered concern that needs financing, no extra capital required for operating, but a going concern that owners want to sell on account of other interests preventing personal attention. For further particulars, address R. W. Gardner, 821 Railway Exchange Building, Chicago, Ill. (10)

FOR SALE—Belting, pipe rails, pulleys, shafting, hangers, chains, all sizes, new and used, half-price. Also cotton waste and wipers. Imperial Waste and Metal Co., Queen St., Montreal. (11-11)

MACHINERY FOR SALE.

MARINE GASOLINE MOTORS of unexcelled quality; jump spark type; two to eighteen horsepower; pleased to show our motors; send for new catalogue. Midland Engine Works Company, Midland, Ont. (1-11)

FOR SALE—2 new 34" square x 10 ft. Planers, double heads. 2 second-hand 40" x 46" x 10 ft. Planers, double heads, rebuilt, practically good as new, immediate delivery. NEW HAVEN MFG. CO., New Haven, Conn. (7)

FOR SALE—A complete set of patterns and equipment for the manufacture of an improved line of iron toys, such as trains, hose carts, hook and ladders, engines, pistols, banks, stoves, etc. An established demand for this particular line of toys. Everything necessary for the successful manufacturing of same. Very fine proposition for anyone interested. Reason for discontinuing manufacture lack of factory room on account of heavy lines of other materials. Address Box 107, CANADIAN MACHINERY, Toronto.

FOR SALE—One 14" x 6' Porter Lathe, second-hand, complete with chuck. In excellent condition. KELLOGG & CO., 196 King St. West, Toronto.

THE PEMBROKE ELECTRIC LIGHT CO., LTD., have the following Machinery for sale, which will be sold separately, or as a unit.

This Plant comprises the complete outfit of their steam station, and is in first class running order.

2 return boilers—14' x 66" (tubular)
1 " " —12' x 54" "
1 Wheelock Engine—15" x 34", speed 95 R.P.M.
1 " Tandem Compound Engine—9" x 24" & 17" x 24"—speed 95 R.P.M.
1 Generator, 3 phase, 225 K.W., 60 cycles, 2200 volts, 450 revolutions.
1 40 amp. Exciter.
1 Marble Panel with Instruments.
1 Jet Condenser
1 Duplex Steam Pump.
50 feet 4" shaft with pulleys, including 2 friction pulleys
1 double leather belt—50' x 30"
1 " " " —73' x 22"
1 " " " —70' x 16"

PEMBROKE ELECTRIC LIGHT CO., LTD
Pembroke, Ontario (tf)

MACHINERY WANTED.

ONE PRESS, foot power preferred. Also ¼ or ½ h.p. alt. current motor, 104 volt, 60 cycle. E. D. Smith, Magog, Que.

FOR LEASE.

FOR LEASE—Brass and Aluminum Foundry in Indianapolis, Indiana. Thoroughly modern in equipment and appliances. Did a business last year of nearly $200.000. Second largest automobile centre in the United States, over thirty automobile factories in city and vicinity. Present owner engaged in other business requiring his time. Address Frank E. Janes, care F. E. Janes Coal and Grain Co. Indianapolis, Ind. (6)

BUSINESS CHANCES.

WANTED—A small Machine Shop to rent, with option of buying. Box 91, CANADIAN MACHINERY, Toronto (11)

POSITIONS WANTED.

ENGINEER, power gas, take charge of complete plant, engines and producers. Experience erecting, testing and running; undertake all repairs; first class electrical experience, sound technical knowledge, excellent references; prefer Ontario or British Columbia. R. BELL, 128 14th St., Brandon, Man.

FOREMAN Moulder is desirous of a change. First-class moulder; well up in modern methods of foundry practice; exceptional experience; good references. Box 88, CANADIAN MACHINERY, Toronto. (9)

PRACTICAL MACHINIST desires position as general foreman or superintendent. Good systematizer, with executive ability. Can handle all grades of labor. Box 106, CANADIAN MACHINERY, Toronto. (6)

PATTERN MAKER — Young energetic pattern maker, fourteen years' experience, two as foreman, desires position as foreman. Good executive ability and thorough knowledge of drawing and foundry practice. Address Box 90, CANADIAN MACHINERY, Toronto (11)

SITUATIONS VACANT.

WANTED — Mechanical Draughtsman on jig and tool design and general mechanical shop equipment. Give particulars of previous experience and salary expected. Box 89, CANADIAN MACHINERY, Toronto (11)

WANTED — Competent foreman for plate shop where layer out is kept. Work consists principally of water and air-tight tanks, and some light steel fabrication, such as fire escapes. Apply Box 92, CANADIAN MACHINERY, Toronto. (11)

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

MANUFACTURING CENTRES.

FREE FACTORY SITES — Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

TRAVELER WANTED.

ENGLISH FIRM of high class machine tool makers requires services Canadian representative to work on commission. Apply Box No. 27, CANADIAN MACHINERY, 88 Fleet St., London, England. (8)

PATENTS.

THE PROPRIETOR of the Canadian Patents, Nos. 119683 and 114649, "Improvements in Multiple Cylinder, Internal Combustion Engines," and "Improvements in Reversible Valve-Gear for Internal Combustion Engines, Steam Engines, Air Compressors and the like," is desirous of entering into arrangements by way of license or otherwise for practically working the patents. For particulars apply KLAUSER & CO., 9 Friedrich St., Berlin, Germany. (6)

MISCELLANEOUS.

A BOOK-KEEPING STAFF IN ITSELF — doing the work with machine-precision and accuracy, the National Cash Register. Write us for demonstration literature. National Cash Register Co., 285 Yonge St., Toronto.

A BOON TO EVERY ENGINEER — A perfectly reliable fountain pen is to be found in the Beaumel "Rival" Pen. Easy to fill, non-leakable, and writes with exceptional smoothness. Gold nibs of thicknesses to suit every style of handwriting. Guaranteed in every respect. Sold by all stationers. A. R. MacDougall & Co., Canadian Agents, Toronto.

ACCURATE COST KEEPING IS EASY if you have a Dey Cost Keeper. It automatically records actual time spent on each operation down to the decimal fraction of an hour. Several operations of jobs can be recorded on one card. For small firms we recommend this as an excellent combination—employees' time register and cost keeper. Whether you employ a few or hundreds of hands, we can supply you with a machine suited to your requirements. Write for catalog. International Time Recording Company of Canada, Ltd. Office and factory, 29 Alice Street, Toronto.

BUSINESS MEN, professional men, merchants and church workers, find innumerable uses for Fulton Sign and Price Markers. The Fulton Rubber Type Company of Elizabeth, N.J., are makers of Ink Pads, Daters and Business Outfits of high quality. Sold by all stationers. A. R. MacDougall & Co., Toronto, Canadian Agents.

COPELAND-CHATTERSON SYSTEMS — Short, simple. Adapted to all classes of business. Copeland-Chatterson-Crain, Ltd., Toronto and Ottawa. (tf)

DOUBLE YOUR FLOOR SPACE. An Otis-Fensom hand-power elevator will double your floor space, enable you to use that upper floor either as stock room or as extra selling space, at the same time increasing space on your ground floor. Costs only $70. Write for catalogue "B." The Otis-Fensom Elevator Co., Traders Bank Building, Toronto. (tf)

EGRY business systems are devised to suit every department of every business. They are labor and time savers. Produce results up to the requirements of merchants and manufacturers. Inquire from our nearest office. Egry Register Co., Dayton, Ohio; 123 Bay St., Toronto; 258½ Portage Ave, Winnipeg; 308 Richards St., Vancouver.

ELLIOTT-FISHER STANDARD WRITING-ADDING MACHINES make toil easier. Elliot, Fisher, Limited, Room 314, Stair Building Toronto.

ENGINEERS everywhere find it most convenient and economical to remit money by Dominion Express Money Orders or Foreign Draft. Absolutely safe- payable anywhere no loss or delay—lowest rates. Always remit by Dominion Express Money Orders. Agents all over Canada. Agencies in all Canadian Pacific Railway Stations.

ERRORS AVOIDED LABOR SAVED—Using the Shouperior Autographic Register. Three copies issued at one writing. 1st, invoice; 2nd, delivery ticket; 3rd, charge sheet, perforated for filing. No handling of carbons. High grade printing and neat invoices. Make full inquiry. Autographic Register Co., 191-193-195 Dorchester St. East, Montreal.

MISCELLANEOUS.

FIRE INSURANCE. INSURE IN THE HARTFORD. Agencies everywhere in Canada. (tf)

FREE TEST. Prove our claim that "Klear Copy" Carbon gives the best, clearest, unsmudged copies of all typed matter at our expense. Send for sample package "K" free. Peerless Carbon & Ribbon Mfg. Co. of Canada, Limited, 180 Richmond West, Toronto.

GET THE BUSINESS—Increase your sales—Use Multigraph typewritten letters. The Multigraph does absolutely every form of printing. Saves you 25 p.c. to 75 p.c. of your printing bill. Multigraph your office forms, letterheads, circular letters. Write us. American Multigraph Sales Co., Ltd., 129 Bay Street, Toronto.

KAY'S FURNITURE CATALOGUE No. 306 contains 160 pages of fine half-tone engravings of newest designs in Carpets, Rugs, Furniture, Draperies, Wall Papers and Pottery with Cash prices. Write for a copy—it's free. John Kay Company, Ltd., 36 King St. West, Toronto.

MODERN FIREPROOF CONSTRUCTION—Our system of reinforced concrete work, as successfully used in many of Canada's largest buildings, gives better results at lower cost. "A strong statement," you will say. Write us and let us prove our claims. That's fair. Leach Concrete Co., Ltd., 100 King St West, Toronto. (tf)

MR BUSINESS MAN, are you progressive? It's up to you to test "Consolidated," our new process carbon paper. Because it costs less. Soft finish, without smutting, and clear, permanent copies. Write for sample sheets and prices. "Consolidated." Stratford, Ont.

PROBABLY the most talked about machine in Canada is the Hainer Book-keeping Machine. It combines in one machine the cash and credit register, time recorder and account register. Representatives wanted everywhere. Write for our proposition. Book-keeping Machines, Ltd., 424 Spadina Ave., Toronto.

"SYSTEMS" stand for all that is best in loose-leaf binders and supplies, letter-heads, statements and in fact your office stationery of every description. PETERSON'S CORE OIL

The Strongest Core Binder on the Market

Peterson Core Oil is the one oil that is fully equal to the best linseed oil for all core-making purposes.

It has the additional advantage of costing considerably less than high-grade linseed oil.

We do not expect to convince you by a mere assertion. We request the opportunity to demonstrate its truth to your utmost satisfaction.

A communication with us will probably lead to a great saving in your core-room. Write us to-day.

T. J. Peterson Co.

AMERICAN and SCOTCH

CUPOLA BLOCKS and all other SPECIAL SHAPES

For Foundries, Blast Furnaces, Rolling Mills, Steel Plants, Cement and Lime Kilns, Glass Plants, Boiler Settings, etc.

IMMEDIATE SHIPMENTS
from our stock in Toronto, or direct from Works.

The Ontario Lime Association
LMITED
118 Esplanade East, - TORONTO

GREEN'S

"Emergency" Cupola

is a most excellent little melter, and has been extensively adopted both at home and abroad, including several Government departments.

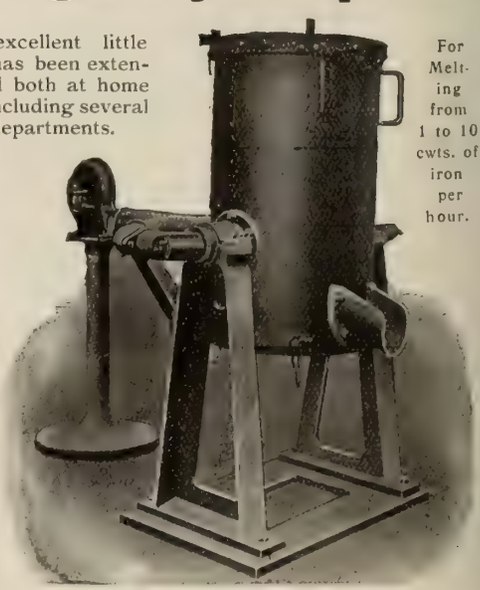
Full Particulars on Application

We are also makers of

The Rapid "Economic" Cupola

and complete Foundry Melting Equipments.

FEED-WATER HEATERS, FILTERS, &c.

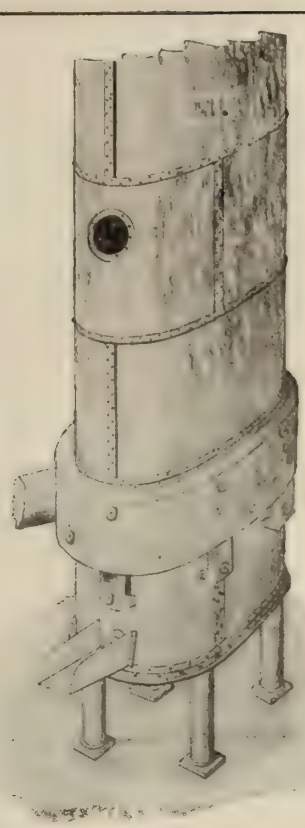


For Melting from 1 to 10 cwts. of iron per hour.

GEORGE GREEN & CO.
FOUNDRY ENGINEERS
KEIGHLEY, - ENGLAND

Cable Address: "CUPOLA," Keighley.

The advertiser would like to know where you saw his advertisement—tell him.



Do you want clean tuyeres and pure iron?

Use the

Baillot Cupola

and reduce your coke bill 20 per cent.

SCRUTARI TRUST
MONTREAL

A Happy Pair

That is just what our

"ACME" Parting

and

Red Facing

are.

Foundries using the above are saving money. They get nice, clean castings. The molder gets a clean lift every time.

Rock Bottom Prices.

We can ship on the drop of the hammer.

If you have not tried them, drop us a post card. You will get samples and prices.

WINNIPEG TORONTO CALGARY

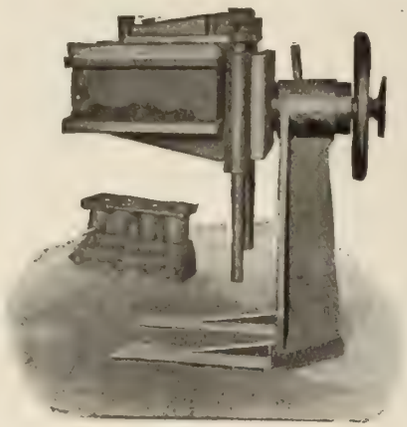
JONATHAN BARTLEY CRUCIBLE CO.

TRENTON, N. J., U. S. A.

MANUFACTURERS OF

Crucibles of Quality

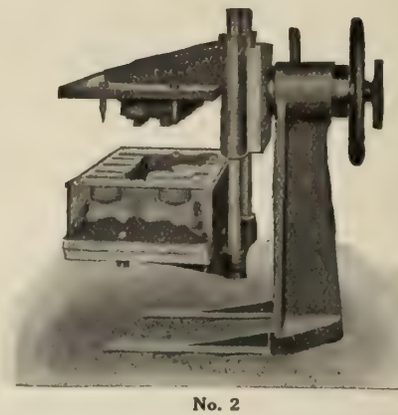
Grimes Roll-Over Molding Machine



No. 1

This is a simple, standard machine, requiring small floor space.

It is perfectly balanced, requiring no counter-balancing mechanism, as centre of gravity is centre of rotation.



No. 2

By means of small hand wheel shown in cut, one man can turn largest flask smoothly and without jerk.

Pattern is drawn by absolutely straight gravity drop.

This machine is adjustable for deep flasks and can readily take care of flask 24 in. x 36 in. and 4 to 12 in. in depth, with maximum pattern draft of 12 in.

Positive adjustable pins at four corners of clamping device, Fig 2, compensate for unevenness of floor boards.

PRICE, f.o.b. cars Windsor, $125.00

HIGH GRADE CASTINGS are not made with low grade materials. Think this over when you see a poorly finished casting in your cleaning room, and remember, if you please, if you wisb to place the pattern in the high grade class, our No. 48 Plumbago will do it, also that the saving in cleaning room expense would pay for three times the necessary No. 48 Plumbago to have made it high grade.

Another vital point is that you have a core wash which will peel clean and not run before the metal. Try our Eureka Blacking, the best core wash on the market.

WANTED

IN order to cope with the ever-increasing volume of business that the Canadian foundries have favored us with, we find it imperative that we should secure the services of a thoroughly competent

SALESMAN

for the Western part of Ontario.

The qualifications required are a thorough theoretical and practical knowledge of the Foundry Equipment and Supply business and proved ability as a business getter. To such a salesman we offer a proposition which will eventually put him in the way of carving out for himself a future which could not be duplicated elsewhere in the line.

We have no salary in mind at the present time—but will pay according to ability. All applications must be made by letter, stating qualifications and references.

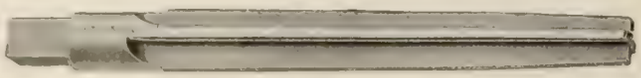
Patentees and Canadian Manufacturers of the

KING FUEL OIL FURNACES

Straight Reamers With Taper End

These Reamers from 1/4 to 5/8, inclusive, have 4 flutes; from 1 1/16 to 1 1/4, inclusive, have 5 flutes; from 1 5/16 to 1 1/2, inclusive, 6 flutes.



These Reamers are especially designed for use in Structural Iron and Steel, Boiler Plate and Bridge and Ship Building. They are cleared before hardening and are used for a rough, heavy class of work. They are now used to a great extent with air tools.

Morse Twist Drill and Machine Co.
New Bedford, Mass., U.S.A.

Our goods are handled by—Rice Lewis & Son, Ltd., Toronto; Aikenhead Hardware Co., Ltd., Toronto; Frothingham & Workman, Montreal: Mechanics Supply Co., Quebec.

Three Minutes' Grinding puts a new and stronger tang on the shank. It fits the lower slot in the socket.

What Do Your Twisted-Off Tangs Cost?

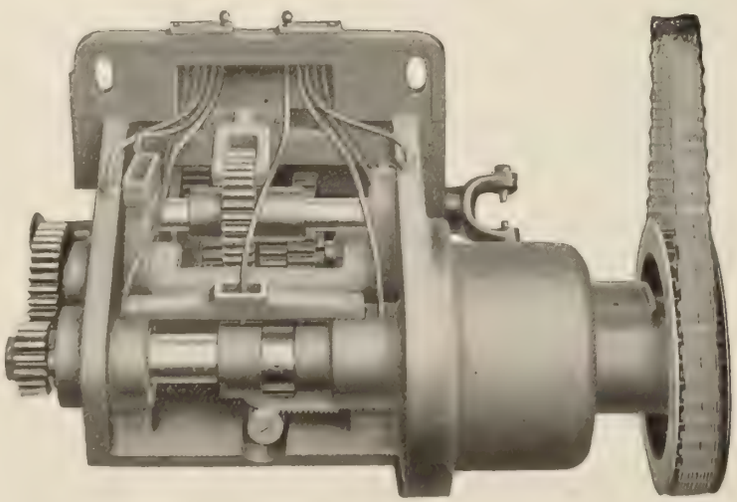
Keep account for a time of the new drills used to replace those thrown into the scrap heap because of twisted-off tangs, and you will see. These scrapped drills are all right in every other respect.

The "PERFECT" Double-Tang Socket

gives a simple, effective, and inexpensive means of eliminating this cost and putting the drills back in money-earning shape. **Write for Folder A.**

The CLEVELAND Twist Drill Co. CLEVELAND Chicago New York

There are two important features of the feed box on B. & S. MILLING MACHINES: Instant engagement of gears; strength to withstand the sudden shock of throwing in gears when machine is running.



Instant engagement of the gears is secured by the special form of the teeth which are made long and pointed with chamfered ends.

This form also gives extra thickness at the bottom of the tooth, which, coupled with the fact that each gear is carefully hardened, provides strength to the teeth to withstand the sudden shock of being thrown in mesh while the machine is running.

Send for our "Features of the Original Constant Speed Drive Milling Machine."

How about that "Bum" Casting?

Do you ship it out at a profit?

or do you consign it to the scrap-heap?

WHICH?

Profit- or Loss?

SHELTON METALLIC FILLER

will keep your scrap-pile corner empty. It will fill in all sand-holes, blow-holes, cracks and minor defects, so that the casting will pass the closest inspection.

It cannot be detected, and is as durable as the casting itself. If you use Shelton Metallic Filler, you will avoid all **make-overs.**

There will be no delays--every casting will reach its destination on time.

NO MAKE OVERS - NO SCRAP HEAP
NO LOSSES.

Shelton Metallic Filler means greater profits.

Shipped

Scrapped

Now the Third City in Canada

WINNIPEG

(MANITOBA)

THE SUPPLY CITY OF WESTERN CANADA

Offers greater combined advantages to manufacturers and capitalists than any city in Canada. The remarkable development of this great central market is creating an unprecedented demand for home industries.

WINNIPEG WANTS THESE MANUFACTURERS

and offers cheap power, cheap sites, low taxation, varied raw materials, the best of labor conditions, unexcelled railway facilities, and the earnest snpport of a community that recognizes the importance of its industries. Over a billion dollars produced by the farms of Western Canada in the past five years, and this with only eight per cent. of the available land under cultivation. Consider what this development makes possible for the home manufacturer.

YOUR OPPORTUNITY

Get Close to this Market

Special openings for manufacturing farm and agricultural implements, including gas and steam tractors; paper and strawboard mills, men's clothing, ladies' ready-to-wear goods, food stuffs, starch factory, boots and shoes, felt wear, metal goods, wire nail factory, hardware specialties, flax and jute works, beet sugar factory, elevator machinery, electrical fixtures and appliances of all kinds, automobiles and commercial motor carriages, home and office furniture, leather goods, cereal foods, dairy supplies, building materials, stoves, ranges, furnaces and heating plants, and twenty-five other smaller lines.

Special reports prepared and mailed free of charge on the manufacturing possibilities of any of these lines of industries, by addressing CHAS. F. ROLAND, Commissioner of Industries, Winnipeg, Canada.

St. Marys, Ontario, Canada

offers manufacturers many advantages:

Good Labor Conditions	*Cheap Building Material*
Low-Priced Homes	*Railway Competition*
Moderate Rents	*Municipal Lighting*
Low Assessments	*Niagara Power*
Abundant Water Supply	*Ideal Location*
Healthy Environment	*Splendid Schools*

A Million People Within a Radius of One Hundred Miles

HARBISON-WALKER

The Standard *of* Quality

Fire Brick for Boiler Settings

Look up, **not** your prices per thousand Brick but your **costs** for repairs per thousand H.P. per hour.

Remember the costly shut downs when every H.P. was needed. It all shows up on the cost sheets.

It's on the cost sheet basis we want to take it up with you. A postal will bring catalog and any data you wish.

HARBISON-WALKER REFRACTORIES COMPANY

PITTSBURGH, - PENNA.

THE BEST FIREBRICKS

ARE

GLENBOIG AND GARTCOSH

MADE IN SCOTLAND

and BEST RESULTS can only be got by using these brands, as they will stand the highest heat without melting.

Are also largely used for building purposes where a handsome appearance is desired.

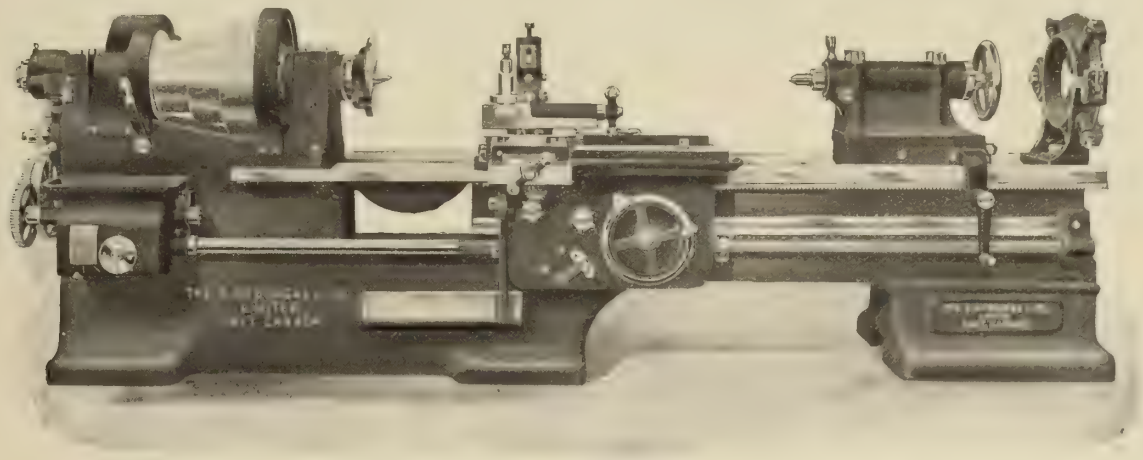
The Gap Lathe of Highest Quality

Extreme accuracy and speed, the best materials, a strongly supported and non-vibrating bed at gap, where many lathes of this type are weak, and extreme flexibility in speed adjustment—these put the McDougall Gap Lathe in a position by itself among machines where quality and cost of work done must meet exacting demands. You need a McDougall Lathe for all such work.



Made in sizes 18 x 30, 20 x 36, 22 x 40, and 26 x 48 in any length of bed

Headstock construction prevents chattering, and deep oil chambers fitted with ring oilers make spindles and bearings self-oiling and always well lubricated.

Tailstock of a special type, and sleeve is clamped by a quick acting locking device. Tailstock is secured to bed by bolts adjusted from the top where they are easily accessible.

Bed, non-springing and webbed, and braced to secure rigidity.

Gap, vibration absolutely prevented by use of brace supports to carriage.

Spindle, high carbon hammered steel in solid chilled cast iron bearings, accurately fitted and self oiling.

Carriage and Apron, non-springing under severest strain, full "V" bearings and flat bearings in addition on front ways.

Double Back Gears give eighteen distinct spindle speeds, suiting lathe to work on widely different diameters.

Compound Rest, with graduated base, accurately fitted taper gibs, end adjusted. Screws in both rest and cross slide read to thousandths.

Friction, Safety Feeds, screw and rod feeds cannot be both engaged at the same time. Quick changes of 1¼, 2½ and 5 times thread being cut.

Gears and Racks, cut from solid and steel where necessary.

Screw Cutting, full range of commercial threads provided for.

Equipment, Compound rest, steady rest, follow rest, large and small face plates, wrenches, two-speed, friction countershaft furnished with each lathe.

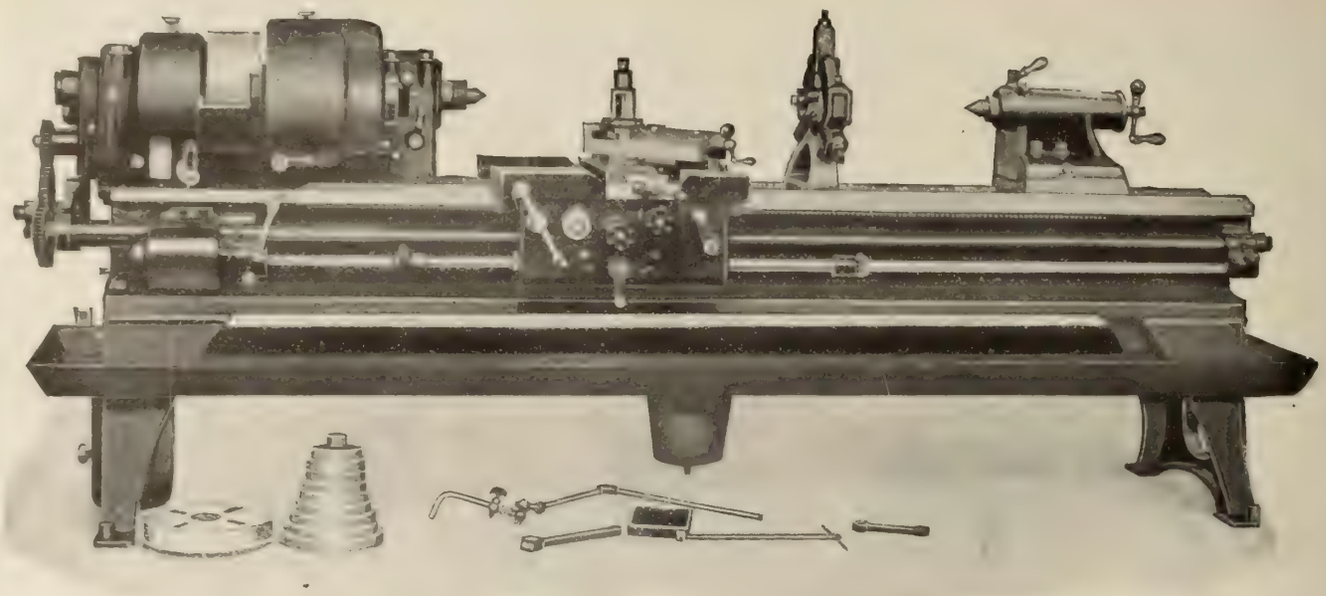
Accuracy, Strength, Solidity, Wear. These are the paramount features behind all McDougall Machines. Made **to meet extreme demands.**

Write for Particulars

The R. McDougall Co., Limited

GALT, ONTARIO

Canadian Fairbanks Company, Sales Agents **Cable Address: Dougalt, A.B.C. 5th edition**



The Springfield High Power Rapid Reduction Lathe

might be used as a model of modern lathe construction. It is one of the most powerful and rigid machines ever put on the market. The operator has full control at all times. Six variations of speed are instantly obtainable. The compound rest is of new design, countershaft particularly simple and every convenience for operating incorporated in the general plan. Try it when accuracy means money.

This Lathe under severe test has proven to be remarkably steady under the heaviest cuts—the carriage traveling steadily along, due to its most excellent design, and the proper distribution of metal—thus doing away with chattering, and jerky motion, so often found in so-called Rapid or High Speed Lathes.

With the number of speeds and feeds possible, together with its high power, accuracy and ease of operating, we confidently place this Lathe on the market, as representing the highest type of design, excellence, and accurate and careful manufacturing.

We also supply for Prompt Shipment:—Engine Lathes, Turret Lathes, Brass Finishers' Lathes, Automatic Machines, Horizontal or Vertical Boring and Turning Mills, Planers, Shapers, Slotters, Bolt and Nut Machinery, Cutting-off Machines, Drilling Machines, High Speed Cold Saws, Velos High Speed Steel and Twist Drills, Special Steel for all Purposes, Pneumatic Tools, Woodworking Machinery, Chain Hoists, Electric Traveling Cranes, Etc.

Full stock now carried of Velos U.R. High Speed Twisted Drills.

Variable Planer Speeds

as many as you want—changed as often as you wish—at any instant on the

Pond Reversing Motor Planer

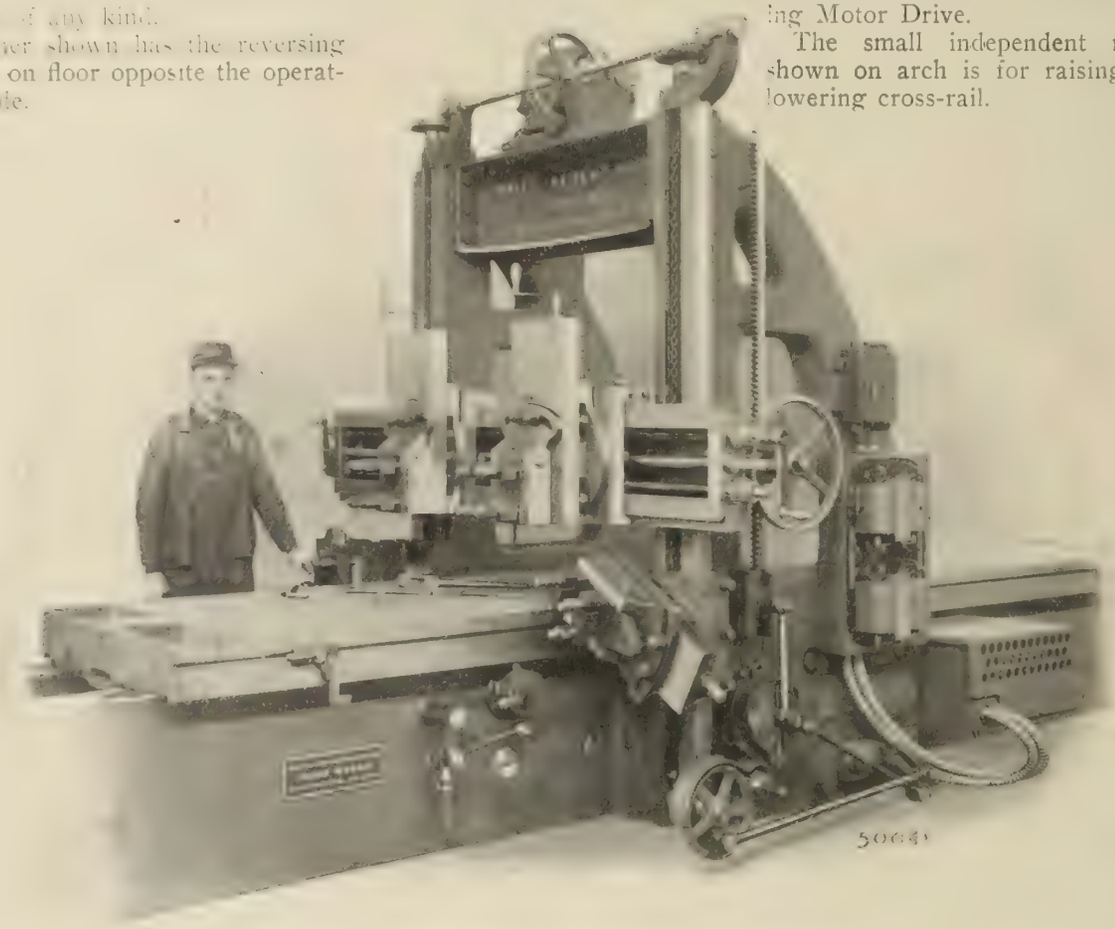
ANY CUTTING SPEED — ANY RETURN SPEED

The first successful variable speed planer, reversed without mechanical devices of any kind.

Planer shown has the reversing motor on floor opposite the operating side.

Pond 48-inch Variable Speed Planer with Patent Direct Reversing Motor Drive.

The small independent motor shown on arch is for raising and lowering cross-rail.



Reversing motor is directly on driving shaft and controlled by the Pond Patent Planer Control

The reversing is accomplished so accurately and positively that a stroke of 4½ inches can be taken on a 96-in. machine. No clutches, belts or complicated gearing. Nothing to slip and wear in the reversing drive. No overhung drive and projecting pulleys that are liable to be put out of commission by an overhead traveling crane. No shrieking belts and noisy gears.

A silent drive, reversing instantly without shock, jar or hesitation, and with the entire reversing variable speed drive on the floor or near the floor, making it readily accessible at ALL times.

Brass, bronze, iron and steel castings can be planed at the most economical speed for each metal. Should a heavy cut or hard spot be encountered, the cutting speed can be instantly slowed down to meet the conditions and immediately speeded up again after passing the cut.

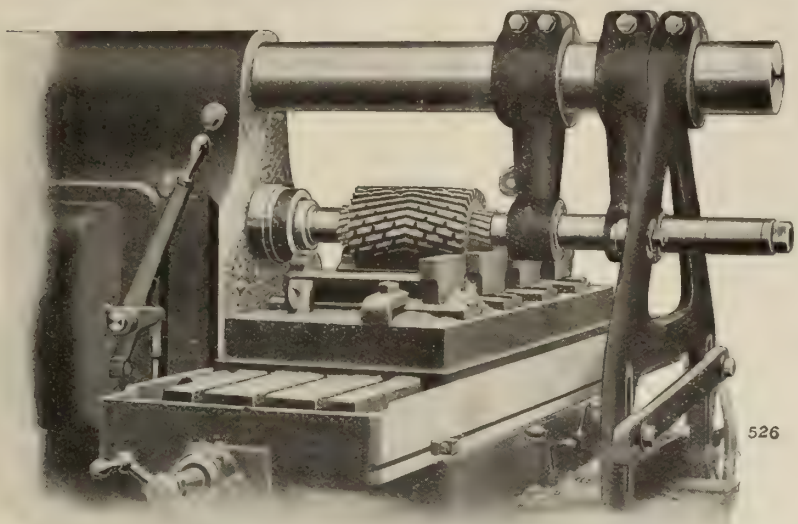
Do YOUR Milling the Cincinnati Way



526

THIS operation roughs out the inside of Cast Iron Vise Bodies. Total width of cut 15 inches; greatest depth 3-16 inch; length 6 inches. The largest cutter is 6 inches in diameter, 9 3-8 inches face, runs 32 revolutions, feeding 4 3-4 inches per minute.

The pieces are held in a string jig---each one clamped independently. The milled pieces are removed as fast as traversed by the cutter and others chucked in their places.

At the end of the cut the knee is lowered, the table returned, readjusted and a new cut started.

The operator then removes the last piece at the right-hand end of the gig and chucks a new one.

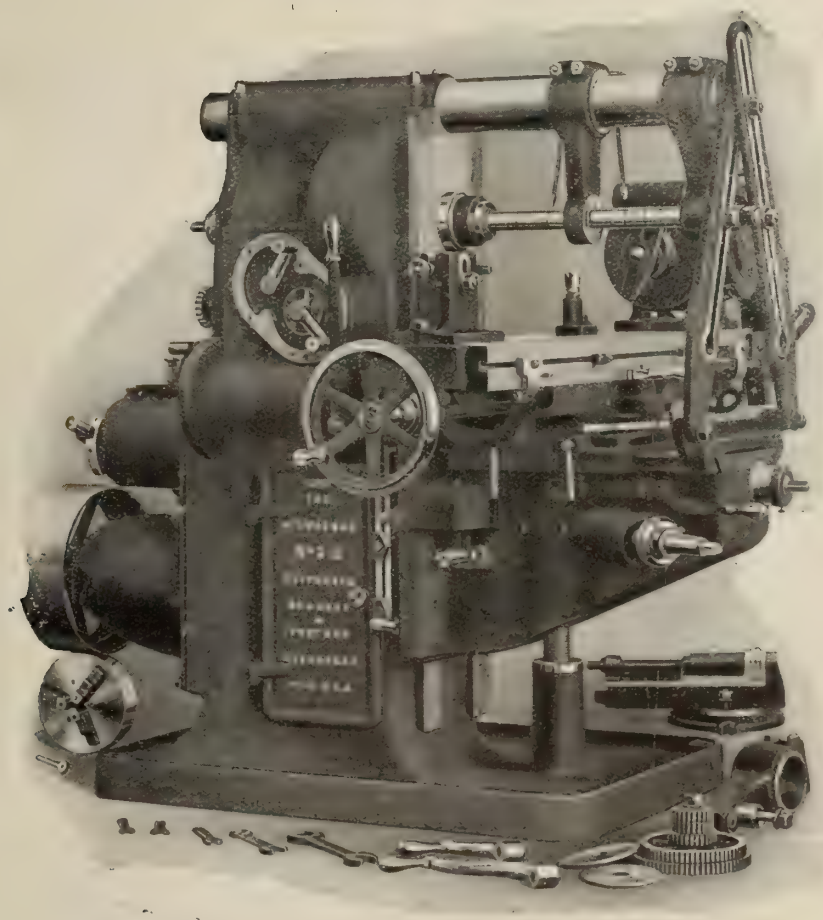
By this time the first one at the left has been milled and he repeats the above process by again chucking new pieces behind the cutter.

Both the operator and the machine are busy all the time. Neither waits for the other. The only time lost is returning and readjusting the table, and the TOTAL TIME PER PIECE IS ONLY 4 1-4 MINUTES. Let us show you how to mill your work the Cincinnati way.

The Cincinnati Milling Machine Company

CINCINNATI, OHIO, U.S.A.

Canadian Agents---H. W. PETRIE, Toronto, Montreal and Vancouver.



THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

MINISTÈRE DE LA MARINE

République Française

Paris le 28 DEC 1908

Direction

Direction Centrale des Constructions Navales.
Bureau
Bureau Administratif.
Bureau Technique.

Le Ministre de la Marine

A Monsieur le Directeur de la Compagnie Magnolia, 50 rue Taitbout, Paris IX.

Admission aux fournitures de la Marine.

Monsieur, par lettre du 10 juillet 1908 vous sollicitez l'autorisation d'être admis à soumissionner certaines fournitures de la Marine.

J'ai l'honneur de vous faire savoir qu'après examen des renseignements fournis par le Service de la Surveillance sur vos moyens de production, j'ai décidé que vous pourriez être admis à soumissionner les fournitures de métal antifriction "MAGNOLIA".

Par dépêche de ce jour je donne avis de cette décision aux Administrations des cinq ports, de la Tunisie, aux Etablissements de la Marine à Indret et à Guerigny et à la Commission des Machines et du Grand Outillage à Paris.

Recevez, Monsieur, les assurances de ma considération distinguée.

Pour le Ministre et par son ordre,
Le Directeur Central des Constructions Navales,

MAGNOLIA ANTIFRICTION METAL

TEST No. 783

By the Research Laboratory of the

FRENCH GOVERNMENT

These Tests were Divided into Three Sections

1st. Determination of the coefficients of friction under varying pressures.

2nd. Determination of temperatures under different velocities. "Endurance Tests."

3rd. Determination of the rate of wear.

Report of these tests was accompanied by fourteen tabulations and the results were so highly favorable to Magnolia Metal—sustaining in every particular its well-known qualities---that the letter shown hereon was written by order of the Minister of Marine approving of the use of Magnolia Metal by the French Navy. No people surpass the French in scientific knowledge and highly technical, painstaking investigation, and their endorsement of Magnolia Metal is another strong link in the chain of evidence that we are able to urnish.

Sold by the leading dealers everywhere or by

THE "CYCLONE"
HIGH SPEED CHAIN HOIST
is Simplest, Fastest, Easiest-working

Fig. A.

The CYCLONE'S simplicity of operation can be easily understood from the two sectional views shown.

The central spur wheel in Fig. A is mounted on the same shaft as the hand wheel. The two outer spur wheels turning with it have at their other ends eccentrics which give a gyrating motion to the yoke shown in Fig. B. This yoke turns the spur wheel shown, which is cast in one piece with the sprocket wheel carrying the lift chain.

This double wheel turns freely on a hollow shaft which encircles the shaft carrying the central spur wheel shown in Fig. A. The rate of revolution of the lift wheel is determined by dividing the number of teeth in its pinion by the difference between this number and the number of internal teeth in the yoke. Thus in the one-ton size the yoke has 24 teeth and the lift wheel pinion 21, giving one revolution of the lift wheel to seven revolutions of the hand wheel.

Thus the gyrating yoke principle allows great reduction of speed with fewer working parts and larger gear wheels than can be used in any other hoist. This means far less friction.

Friction is still further reduced by supporting every shaft in the "Cyclone" at both ends, so that there are no overhanging bearings to spring and bind the working parts—by fittting every bearing with rollers—and by using graphite bronze bushings, which need no oil.

The result is that it has been found practicable to gear the "Cyclone" higher than any other hoist yet manufactured, without increasing the hand pull. For example, the one-ton "Cyclone" overhauls only 29½ feet of chain to raise the full load one foot, with a pull of 85 pounds. The "Cyclone's" speed is more than twice that of the best screw hoists.

Fig. B.

The automatic brake permits the spinning of the hand wheel in either direction when there is no load, locks the load safely, and permits its lowering by a very slight reverse pull on the hand chain.

We are prepared to ship "Cyclones" direct from the four centres---Montreal, Toronto, Winnipeg and Vancouver.

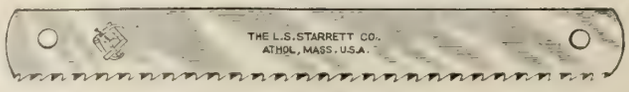
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH

HACK SAWS



These blades are made of the finest grade of steel. The teeth are sharp, with square cutting points, and evenly set. They are tempered by our improved process, which leaves them hard and tough, so that they will not "shell off." They are too hard to file. The set of the teeth is just enough to insure a a free, smooth and rapid cut, removing no more stock than is necessary.

High Speed Steel; Its Treatment in Modern Practice

By J. J. Duguid *

The efficiency of the Machine Shop has Been Greatly Increased by the Introduction of High-Speed Steel. Mr. Duguid, in a Paper Read Before the Central Railway and Engineering Club, Toronto, Gives a Summary of Recent Advances in Machine Shop Practice due to Progressive Shops Adopting High-speed Steel. He Also Gives Valuable Pointers in Regard to Grinding, Forging, etc., Which, if Followed, Will Give Excellent Results and Greatly Increase the Present Output of Many Machine Shops.

I AM not going into the subject of high speed steel technically, but will give you my observations through using this steel and also what I have read about it. High speed steel got its name

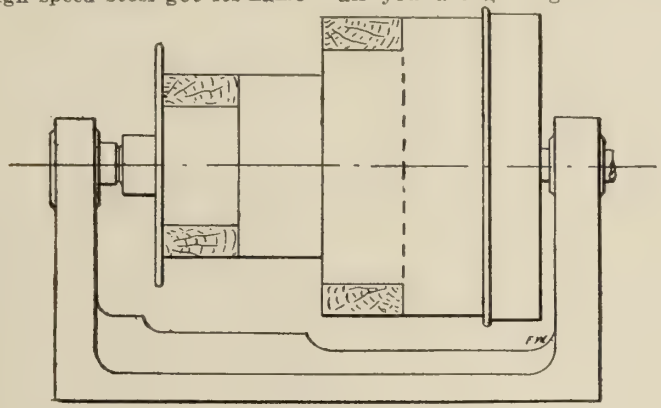

Fig. 1.—

no doubt from the fact that when it was first introduced the only way to get the increased efficiency of it was to run the machines at a high speed, as the old style machines were not built to carry heavy cuts, the driving belts and cones being too narrow to transmit the necessary power, and it was found if you increased these, as was done in some cases, as shown in Fig. 1, the other parts of the machine gave out under the strain. These parts then being strengthened up it was then found that the whole machine frame was not rigid enough and caused the tools to break on account of the vibration, and in the face of these facts all that could be done was to carry about the same size cuts with the high-speed steel as with old carbon steel, but speed up the machines. It was at this point that the manufacturers of machine tools saw the necessity of building more powerful and rigid machines, and to them should be given as much credit for increased output of machines as the high speed steel manufacturers. Although the great majority of machine shops are using high speed steel at the present time, I venture to say that very few af them are getting over 45 p.c. of the total efficiency of the steel, principally for the following reasons:

1. The great number of old out of date machines and heavy work being done in them, they are therefore not carrying a heavy enough cut, neither can they be run to proper speed, and about 50 p,c. of the steel efficiency is all you are getting under these conditions. There are conditions, however, that old machines can be used to good advantage with the high speed steel

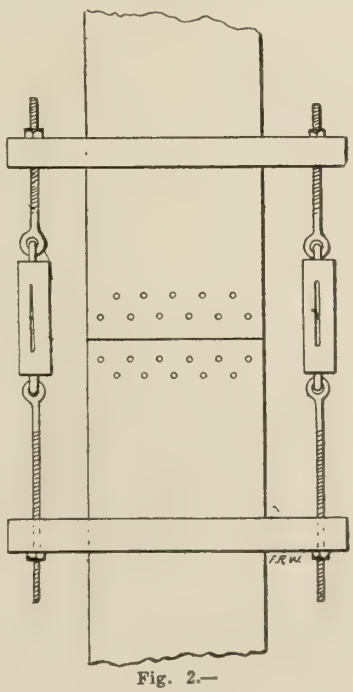

Fig. 2.—

and that is on repair work such as skimming up old piston rods, valve rods, etc.

2. The different shape of tools on uniform work. Workmen will grind machine tools about the same as ladies choose their hats, which is every shape and some of these the most ridiculous. I believe if there was a uniform system in every shop for the grinding of tools (such as some shops have adopted) that it greatly increases the life of the steel also the efficiency.

3. The different speeds and size of cuts on uniform work and material. This is one of the most serious defects in the use of high speed steel or in fact any steel.

4. The use of belting not of proper tightness and belts that are worn out. I think you will agree with me that a great many manufacturers will use a belt until it all falls to pieces, although it may be decreasing the output of their high speed steel by 50 p.c. All belting that is driving machine tools should be adjusted with spring clamps as shown with sketch, so as to ensure proper tension and driving power.

5. The over hang of tools in tool rest causing excessive chattering and consequently breaking of tools.

6. The use of dull tools also the want of reforging. The use of dull tools causes excessive heating destroy-

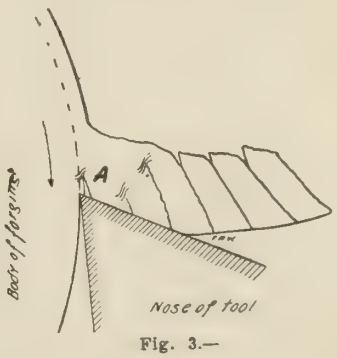

Fig. 3.—

ing them and also a great loss an account of the extra power required to drive the machine.

7. The want of proper supply of cooling water used, thereby allowing the tool to become overheated and fail.

8. The want of variable speed enough on the machines to suit the different diameters of work.

9. The use of too light tools on heavy work.

Now these are some reasons why we are not getting nearly the full efficiency from high speed steel, which must be quite apparent to those of us con-

* General Foreman, G.T.R., Toronto.

nected with machine shops, and are all defects that can be remedied with proper supervision. I will now try to describe to you the action of a tool and its wear in cutting metal. A great many of us imagine that it is the sharp edge of the tool the same as a razor that is doing the work, such however, is not the case.

Fig. 3 is an enlarged view of the action of a tool in cutting a chip from a forging at its proper speed, and it is therefore plain that in all roughing cuts the chip is torn away from the forging rather than removed by the action of cutting. The familiar

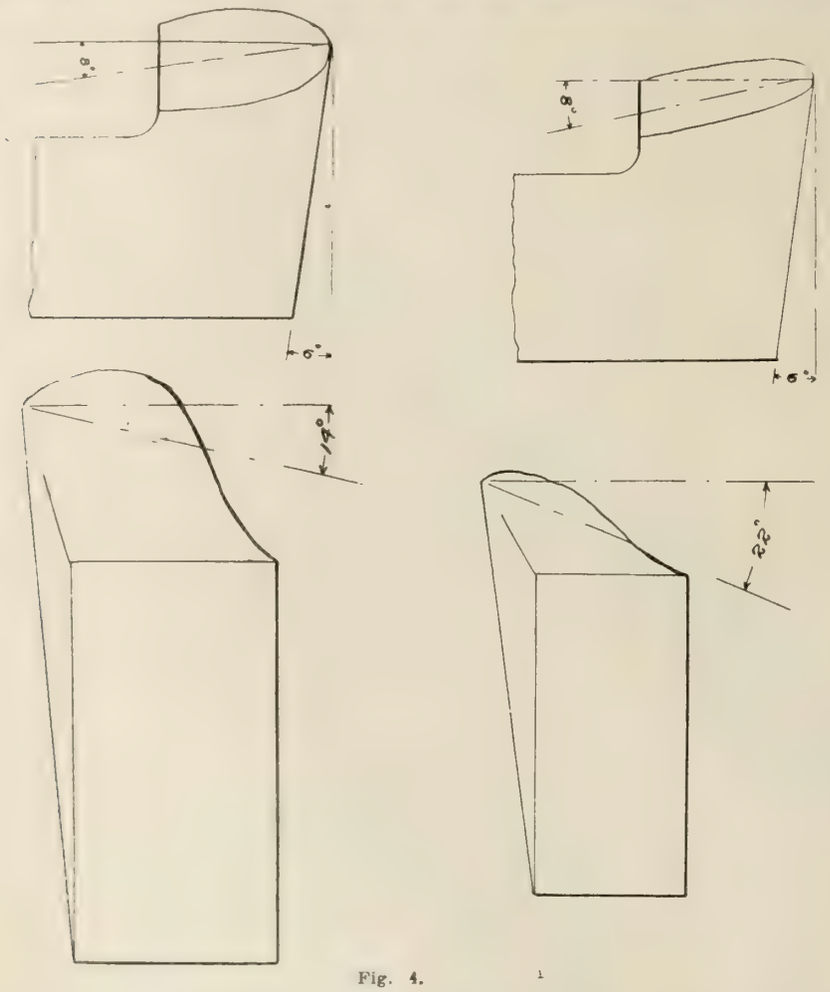

Fig. 4.

action of cutting, as exemplified by an axe or knife removing a chip from a piece of wood, for instance, consists in forcing a sharp wedge (i.e. one whose flanks form an acute angle) into the substance to be cut. Both flanks of the wedge press constantly upon the wood, one flank bearing against the main body of the piece, while the other forces or wedges the chip or shaving away. While a metal cutting tool looks like a wedge, its cutting edge being formed by the intersection of the "lip surface" and "clearance surface" or flank of the tool its action is far different from that of the wedge. Only one surface of a metal cutting tool, the lip surface, ever presses against the metal. The clearance surface, as its name implies, is never allowed to touch the forging. Thus "cutting" with a metal cutting tool consists in pressing, tearing, or shearing the metal away with the lip surface of the "wedge" only under pressure, while in the case of the axe and other kinds of cutting both wedge surfaces are constantly under pressure. The enlarged view of the chip, tool and forging, shown in Fig. 3 represents with fair accuracy the relative proportions which the shaving cut from a forging of mild steel finally assumes with relation to the original thickness of the layer of metal which the tool is about to remove. Now some of you may think this theory is all wrong, because you have noted that the cutting you have taken off a forging was of the same size as the depth of cut and the feed you used, but that only shows that you were not using a heavy enough feed and not running at a proper speed.

In experiments made to show the pressure of the chip on the tool cutting a chip of uniform size, that the pressure varied with the waive like regularity and that the smallest pressure was about two-thirds the maximum pressure and this is the reason that old light machines will not handle the heavy cuts of high speed steel. The cause of these variations in pressure is the making of the chip in sections. It would appear

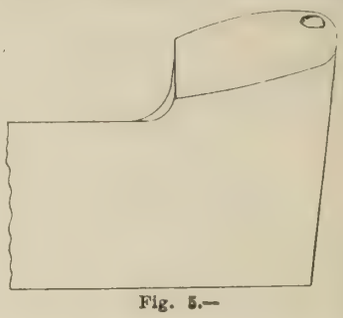

Fig. 5.—

that the chip is torn off from the forging at a point above the cutting edge of the tool, and this tearing off action leaves the forging in all cases more or less jagged or irregular at the exact spot where the chip is pulled away from the forging, as shown to the left of A. An instant later the line of the cutting edge, or more correctly speaking, the portion of the lip surface immediately adjoining the cutting edge, comes in contact with these slight irregularities left on the forging owing to the tear-

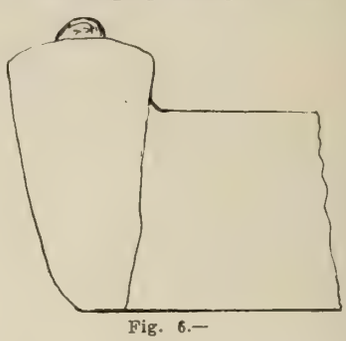

Fig. 6.—

ing action, and shears those lumps off, so as to leave the receding flank of the forging comparatively smooth. The cutting edge of the tool is continually in action, scraping or shearing off or rubbing away these small irregularities left on the forging, yet that portion of the lip surface close to the cutting edge constantly receives much less pressure from the chip than the same surface receives at a slight distance away from the cutting edge. This allows the tool to run at higher cutting speeds than would be possible if the cutting edge

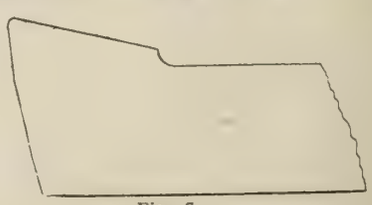

Fig. 7.—

received the same pressure as does the lip surface close to it.

There are many things which indicate this tearing action of the tool. For

example, it is an everyday occurrence to see cutting tools which have been running close to their maximum speeds and which have under cut for a considerable length of time, guttered out at a little distance back of the cutting edge, as shown in Fig. 5. The wear in this spot indicates that the pressure of the chip has been most severe at a lit-

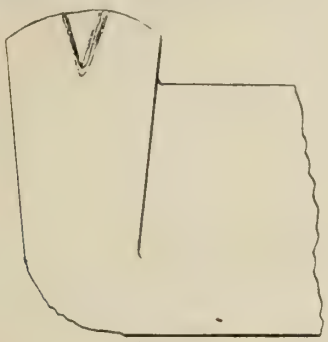

Fig. 8.—

tle distance back from the edge. Still another manner in which in many cases the tearing action of the tool is indicated is illustrated in Fig. 6, in which a small mass of metal is shown to be stuck fast to the lip surface of the tool after it has completed its work and been removed from the lathe. Then broken off, however, and carefully examined, this mass will be found to consist of a great number of small particles which have been cut or scraped off the forging, as above described, by the cutting edge of the tool. They are then pressed down into a dense little pile of compacted particles of steel or dust stuck together and to the lip surface of the tool almost as if they had been welded. In the case of the modern high speed tools, when this little mass of dust or particles is removed from the upper surface of the tool, the cutting edge will in most cases be found to be about as sharp as ever, and the lip surface adjacent to it when closely exam-

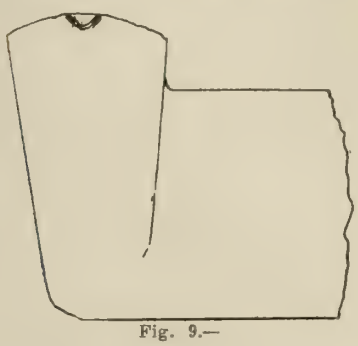

Fig. 9.—

ined will show in many cases the scratches left by the emery wheel from the original grinding of the tool.

With roughing tools made of old-fashioned tempered steel, and which have been speeded close to their "standard speeds" in most cases after removing this "dust pile" from the lip surface the cutting edge of the tool will be found to be distinctly rounded over. And in cases where the tool has been cutting a very thick shaving, the edge will be found to be very greatly rounded over, as shown in the enlarged view of the nose of a tool in Fig. 7.

With carbon steel tempered tools at standard speeds the cutting edge begins to be injured almost as soon as the tool starts to work, and is entirely rounded over and worn away before the tool finally gives out, but the tool works well in spite of its cutting edge being damaged. While with high speed tools at standard speeds, the cutting edge remains in almost perfect condition until just before the tool, gives out, when even a very slight damage at one spot on the cutting edge will usually cause the tool to be ruined in very few revolutions.

Carbon tempered tools and also, to a considerable extent, the old-fashioned

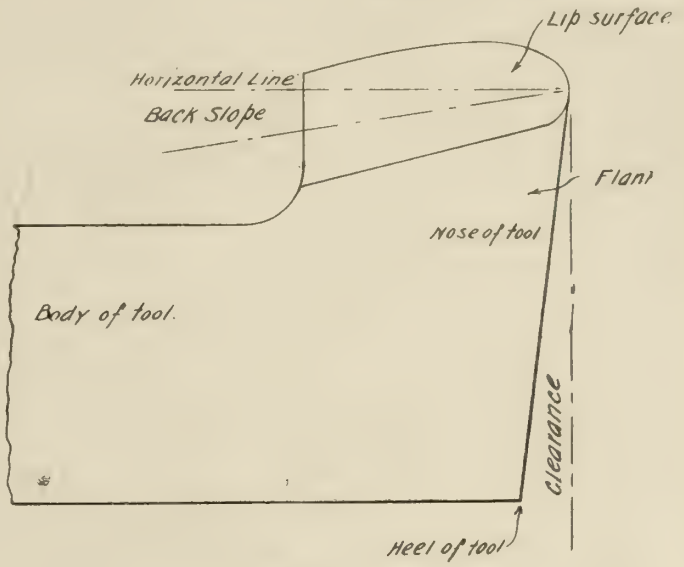

Fig. 10.—

self-hardening tools such as Mushet, when run at their "standard" speeds, pass through the following characteristic phases as they progress toward the point at which they are finally ruined "Rounding of the cutting edge," "mounting of the steel upon the lip," and the "rubbing away beneath the cutting edge." Long before the tool is ruined the fine particles of steel or dust scraped off by the cutting edge, begin to weld or stick to the lip of the tool and mount upon it sometimes from 1-16 inch to ¼-inch in height, as shown in Fig. 6. As stated above, in the case of modern high speed tools the damage caused to the tool through the action of cutting is confined almost entirely to the lip surface of the tool. Doubtless also the metal right at the cutting edge of the tool remains harder than it is directly under the centre of pressure of the chip, because the cutting edge is next to and constantly rubs against the cold body of the forging, and is materially cooled by this contact.

Whether the lip surface be ground away at high speeds or at slower speeds, the nose of the tool is generally "ruined" in a very short time after the cutting edge has been so damaged that it fails to scrape off smoothly even at one small spot the rough projections which have been left on the body of the forging by tearing away the chip. The moment the body of the forging begins to rub against the clearance flank of one of these high-speed tools at or just below the cutting edge, even at one small place, the friction at this point generates so high a heat as to soften the tool very rapidly. After a comparatively few revolutions, the cutting edge and the flank of the tool beneath it will be completely rubbed and melted away, as shown in Fig. 8. A tool which was still in "fair" condition when removed from the lathe, although showing some slight signs of ruining, is shown in Fig. 9. The above characteristic of holding their cutting edges in practically perfect condition while running at economical speeds up to the ruining point is a valuable property of the high-speed tools, since it insures a good finish, and the maintenance throughout the cut of the proper size of the work, without the constant watchfulness required on the part of the operator in the case of old slow-speed tools with their rounded and otherwise injured cutting edges, which when run at economical speeds were likely at any minute to damage the finish of the work.

But when one of these high-speed tools is nearing its ruining point, a very trifling nick or break in the line of the cutting edge will be at once noticed by

its making a very small but continuous scratch, projecting ridge, or bright streak, on the forging, that is, upon that part of the forging from which the spiral line of the chip has just been removed, thus warning the operator of the impending break down of the tool.

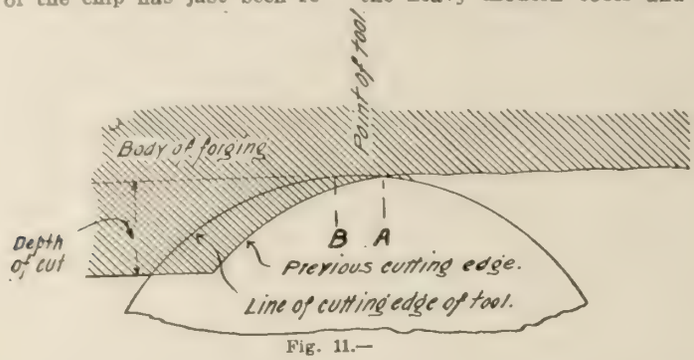

Fig. 11.—

Proper Speed to Run High-Speed Steel.

There can be no uniform standard for the speed for the reason that even on the same class of material there is a wide variation in the speed that it can be econnomically worked and then again a forging of large dimensions can be cut at a greater number of feet per minute than a small one on account of its capacity for carrying of the heat generated, and the tool is not cutting on the same point on the circumference so often on account of the larger diameter. A cutting speed which will cause

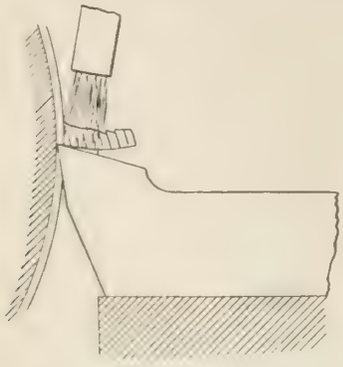

Fig. 12.—

a given tool to be ruined at the end of 80 minutes is about 20 p.c. slower than the cutting speed of the same tool if it were to last 20 minutes. On the whole it is not economical to run roughing tools at a cutting speed so slow as to cause them to last for more than one and one-half hours without being reground, this, of course, refers to working on ordinary machinery steel.

High speed can be used on forgings up to 110 feet per minute, but only on short cuts and light feeds on such work as bolts, pins, etc., but when working on heavy rigid forgings that require heavy reduction to bring them to desired size it is more economical to increase the feed to the limit of the machine capacity and reduce the feed to suit, as you will find that by reducing the speed 25 p.c. the feed can be increased 50 p.c.

Heavy cuts and heavy feeds have become specially necessary because superintendents of shops have found it more economical to reduce forging to size by the heavy modern tools and high-speed steel, that under the hammers in the forge shop, and are therefore having much more material to remove than they formerly did.

The following are some tests I have made from time to time with high-speed steel:

1st. Locomotive driving axle, speed, 75 fet per minute; reduction in diameter, 1 5-16 in.; feed, 3-16.

2nd. Old locomotive steel tyres, two tools; depth of cut, ½-in.; feed, 5-16-in.; speed, 28 feet per minute; metal removed, 155 lbs. in 12 minutes.

3rd. Six pair of old and two pair new 63-in. locomotive driving tyres turned in 5 hours 50 minutes; average time, 43.75 minutes each; average cutting time, 35.87 minutes each pair; speed from 14 to 21 feet per minute; 5-16 feed; depth of cut, ⅜-in.

4th. Forged steel shaft, 16 in. diameter, 13 feet long; feed, ⅜-in.; depth of cut, 1 1-16-in.; speed, 50 feet per minute; the tool took this cut entire length with one slight grinding.

Now, I do not pretend to say that this is the average cutting speed for high-speed steel, but only to show how much high-speed steel will do.

Regarding the shape of turning tools, you will note in this paper that I have only referred to standard roughing tools. The shape of tools is of just as much importance as the material they are made of, and must have the following requirements:

1st. To have the work true and sufficiently smooth.

2nd. To remove the metal in the shortest possible time.

3rd. To do the largest amount of work with the lowest cost of grinding and forging.

4th. To be adopted to the largest variety of work.

5th. To remove the metal with the lowest horse-power.

6th. It must be shaped to have the point as strong as possible and cutting edge supported.

One difficulty in practice is to have always a supply of sharp tools for the machinist, and it is better to have a few shapes and plenty of tools, than to have many shapes and not enough of any one kind. These should be ground to templets, if they must be done by hand; but an automatic tool grinder will pay even in a moderate-sized shop.

Fig. 10 represents a good standard roughing tool, and note that the lip surface is raised above the body of the tool; this is to increase the life of the tool before being reforged and also to reduce the grinding to a minimum.

Curved Cutting Edge Best.

The curved-edge cutting tool is best for roughing in all cases, for the reason that it removes a shaving which varies in its thickness at all points, and that the part of the cutting edge which finishes the cut is removing so little metal that it remains sharp even though most of the cutting edge has been worn or broken away. The effect of this is shown in Fig. 11. This indicates that the accuracy and finish of the work depend on that part of the edge from A to point B remaining sharp and uninjured.

The curved face, as you will note on Fig. 11, also puts the heaviest part of

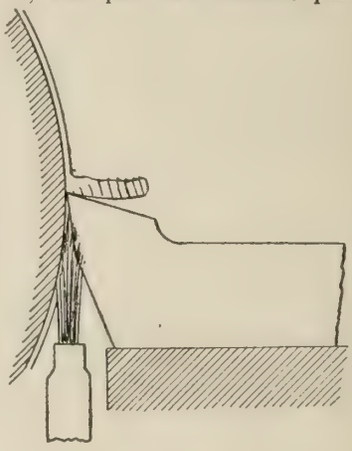

Fig. 13.—

the cutting back from the point, and where the tool is heavy and can carry off the generated heat. Standard tools should have a clearance angle of 6 degrees for all classes of material, and a back slope of 8 degrees for all material, and a side slope of 14 degrees for cast iron and hard steel, and 22 degrees for medium and soft steel.

The lip angle is determined by making it just blunt enough to stand the cut without crumbling or spalling. A sharp side slope is better than a sharp back slope, because the tool can be ground more often without weakening it, the chips run off better, the strain is more on the base of the tool and it is easier to feed.

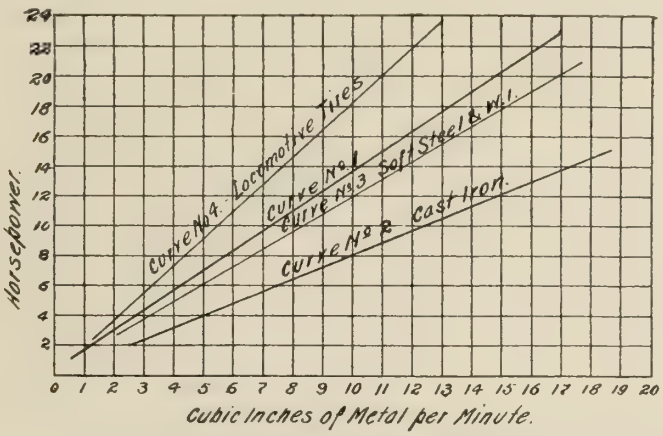
It may seem strange that the lip angle for cutting cast iron is not as keen as

for the softer steels, but the highest cutting speeds, with equal depts of cut and feed, can be obtained by using the angles given. The thickness of the shaving has the most important effect on the cutting speed, much more so than the depth of the feed. This is the reason for the advantage of the large curve on the cutting edge, as this decreases the thickness of the shaving, as can be seen in Fig. 15.

The clearance angle of any tool is the most important and if it is more than 6 degrees it will not properly support the cutting edge, which will break and cause a fracture of the tool.

Grinding of High Speed Tools.

I believe more tools are ruined by careless grinding than by any other means, and it is a peculiar fact that



Horsepower.

Curve No 3 Soft Steel & Nickel
Curve No 2 Cast Iron.
Cubic Inches of Metal per Minute.

CHART OF HORSEPOWER REQUIRED TO REMOVE METAL

FIG. 14.

which high speed tools can be run at a high temperature in work without injury.

They are easily destroyed on an emery wheel, and if the tool is pressed firmly against the wheel and allowed to heat up you will find small cracks started in the steel In a great many shops high speed tools are ground on a dry wheel, but I think this is a mistake, and again when a wet wheel is used there is not a sufficient amount of water used. Experience has shown that not less than four gallons of water per minute should be used. Automatic grinders should be used for heavy grinding on all high speed tools, as the pressure on the wheel is uniform and the shape of the tools are kept uniform, and much better results will be obtained in turning out work.

Use of water on Material where Turning.

Water used on a high speed steel increases its capacity in every case and the gain practically the same for all qualities of steel. and for removing thin or thick chips. With high speed tools a gain is made by using water on cast iron, contrary to most beliefs.

A heavy stream of water should be thrown directly on the chip as shown in Fig 12 and not up the chip as in Fig. 13. even though this might seem the correct way. Experience has shown that throwing it on the chip takes away the heat fastest. A guide to the amount of water to be used is that three gallons a minute is right for tools 2 x 2½ inches, and less for smaller tools. The gain is efficiency by the use of water is given as:

40 per cent. with modern high-speed tools.

30 per cent. with old-style self-hardening tools.

20 per cent. with carbon-tempered tools.

16 per cent. in cutting cast iron.

In some shops various cutting compounds or lubricants (as they are called) are used on lathes and planers, but there is no extra efficiency using this material on an engine lathe or planer, any further than it does not rust the machine. However, these compounds give first-class results on drills, screw-cutting machines and turret lathes, but with these you require both a cooling and lubricating mixture, whereas. on ordinary turning all that is required is cooling.

Horse-power Required Using High-Speed Steel.

With the advent of high-speed steel the power required to drive the machines to their maximum increased enormously, for example:

- a 12-in. lathe increased from 1 to 4 horse-power.
- a 30-in. lathe increased from 5 to 20 horse-power.
- a 72-in. lathe increased from 15 to 50 horse-power.

and in a test made with a 72-in. lathe with a cut 1½-in. drip and ¼-in. feed and 30 feet per minute, required 75 h.p.

Fig. 14 shows the horse-power required to remove metal with roughing tools of the shape mentioned previously in this paper, and it must be remembered that the shape not only increases the life of the tools and is easier on the machine, but there is also a marked difference in the power required.

Forging.

For forging high-speed steel an ordinary forge fire will serve, though, indeed, better results may be expected if better apparatus is used. The principal thing is to secure the required heat, and to keep air currents away from the tool in heating. For small tools of the simpler sort, good results are sometimes obtained from an ordinary open fire. The result is, however, much more likely to be satisfactory if a sort of a hood is built over the fire. This serves to prevent the radiation of heat and the circulation of air currents, and is a necessity in heating tools of any size. It also makes it easier to bring up the heat gradually, and to apply it uniformly on all sides of the tool, so that the heat penetrates uniformly. This is an important point. Unless the mass of steel to be wrought is uniformly hot throughout, it will work unevenly in forging, with the result that internal strains are set up, which may ruin the tool when it is put at work, if not before. Though the heating is to proceed gradually, in the sense that it must be regular, it may go on quite rapidly. In fact, it should be done as rapidly as may be without burning projecting edges or corners. Unless this is done the heat soaks up into the neck or shank, and when hardening takes place this important part of the tool loses some of its toughness.

The Right Heat.

However, the fire must not be too hot, for in that case the outside is likely to be burned before the interior is thoroughly heated. In any event there is a likelihood that the toolsmith may be deceived into thinking the whole mass properly heated when in fact only the outside is hot enough for forging. If the interior has not reached a bright red heat, or 1400 degrees F., it is not ready for hammering. Of course it is impossible to know the condition of the interior, except through its behavior under the hammer after removal from the fire, and it is largely a matter of experience to determine the proper time during which a tool is to be heated.

Heating for Hardening.

The extent to which the heating is to be carried for hardening may vary within narrow limits. just short of melting point. The steel will then be at a dazzling white, and just beginning to flux. Some brands reach this point somewhat short of the extreme white color. Where this is the case, care must be

Continued on Page 41.

A Day's Ramble Through the M.C.R. Shops at St. Thomas

By Fred. H. Moody

Every Shop has its Ways and Means of Meeting Exigiencies That Arise in the Shape of Unusual or New Jobs, but the Railway Repair Shop has an Exceptionally Large Number of Such Special Tools. The M. C. R. Shops, Under the Direction of an able Staff of Men, have Developed Numerous Special Methods and Devices, a Number of Which Were Picked up by the Writer in a Recent Trip Through the Shops, and are Here Given with Some Detail, as They Will Doubtless Prove Beneficial to Machinists, in General, in Developing Initiative for Undertaking New Jobs.

PART I.

The railway repair shop usually proves to be a store house of excellent ideas of doing work, for, from the class of work to be done many special operations are made, necessitating special tools and machinery. The saying that "necessity is the mother of invention" applies very forcibly in such shops, for when necessity arises, the tools essential to the work, are usually forthcoming. The Michigan Central repair shops afford an exceptionally good example for tools of all kinds abound, the majority of them showing much ingenuity.

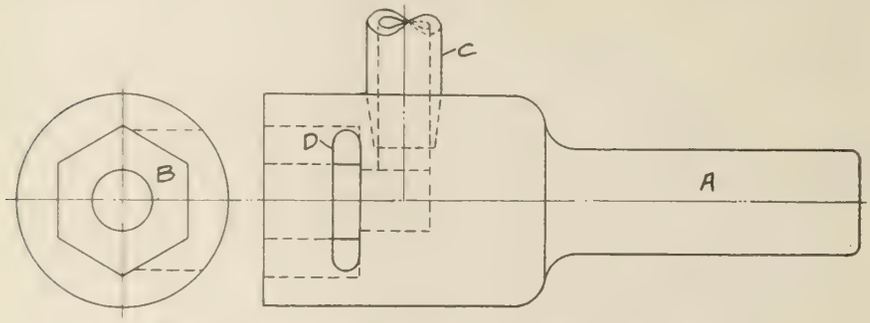

Fig. 1.—Self-cleaning Nut Holder for Turret Lathe.

Machine Shop.

The machine shop invariably has a number of special methods, and this shop proves to be no exception. Fig. 1 shows a nut holder for use in tapping nuts on the turret lathe—brass nuts in particular. The special feature is that it is self-cleaning. The shank A is held in the turret head, and the nut in recess B. A blast of air is admitted by a valve to gripe C, which blows into the holder removing the chips. The intensity of the blast can be so regulated as to keep the holder always clean with no interfering chips or cuttings. The chips and blast are let out through side passage D during the tapping operation.

The turret lathe has developed a number of special tools in these shops, Fig. 2 being representative of one class of such. As can be seen, it is a forming tool for boring and turning the nipple A, the only other operation required being the bevelling of the end by the cutting-off tool. In form, it is like a hollow mill with an inserted formed tool to do the internal work. The tool consists of a tool steel body B, of which the shank C is held in the turret head. The mill is bored out to the external size of the finished nipple A at D, the face of it finishing the shoulder E. An inserted tool F, ground like a flat drill to correspond to the two internal diameters, bores as desired, this tool being set as desired by set screw G, bearing on the shank of the tool. The whole mill can be dissembled for regrinding, when needed, and is therefore very convenient. The tool F can be sharpened at an ordinary wheel without setting up in a cutter grinder. As before mentioned this system is used extensively, this one tool affording but a single example. The same tool may be used for different bores by inserting a different sized cutter F, and similarly the internal cutter F may be used in other mills of larger size. This plan has been developed to a considerable extent.

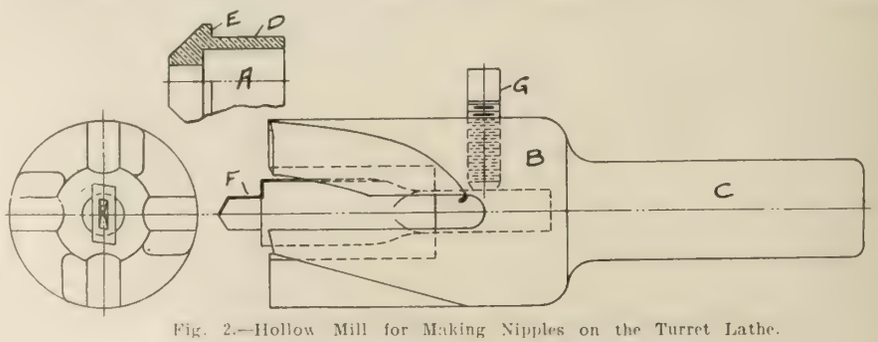

Fig. 2.—Hollow Mill for Making Nipples on the Turret Lathe.

Fig. 3 shows an excellent form of roughing reamer used for roughing out the valve stem connection shown at A, Fig. 4. Referring to Fig. 3 it can be seen that the reamer is formed from round stock flattened and tapered to the approximate size shown. The reamer is turned to the finished tap, and and threaded with a type of worm thread, with a pitch of three. The valve stem is first drilled, and then this rough reamer inserted, all these operations being done on the turret lathe. Each of these teeth presents a separate cutting tool to the work reducing it very rapidly, in fact, as heavy a feed may be used as with the drill. After this roughing operation, the usual finishing reamer is employed.

Separating a tapered pin connection, such as that shown in Fig. 4, usually presents considerable difficulty, as the taper key used to hold the two parts A and B together, forces the two parts together very tightly. The following method is employed to separate them: After the removal of the key two pieces shaped like C and D are inserted. C is cut out at the centre, and D has a central projection as shown. The wedge E when driven down, forces outward on the projection of D and loosens the two parts, which can then be removed. This is much preferable to the customary method of loosening by tapping on the outer shell, the latter method also mars the work.

Many and divers are the bolt hole facing tools in use, but the one employed at these shops, is second to none. While it is not new in principle, it is so seldom seen, that it is worthy of description. The general construction, feed, and other details, are so well understood, that a description is unnecessary. The interesting feature lies in the cutter A, which is turned up, and the teeth milled out from a high speed steel block. In place of being keyed in the usual manner, the centre

hole is bored flat on one side, and the bar itself flattened to correspond. This acts as the drive for the cutting tool. Being made of high speed steel, it

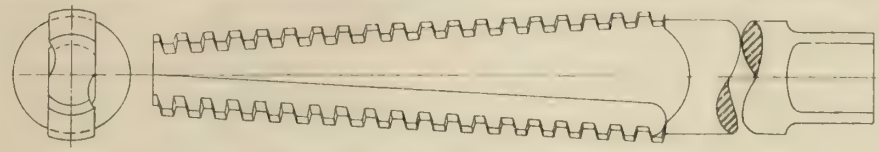

Fig. 3.—Rough Reamer for Turret Lathe.

stands a good deal of abuse in the shape of being roughly used on the hard skin of the casting. It is principally used for facing the bolt holes in the locomotive saddle, i.e., the connection between the cylinder and boiler.

Where similar wedges must be produced in sets, a simple method of setting them up must needs be employed, if rapid and accurate work is to be expected. The jig shown in Fig. 6 meets these requirements admirably. They operate in pairs. Essentially, they con-

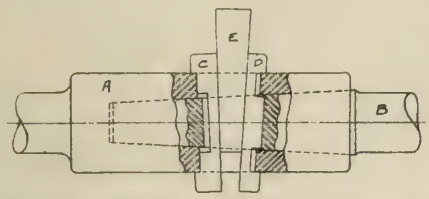

Fig. 4.—Removing Valve Steam from Valve Rod.

sist of a steel forging A with a projection to fit the planer slot, and two lugs B B through which are the set screws D D. In the base, are the two screws E E with pin tops, which fit into holes in a strip F. In use, the screws E E are so adjusted as to give the proper taper to the shoe to be planed. The shoe is inserted into the jig, and is shoved against the shoulder which lines up the work. To hold the work more securely than it would be possible with the use of set screws alone, intermediate pins H H are used, which are of hardened steel pointed at the end which touches the work, and round to fit the set screw at the other end. They can be set at any angle to bring a considerable downward pressure

Fig. 5.—Bott Hole Facing Tool.

on the work. To set up, the left set screw D is screwed up with its intermediate pin, against the work, shoving the wedge over to shoulder G. The other set screw D is then tightened down on the work. The shoulder G aligns it perfectly. While apparently

light in construction, 1 inch cuts with 1-16 inch feed can be taken on cast iron locomotive wedges.

A convenient vise for planing thin strips is shown in Fig. 7, and is employed for planing the thin valve strips used in locomotive balanced D slide valves. The jig consists of a body A, on the top of which the work is secur-

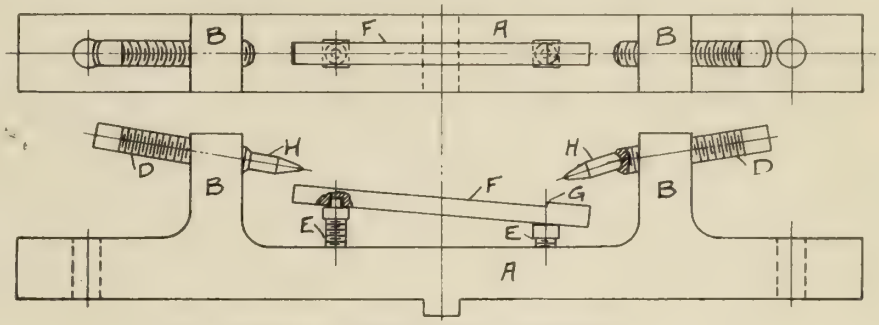

Fig. 6.—Planer for Planing Wedges and Slippers.

ed. The body has a groove B, to fit the planer to which it is bolted. Two stationary projections C C of thin bar iron align the work, and it is held on the other side against these projections

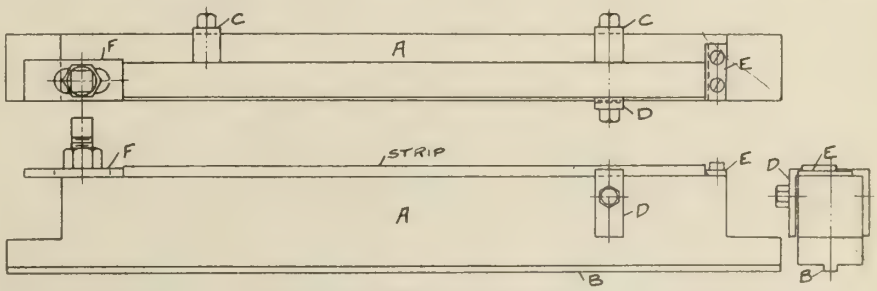

Fig. 7.—Planer Vise for Val e Strips.

by the piece D which is tightened down on the strip. The stop E is a hardened steel strip knife edged against the strip being planed. It is held at the other end by piece F, which has a bolt slot. The bolt is tightened down loosely and then F is tapped up tight when the bolt is tightened down securely. It is thus held firmly from all sides.

A handy jig for turning locomotive brasses is shown in Fig. 8, the broken lines indicating the way in which it is supported. The cast iron body A, which swings between lathe centres, has the two screws B B passing radially through the centre. The brass is set in on this, and the end set screws C C tightened down loosely, holding the brass against the collar D of the jig. The brass is then centralized in the usual manner by adjusting screws E B, and tapping the brass from side to side, when the screws C are tightened down and the brass machined. The principal feature of the jig, is the ready manner in which the second and succeeding brasses of a set may be chucked. After the first, B and B are correctly set so the simple side adjustment is all that is necessary, the brass swinging on the tips of screws B B. The whole is driven through the double lug E, by dogs on the lathe face plate.

Fig. 9 is from a data sheet gotten out by the apprentice department. Each of the different shops of the New York Central lines, gets out several such each year. This one, while not exactly new, has never been seen by the writer in this form, and ought to prove of value in determining the nature of a ferro metal when no other means is at hand.

For testing boilers with hydraulic pressure, a handy pump has been rigged up, utilizing old parts. The pump itself has a 3-inch plunger, and the power end consists of an old 8-inch air cylinder. Using the slip air pressure on this produces an extremely high hydraulic pressure for the boiler, the latter being regulated at will by the air pressure.

On the boring mill, in place of the usual type of movable chucks, they have special chucks made from steel forg

ings, and which will therefore stand the great strain put upon them, when holding heavy steel locomotive tires. Each

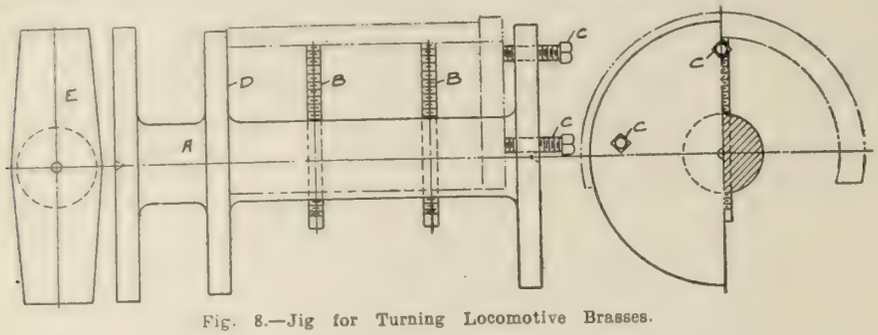

Fig. 8.—Jig for Turning Locomotive Brasses.

chuck has a dowel hole, which corresponds at different points on the boring mill table, with similar holes. The

Fig. 9.—Spark Test

dowels being used, relieves the tightening bolts from any strain, and prevents slipping of the chuck on the table.

GOOD CUTTER BAR.

Fig. 1 shows the tip of an excellent cutter bar used in the shops of the London Machine Tool Co., Hamilton, the cutter for which is shown in Fig. 2. In operation the bar is usually attached to a support on the carriage of the lathe, and centred by a steady rest, the carriage feeding it forward into the work. A steady stream of water is forced onto the cut at all times by two imbedded brass tubes AA, down the side of the cutter bar, which is $\frac{1}{8}$ inch smaller than the bore. This heavy stream of water, keeps the tool cool, and at the same time drives out the chips through the longtitudinal cut-outs BB.

The pin C is absolutely central in the bar, as the hole in the cutter, Fig. 2, is central, making the cutter reversible. As new ends are often required on the cutter bar, from the fact that the old ones twist off or become broken, etc., a jig is used, which makes central

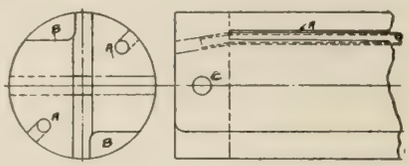

Fig. 1.—A Good Cutter Bar.

drilling very easy. This jig is shown in Fig. 3. The bar is shoved in from the left, in a bush if required. the end slot going up against the crosspiece, so that the hole C in Fig. 1, is always the same distance from the bottom of the groove. No trouble is thus experienced in reproducing ends for any size as a range of bushes are always on hand.

The particular feature about the cutter-bar is the cutter, shown in Fig. 2, which is made standard in every way and is formed of high speed steel. A special jig to take any size cutter is used to drill the hole A centrally and the same standard distance from the back adaptable to any size, the cutter is tap-

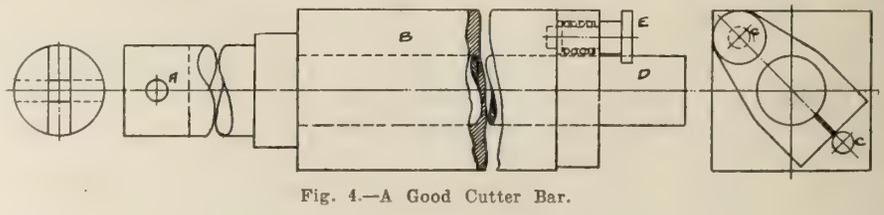

Fig. 4.—A Good Cutter Bar.

as with the bar. Then in another jig, ered and the lip cut by a 2-pitch stocking miller in both sides by reversal. It will be noticed that the lip becomes deeper towards the centre, caused by the special design of the jig. Its special feature is its flexibility for machining any sized cutter.

After tempering, the blades are sharpened in a Gisholt grinder, the special jig shown in Fig. 4, being used. The cutter is held in the left hand groove by body B of the jig, is held in the adjustable arm of the grinder, which can be set for 70 degrees, the angle of the cut- a tapered pin in hole A, the cutter being held against the back shoulder. The

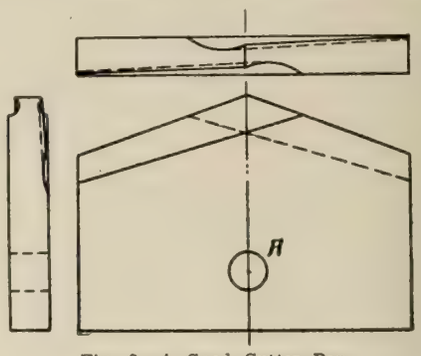

Fig. 2.—A Good Cutter Bar.

ter. D is an arm that extends from end to end through the jig body, and holds the cutter. C and C are two holes on the same circle, 180 degrees apart. After setting for, and grinding one face of the cutter, the spring pin E may be pulled up, and the arm D containing the cutter,

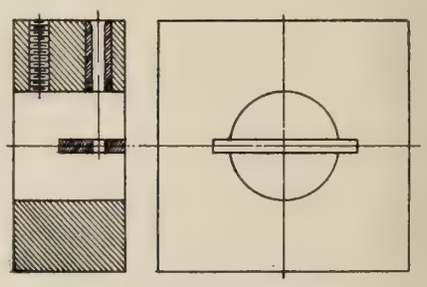

Fig. 3.—A Good Cutter Bar.

swung 180 degrees so that the pin E is in the diametrically opposite hole, so that the cutter can be ground exactly the same as the other face. Similarly the grinder table can be set for the sides micrometer measurements. Thus any cutter will fit either way into a cutter bar. But, to insure against any possible which can be symetrically ground to error, the parts are all numbered to fit one way.

The whole cutter-bar, cutter, and necessary jigs, reflect credit on the designer, as they are adapted to a wide range of work. The standard features of the bar and cutter, which make them mutually interchangeable is a very prominent and noteworthy feature.

HIGH SPEED STEEL.

Continued From Page 37.

taken that sharp edges and angles of the tool are not melted down. As in forging, it is necessary to see that the heating proceeds uniformly, and reaches through the entire mass of metal.

The Air Blast.

As most of the high speed steels harden by mere exposure to air, little apparatus is absolutely required in addition to the heating furnace; and some very good results have been obtained with none at all. The hardness of the steel depends considerably, however, on the rapidity of the cooling,, therefore mere exposure to the air and slow cooling is not always satisfactory — for many purposes, indeed, it is very unsatisfactory. Most makers recommend the air blast for hardening. As this furnishes a continuous supply of good air in rapid motion, the result is generally good.

Since part of the latent heat in the air is extracted in the process of compression, compressed air is better for the purpose than that from a blower. The convenience and simplicity of this agent, when available, recommends itself.

The Different Uses of High Speed Steel.

When high speed steel was first introduced users were of the opinion that it was only fit for roughing tools. This was a fact at that time as the edges of the tools would not keep sharp enough for the finer classes of tools. However, since that time the manufacturer of high-speed tools have improved it so that at the present time it can be used, and is used, for milling cutters, reamers, cold saws, and, in fact, all machine shop tools, with good success, and a great increase of efficiency over carbon steel, and at the present time it is also used for the very finest of tools, even razors.

Machining a 12,000 h.p. Generator at the Canada Foundry

The Contract Between the Ontario Hydro-Electric Commission and the Ontario Power Co. at Niagara Falls has Necessitated the Making of Three 12,000-h.p. Generators, the Contract for These Being Secured by the C. G. E. The Machine Work on These Large Machines is Being Done at the Canada Foundry, Toronto. As Many Large Jobs are Now Being Done in Canadian Shops, the Machining and Handling of These Large Generator Frames Cannot Help but be of Interest.

THE Ontario Power Co., Niagara Falls, in order to supply the power required by the Hydro-Electric Power Commission, have placed a contract with the Canadian General Electric Co., Toronto, for three new units of 12,000 h.p. These are 3-phase, 25 cycle, 12,000 volts and will run at 187½ r.p.m.

The machining of these three large generators was done at the Canada Foundry, Toronto, under the supervision of Mr. Loach, general foreman. An idea of the size may be gained by reference to the accompanying illustration.

Setting on Planer.

The first operation was to plane the jointing surfaces of the two parts of the frame. The joint line was set up parallel, but on account of the large diameter of the hubs, it would not pass through the housings. One end, was, therefore, planed first, then it was turned and reset against an angle plate and other end finished to angle plate, giving a perfect line.

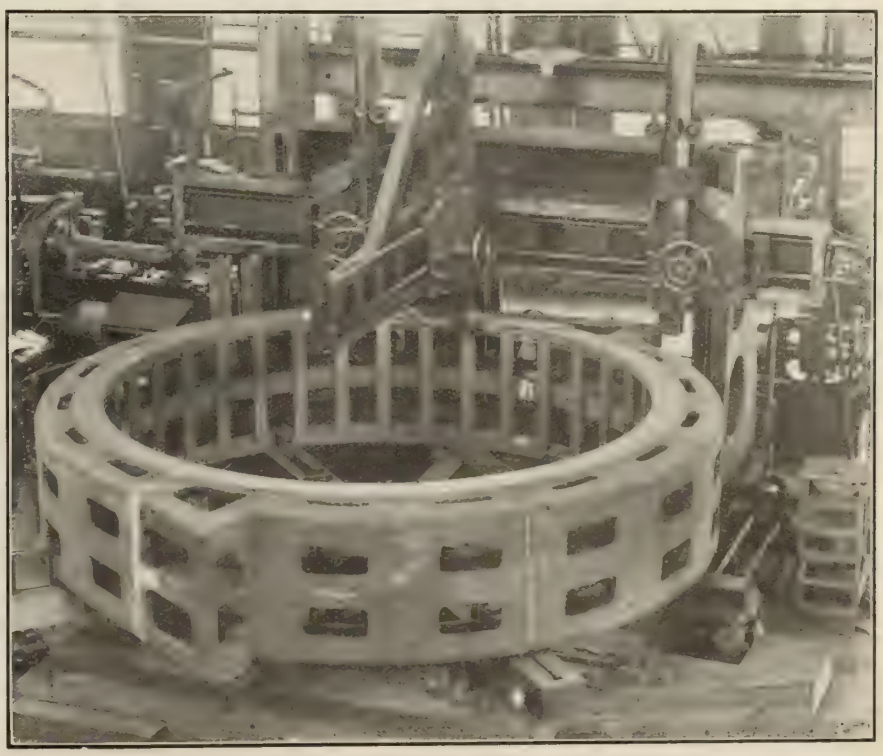
Slotter and Drilling.

After the planing it was taken to a locomotive frame slotter and slotted for the 1½ in. keyway on both sides, the two keyways being done at once.

It was then drilled on two drills at once. There are four 2 in. holes on each end for 2 in. turned and fitted bolts with case-hardened heads. The two parts were then assembled in a wheel pit and the keys fitted.

The bore of the frame is 14 ft. It was machined to size on an 18 ft. boring mill. This is a 20 ft. 4-inch job, and was done on the 18 ft. mill by running the housing back, taking off small parts and erecting parallel strips on table of boring mill extending out to take in the job. The mill is a back geared powerful mill driven on face plate built by John Bertram & Sons Co., Dundas. The mill operated successfully under the load of 38,040 lbs.

After boring, which had to be done to within .001 in., to keep air space in generator accurate to give high efficiency, it was put on a planer and the legs that set on the base were accurately planed. This was done by setting up to the centre line of bore as in many cases a casting has to be moved from plane centre of casting. In this method a correct height from base for bearing is obtained.



Machining 12,000 h.p. Generator Frame at Canada Foundry, Toronto.

Lake Superior Corporation and Subsidiary Companies

Large Additions are Being Made to the Various Interests of the Lake Superior Corporation, Which Will Make it One of the Largest Steel Plants in America. Altogether 7,840 Men are Given Employment at the Present Time. Last Year was a Record Year With the Company, but 1911 Will, no Doubt, Show Increases. The Enlarging of This Industry Shows the Satisfactory Outlook for the Canadian Steel and Iron Trade.

THE Lake Superior Corporation is undergoing a period of prosperity which necessitates many large additions to the plants. Among those affected are: Dominion Tar and Chemical Co., tar distilling plant; shingle and keg factory in connection with the Algoma Steel Co.; Soo saw mills; Bi-product coke oven plant; Docks, coal, rail and ore; Algoma Central Railway; Algoma Steel Co., blast furnaces; Gas washing plant; Gas Engine Power Plant; Open Hearth Department; Bessemer Department; Blooming Mill; Rail Mill; Finishing Mill; Merchant Mill; Algoma Iron Works; Sault Ste. Marie Pulp & Paper Co., and Lake Superior Power Co.

Tar Distilling Plant.

The plant of the Dominion Tar & Chemical Co. is under construction. This plant will employ 50 men to start with and will manufacture out of the coke oven tar, hard pitch for briquetting purposes, creosote for the preservation of timber and light oils.

Shingle and Keg Factory.

The Algoma Steel Co. have nearly completed a factory for the manufacture of shingles, kegs and boxes to be used in shipping material such as spikes, bolts, nuts, and other steel products of the new Merchant Mills. This plant was formerly a hardwood veneer plant and is being converted into the above.

Soo Saw Mill.

The Soo Saw Mill has a capacity of 250,000 ft. per day, 40,000 shingles per day, 35,000 pickets per day and 60,000 laths per day giving employment to 180 men. There is now 10,000,000 ft of lumber on hand, all sold, being shipped as fast as seasoned. The mill is operated from March 1 to Dec. 1, the season's cut being 26,000,000 ft. Logs are cut on Algoma Central grant lands and brought to the Soo by Algoma Central Ry. and by water.

T. J. DRUMMOND,
President Lake Superior Corporation.

Blast Furnace Plant, Lake Superior Corporation, Sault Ste. Marie

By-product Coke Oven Plant.

This plant is under construction and will employ 125 men. There will be 110 Koppers type ovens installed by H. Koppers, Essen, Germany. The size of the ovens is 37 ft. long, 19 ft. wide and 10 ft. high, each charge being 12.75 tons of coal. The yield per oven is 76 per cent. or 9.69 coke per oven, the time required being 21 hours. The total capacity of the plant is 1100 tons per day of 24 hours, blast furnace coke, 505,000 tons coal per annum being required.

The coal used is gas coking coal from Cannelton, West Virginia. The company has acquired 6,000 acres of coal lands in West Virginia from the Cannelton Coal & Coke Co. and are now operating them.

One of the bi-products will be 27,000 tons of tar per year, to be used by the Dominion Tar & Chemical Co. The 5400 tons sulphate of ammonia per year will be sold in the general markets and the 7,500,000 ft. surplus gas

Crusher Plant and Shafts, Helen Mine, Michipicoten.

Helen Mine, Michipicoten. The Mines are Connected by Railway with Michipicoten Harbor on Lake Superior, a Distance of 11½ Miles. About 3,500 tons are Loaded Into the Boats in two Hours.

per 24 hours will be used in the Steel Plant for heating furnaces, soaking pits and fuel. The coke from these ovens will be used direct in the blast furnaces of the Algoma Steel Co. and handled in special cars by electric locomotives to the blast furnace tracks.

New Dock.

A coal dock of 900 ft. is under construction and it will be equipped with two unloading machines with a capacity of 600 tons of coal per hour from vessels. The total coal to be handled over this dock during season of navigation, May 1 to Nov. 30, is 650,000 tons. The coal storage is 1,100 ft. by 300 ft. for storage of winter supply of coal for coke ovens.

The rail dock, for loading rails and steel products into vessels for water shipment, is 450 feet.

The old ore dock is 900 ft. To this is being added 705 ft. making a total of 1605 ft. It is equipped with three ore bridges with 4-ton buckets, handling ore from vessels to docks and from docks to furnaces, the ore handled per year being 650,000 tons.

The total dock frontage is 2,955 ft., all deep water admitting the largest freight boats. Most of the ore and rails and a large portion of the coal is handled by the company's boats. All the docks employ 250 men.

The commercial dock is used by the Algoma Central Ry. for handling all classes of commercial business, including coal for outside industries and different commodities from package freight boats.

Blast Furnaces.

Blast furnaces Nos. 1 and 2 of the Algoma Steel Co. have a capacity of 250 tons per day. The stacks are 80 ft. high and 10 ft. 6 in. in hearth. They are now producing Bessemer Iron which is taken direct to the Bessemer Converter and used in the form of hot metal. There are four steam blowing engines with 44 in. steam cylinders and 74 in. blowing tubs. These engines are to be replaced by the gas blowing engines now under construction.

The new blast furnace No. 3 will have a capacity of 450 tons per day with a stack 96 ft. high. The three blast furnaces will employ 250 men.

Gas Washing Plant.

Under construction is a plant for washing blast furnace gas by scrubbing with water to purify the gas for use in gas engines. In this connection a new pumping plant for water supply is being put in with a capacity of 30,000,000 gallons of water in 24 hours.

Gas Engine Power Plant.

The gas engine power plant has eight Allis-Chalmers gas engines of 2200 h.p. each, total horse power in building being 17,600. Four of these engines have blowing tubs for blowing the three blast furnaces, and the other four are direct connected with 1,500 k.w. generators for supplying electric power to the new Merchant Mills, docks, and for the Blooming Mill motor.

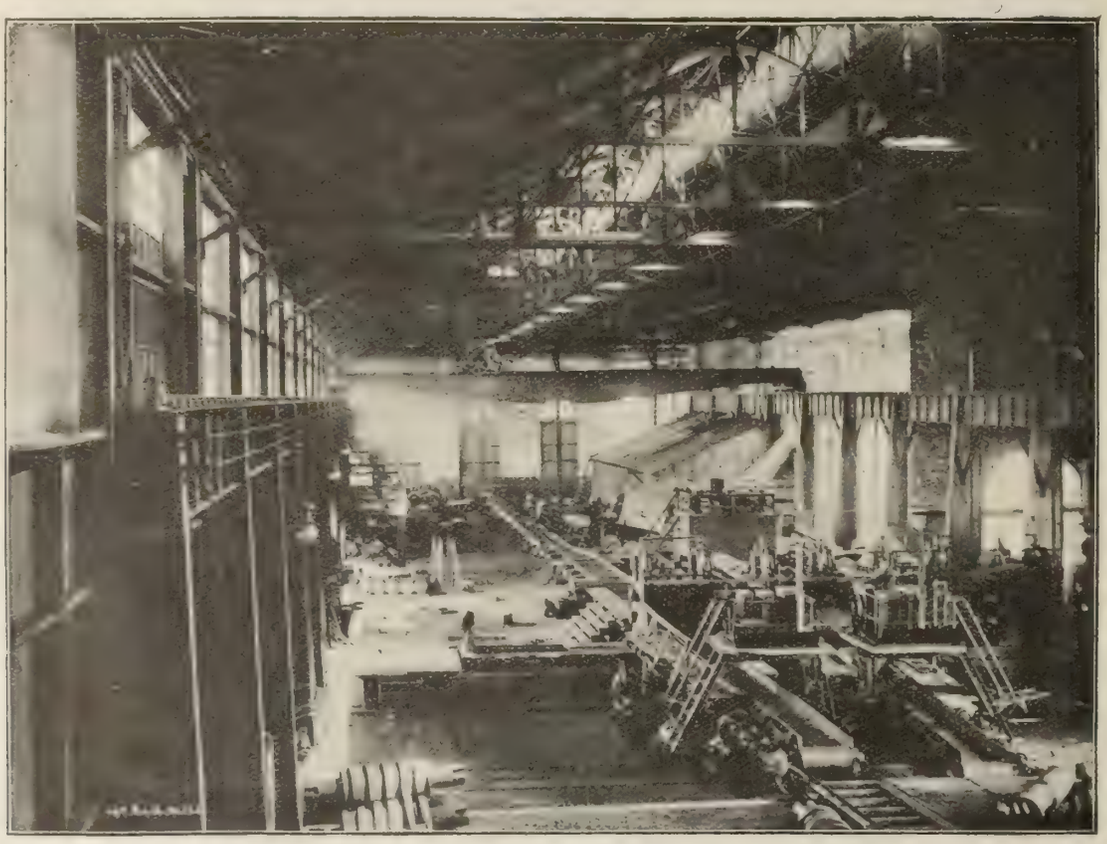
Open Hearth Department.

Three 40-ton open hearth steel furnaces are in operation, producing 280 tons steel per day. Three additional furnaces of same capacity are under construction and will be in operation early next year.

These furnaces are charged with basic pig iron and scrap which is converted into steel by high heat secured from the use of producer gas. The heat in these furnaces average about eight hours. Steel is poured into ingots and taken to soaking pits.

Bessemer Department.

Two 4-ton converters make from 175 to 200 heats per day. The average is 800 tons Bessemer steel in 24 hours. In these converters the hot iron from the blast furnaces, is used and converted into steel by the blast. These heats average about nine minutes and the steel is determined by color test. The steel is poured into ingots and taken to soaking pits to get uniform heat before rolling.



Interior of Rail Mill, Lake Superior Corporation, Sault Ste. Marie

Bessemer and Open Hearth Blooming Mill.

The steel ingots are taken from soaking pits and are rolled into blooms with 18 passes. The capacity of the mill is 1,200 tons per day. A 4,000 k.w., d.c. motor is being installed to operate this mill. The motor equipment will be in operation in Jan., 1911.

The blooms are cut at shears in lengths according to the weight of rail to be rolled. The blooms are then placed in reheating furnaces by electric charging machines to get even heat in the steel before rolling into rails.

The blooms are taken from heating furnaces and carried to rail mill by tables and passed through three stands of rolls, 11 passes in all to finished rail. The sections rolled are 56 to 100 lbs. per yard. Hot saw cuts rail to length 33 ft. before passing to cooling beds.

Rails after cooling are straightened, drilled, and loaded on cars. They are all tested to see that the section is perfect and not over $\frac{1}{4}$-in. variation allowed in lengths. Part of the product is shipped out by rail and part taken to docks on cars and loaded on vessels for shipment. The total number of men employed in the steel plant is 1,500.

The Merchant Mills include one 18 in. mill and one 12 in. mill. The product will consist of all shapes and sizes of steel from $\frac{3}{8}$ in. rounds to 8 in. beams and channels and 6 in. angles, also spikes, bolts and nuts, all railway fastenings and tie plates. The 18-in. mill will be operated with a 1,500 h.p. motor and the 12 in. by a 900 h.p. motor. Tables will all be electrically operated. This plant will give employment to 200 men.

The foundry produces 20 tons iron castings per day. The machine shops are equipped for both heavy and light work, and does work for outside companies in addition to repair work and renewals for the different subsidary companies. They employ 150 men.

The Sault Ste. Marie Pulp & Paper Co. produce 100 tons pulp per day from spruce wood cut in the company's wood operations. Water power is used by vertical turbines connected with pulp grinders. Steam dryers produce pulp 98 per cent. dry. About 150 men are employed.

Water power is used by the Lake Superior Power Co., through six penstocks to generate electric power for street railways. Tagona Water & Light Co., city use and power for different industries.

Other Interests.

In addition to these industries at Sault Ste. Marie, the Corporation owns and operates the International Transit Co. with $3\frac{1}{2}$ miles of track and 8-minute service electric cars; also the ferry between the two Soo's, having two large ferry boats, and the Trans-St. Mary's Traction Co. at Sault Ste. Marie, Mich., with 7 miles of track.

The Algoma Commercial Co. owns and operates car shops located on the line of the Algoma Central Railway with modern car manufacturing machinery, and an output capacity of 5 cars per day.

All industries at Sault Ste. Marie are located on the tracks of the Terminal Railway, which is owned and operated by the Algoma Central Railway.

The Algoma Central Railway is now operating 70 miles north of Sault Ste. Marie, and has 26 miles in operation from Michipicoten Harbor north, with 140 miles under construction, which will be completed by the latter part of 1911 giving a connection through from Sault Ste. Marie and Michipicoten to the Canadian Pacific.

The company owns and operates the Helen Iron Mine, located on the Algoma Central Railway, 11 miles north of Michipicoten Harbor, which produces 200,000 tons of high grade iron ore per year, and started shipping this year at the rate of 50,000 tons of 44 p.c. sulphur iron pyrites. This is the largest producing iron mine in Canada. The ore is all hauled to a modern dock at Michipicoten Harbor, having twelve loading pockets, and capacity of handling 1,000 tons of ore per hour from cars to vessel. In addition to Helen Mine, in this territory the company is now opening up the Magpie Mine, which has been proven by drilling to be a very large deposit of Bessemer ore. A large force of prospectors and six diamond drills are kept at work constantly in prospecting and testing iron properties.

PETRIE LEVEL.

The accompanying illustration is a full size reproduction of a level that is being sent to those interested by the H. W. Petrie Co., Front St., Toronto. It is a very useful instrument and is accurate in construction. Readers of Canadian Machinery, writing to H. W. Petrie on their company's letterhead and mentioning Canadian Machinery, will be supplied with one of these useful levels gratis.

H. W. Petrie Level

C. P. R. OFFICIALS' CONVENTION.

Matters of importance pertaining to the welfare of the C.P.R., the discussions being principally in connection with motive power and rolling stock, was the business discussed by the leading officials of the mechanical department of that company at the fourth annual convention which was held in Fort William recently.

Fifteen officials, including superintendents of locomotive power, master mechanics, assistant master mechanics, superintendents of shops and mechanical engineers, representing the C. P. R. system from coast to coast attended. The convention is held in Fort William annually the second week in November and at Montreal early in the spring.

New ideas as to the construction of locomotives for speed and safety, and also for the construction of passenger coaches, for the maximum of comfort are discussed. Those attending the convention in Fort William are H. H. Vaughan, of Montreal, assistant to the vice-president, who is the chairman; C. H. Temple, of Winnipeg, assistant superintendent of motive power on western lines; L. R. Johnston, Montreal, assistant superintendent of motive power on eastern lines; J. B. Elliott, Montreal, master mechanic of the eastern division; C. R. Ord, McAdam, master mechanic of the Atlantic division; J. Mills, Toronto, master mechanic of the Ontario division; A. Dixon, Toronto, superintendent of shops; G. Reid, North Bay, master mechanic of the Lake Superior division; R. Preston, Winnipeg, master mechanic of the Manitoba division; W. Woodhouse, Winnipeg, superintendent of shops; J. Frith, Winnipeg, mechanical engineer; G. Evans, Montreal, mechanical engineer; S. Phipps, Vancouver, master mechanic of the Pacific division; R. Pyne, Calgary, master mechanic; A. T. Short, Moose Jaw, master mechanic of Saskatchewan division.

PNEUMATIC TOOLHOLDER.

On page 48 of the November issue of Canadian Machinery is a description of a pneumatic toolholder used on Bertram wheel lathes. This clamp was designed by W. Peterson of the C.P.R. shops, Montreal, who has taken out. Canadian and United States patents. This patent, No. 128267, has been assigned to John Bertram & Sons Co., Dundas.

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

PITCH OF PROPELLERS.

By H. J. McCaslin.

It occurred to the writer, after reading with much interest Mr. Cleaton's article, Practical Method of Obtaining Pitch of Propellers, appearing on page 45, November issue of Canadian Machinery, that he, as well as other readers of your publication might, perhaps, be interested in a simple and inexpensive device employed extensively along the Great Lakes.

The outfit is shown in Fig. 1, and consists of 3 in. parallel pieces about 36 in. long, 2 in. wide and ¾ in. thick, and 2 little blocks about ¾ in. square. Two of the pieces are fastened together with a bolt or screw, in the form of an angle, as shown, this arrangement permitting the adjustment of the leg A while trying for the angle of pitch. The two little ¾ in. square blocks B are bradded to the lower leg C in about the position shown, and are intended for bearing joints, as the edge of this leg would not rest evenly upon the curved surface of the blade. Fig. 2 shows the manner in which the device is applied. The piece D is placed across the hub parallel with the angle which is set near the tip of the blade. Now by sighting over the upper edge of the leg A of the angle, the leg is adjusted untill it lies in the same plane as that of the upper edge of the piece D. This operation is identical to sighting over two parallels to detect the wind or twist in a board or surface, only in this case the leg of the angle is adjusted to suite the variation. Distortion is very apt to appear in the different blades of a propeller and it is advisable to try each one and then take the different average of any difference, which may be found.

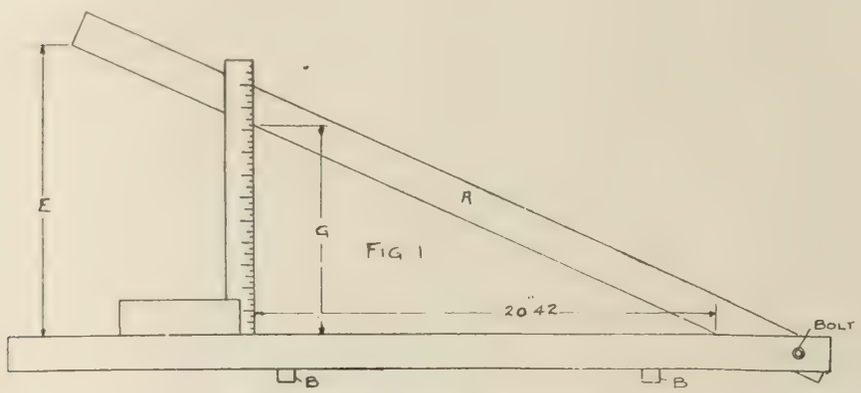

Fig. 1.—Measuring Pitch of Propellor.

To obtain this variation, the distance E can be measured after each adjustment of the angle to the various blades, and then the leg A set midway between the two extremes for making the calculations.

The distance F which is the horizontal distance between the angle and tip of blade is next measured and we are ready to calculate the pitch of the propeller. For an example, let it be assumed that the propeller to be measured is 6 feet 8 inches diameter with a pitch of 9 feet 3 inches, the latter dimension, of course, being the one to be found. Since the propeller is 6 feet 8 inches diameter and the angle is placed 1 inch from the tip of the blade as shown at F, the diameter upon which the pitch is taken would be 6 feet 6 inches and this diameter would have a circumferential length of 20.42 feet. Now by applying the scale of 1 inch=1 foot, we lay off 20.42 inches upon the upper edge of the lower leg of angle as shown in Fig. 1 and apply a square as shown, and measure the perpendicular distance G. This distance G is equivalent to the pitch of the propeller to a 1 inch=1 foot scale and it would be 9¼ inches in this instance which would be equal to 9 foot 3 inches, the pitch of the propeller.

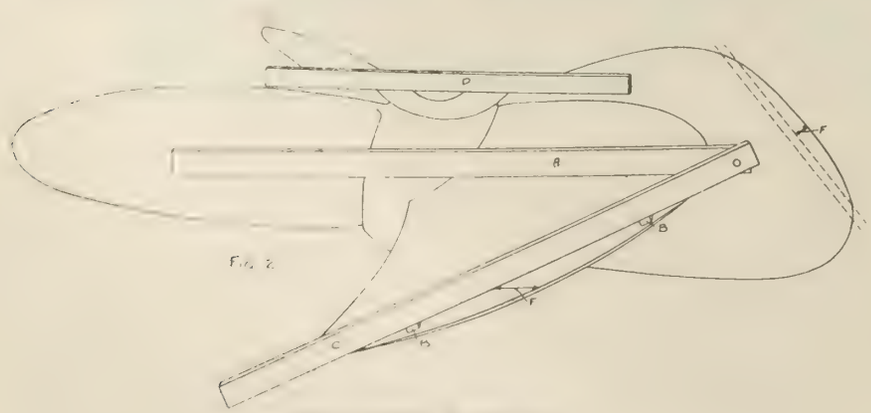

Fig. 2.—Pitch of Propellor.

The reason for the above method arises from the fact that a true screw or helex is formed by a right angle triangle wrapped around a cylinder, the base of said triangle will equal the circumference of the screw, the perpendicular will equal the pitch, and the hypothenuse will equal the length of the winding thread or helix.

MACHINING WATER WHEEL GATES.

It is principally with the boring of the pivot holes shown at A, Figs. 1 and 2, that this article has to deal, rather than with the general machining of the gates.

Consider first the small gate shown in Fig. 1. It measures 11 ins. from tip to tip, and is 12 ins. in width, with two 3 in. bosses B, one on either edge of the gate. The core of hole A is often off centre. Preliminary to boring this hole, the two sides are planed the proper width. Then, for the boring operation, an angle plate is bolted to the face plate of the lathe, the proper distance off centre, so that when the gate is resting at points C and D, the centre of hole A is in line with the lathe centre. Alignment in the other direction is quickly made by bringing the outer edge at D, up to a line previously marked on the angle plate. The gate is then forced against the face plate on its finished edge, and bolted there, and the one boss bored with a small inside boring tool, and reamed, in that position. The other boss, which must be aligned perfectly with this first one before being bored, has this feature expeditiously done, by putting a centre in the lathe head, with a shank the size of the reamed finished hole. This aligns the gate perfectly by shoving up into position, when the boring and reaming operations are repeated.

The larger gate shown in Fig. 2, presents more interesting operations. Its dimensions are 21 ins. from tip to tip, and 25 ins. wide, with the boss B pass-

ing from side to side, with the exception of a 1 3-8 in. cut-out at the centre. This cut-out is the ending place of the machining operations from each side. As before, the sides are planed parallel. The gate is then bolted onto the lathe carriage, the whole being shoved up against the face plate first for squaring up. The bottom is jacked up to give the

Fig. 1.—Small Water Wheel Gate.

proper alignment. Now the difficulty is to have the two parts of the cross boss B bored perfectly in line, and the operation would be very difficult unless the whole operation were done at one setting, as re-setting perfectly correctly would be difficult. For the purpose of boring completely at one setting, a special boring bar is employed, of the shell reamer type. Now, if the whole operation had been done right through, a bar twice the width of the gate would be required, with the reamer at the centre of this bar, the whole suspended between lathe centres. If the whole is cored off centre, this will make the bar chatter, and ream the hole incorrectly. This is overcome in the following manner: A shorter bar is used, with the reamer quite near one end—just far enough in that it will completely bore one end of the divided boss. As the reamer is near either centre, it is quite solid. When one end is completed, the whole bar is removed, and placed in the machine, end for end, and the direction of rotation of the lathe reversed. This completes the other half of the boss, the

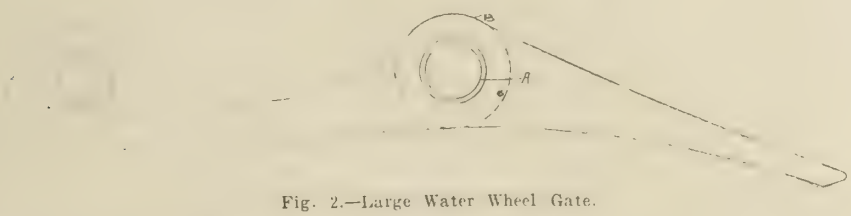

Fig. 2.—Large Water Wheel Gate.

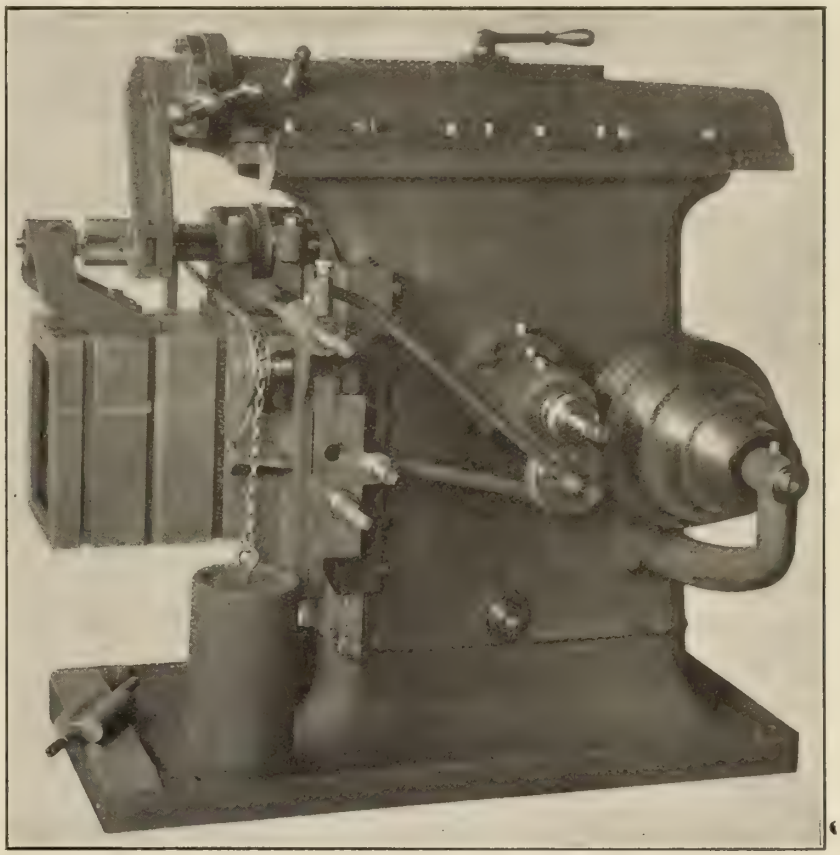
cutter being held rigidly. By these means, a perfectly true hole is expeditiously made.

AUTOMATICALLY MACHINING BLOWER IMPELLERS.

The illustration shows an attachment recently built by the Rockford Machine Tool Company, Rockford, Illinois, for one of their customers, to be used in connection with a 16'' Rockford shaper, for automatically machining the impellers for exhausters used with vacuum cleaning machines. A finished part is shown on the base of the shaper, and an impeller will also be seen in the machine set up ready for operation.

The fixture will be understood by referring to the cut, and consists of a head bearing, carrying a hollow spindle with work driver and masterplate on the



Attachment on 16'' Shaper for Automatically Machining Blower Impellers.

inner end, which is of the exact form of the work to be produced. The crossfeed screw of the machine is removed, leaving the saddle with work table free to move on the cross rail slide. The master cam is held against the roller by the weight and the worm is fitted with a sliding key to the feed shaft, allowing the table to move back and forth as the work rotates. The stud carrying the roller is mounted on a casting which is clamped in a fixed position to the vertical slide of the shaper column. The cutting tool used is round and of the same diameter as the roller. The fixture has been found to be very satisfactory, finishing the impellers very rapidly and with a very high degree of accuracy. It will be seen that it can be used for machining cams, or other irregular parts without sharp corners and will reproduce any shape that can be rotated against the roller.

TURNING LONG BARS.

It quite frequently happens, in a small shop that a long bar must be turned a bar often too long for any lathe in the shop to handle. To send it to some larger shop would involve considerable extra expense which perhaps would not be warranted.

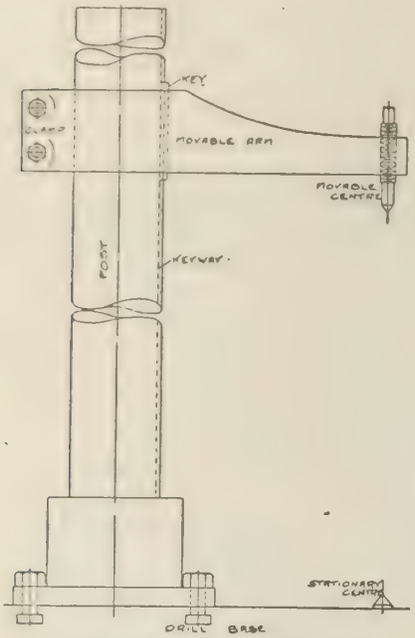
Wm. Kennedy & Sons, Owen Sound, overcome this difficulty very simply. They had in their shops two long, low-swing lathes, neither one of which is long enough to handle some of their work. They have found it convenient for that reason, to place these two lathes end for end, aligning them correctly, in every plane, so that the tool of one lathe can take up the work where the other lathe leaves off, continuing the work, and doing it as perfectly as in a large lathe, capable of handling such large work.

DRILLING PROPELLER BLADES.

This device, used by Wm. Kennedy & Sons, Owen Sound, while designed especially for drilling the bolt holes in the hubs of propeller blades, may be applied to such an operation on any piece that has lathe centres.

The post shown is bolted to the drill base table, and has dowels in it to insure the exactness of its location when

being re-set. The movable arm is keyed, allowing only of vertical motion. In the drill table is screwed a stationary



Drilling Jig for Propeller Blades.

centre, directly below the adjustable centre in the movable arm. The article to be drilled is set on the lower centre, the drilling jig placed on the top of the hub, and clamped there, and the adjustable centre tightened down. The article, a propeller blade, is thus held perpendicularly on its centres, causing the hub to be horizontal. The radial drill arm can then be swung over, and the holes drilled.

As before mentioned, this may be used for any piece having centres. Another use to which it is put is to make it serve the purpose of a clamp. The stationary centre is removed, and the movable centre screwed down on the article to be held, clamping it to the drill table securely.

In the form shown, it will take propeller blades up to three feet long. For larger sizes, it can be moved to a new location on the drill table overhanging the pit, in which is another stationary centre, directly below this new location of the post. Long blades can be handled by these means.

TO REMOVE RUST.

By E. Lambert.

Numerous methods of removing rust are in use, some of them good and others of little value. One remedy, both simple and effective, is a mixture of machine oil and emery powder. The use of coal oil is apt to do more harm than good as a rust eradicator: it removes but the rough top coating and glosses over where the process of erosion has begun.

JIG FOR IRREGULAR TURNING.

By J.H.R., Hamilton.

The accompanying sketch shows an attachment to be used on a lathe for turning or boring sections of circles where it is impossible to use a continuous cut, as the slots in cam plates or circular parts in irregular work, and other similar work.

Fig. 1 shows a front elevation of the attachment and Fig. 2 an end view of the same. On the lathe face plate F is secured a crank plate C, the pin of which is removed from the centre of lathe spindle the required distance so as to give the stroke necessary for the surface being turned. Extending from the rear of the frame of the jig J is the arm A which carried the bell-crank B and also a quadrant on the side which carries a train of gears, to be used when the surface being turned exceeds about one-third of the circumference. The jig spindle is threaded on the end S, similar to the lathe spindle to receive the chuck or face plates belonging to the lathe. To operate, place the jig on the lathe shears and secure in position by the bolt B. Loosen the nut N on jig spindle and remove pin P allowing the spindle to revolve free. Secure the work W in the desired position in the ordinary way, and determine the stroke necessary for the desired operation. The collar O has a number of holes around its face to allow for adjustment; the pin P is placed in the nearest hole and further adjustment is made by lengthening or shortening the connecting rods, or shifting the crank plate C. Where the surface exceeds about one-third of the circumference, the train of gears can be used giving the desired travel to the face plate on which the work is secured.

Fig. 3 shows a skeleton sketch of the motion when using the bell-crank B and crank lever L. A cam plate (cam being about 1-6 of a revolution) is shown in position on the face plate F. The heavy lines show the position of the movable

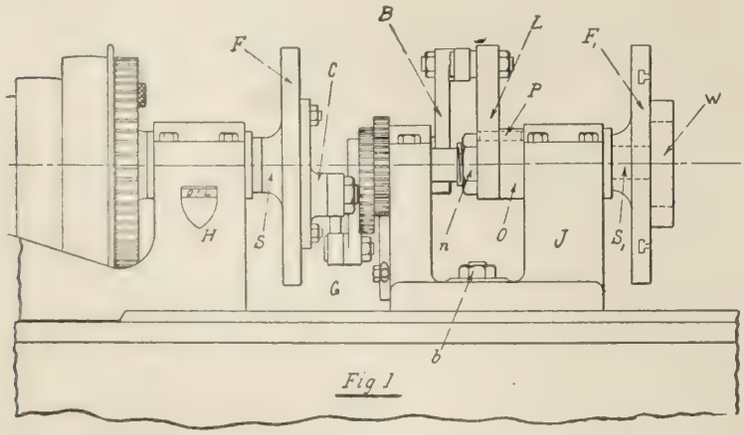


Fig 1

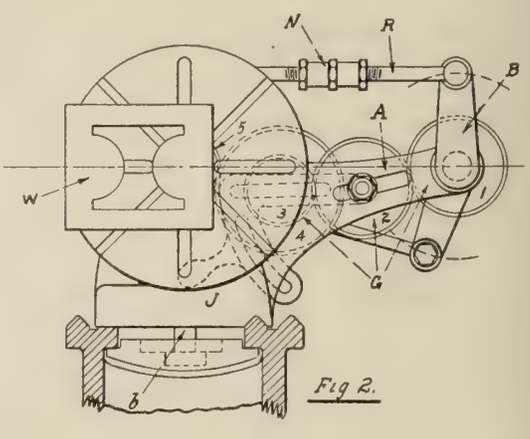

Fig 2.

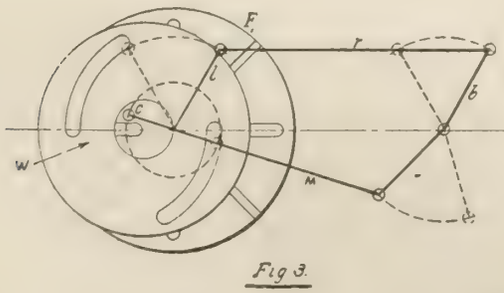

Fig 3.

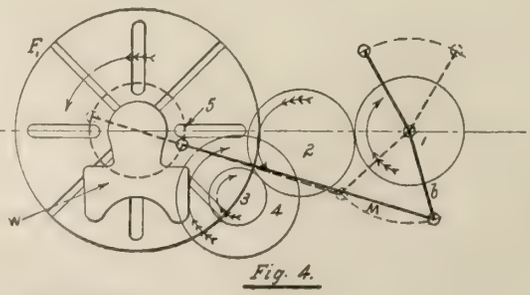

Fig. 4.

Jig for Irregular Turning.

parts at the beginning of the stroke, and the dotted lines show the other extreme position.

Fig. 4 shows a skeleton sketch of the motion when the train of gears are being used. The portion to be machined is (roughly figured) about 220 degrees of the circuference. With crank C in the former position the ratio of motion must be

$$\frac{220}{360} : \frac{1}{6} \text{ or } \frac{11}{18} : \frac{1}{6}$$

Take a 72 gear for jig spindle:

X=gear on bell-crank

$$\text{then } X : 72 :: \frac{11}{18} : \frac{1}{6}$$

$$\text{or } X = \frac{72 \times \frac{11}{18}}{\frac{1}{6}} = 264$$

There being no gear of 264 teeth, we must compound the train. Take 3 as a divider then:—

264 ÷ 3=88 for the gear on the bell-crank the compound gears 3 and 4 must be in the ratio of 1 : 3 or 30 : 90: then the gears necessary are:

1=88

2=any intermediate gear.

3=30.

4=90.

5=72.

$$\text{Proof: } \frac{88 \times 90}{30 \times 72} \text{ should equal } \frac{\frac{11}{18}}{\frac{1}{6}} \text{ or}$$

$$\frac{88 \times 90}{30 \times 72} \times \frac{1}{6} \times \frac{18}{11} = 0.$$

If the necessary gears are not obtainable, select the next nearest and adjust for stroke by shifting the crank C.

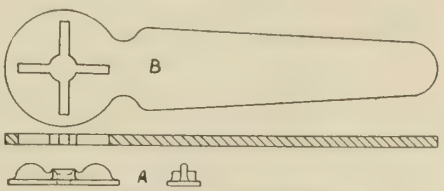
The pin P must be removed and nut N relieved when gears are being used; and quadrant lowered when lever L is being used.

WRENCH FOR WING NUTS.

By K. Campbell.

I was working in an agricultural shop at one time and one of my jobs in the early days was to put the caps on the oil boxes or bearings on disc harrows. These bearings were cast iron with chilled ball races. An oil reservoir kept the bearing lubricated. A little waste was put in the reservoir and the cap fastened on with a wing nut.

The screw often had scale on it or was rough from molding sand as it was placed in the mould and was thus fastened securely. The nuts had to be put on by hand and it was rather hard on the fingures. I often used to use a monkey wrench until one of the machinists told me of a wrench he had seen



Wing Nut and Wrench.

used for this purpose. I therefore made one, similar to that in the sketch, out of a piece of flat stock I picked up in the shop. The device worked excellently and I was able to screw on the wing nuts much quicker than before. In the illustration A shows the wing nut and B the wrench.

SIMPLE BROACHER.

The knitting machine made by the Harley-Kay Co., Georgetown, Ont., has

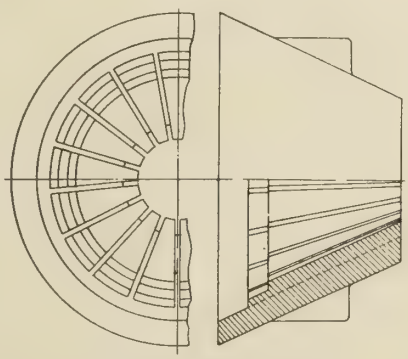


Fig. 1.—Knitting Machine Part.

a tapered part, shown in Fig. 1, which, as can be seen, is a conical shell, with slots on the inner surface in which the needles work. The simple machine shown in Fig. 2, which was devised and made by the firm, does the work very satisfactorily.

It is in reality a simple broacher, operating much the same as the standard machine. A is the broaching bar with cutter inserted in its lower face. This is given motion from the crank to the left, and is guided as shown. The work is held in the part B, which may be adjusted about pin C, and tightened in that position by Bolt D. Thus any taper can be slotted. Up and down motion is provided for by the part E, which can slide up and down in ways, and is adjusted by set screws at the top. The work is held in this chuck by the collar F, screwed down on it. Collar G has radial holes, evenly spaced, each collar containing three sets. A pin attached to E engages in these holes successfully as desired. Having sets of these collars, any circular division can be made by the use of the proper collar. The collar shown has a 34 hole collar to give 17 slots in the piece being machined.

CRANE SIGNAL.

One of the difficulties of overhead cranes in machine shops is often the waste time signalling the crane operator. When a man wants the crane he waves his arms, shouts or whistles, disturbing other workmen, or walks along the shop to give instructions to the operator, wasting a great deal of time.

The Lodge & Shipley Machine Tool Co., Cincinnati, have a shop 680 feet fong and to facilitate the handling of materials by their two overhead cranes, have installed a system of signal lamps. Switches are placed at convenient intervals on the columns along the sides of the centre bay, each controlling a red lamp hung from the ceiling directly over that portion of the floor. These lamps are all connected in parallel with the regular incandescent shop lighting system, although each is turned on and off by its own switch. When an erecting hand needs the crane he throws the switch nearest him, which lights the lamp over that portion of the floor. If not already engaged the crane operator runs at once to the spot. If his

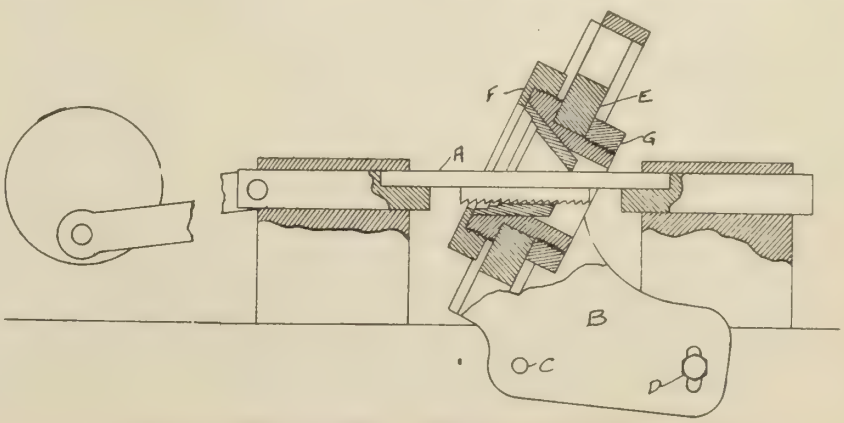

Fig. 2.—Broaching Machine for Slotting Knitting Machine Part.

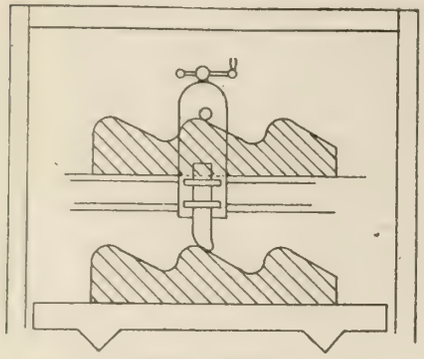
crane is engaged at that moment he goes as soon as he is free. In either case the light remains burning until the crane reaches that point, when it is turned off.

PLANING SHAPES.

The accompanying illustration shows how a company planed a number of special plates for which it had a contract. The plates had to be absolutely accurate, and in order to machine them



Planing Shapes.

a jig plate was made from a ⅜ inch sheet steel. This was fastened on the cross rail. They then ratcheted a slide in the head, and fitted a pin in it. As the head was fed across the job, the slide with the pin was fed up and down on the jig, making a particularly fine job.

60 IN. WHEEL VS. 18 IN. LATHE.

Some time ago, D. MacKenzie, Guelph, had the job presented to him of boring and facing the hub of a 60-in. flywheel. As he has nothing greater than a long 18-in. swing lathe in his shop he was in a quandary as to how to undertake the task, but finally overcame the difficulty in the following manner.

A long shaft was put in this lathe, just long enough to overhang at the end. At this far end, a pillar block was built up on the lathe, to support the shaft, it being thought that the steady-rest would not be sufficiently rigid for such a heavy job. The overhanging end of this shaft had previously been threaded to take the lathe chuck, which was then attached, and the flywheel chucked in this position. A small lathe from another part of the shop, and which was light enough to be portable, was brought up to the flywheel, and placed in line with the other lathe for boring the hub and then placed cross wise with the lathe for facing the hub. A good job resulted from this operation, and a trip to Galt saved, as the latter course would have been necessary otherwise.

REPAIRING LOCOMOTIVE BOILER.

By K. Campbell.

In round house practice and in boiler repair shops there are a number of special handy tools required to facilitate the work. In a paper read before a joint meeting of the British Institu-

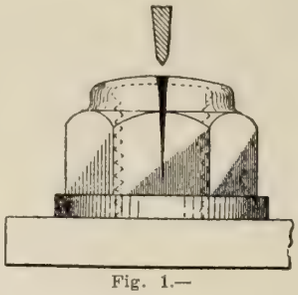


Fig. 1.—

tion and American Society of Mechanical Engineers, a paper was given in which a number of special tools were described.

To remove main steam pipes and steam chest covers from smokeboxes it is often necessary to split the nuts down vertically in the manner shown in Fig. 1, as they are apt to get "burnt" or corroded on the studs.

If the studs are broken, they will require to be drilled out carefully, and new studs put in, screwed to a tight fit. For removing and screwing in studs, a stud setter is an almost indispensable tool, though with skill and care two ordinary nuts tightly locked may be utilized for the purpose.

It is at times, when in a confined position, a difficult task to cut an iron nut from a stud without damaging the thread, and this often means the renewal of the stud. On the other hand, a few small screw die nuts of different sizes will assist in jobs of this description and are useful for running down studs and bolts which have been damaged or when they prove too tight a fit for new nuts. A good method of making die nuts is to get a square bar of good tool steel nicely softened and have it faced and cut off in a lathe to a suitable thickness. Four small holes are drilled to act as cutting edges, as shown in Fig. 2 ; but before drilling the

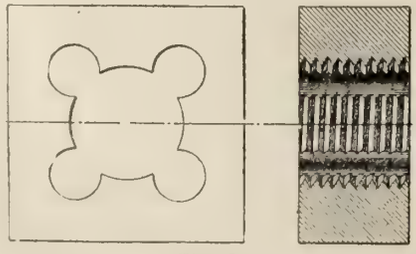

Fig. 2.—

larger centre hole to tapping size these smaller holes must be plugged with pieces of soft iron. The drill will then be enabled to run true, and the plugs furthermore assist the tap to cut a good thread to the proper size. After tapping the thread, the soft iron plugs can be removed, and the cutting edges formed on the thread be finished off with a smooth file. These little appliances are almost indispensable in a round house or repair shop, for in taking off cylinder covers in a hurry, as often is needful, the stud threads are frequently damaged, and a die nut can be requisitioned to remedy the defect. Also, in taking down big-ends for examination it is a common occurrence to bulge the thread in knocking out the bolt ; in such a case, a die nut is used to recut the thread before the nut can be replaced.

Drilling out broken studs on boiler mountings and fittings placed in a position not accessible for the ordinary ratchet brace drill post and tackle makes a demand upon the fitter for a special tool. In Fig. 3 is shown a small drill post that can be used to drill out broken studs ranging from ⅜-in. to ⅝-in. The foot of the post is well drilled out

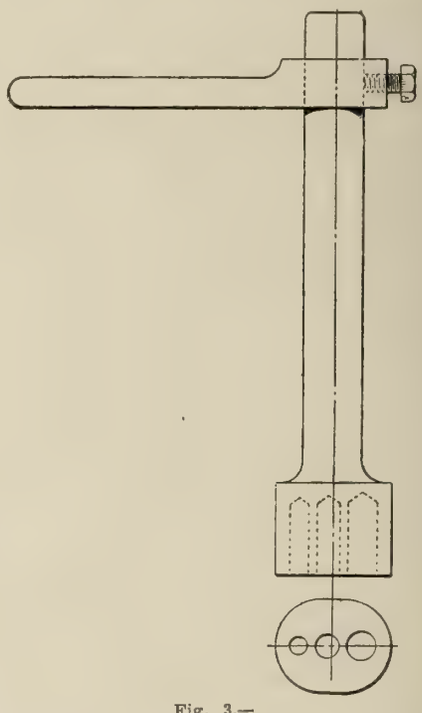

Fig. 3.—

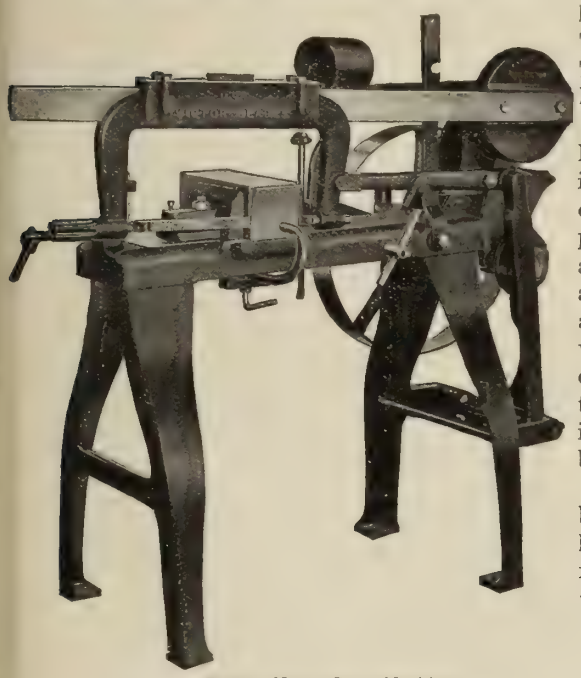
to enable it to be attached to seatings where studs are standing ½-inch, ⅝-in. and ¾-inch high on the boiler face plate, and the arm can be attached in any position to suit the convenience of the operator. A tool of this type has been found especially handy and useful in drilling out broken studs in Gresham's face-plate injectors, which are attached to face plates in a vertical position. One great advantage is the small space occupied by the base of the post ; the appliance is also very light and suitable for packing in the fitter's tool bag.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

POWER HACK SAW MACHINE.

The Massachusetts Saw Works, Chicopee, Mass., manufacturers of "Victor" hack saw blades, frames, machines, etc., have recently added to their line a new hack saw machine. This machine, which is illustrated herewith, is know as the No. 6 M.S.W. Hack Saw Machine. In the construction of this machine, each part has been made high grade in every particular—it is built like a machine tool, with a capacity for cutting 6 inch stock. It is unusually rigid and strong, the frame being braced from two directions, which eliminates all side play and vibration, and assures a straight cut.



Power Hack Saw Machine.

An adjustable stop is provided so that cuts can be made to any desired depth. The machine stops automatically and does not require any attention after cut is started. There is also a rest for the piece being cut off, which prevents the blades from getting broken, when the piece falls.

This machine has a very steady, even forward stroke, and a quick return stroke. There is a patent lift that can be adjusted to raise the blade 1-1000 to $\frac{1}{8}$ of an inch from the work on the return stroke, which saves wear on teeth and greatly increases the life of the blade, a feature which very soon results in a saving of hack saw blades sufficient to cover the cost of the machine.

BORING MILL AND LATHE TOOLS.

Figs. 1 and 2 show left and right hand tools for use on a boring mill. These tools have a shank $1\frac{1}{4}$ inches deep. The cutter in this tool is 1 inch triangular steel.

Figs. 3 and 4 show tools for general lathe and shaper work. The cutter is inserted in the centre of the holder and can be used either right or left, or the point ground to any shape the same as a square cutter. The V-shaped seat is a steel bushing pressed into the holder and can be renewed if it should become worn. This is to overcome the tendency of the constant pressure on the end of the cutter point to wear the seat down in the front end causing the cutters to break off.

The holders, including set screw and bushing, are made of tool steel, and hardened. These tool holders are manufactured by the G. R. Lang Co., Meadville, Pa.

FARWELL GEAR HOBBLER.

The Farwell Gear Hobbler, made by the Adams Co., Dubuque, Iowa, is designned for work up to 24 in. a cutting 12 in. face. The head has a long bearing upon the housing, the spindle has no unnecessary overhang, has adjustable bronze bearings of ample size and length, and is rigidly secured to the saddle. The compact and rigid design of the spindle support has been a feature of the Farwell Gear Hobber.

On account of handling coarse pitches, this new tool is provided with a slide in the saddle that carries the hob, making it possible to adjust the hob spindle longitudinally, bringing any tooth exactly central with the work arbor. This is quite important in obtaining perfect gears in coarse pitches, but does not require attention on fine pitches, as the difference in position of two succeeding teeth is not sufficient to be noticeable in the gears.

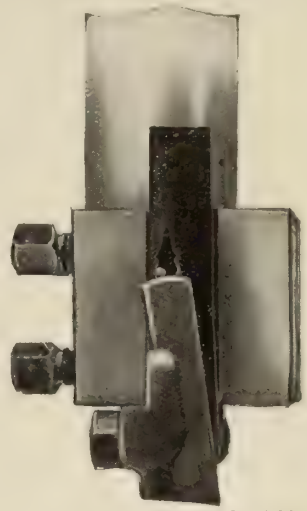


Fig. 1.—Left Hand Tool Holder.

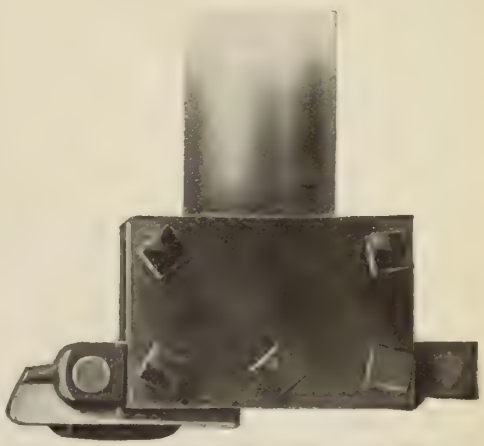

Fig. 2.—Right Hand Tool Holder for Boring Mills.

Fig. 3.

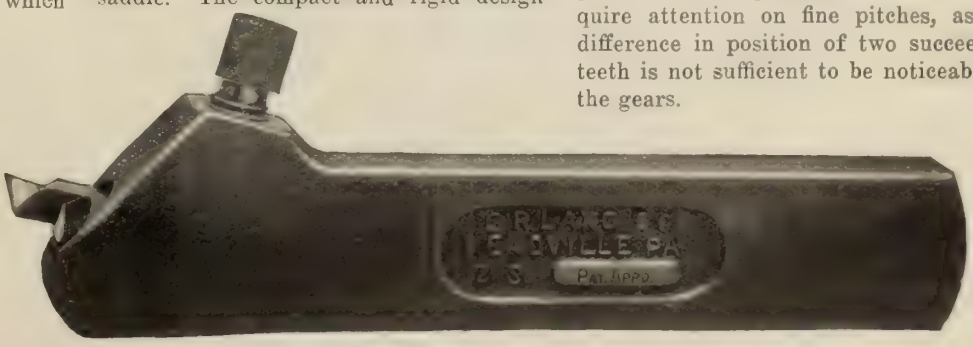

Fig. 4.—Lathe and Shaper Tool Holder.

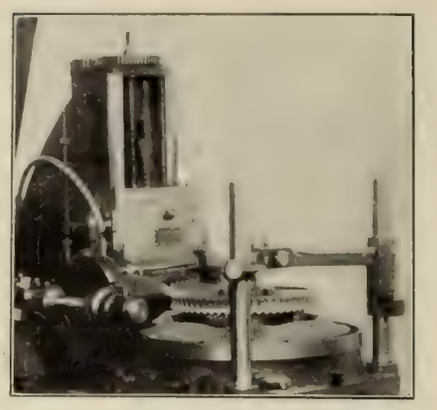
This longitudinal movement of the spindle head permits also the shifting of the hob to a new cutting position without resorting to moving the hob or the arbor. Several shifts may be made, bringing sharp cutting parts of the hob into action before it is necessary to grind the hob.

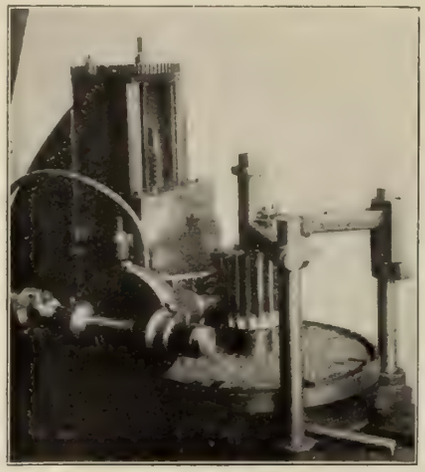
The head has an automatic trip to stop the downward feed and is also equipped with a power mechanism for raising the head after the cut is finished. The head, of course, returns but once for each stack of gears, and on the small machine this operation is performed by hand. There are two extra feeds, making ten, all of which are obtained in the gear box. The horizontal feed mechanism for cutting worm wheels is incorporated in the design of the machine, and is also the special support for upper end of arbor. This arbor support is only necessary when gears must be swung on centres, for wide face gears or in cutting a stack of gears of small diameter. A more rigid support can be secured in other cases by the use of face plates or supporting rings which rest upon the table and support the blanks immediately below the rim.

The spindle is driven by a bevel gear, as this is necessitated by the coarser pitches tilting the hob to a greater angle than belt drive would allow. This angle and the tooth depth are set with a hardened steel gauge.

All important bearings have bronze bushings and the spindle and arbor bearings may be adjusted by simply loosening a lock ring and tightening an adjusting ring nut.



Farwell Gear Hobber, Cutting Worm Gear.

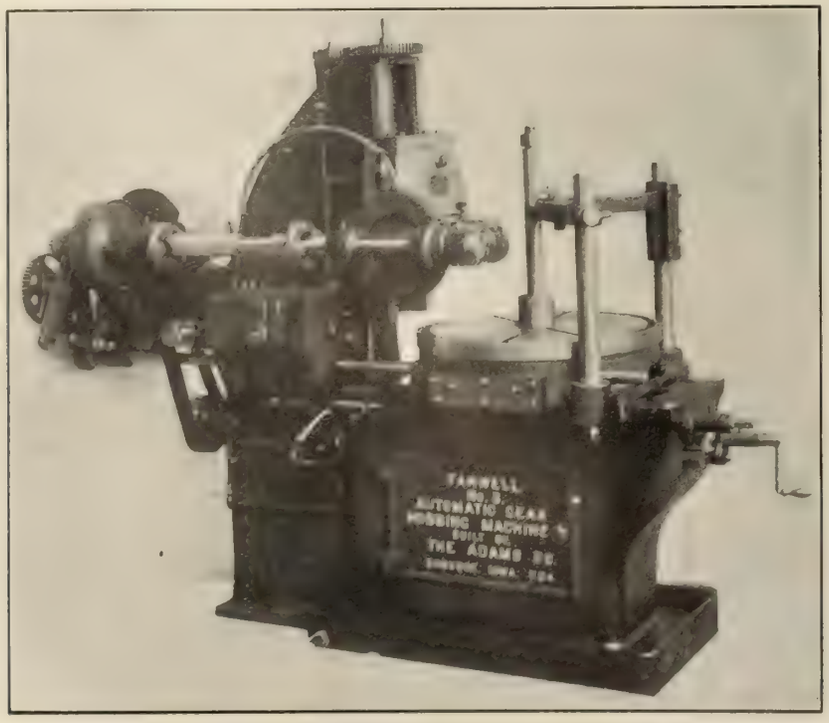


Farwell Gear Hobber Cutting Pinion.

The design of the base and column of this machine is exceptionally rigid, one casting forming both, as well as the knee below the table and an oil pan around the machine. The weight of the machine is over 2,000 lbs.

A large tank to hold lubricant is enclosed in the base, and ample passages through the hub are provided to conduct the lubricant from the table back to the tank. The lubricant pump is gear driven and has means for regulating the flow of lubricant.

All gears are provided with shields, as is also the universal joint shaft.



Farwell Gear Hobber.

PUNCHING AND REAMING BOILER PLATE.

At the recent annual convention of the American Boiler Manufacturers' Association held in Chicago, the following question was given for discussion:

"There seems to be a very wide range in engineers' ideas of what amount of metal is necessary to be taken out after a hole is punched in a plate. To remove all doubt as to the possibility of a fracture from that operation an answer to the following is suggested: Is a hole enlarged 1-8 or 1-16 in. all around sufficient? Is a hole enlarged ¼ or ⅛ in. all around sufficient? Is a hole enlarged 3-8 or 3-16 in. all around sufficient?"

In answering the question John J. Main, of the Polson Iron Works, Toronto, referred to tests made in England some 18 or 20 years ago as to the difference between punching and reaming a hole or drilling it, which established that a ¾ in. hole would require to be punched ½ in. in diameter in order to make it equal to a drilled hole, and a punched hole ¾ in. in diameter would not stand within 20 per cent. as much as a drilled hole; but in a reamed hole, taking out 1-8 in. all around would eliminate all the damaged part of the plate, and it would then stand just as good a physical test as the drilled hole would. Any practical man, however, will admit that it depends largely upon the condition of the punch and the die. These must be absolutely sharp and clean cutting.

BOUNTIES ON IRON AND STEEL.

The following companies participated in the bounties paid by the Dominion Government on iron and steel in the fiscal year ended March 31, 1910:

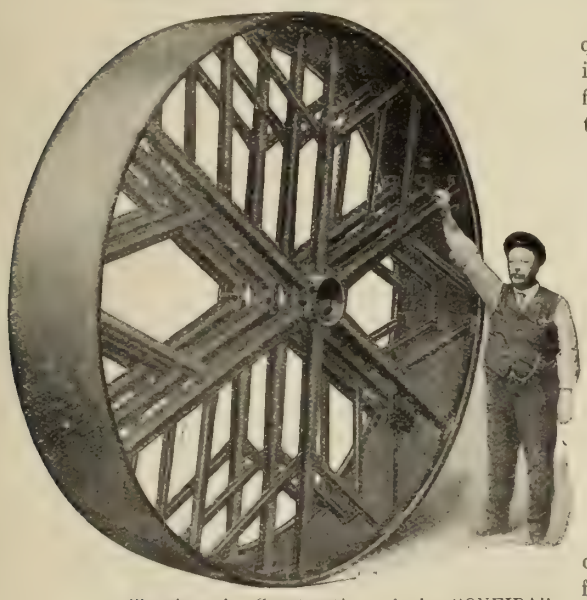
Algoma Steel Co.	$ 318,814
Dominion Iron & Steel Co.	1,029,503
Nova Scotia Steel & Coal Co.	97,345
Hamilton Iron & Steel Co.	238,408
Lake Superior Iron & Steel Corporation	54,628
Ontario Iron & Steel Co.	4,463
Canada Iron Corporation	41,146
Atikokan Iron Co.	15,099
Standard Chemical Co.	10,120
Total bounties paid	**$1,808,533**

POWER GENERATION AND APPLICATION

For Manufacturers. Cost and Efficiency Articles Rather Than Technical.
Steam Power Plants ; Hydro Electric Development ; Producer Gas, Etc.

ONEIDA STEEL PULLEY

All-steel pulleys, made by Oneida Steel Pulley Co., Oneida, N.Y., with offices at 32-36 South Clinton St., Chicago, are being placed on the Canadian market. The pulleys are light, strong and serviceable. Their system of construction allows a great range of sizes and styles of steel pulleys. They make pulleys from 6-in. to 126-in. in diameter, with 2-in. to 40-in. face to fit any standard-size shaft from 1-in. to 8-in. in diameter. Besides the regular belt pulleys, they can make such specialties as conveyor drums, elevator, head, tail and tripper pulleys, flanged pulleys, cork insert pulleys, and flanged pulleys for axle dynamos, used in car lighting service.



Showing the Construction of the "ONEIDA" With Spiders for Wide Faces.

The system of construction used by the Oneida Steel Pulley Co. is very unique—one of the most prominent features is the fish-plate system of arm to rim fastening, on pulleys above 20-in. in diameter. This fish-plate makes a broad bearing for the arm, and it answers the purpose of a double-thick rim with no superfluous weight.

They also insert extra sets of arms or spiders in wide-faced pulleys, to afford support accross every 8 inches of the entire width of the pulleys—for instance, a pulley with a 24-in. face has three spiders, while a 40-in. face pulley has five spiders.

It is not necessary to use key-ways or set-screws to fasten the "Oneida" pulley to the shaft—the hub is so constructed that it grips the shaft securely without danger of slipping. A system of interchangeable cast iron bushing is also used. This allows the pulley to be used on several different sizes of shafting, by merely inserting the correct bushing.

The illustration shows the construction of the Oneida all-steel pulley, with spiders for wide faces.

IMPROVEMENT IN SLIDE RULE.

By Carl J. Printz.

The slide-rule is such an old reliable tool that few, in this busy day of ours, will care to read an article under that heading. The old saying that "Rome was not built in a day" applies here.

The heading of this article is not quite correct as the improvement is not in the rule itself, but in one of its fittings, that is on the so-called indicator or rider.

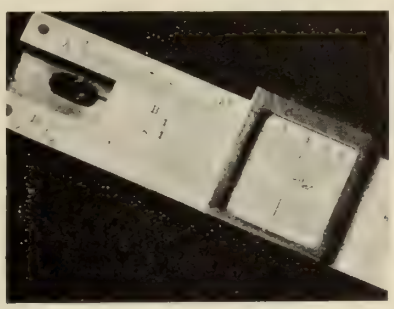


Fig. 1.—Old Style Indicator.

Fig. 1 shows the common indicator, consisting of an aluminum or brass frame, into which is fitted a glass plate with the indicator line. As the slide-rule seems to have a tendency for "flying" from the draughting board to the floor, the result is generally disastrous.

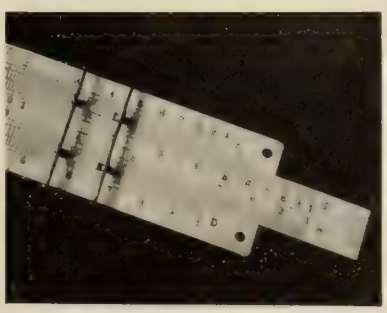

Fig. 2.—Improved Indicator.

This, however, is not the main objection to the glass-aluminum framed indicator. What bothers the user many times more, is the constant covering up of the figures on the logarithmic scales by the wide frames.

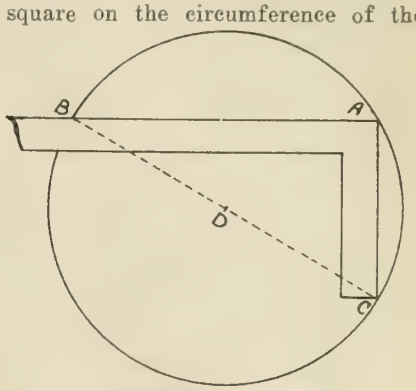
Fig. 2 shows an improved indicator, patented in the United States, but which for certain reasons is not yet on the market. Any engineer in the habit of using a slide-rule, will readily see the advantages. There is no glass to break, and, on account of the wire framing being out from the graduations, the figures are always visible. The index lines are on the celluloid covered cross-bars, and a much closer reading can be made.

It is to be hoped that somebody will take up the manufacture of this article in the near future. It is not patented to break, and, on account of the will in Canada.

FINDING CENTRE OF CIRCLE.

By K. Campbell.

To find the centre of a circle, place a square on the circumference of the



Finding Centre of Circle.

circle, as shown at A, B and C. Draw a line as the dotted line BC and bisect it at D. Then D is the centre of the cir-

REMOVING INK FROM TRACING LINEN.

Much difficulty in removing ink lines from tracing linen has been experienced from time to time by draftsmen and mechanical men generally. No instrument will satisfactorily remove them and no aqueous solution will remove the ink. In fact water in any form is harmful to tracing linen, as every draftsman knows to his sorrow.

If lines are to be removed from tracing linen, it can be done easily by rubbing the tracing linen with a cloth moistened with a solution of gum camphor in alcohol. This may not remove the lines altogether but they will be left so thin and faint that a slight application of a soft rubber will entirely erase them. This method does not harm the tracing linen to any extent.

FILING DATA.

By Jno. A. Bradley.

I have often read with much interest in various Trade and Technical papers, methods for keeping track of data, and reading matter appearing therein of special interest to the individual reader. A system which I have found to require the least labor to maintain and to show instantly where any article to

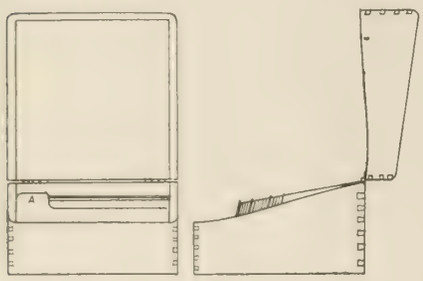


Fig. 1.—Filing Data.

which this system has been applied may be found, is as follows:

Obtain from any stationery store a card index box, measuring 5½ inches long by 3 inches wide, as shown in Fig. 1, containing cards and index.

When the paper for the current month is received, all the articles are read, or only those which are of interest. After having read an article, the heading under which it is desired to be entered in

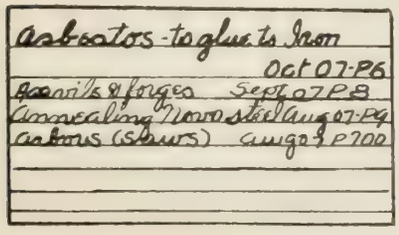

Fig. 2.—Filing Data.

the index, is written above the regular title, or the regular title may be entered depending upon the nature of the article.

The various headings are then entered under their regular or selected titles on the cards, giving the month, year and page in which the various articles appeared. See Fig. 2.

The paper is then filed according to the month, and when it is desired to make use of any of these articles, or if you are seeking information upon a subject, the file will show instantly where it is to be found.

It will be found an excellent plan to have the papers bound, six or twelve to a binding, according to the size of the paper. This may be done from seventy cents per binding up. The necessity of preserving obsolete advertisements which form the greater part of most papers, is then eliminated, and these papers when bound make ornamental and valuable additions to the library.

SHOP BLACKBOARDS.

In the shops of Lodge & Shipley Machine Tool Co., Cincinnati, blackboards are used for posting shop order numbers for the information of the assembling force. There is a shop order number for every job entering the factory. A blackboard 18 x 24 in. in size is hung above each lathe which is in course of construction on the assembling floor, just as soon as the bed is placed for the first operation. On this board are chalked the size of the lathe, its order number, the special attachments, if any, and the completion date.

The data on the blackboard serves to keep prominently before each man the information necessary for his particular work. For example, those who align the headstocks know that they must complete their part of the work two weeks before the date chalked on the board. If a tool room lathe is to be fitted with a relieving attachment as an extra, it is plainly shown in black and white.

The same information is also given on the shop order tag which is wired to the lathe. The blackboard is merely an added convenience and timesaver, so that a workman, even if a few yards away, can get at a glance the important particulars of the job.

ORGANIZATION CHART.

By F. H. M.

Organization is the keynote of all modern business. To put it in the words of Mr. Barton, general manager of The Niagara Falls Power Co., and its allied interests, "We CONSIDER THAT ANY COMPANY THAT IS NOT WELL ORGANIZED WILL SOONER OR LATER COME TO GRIEF; AND ANY ORGANIZATION SCHEME THAT CANNOT BE TABULATED IS NOT WORTH HAVING." The company indeed carries out this principle, the accompanying diagram being the tabulated scheme of their organization.

Under the one management are four companies, The Niagara Falls Power Co., Canadian Niagara Power Co., Niagara Junction Railway Co., and the Niagara Development Co. The diagram as shown is practically self-explanatory. Following the diagram down from the Board of Directors, Vice-President, the authority for each of the minor statellites is shown. Under the general manager, come the production department.

The greatest part of the combination includes the power houses, of which there are two: one on either side of the line, both under the one superintendent, who has an assistant at each plant. Each assistant has his own staff of operators, as shown. An apparent overlapping of authority occurs in connection with the electrical and mechanical assistants to the superintendent. These two men report to the assistant superintendents, thus introducing double authority apparently, but, as the assistant superintendents are in daily consultation with the superintendent, this over-lapping does not actually exist. A similar condition exists with regard to the chief lineman and his staff.

Another feature of the diagram stands out as worthy of note. After most of the names appear numbers. In connection with the chiefs, these numbers have reference to the number in the staff under that particular official, e.g. the general manager has a staff of 293. The numbers following the workmen have reference to the number of that kind of workmen there are, e. g. looking at the column at the lower left corner, there are three electricians in charge at Power House No. 1, six assistant electricians. The same follows out for the rest of the officials.

If every large company would follow out a scheme somewhat the same as this one shown, much confusion would be

ORGANIZATION

OF

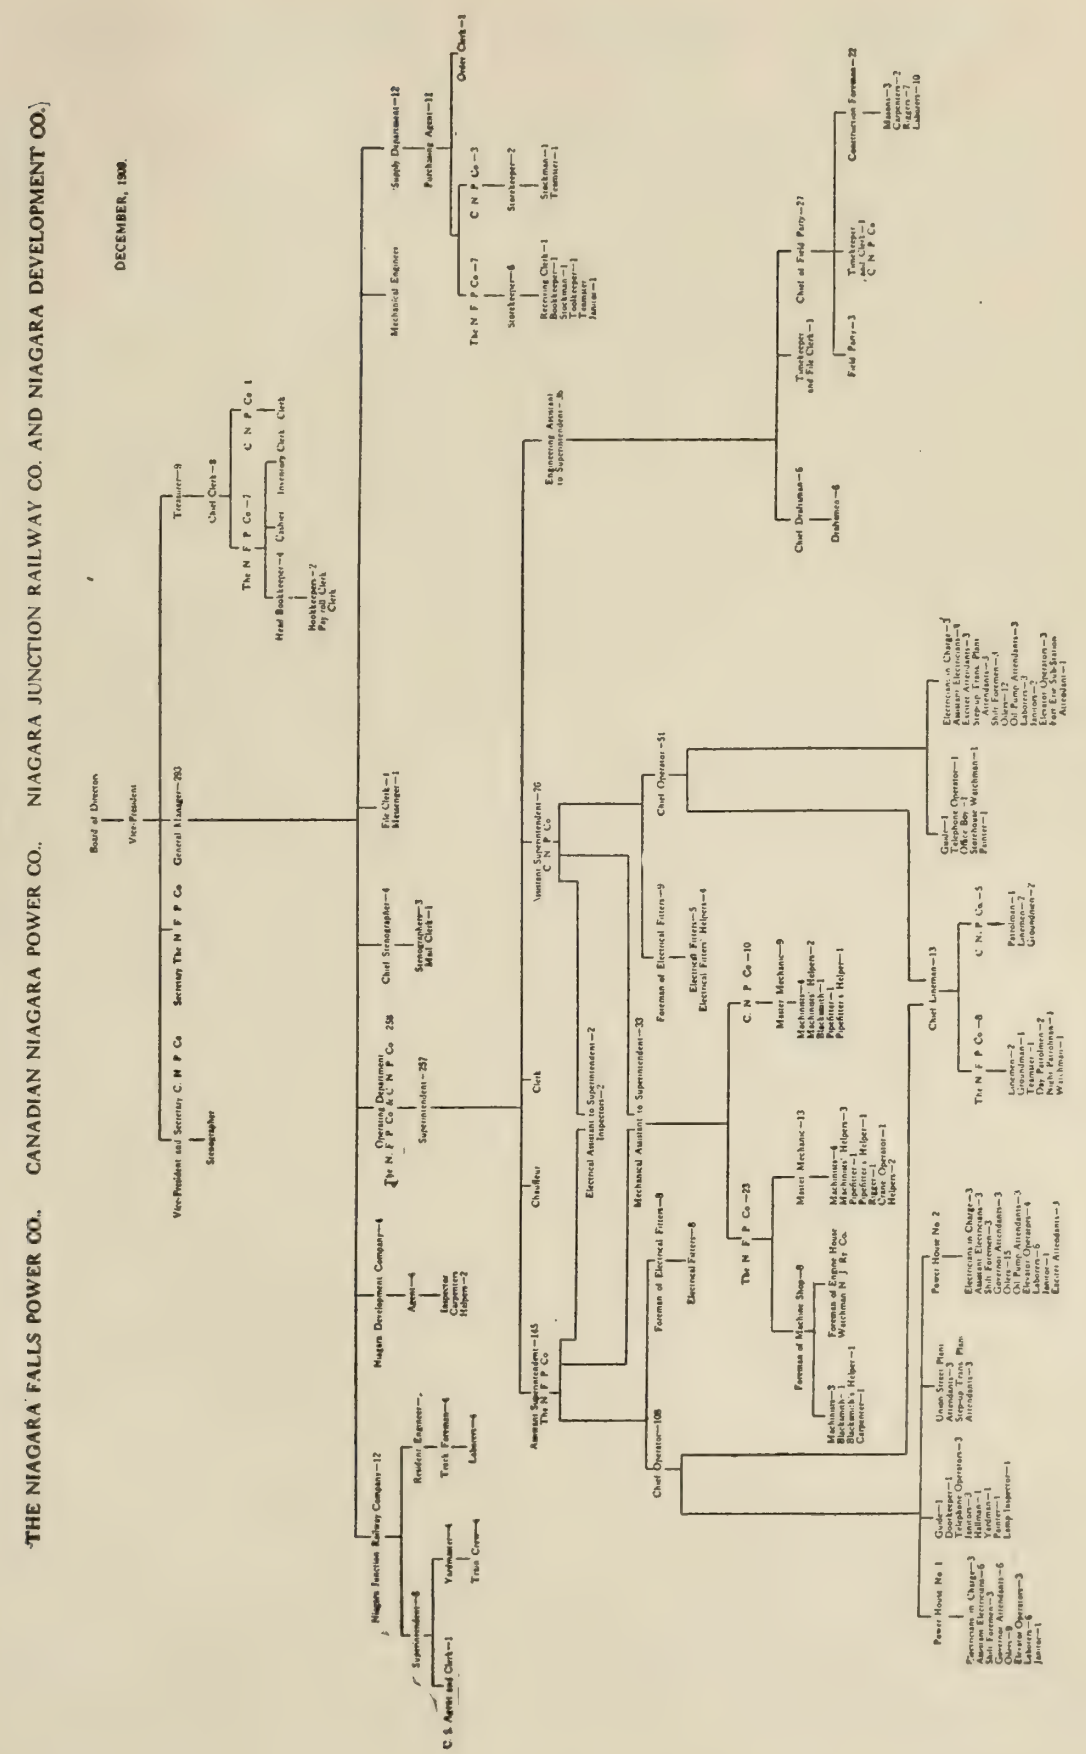
DECEMBER, 1908.



go to Niagara Falls, and go over the plants will stand testimony to the efficiency of the system, and the ease of its application. It is the evolution of years, avoided as well as increasing the efficiency of the organization, making it an organization in fact as well as in word.

Any person who takes the trouble to at first containing many mistakes, showing the imperfect manner in which most organizations exist, and continue to exist, as no check system like this is used.

The Scheduling of Locomotive Repair Work on the C.P.R.

The C. P. R. have Worked out a Method of Handling Engines in the Shops by Which the date of Delivery is at Once Known. The Routing System, Described in Industrial Engineering, Shows that the System Produces Results, Both in Efficiency and Financially. By it the Various Departments are Tied Together, the Work is Now Done Better and More Cheaply, for There is no Waste Time. There is a Decreased Overhead Expense on Each Engine, and an Estimated Saving of $65,000 per Year.

THE Canadian Pacific Railway has adopted at its Angus shops in Montreal, a system of scheduling locomotive repairs, so that it can be definitely determined in advance just when an engine sent into the shop for repairs can be placed back in service. It has done more than this, for incidentally in scheduling the engine through the shop, it has eliminated friction between departments by squarely placing the responsibility for delays ; it has definitely assigned to each department a task, to be done on a certain day, and has issued instructions as to how this task can best be performed in the shortest possible time ; it has thereby reduced the cost of repairs ; it has shortened the time that an engine is out of commission, thereby saving to the road the loss it would otherwise sustain due to the loss of the engine's services ; in short, it has raised the efficiency of the entire plant a measurable degree.

Locomotive repairs are a perplexing problem on all railroads. The time that an engine is in the shop represents a dead loss to the road. While it is desirable to cut this time down to the lowest possible limit, it is yet necessary to make the repairs in such a manner that the intervals between trips to the shop shall be as long as possible. Consequently, any means which will enable the most complete overhauling to be done in the shortest time, is the most efficient. Due to the fact that many separate departments are involved in locomotive repairs, delays in putting the engine back on the road are liable to occur, and the responsibility cannot always be clearly placed. Inasmuch as the erecting shop must receive from the various departments, such as the boiler shop, foundry, machine shop, and stores, the various parts of the engine in a certain sequence, a delay in one department, which is required to have its part placed on the engine at an early date, will nullify all the good work of every other department, and may delay the completion of the engine for a considerable period. The Canadian Pacific suffered from these repair troubles like every other railroad, and a couple of years ago engaged the services of Mr. H. L. Gantt to supervise the reorganization of the Angus shops. This re-organization, while as yet uncompleted, has already progressed to a point where there is a marked improvement in the conduct of the locomotive department.

Routing the Work.

THE SYSTEM IN USE TIES TOGETHER ABSOLUTELY THE VARIOUS DEPARTMENTS CONCERNED. When an engine comes into the shop, it is known in advance what must be done on it, and the date on which it must be delivered back to the operating department. Before a stroke of work is done, every operation that must be gone through is determined, and not only that, but who shall have charge of that operation, and when it shall be completed. THE WORK IS LAID OUT SO THAT THE MAN RESPONSIBLE FOR THE SCHEDULING OF AN ENGINE THROUGH THE SHOP CAN TELL, LITERALLY, AT A GLANCE JUST WHERE EACH PIECE IS, WHEN IT WENT THERE, AND WHEN IT WILL BE DELIVERED TO THE ERECTING SHOP. He can also tell when each portion of the engine will be assembled, when it will be tested under steam, and when it will be delivered to the road for service. He can, almost instantly, tell when a piece is delayed in any department, and can take the steps to remedy the delay, such as a re-schedule, or whatever remedy is best suited to the needs of the case. He renders daily to the superintendent a report showing the condition of work in the shops, and that official is able from these reports, with a minimum of effort, to place responsibility where it belongs. All this has been accomplished with a comparatively small amount of clerical labor.

Delivery.

The entire scheme hinges on the date on which an engine must be delivered back to the road. Two classes of repairs are made, those involving a complete overhauling of the engine and scheduled to be made in 18 days, and those which are less complete, these being scheduled to require 14 days. It was found that, in order for the locomotive to be delivered to the road in the time specified, the erecting shop must receive the various parts, such as frames, boiler wheels, valve gear, etc., in just the sequence that they were needed, and just at the time they were needed. As it requires time to make these various parts, it would not do to wait until the engine was stripped before ordering them. Consequently, the engine is carefully inspected in advance, and a full list of the repairs necessary is sent to the schedule clerk, whose duty it then is to order the new pieces required, and to advise the shops of the work they will have to do and when they will be required to deliver it.

There are, of course, many different blanks and forms involved, although these are less in number than might be expected. It would cause confusion, and would not particularly help the description of the system to take these forms up in detail and explain the particular function and arrangement of each. We will content ourselves with a discussion of the general principles of the system in use. The forms would, in any case, have to be varied to suit the conditions under which they might be used, but the principles will apply to similar work everywhere.

Let us assume therefore the the schedule clerk has received from the inspector the list of repairs necessary on a given engine. He also knows whether it is to have 18 or 14 days in the shop. This determines the final date of the schedule for that engine and all other dates are fixed to conform to it.

The schedule man classifies the repair operations according to the shops in which they are to be done. They are classified first in a general way, such as motion work, wheels, boiler work, etc.

The date on which each class of work is required by the erecting shop is noted opposite it, and the order is transmitted to the department concerned. In many cases it is only necessary to give the order for the part, and the date on which it is required. The job may be a standard one, with which the shop foreman is thoroughly familiar, and no further instructions are necessary. Other jobs, however, are more complicated, and require the services of several machines in the shop. The various machine jobs, perhaps, must be done in a certain sequence. In such cases the various operations are scheduled in detail for the benefit of the shop foreman. Take, for instance, a crosshead.

It must be planed bored, babbitted, fitted and assembled, and inspected. The schedule man notes the day on which each of these jobs must be done in order that it will be ready when the erecting shop wants it. He does not endeavor to tell the shop foreman the particular machine to use, that being left to the judgment of the foreman.

The schedule clerk has in his office a large board, ruled into columns, and having 31 lines, one for each day of the month. Each column is headed with the name of a certain class of repair work, the classes being grouped together under the shop in which they are performed. When a job is scheduled for a given day, the engine number is entered on the line for that day, and in the column for the class of work to which the job belongs. Thus, by following along a given line, every piece of work due on that day is exhibited, and also the amount of work of each class that is scheduled. Knowing the capacity of the shop for each kind of work, the schedule clerk is enabled by means of this board to avoid overloading a department with one class of work on a given day and thereby throwing awry the schedule of other departments.

Schedule Sheet.

The sheet on which the detail schedule for each class of work is laid out, such as the motion schedule, is ruled in a similar manner to the schedule sheet above described—that is, with horizontal lines for each day, and with colums for each part to be furnished. When laying out the schedule, a symbol is entered in the proper space, to show the particular operation that shall be done on a given part on a given day. For instance, if a crosshead was to be babbitted on the 14th of the month, the letters Bb would be entered in red ink in the crosshead column on the 14th line. When the work is done the letters Bb are entered in black in the crosshead column and opposite the date on which the work is done. Thus, when a job is on time, the red and black symbols appear in the same space in the schedule sheet. It is thus easy, if a report on any engine is called for, to tell exactly where delays occurred, and of what duration they were.

Schedule Report.

Every day the schedule man makes out a typewritten report for the superintendent and shop foremen, showing the work scheduled to be completed on each engine during the day. To this list are added those jobs which were scheduled for previous days, but which are one or more days late. A letter X is placed opposite each of these delayed jobs, one X for each day that the job is delayed, together with the reason for the delay. This has an effect on the various foremen not exactly contemplated at first, but which tends nevertheless to keep them up to schedule. A string of Xs after a job, together with the statement, say, "Waiting on castings," appearing day after day makes it apparent to every foreman in the shop that the foundry is holding up the locomotive, and incidentally delaying the work of all the other foremen. The constant reappearance of the statement until the piece is out of the shop, has a better effect in getting the piece rushed through than would the most severe "jacking-up" the superintendent could give. A man at fault dislikes exceeding publicity, but under the scheme in use in the Angus shops the greater the fault the greater the publicity. It further prevents placing responsibility for errors on the wrong man. The machine shop foreman is not censured when he does not deliver a certain part to the erecting shop on the scheduled date, if the report shows that the castings were not delivered to him when due. Instead, the censure is passed on to where it belongs, namely, the foundry.

While the principal work that has already been done at the Angus shops is the arranging of these schedules, a start has been made on a further systematizing of the work. To schedule the work through the machine and other departments with a knowledge that it will be finished at the time appointed, involves a knowledge of the time required for each operation and the certainty that the operation will be done in that time. This led to an investigation of the machine operations, with scientific time-studies, and the making of instruction cards embodying the results of these time-studies. The instruction cards are issued to the various foremen, and if they are unable to do the work in accordance with the time given in them, the man who made the time-study is ready to demonstrate to the foremen the exact method to follow in order to meet the schedule. These time-studies have resulted in standardizing many of the operations, and have materially cut down the time required for them. When a job is finally standardized, the instruction card is printed in a permanent form, with a sketch of the job on it. It is then used not only in the Angus shops, but in all the shops of the Canadian Pacific. The work, therefore, is larger than appears on the surface, since it affects not only one shop, but the entire system.

The by-products of the work which has been done are, in a measure, of as much importance as the work itself. The morale of the force has been improved to a great extent. The erecting shop foreman stated that his work was so much lightened that he was able to give his entire attention to his men, and consequently to do better and quicker work. His attention was not distracted by the necessity of having continually to prod the other departments for material. The parts came to him in the order that he needed them and he was able to keep his men busy all the time on the work for which they were best fitted. In the other departments it was the same. The foremen know each day exactly what is expected of them. They are able to concentrate their entire attention on the work for that day, secure in the knowledge that the work of to-morrow is to be provided for them without any effort or worry on their part. The consequence is better and more accurate work.

Financial Benefit.

To the road itself, the benefit has been great. LEAVING ASIDE THE IMMENSE BENEFIT RESULTING FROM BEING ABLE TO KNOW WITH CERTAINTY THAT IT CAN HAVE ENGINES ON THE DAY PROMISED, THE FINANCIAL CONSIDERATION INVOLVED MAKES THE WORK DONE WELL WORTH WHILE. NOT ONLY IS THE WORK DONE BETTER AND MORE CHEAPLY. The road gains the services of the engines in a shorter time than was formerly possible, and the money end of this is no small item. There is in the erecting shop pit capacity for about 32 locomotives. The services of an engine may be valued to the road roughly at $100 per day. If but a single day is saved in the time each locomotive is in the shop, the money represented amounts to $3,200 each 18 days, or approximately $65,000 per year, to say nothing of the decreased overhead expense on each engine.

It must be borne in mind as yet no attempt has been made to reorganize the shops so that they operate from start to finish on the principles of scientific management. This is a task which, in shops of the magnitude of the Angus shops, would consume a great deal of time. All that has been done is to even up the operating efficiency of the various departments so that they work together. The departments which before were run at a low efficiency have been improved so that they are now in harmony with the rest of the shop. The standard has been, heretofore, the most efficient department. When all have been brought to this standard, the next step will be to raise the efficiency of the shop as a whole. Although the work is far from complete, the results already achieved warrant the belief that in the end the Angus shops will represent the best practice in locomotive work to be found throughout the world.

CANADIAN MACHINERY
AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

Vol. VI. December, 1910 No. 12

HIGH SPEED STEELS.

In this issue is an article on High Speed Steels by J. J. Duguid, general foreman of the G.T.R., Toronto. High speed steel has a cutting capacity which has led to carbon steel being entirely replaced by it in progressive machine shops. The introduction of it has resulted in a complete change in machine tool design, speeds and feeds have been changed and the machines made more rigid to withstand the heavy cuts possible with high speed steel tools.

Mr. Duguid gives a review of the progress made since the advent of high speed steel, but points out that greater results are possible. He states, "I believe more tools are ruined by careless grinding than by any other means." This can only mean that proper grinding methods should be followed if the full capacity of machine tools is to be obtained. To overcome the difficulty the tools should be ground on wet wheels and automatic grinders for heavy grinding. The pressure on the wheel is then kept uniform, the shape of the tools is kept uniform and much better results are obtained turning out work. The points brought out by Mr. Duguid should be perused carefully by mechanical men generally.

HUMANITY OF CORPORATIONS.

It is with pleasure that we note from time to time the recognition of the services of employes, by corporations. From the recent action of the Canadian Manufacturers' Association and the steps being taken by other associations, we can see that the following item which a daily paper has termed "A Novel Incident," will be more common among Canadian employers.

"The announcement is made that the funds subscribed in aid of the Hull sufferers who were victims of the disastrous explosion last May, will be returned to the donors. The refund is made possible by the action of the explosives company, which settled all claims arising out of the disaster. The situation is unique in Canadian annals, if not in America. Actions speak louder than the most vociferous protestations and the explosives people have certainly demonstrated their position in regard to the unfortunate occurrence in a straightforward and upright as well as practical fashion."

Some time ago a workman was injured at the works of the Hamilton Steel & Iron Co., and this corporation dealt so generously with the employe that Judge Teetzel said he was surprised at the generosity of this company. Recently during the G.T.R. strike, two thousand employes of J. R. Booth, Ottawa, were thrown out of employment for several days, but were paid their wages in full. Whether or not, these corporations were legally responsible, they are to commended for their liberality and promptness in dealing with their employes.

CREDIT TO WHOM CREDIT IS DUE.

From time to time valuable improvements are made in the output of shops and factories. Often the men at the machine or the men at the bench are the ones responsible for the advancement made in the design and construction of the product. Very seldom, however, is the credit given to those who deserve it. It is therefore gratifying to note in the anniversary number of "Grits and Grinds," a monthly bulletin issued by the Norton Grinding Co., Worcester, the following paragraph from Charles H. Norton:

"In looking back over the ten years just passed, I want to express the appreciation the Norton Co. and Norton Grinding Co., feel for the help the Norton machine and methods have received from foremen and workmen. Such a large measure of loyal help is worthy of comment, and out of it has come many of our best proved theories and best production.

"CUT TIME BETWEEN CUTS."

"To cut costs, cut the time between cuts," is the way E. P. Bullard president of the Bullard Machine Tool Co., Bridgeport, Conn., sums up the problem of reducing shop costs. As an example of the inefficiency resulting from not cutting time between cuts, he pointed out that in a prominent shop, after a difficult piece of work had been finished on a boring mill, it was necessary to wait from 10 a.m. to 3 p.m. before a new forging was available, the machine in the meantime lying idle. He also pointed out that a great deal of time is wasted in boring mill operations in adjusting the machines to the exact size required by the work and stated that considerable time can be saved on machines equipped with micro-

meter dials which permit instant and accurate adjustment.

Mr. Bullard also pointed out the grave importance of the problem of lubrication, stating that from 80 to 90 per cent. of the repairs required on machine tools are made necessary through lack of proper lubrication.

Not only the builders of machine tools, but also employers and employes should consider carefully these questions which are of mutual benefit. A careful study of the problems will no doubt result in advances being made in the care of machine tools and production from same.

SAFETY OF HUMAN LIFE.

Manufacturers are becoming alive to the fact that maximum production is obtained when the shops are kept running at full capacity. This cannot be done when employes are subjected to accidents due to unguarded machinery. With the conservation of human life in view the American Museum of Safety has been opened in New York. A collection has been made of safety appliances ranging from a safety gas cock for kitchen stoves to a miner's helmet for rescue work, and from a portable fire escape to a protection for bursting fly wheels. In addition there are large collections of photographs of protected machines and of workmen using them, and an embryonic library containing selections from the already voluminous literature of the problems. The exhibition has a home for the present in the Engineering Building, No. 29 West Thirty-ninth Street. It is hoped that eventually the museum will develop to such an extent that a commodious structure will be necessary for its own occupancy.

The museum does not confine itself to safety devices for use in the mechanical arts, but rather takes the broader field of "the conservation of human life." With this idea a section has been devoted to problems of sanitation. Dust, ventilation, the lessening of noise, sewage disposal and heating are among the subjects covered. In the particular application to factory accidents the slogan of the museum is "Prevention is a benefaction, compensation an apology."

In the industrial countries of Europe compensation for accidents and enforcement of preventive methods have been very generally subjects for legislation and for governmental interference. In Canada these matters have been left to the individual and are being worked out in that way through the demands of the workmen and their organizations that men at work shall be protected and through the recognition by employers themselves that in the long run prevention of accidents pays.

Opinion has been given by members of the engineering profession that one-half the accidents are preventable. According to them, a conservative estimate of the number of annual accidents which result fatally or in partial or total incapacity for work is 500,000. Reckoning the wage earning capacity of the average workman at $500 a year—making no allowance for the professional men, railroad presidents, industrialists and other high salaried officials who are injured or killed in the railways, mines, building trades and other occupations—there is a social and economic loss of $250,000,000 a year.

Museums of safety have been established in Berlin, Paris, Vienna, Budapest, Milan, Munich, Stockholm, Zurich, Amsterdam and Moscow, all of which are supported by the State, except Vienna.

The one opened in New York cannot help but be of interest to Canadians. The occurrence of accidents has brought out a desire to prevent them and such men as Judge Gary of the United States Steel Corporation, Mr. Crawford, president of the Tennessee Coal, Iron and Ry. Co. and many others are behind the scheme. The officers of the Museum of Safety are : Philip T. Dodge, president ; Charles Kirchoff, late editor Iron Age, vice-president ; T. Commerford Martin, formerly editor of "Electrical World," Frederick R. Hutton and Dr. N. E. Ditman, chairmen of committees ; William J. Moran, counsel, and William H. Tolman, director. One of the planes is the organization of committees of safety in the factories, workshops and other industrial establishments. Laboratories for experimental purposes will also be opened. The object is a worthy one deserving every support.

CANCELLATION OF ORDERS.

The manufacturers of machine tools have been suffering from cancellations of orders at the option of the user. To receive a cancellation for a machine when it is ready to be shipped is a hardship to the builder, that users will no doubt recognize. At the ninth annual convention of the National Machine Tool Builders' Association held recently in New York, the recommendation of C. Walter Wood of the Cincinnati Milling Machine Co., chairman of the committee which investigated this subject, that there be printed on the quotation lists and acceptances of orders, a clause denying the privilege of cancellation for any other reason than the failure of the builder to fulfill his part of the contract, was unanimously adopted. It was pointed out that the cancellation feature had become an abusive custom and had produced a spirit of speculation among the users of machine tools, so that many builders and dealers had reached the point where they would individually take a stand against this practice unless it were done by the association. It is expected that the dealers will follow the manufacturers in this action, and that the effort to stamp out the cancellation abuse will become general.

The purchase of coal on the basis of its heat content is of the same utility as a definite understanding regarding the quality of any other commodity of commerce or industry.

• • •

Each new belt should be fully treated with some approved form of belt dressing. The old-fashioned dressing, perhaps the best, also the most costly, is neatsfoot oil, but the rules for applying this substance are the same as for applying modern belt dressing, which is to spread a little of the dressing on the belt and let it soak in. Don't put on much at a time; some people smother a belt with dressing, the belt slips and it usually requires two men to keep the belt on the pulleys until the dressing is absorbed. To avoid this, put on a little dressing at a time and do it often. If the belt is new and you wish to stuff it quickly, apply the dressing liberally at night, just at shutting-down time, and the dressing will be absorbed and the belt ready for service in the morning.—American Machinist.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

NEW MONARCH APPLIANCES.

THE Monarch Engineering & Mfg. Co., manufacturers of the "Steele-Harvey" tilting, oil-burning crucible furnace and a large number of other oil burning furnaces and similar appliances, have recently placed on the market some new oil burning appliances that are worthy of the attention of every metal manufacturer. These appliances are herewith illustrated.

Core-Oven Utilizing Waste Heat.

A novel combination of melting furnace and core-oven, in which the waste heat of the furnace is utilized in heating the core-oven, has been constructed. This furnace combination is in Figs. 1 and 2. The furnace shown is the improved Steele-Harvey type and in which metal is melted in crucibles by means of

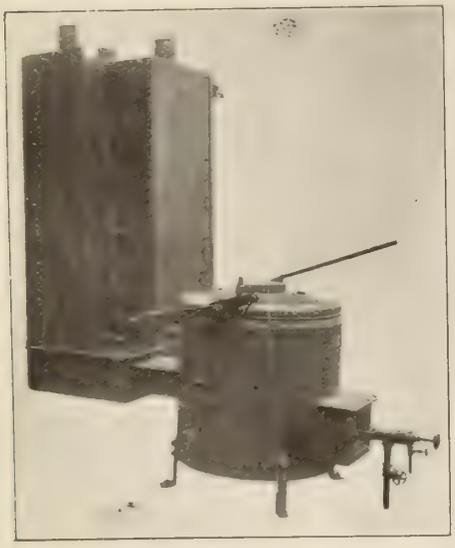

Fig. 2.—Rear View of Furnace and Core Oven

oil or gas. Either kind of fuel may be used. In melting, there is always a large amount of heat wasted and it occurred to the company to utilize the waste for heating a core-oven. The result is the combination shown in Figs. 1 and 2. The well known core-oven manufactured by them and which has given so much satisfaction is used with the furnace.

It will readily be appreciated that such a combination means great economy. The cores may be dried without any cost whatever as the waste heat from the melting furnace only is employed for the baking.

Ladle Heater.

In pouring from tilting furnaces, it is necessary to use a ladle or crucible into which the metal can be poured from the furnace, and then into the molds. Some founders use a ladle and others a crucible. For large quantities, the ladle will probably be found cheaper as there is less danger of breakage. The Monarch Engineering & Mfg. Co., of Baltimore, Md., have constructed a new form of ladle heater for use in drying the ladle or crucible used with a tilting furnace. The heater is shown in Fig. 3. The ladle or crucible is placed under it and the oil flame lighted. A large slab of fire brick over it prevents the escape of heat

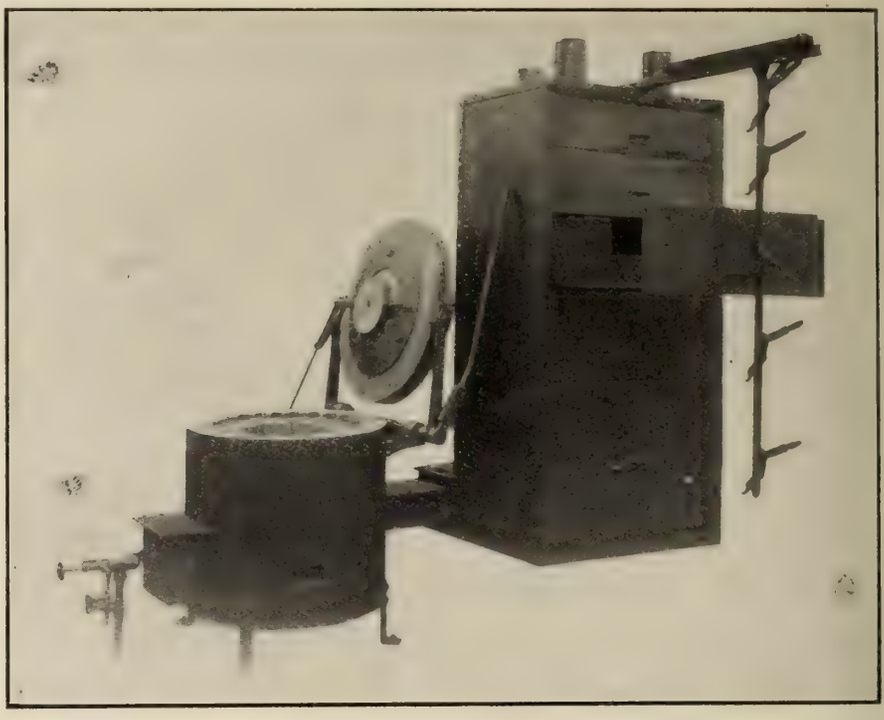

Fig. 1.—Steele Harvey Melting Furnace in Which the Waste Heat is Utilized for Heating a Core Oven.

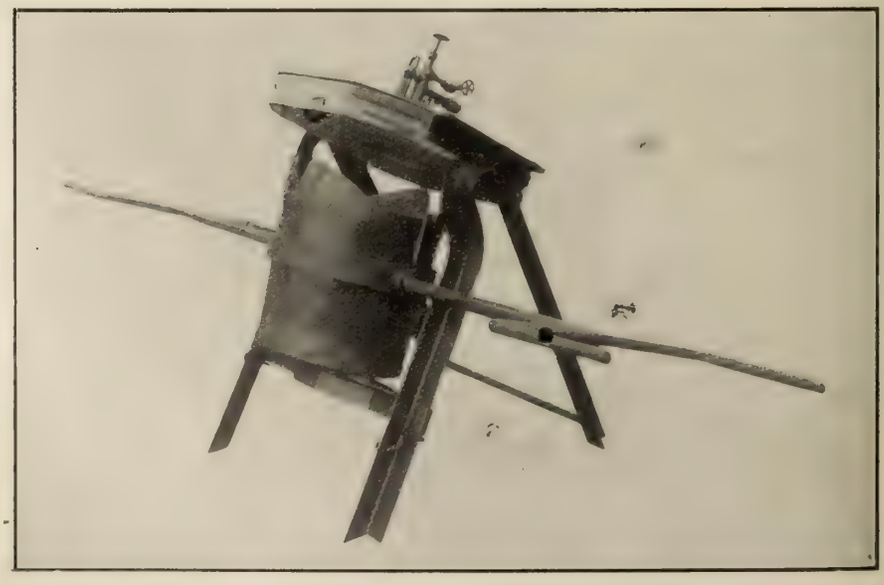

Fig. 3.—New Form of Ladle Heater Recently Placed on the Market by the Monarch Engineering and Manufacturing Co.

to the burner. The drying takes place rapidly and effectively. A feature of the heater is that the ladle or crucible may be heated to a high temperature and not simply dried as it has been found that much better results may be obtained when it is heated quite hot. The metal from the furnace then does chill when poured into it, and there is little danger from the loss of small or thin castings from cold metal. It has been found that many brass founders

Fig. 4.—Heater Without Ladle.

making small castings, and who have had the idea that a tilting furnace could not be used, have discovered that the fault lay in not having the ladle hot enough when the metal was poured into it. By the use of this ladle heater, however, it is possible to have as hot metal for pouring into the molds as though it were melted in small crucibles direct.

WHEEL COST A SMALL ITEM.

In many grinding operations the wheel wear (the first cost) is a mighty small item of expense when compared with the actual cost of operation, in which we must figure the horsepower consumed, labor, machine investment and the production.

In order to obtain a fair idea of the "cost of wheel," an accurate record was kept of a grinding operation on a 10 x 72-inch Norton plain machine. The work was grinding 35-point carbon open-hearth machinery-steel shafts from the black stock, taking off 1-16 of an inch, reducing from 1⅜ inch diameter to 1 5-16 inch. A 15 x 2-inch, 24-L alundum wheel was used and in 10 hours' work it showed but 0.270 inch wear. The wheel was trued once at the start and once at the end of six hours. Work speed, 25 feet a minute; wheel speed, 6,100 feet a minute; table reverse, 12 feet a minute. That means a wheel cost of but a very few cents a week.

It is not good policy, therefore, when endeavoring to reach maximum grinding economy to let the purchase price of a grinding wheel stand in the way of a larger production. Instead of thinking too much about "wheel cost," due consideration should be given to the other factors of cost—labor, which must be figured at from 60 cents to $1 an hour; the horsepower consumed in grinding; the production necessary to make the grinding-machine investment a profitable one and the many advantages of rapid production. These are the factors that must be weighed carefully when purchasing grinding wheels. Compare them with the "wheel cost."

Economy consists in getting the right wheel for the work and operating it under the most favorable conditions, and the original cost of the wheel in most cases is too small an item to take into consideration.—Grits and Grinds.

NEW ANTI-FRICTION ALLOY.

A new alloy for use as an anti-friction metal has been patented by Joseph R. Stratton of Moncton, New Brunswick. He claims that a zinc base alloy has several advantages in it and particularly as the melting point is sufficiently high to prevent the running out when a bearing containing it heats. He recommends the following proportions:

Zinc	25 lbs.
Lead	3 lbs.
Tin	1¾ lbs.
Copper	¼ lb.
Antimony	3 oz.

When calculated in percentages, the mixture works out as follows:

Zinc	82.0 p.c.
Lead	9.8 p.c.
Tin	5.8 p.c.
Copper	1.7 p.c.
Antimony	0.7 p.c.

The alloy is recommended by the inventor for railroad and similar heavy work.

John O'Brien has resigned as night superintendent of the Mahoning Valley Works of the Republic Iron & Steel Co. at Youngstown, Ohio, to become superintendent of the Manitoba Rolling Mills, Winnipeg.

Frank Forsyth recently resigned the position of mechanical superintendent at the works of the Lundy Shovel & Tool Co., Peterborough. He is succeeded by Peter H. F. Spies, late mechanical engineer with Siemens, London, England. Mr. Spies will be assisted by W. Jones, late foreman shovel maker with Henry Mills, Victoria Shovel Works, Worcester, England.

H. J. McCaslin, who is a frequent contributor to Canadian Machinery, has resigned his position with the Wellman, Seaver, Morgan Co., where he was head of the pattern department for ten years, to become instructor in pattern making at the Cleveland Technical High School. The employes of the above company presented him with a watch and fob when leaving.

N.T.R. SHOP EQUIPMENT.

The firms successfully tendering for the equipment of the N.T.R. Shops at Transcona, near Winnipeg, are as follows:—

Machine Tools.

In addition to the Bertram tools, the Canadian Fairbanks Co., Montreal, secured the following orders:

One 24 inch Norton grinder; one 14 inch McDougall bolt lathe with taper attachment; three 16 in. by 6 ft. McDougall engine lathe with taper attachment; one 18 in. Gardner disc grinder; One 14 in. McDougall lathe with taper attachment; two 18 in. by 8 ft. McDougall standard engine lathe with taper attachment; one 22 in. by 10 ft. McDougall lathe with taper attachment; two "Royal" 4 in. power hack saws; one Whitton revolving centering machine, capacity ¼ in. to 4 in; one 14 in. by 5 ft. McDougall bolt lathe with taper attachment; One Morse drill grinder No. 2; one 2 in. Acme single head bolt cutter; one 2 in. Acme triple head bolt cutter; one Bridgeport guide bar grinder; one McDougall 18 in. by 6 ft. engine lathe; one 16 in. Dresses Monitor lathe with taper attachment; one Warner & Swasey grinder; one No. 3 Blount grinder; three Norton double emery grinders with wheels 14 in. by 2½ in.; one 3 in. flue expander; one McGrath flue welder and swedger; fourteen 14 lb. sledges; one Fairbanks' 200 lb. strap hammer with crane; one Fairbanks' 125 lb. strap hammer with crane; One McDougall 14 in. by 5 ft. bolt lathe; two 400 lb. anvils; two 14 lb. cross pein blacksmiths' sledge hammers; one set of Blacksmiths' miscellaneous tools; two Mummert, Wolfe & Dixon combined grind stones and oil stones; fifteen 5 in. self-adjusting bench vises; fifteen 6 in. self-adjusting bench vises, all sivel type; sixty 6 in. box vises; eighteen Fairbanks' railway trucks; twenty-five Tommy bars; ten chisel bars; eighteen 10 lb. cross pein sledges; eight 14 lb. cross pein sledges; twenty-eight sets of box vises; twenty-five ratchet drills; two surface blocks, 6 by 9 ft.; four oil burners.

The Holden Co., 354 St. James St., Montreal received orders for the following:—

17 pneumatic drills, "Little Giant" size 'CR' medium, reversible, for all ordinary drilling and reaming; 5 heavy pneumatic drills, size 'ER' reversible, for heavy reaming and tapping; 15 medium pneumatic chipping hammers, No. 2, new Boyer, hexagon tool nose; 6 heavy pneumatic chipping hammers No. 1, new Boyer, hexagon tool nose; for very heavy chipping and light rivetting; 3 heavy pneumatic riveters, new Boyer,

No. 80, 8 in. stroke; 12 "Little Giant" flue expanders, assorted sizes; 3 new Boyer leg holders-on; 1 12 in. Chicago compression rivetter. All complete with necessary hose, chisel blanks, rivet sets, twist drills, etc. These tools are all of Chicago Pneumatic Tool Company's manufacture.

The Morton Manufacturing Co., Muskegon Heights, Mich., will supply the following machines:

1 60 in. stroke Morton draw-cut cylinder planer with full equipment; 1 32 in. special railroad shaper for planing locomotive axle boxes, with full equipment; 1 30 in. and 2 26 in. stroke draw-cut shapers, with attachments for railroad shops.

All of the above machines to be motor driven.

Joseph T. Ryerson & Son, Chicago, will supply the following:

1 Gisholt tool grinder; 1 12 ft. Ryerson flanging clamp; 1 Ryerson universal cold saw; 1 pipe machine; 1 Ryerson combined hot saw and expander; 1 Ryerson automatic safe end cutting-off machine; 1 Ryerson motor driven flue-cleaning machine; 1 Lennox rotary bevel shear; 1 Lennox rotary splitting shear; 2 high speed cutting-off saws; 1 600 ton hydraulic wheel press; 1 200-ton hydraulic wheel press; 2 3 in. by 8 ft. hydraulic pumps, high pressure; 1 60 in. throat, hydraulic punch; 1 560 ton, 4-column hydraulic forging press; 1 12 in. by 15 in. accumulator; 1 18 in. by 6 in. gap rivetter; 1 130 ton hydraulic bulldozer; 1 170 ton hydraulic shear; 1 hydraulic bar shear; 1 60 ton hydraulic squeezer; 1 hydraulic spring bander; 1 deep throated punch, capacity 3 in. hole in 2 in. plate; 1 Hydraulic band remover; 4 Ryerson steam hammers, also miscellaneous equipment of smaller machines.

Other successful tenders for machine tools were:—John Bertram & Sons Co., W. H. Foster Co., A. B. Jardine, London Machine Tool Co., Mussen's, Rudel-Yeates Machinery Co., A. R. Williams Machinery Co., Williams & Wilson.

Canadian Westinghouse will supply motors for motor drive.

Laurie & Lamb will supply three Belliss & Morcom two stage, two crank air compressors, capable of taking in 660 cu. ft. of free air per minute and delivering same at a final pressure of 80 to 120 lbs. per sq. in. The compressors will be direct connected to Lancashire Dynamo & Motor Co.'s motors, 150 h.p. 550 volts, 60 cycles, 3 phase. These compressors are of the Belliss vertical high speed type such as have been supplied to most of the principal mines in South Africa and other parts of the world.

Francis Hyde & Co., Montreal, are furnishing the following equipment:—

Grey Iron Foundry Equipment.

1 Blast pipe and gates for cupolas; 1 No. 11 Sturtevant blower; 1 40 h.p. A. C. Motor for above blower, blower platform; 1 pneumatic elevator; 1 5 h.p. A. C. Motor; 2 Motor driven emery grinders; 1 25 h.p. A. C. motor; 2 chipper's benches, 3x12 ft; 1 core oven 12x12 ft. by 9 ft.; 2 core ovens, 7 ft. by 12 ft by 9 ft.; 1 portable core oven; 6 water tanks, 18 in. by 18 in. by 36 in.; 8 molding tubs; 12 molders tools for bench work; 6 molders tools for floor work, all complete as specified; 50 molder's shovels; 50 riddles, ½ in. mesh; 50 riddles, ¼ in. mesh; 25 gal. iron water buckets; 25 rammers; 50 soft brushes.

Brass Foundry Equipment.

3 brass furnaces, 26 in. inside diameter, complete with linings, etc; brass furnaces, 32 in. inside diameter, complete with linings, etc; 1 steel stack, complete; floor grates, complete as specified; 1 pair crucible tongs for No. 35 crucible; 1 pair crucible tongs for No. 50 crucible; 1 pair crucible tongs for No. 60 crucible; 1 pair crucible tongs for No. 80 crucible; 1 pair crucible tongs for No. 100 crucible; 1 pair crucible tongs for No. 150 crucible; 1 shank for No. 35 crucible; 1 shank for No. 50 crucible; 1 shank for No. 60 crucible; 1 shank for No. 80 crucible; 1 shank for No. 100 crucible; 1 shank for No. 150 crucible; 1 portable core oven, complete; 1 core maker's bench, 3 ft. wide, 12 ft. long; 1 chipper's bench, 3 ft. wide, 12 ft. long; 1 band saw, complete; 1 sprue cutter, complete; 1 10 h.p. A. C. motor, complete; 1 grinder, complete; 4 molding tubs, complete; 1 moulding machine, complete; cold rolled steel shafting, 2 15-16 diameter; safety flanged couplings for 2 15-16 in. shaft; 24 in. drop hangers, complete self-oiling type; erecting and lining up main line pulleys; structural steel frame work, motor brackets, etc., including painting, erecting, complete.

Furnaces and Forges.

1 single McCaslin forge; 1 open type forge; 1 furnace for boiler flanging work; 1 annealing furnace, 8 ft. by 12 ft.—6 ft. inside; 1 tire furnace for tires up to 96 in. diameter; 2 coke forges; 2 coppersmith's forges; 1 flange forge; 13 double McCaslin forges, 48 in. by 48 in hearth; 1 single McCaslin forge, for spring work; 1 single open frame forge for frame work; 1 bolt furnace, 9 in. by 37½ in. for bolt forging machine; 1 forging machine furnace, 20 in. by 40 in. for 3½ in. forging machine; 1 bulldozer furnace, 3 ft. by 9 ft., for arch bars, etc.; 1 axle furnace, 4 ft. 11 in. by 7 ft. 11 in., for axles, etc.; 1 furnace, 2 ft. 10 in. by 4 ft. 4 in., for 3,500 lb. hammer; 1 furnace, 2 ft. by 5 ft., for spring tapering rolls; 1 double furnace, 5 ft. 6 in. by 8 ft., for spring setting and case hardening; 1 furnace, 2 ft. by 5 ft., for nibber and trimmer; 1 furnace, 2 ft. by 7 ft., for spring setting; 1 furnace, 4 ft. by 4 ft., for spring band work; 1 porter bar furnace, 2 ft. by 4 ft., for bar work; 1 double McCaslin forge, 48 in. by 48 in. hearths; 1 bulldozer furnace, 2 ft. by 6 ft.

Foundry equipment is also being supplied by Whiting Foundry Equipment Co., Harvey, Ill.

Cranes.

The order placed with Geo. Anderson & Co., Montreal, is as follows:—

1 5-ton electric travelling crane, 57 ft. 2 in. span, for grey iron foundry; 1 10-ton hand power travelling crane, 57 ft., 1.5 in. span, for power house; One 5-ton hand power overhead travelling crane, 35 ft., 2 in. span, for stores platform; 3 1-ton hand power travelling cranes, 26 ft., 10.5 in. span, for grey iron foundry; 4 electric underbrased swing cranes, for grey iron foundry and yard; 11 pillar swing cranes for the forge shop.

Others supplying cranes are Morgan Engineering Co., and Mussens.

The Manitoba Bridge & Iron Works, Winnipeg secured orders for shafting, hangers and structural steel framework.

The belting order was placed with D. K. McLaren. The industrial tracks and turntables will be supplied by the Whiting Foundry Equipment Co.

Lockers were shipped in November by the Dennis Wire & Iron Works Co., London. They are double tier style, 12 by 12 by 42. They are made entirely of cold rolled flat patent leveled steel sheets. The doors are expanded metal with angle steel frames with steel reinforcing platform for top and bottom.

Power House.

John Inglis Co. supplied Erie City water-tube boilers, air compressors and pumps. John McDougall Caledonia Iron Works supplied pumps.

The C. G. E., Toronto, suppled 3 engine type, 3-phase-500 K.W.-600 volt generators, 150 r.p.m.; 1 engine type, 3-phase-250 K.W.-600 volt generators, 150 r.p.m.; 1 engine type D.C. generator, 150 K.W., 250 volts, 225 r.p.m.; 2 D. C. exciters, 125 volts, 275 r.p.m.; 1 Motor generator set, 225 H.P. capacity.

The Robb Engineering Co., Amherst, N.S., were awarded contract for one 3,000 h.p. Hoppes feed water heater.

The following engines are being built by the Goldie & McCulloch Co., Galt: Three 21-in. and 34-in. by 30-in. 750 I.H.P. cross-compound, heavy duty non-condensing corliss engines, each direct connected to one 500 K.W., three phase, 60 cycle generator, speed 150 R.P.M; one 18 in. by 30 in. 375 I.H.P. heavy duty, simple non-condensing corliss engine, direct connected to one 250 K.W., three phase, 60 cycle generator, speed 150 R.P.M.; one 14 in. by 30 in. 225 I.H.P. heavy duty simple non-condensing corliss engine, direct connected to one 150 K.W. direct current generator, speed 150 R.P.M.; two 11 in. by 12 in. (exciter) side crank, non-condensing ideal engines, direct connected to 75 K.W., D.C. generators, speed 275 R.P.M., 115 H.P. each.

View of the Plants of the Ontario Iron and Steel Co., and the Page-Hersey Iron Tube and Lead Co., Welland.

The Large Steel Foundry and Pipe Mill at Welland

Under One Management, There are Two Large Industries at Welland—the Ontario Iron & Steel Co., and the Page-Hersey Iron Tube & Lead Co.—Both Large Concerns Producing Iron and Steel Products. The Steel Plant has Been in Operation for Some Time, While the Pipe Mill was Opened Quite Recently. Both These Plants are so Well Equipped and Modern in Every Particular That a Brief Description is Interesting and Instructive.

THE steel plant of the Ontario Iron and Steel Co., Welland, has the largest, most extensive, and probably the best equipped steel foundry in Canada, producing a very large output each year. The plant is capable of handling almost any size of work, and have successfully made intricate castings weighing upwards of 27,000 pounds—such articles as generator frames, turbine runners, etc.

The steel foundry is housed in the large building to the right in the halftone, and is conveniently arranged throughout. It is 250 ft. long by 180 ft. wide. The small building in the immediate foreground is the pattern storage building, a building 100 ft. long by 50 ft. wide, but which is much too small to accommodate conveniently all the patterns they have accumulated. Additions are therefore contemplated. The smaller building to the right which is 100 ft. by 34 ft., is the pattern shop, where the majority of the patterns are made. The equipment is of the best to produce high class work.

Back of the steel foundry, is the open-hearth ingot shop, where open-hearth steel ingots are produced. The building is of the usual light corrugated galvanized construction, so generally used for such work, and measures 200 ft. by 100 ft. The furnaces are ranged along the back wall, with the ingot pit directly before it, and the stripping floor in front of that again. Convenience has been the keynote of the whole construction, which has been carried on throughout the whole plant by A. M. Moseley, works manager, who installed the whole plant of both concerns.

To the left of the ingot shop is the rolling-mill, a building 300 ft. long by 100 ft. wide, in which are two sets of rolls, actuated by a large induction motor. A large variety of bar stock and re-inforcing bars are made, as well as angles up to 2 inches in size.

In front of this building is the rail joint mill, a 100 by 40 ft. building devoted to the production of this particular class of work.

Pipe Works.

The series of buildings back of these buildings just described, belong to the Page-Hersey Iron Tube and Lead Co., which, as before mentioned are under the same management as the Ontario Iron and Steel Co. The building in the far distance is one that the prophetic eye of the artist portrayed, as are also the two smaller buildings to the left in the illustration. They are additions that are to be erected in the very near future, for the capacity of the pipe mill is already taxed.

At the end of the long shop, extending to the right, is the pipe rolling mill, where the rough skelp passes through the various operations that finally turn out as pipe. It is a building 180 ft. long and 100 ft. wide.

The long building before-mentioned, contains pipe threading department, and the pipe storage. The nearer third of the building is not completed as yet, as the company is still quite young. It is a building 50 ft. wide, with the finishing section 140 ft. long, and the storage of a similar length.

On the right, projecting this way from the rolling mill, is the coupling department and machine shop, the building being 180 ft. long by 50 ft. wide. An extensive machine shop is necessary to repair the many breaks occurring in such heavy machinery subjected to considerable strains.

To the right of this building may be seen a long crane way, 300 ft. long, running into the far end of the rolling mill. It extends over the whole length of the skelp storage yard, and is used for carrying the latter into the rolling mill.

At the far end of the rolling mill is another lightly constructed building where the producers are located. While national gas is plentiful, producer gas has been found to be superior. Three large producers are in service.

Transportation facilities are excellent. In the immediate foreground, is to be seen the main line of the Canada Southern division of the Michigan Central. Numerous switches and tracks reach every part of the yard. The same set of tracks lead to a small industrial line running to the Welland Canal, seen in the distance. In every way, the plant is thus ideally located.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

SYDNEY—An agreement between the Dominion Steel Co. and Alexander Cross & Sons will result in the latter erecting grinding machinery to deal with the Steel Co.'s production of basic slag. This means a large expenditure in buildings and machinery and the employment of a considerable staff of men.

HUMBERSTONE—The foundry and automobile supply store of T. E. Reeb & Sons, here, was destroyed by fire on Nov. 23. The loss is $15,000 and insurance $4,000.

CHELMSFORD—Anthracite coal of the best quality has been found here and experts say that the whole valley in which the town is situated is underlaid with coal. A company has been formed and the coal will be marketed in a short time.

HUNTSVILLE, ONT.—The Huntsville Engine Works Co. has assigned.

CALGARY—The Ottawa Furnace Co. will erect a plant here for the manufacture of furnaces, ranges, etc.

SOUTHAMPTON, N.S.—The carriage factory of S. Fillmore, was destroyed by fire. Loss, $35,000.

EDMONTON—Edmonton will spend $500,000 for new waterworks and pumping machinery.

BOSTON MILLS, ONT.—The flour mills of H. Bracken & Son, were destroyed by fire. Loss, $15,000.

SELLWOOD, ONT.—The Moose Mountain Mining Co. have decided to erect a new refining plant on their property here. With this new addition it is estimated that a total of 2,500 tons of finish iron will be turned out daily. Mackenzie & Mann are prominent in the management of the company.

PORT ARTHUR, ONT.—A large foundry will be erected at Port Arthur to manufacture cast-iron pipes and car wheels. This is in conjunction with the Atikokan blast furnace. Five hundred thousand dollars will be expended in the project and as this will make a very much larger demand for the pig iron of the present plant, which is of 200 tons capacity and 100 coke ovens, the extension of the blast furnace is already under serious consideration.

SUALT STE MARIE—On Nov. 12 the blast furnaces of the Lake Superior Corporation turned out 680 tons of Bessemer iron. The former record for one day was 676 tons. The average output for the last month was 652 tons per day.

PORT HOPE—The Judicial Committee of the Privy Council in England, which is the court of last resort in the British Empire, has decided in favor of the Standard Ideal Co., Port Hope, Ont., in the litigation between that company and the Standard Sanitary Mfg. Co., Pittsburgh, Pa. The matter at issue was the use of the word "Standard" in the Port Hope company's name. In the Canadian courts the case was decided in favor of the Pittsburgh company. The Standard Ideal Co. will now, it is said, increase its manufacturing capacity. It has already under construction at plant No. 2 a building that is to cost about $100,000.

PORT ARTHUR—It is announced that the Atikokan Iron Co.'s furnace here will be kept in operation all winter.

OTTAWA—The Schwab Boiler Heating Co. has been incorporated under Dominion laws, with a capital of $100,000, the head office to be at Ottawa.

NEEPAWA, Man.—The Match Factory Co., whose building operations here have begun is to put in a large amount of machinery.

ORILLIA—Proposals have been made to the National Hardware Co., to remove its lock works from that town, but the company has practically decided to enlarge the Orillia plant rather than build entirely new works elsewhere.

FORT WILLIAM—Lumby-Stenhouse, Ltd., is building a foundry and machine shop here to cost $40,000.

PORT DOVER, ONT.—The Widespread Implement Co. is putting up buildings. Its planing mills are nearly ready for the machinery, and the foundry building is progressing rapidly.

FORT WILLIAM—The Superior Rolling Mills Co., of Fort William, recently organized to establish a plant at that city, has been merged with the Steel Co., of Canada. J. Orr Callaghan, of the Steel Co., states that plans are in preparation for the plant on a considerably larger scale than that contemplated by the Superior Rolling Mills Co

WINDSOR—The Winkley Co. will establish a Canadian branch at Windsor, for the manufacture of brass goods, at a cost of about $15,000.

YORKTON, SASK.—The Birrell Motor Plow Co., of Winnipeg, may establish a branch factory here at a cost of $50,000.

HAMILTON—The Canadian Steel Co. obtained a permit on Oct. 21 for the first of its new buildings to be erected here. The structure will be a 1-storey frame and corrugated iron mill building 210 x 70 feet.

TORONTO—Fire damaged the plant of the Wilkinson Plow Works to the extent of several thousand dollars on Nov. 8. The molding shop was destroyed together with scores of patterns.

MEDICINE HAT—A by-law was carried on Oct. 17th granting a site and a $10,000 gas well to the Alberta Iron Roller Mills Co. Work on the buildings has commenced.

FERGUS, ONT.—Fergus may grant Beatty Bros., manufacturers of agricultural implements, a loan of $25,000 for 15 years, without interest, and a fixed assessment of $5,000, exclusive of school taxes.

MONCTON—A proposition is on foot to move the Whelpley Skate concern from Greenwich, King's County, to Moncton, N.B. The council of Moncton has fixed the taxes on the industry at $1.00 a year for ten years, and promises free water. Moncton men are subscribing stock.

TORONTO—H. Disston & Sons are to erect a one storey addition to their Canadian saw-making plant on Fraser Avenue, to to cost $6,000.

SARNIA—The Sutherland Fence Co., of this place, are building a new factory, 150 by100 ft., capable of handling a large output of woven wire fence.

AMHERST, N.S.—The Amherst Malleable Co. is extending its premises by an addition in which it is expected 150 men will be employed.

ST. BONIFACE, MAN.—The Winnipeg Ceiling and Roofing Co. is building a $60,000 plant at St. Boniface.

GANANOQUE—Fire was the cause of from $150,000 to $175,000 loss to the Ontario Wheel Co.'s works here on Nov. 3rd. Insurance will be rebuilt as Gananoque has guaranteed the company exemption from taxation for ten years.

MORRISBURG—The tack factory will increase the number of machines used from twenty-five to fifty. A steam heating plant is being installed.

GUELPH—The property of the Grundy Stove Co. has been purchased by James Fowler, of Toronto, who will commence operations shortly.

TORONTO—The Canadian Autopress Co. have purchased a factory at the corner of Eastern and Carlaw Avenues, this city, and will build an addition.

GUELPH—A proposition has been accepted by this city from Mr. Phillips, of Detroit, re the establishing of a plant for the manufacture of automobiles. The company will occupy the old Morlock factory for three years at a nominal rental of $1 and for the remaining seven years of a ten year lease at $600 per year.

WINNIPEG—The Winnipeg Wire and Iron Works have registered a partnership between Chas. E. Hammersley and Geo. A. Pepper.

TORONTO—The King Radiator Co. is making extensive additions to its plant.

WALKERVILLE—The Penherthy Injector Co. is extending its plant.

OTTAWA—Negotiations are being carried on with Detroit capitalists regarding the establishment of an automobile factory here.

TORONTO—The Ontario Wind Engine & Pump Co. is building a new $6,000 boiler house. The company reports having received large orders for railroad tanks.

TORONTO—The Dayton Scale Co., of Dayton, Ohio, will establish a branch factory in Toronto. A site with 200 feet frontage on Campbell Ave. has been purchased.

VANCOUVER—An engineering works to cost $5,000,000 is to be established near this city. The proposition is being looked after by Lincoln Chandler, of Birmingham, England, who is connected with the British Empire Bridge Works in that city, and is secretary of the Metropolitan Amalgamated Railway Carriage and Wagon Co., of Saltley.

TORONTO—Permits were issued during the week of Oct. 22-31 for the erection of a 3-storey brick automobile factory for the Elder Carriage Works to cost $12,000; a 4-storey brick warehouse for the Consolidated Optical Co. at $45,000; a 3-storey brick factory for the National Electric Heating Co. at $14,000; a brick car storage for the Toronto Ry. Co., at $14,500.

KAMLOOPS, B.C.—A smelter, of the reverbatory type, is to be established here by the interests operating the Iron Mask properties.

KINGSTON—The locomotive works here have received an order from the C.P.R. for eight additional engines, making 18 now under contract.

YARMOUTH, N.S.—The Burrell-Johnson Iron Co. are fitting four steamers with boilers and machinery.

WOODSTOCK—The Maximillian Machine Co., of Buffalo, will erect a Canadian branch factory here for the manufacture of pneumatic rivetting machines. $100,000 will be expended.

GALT—A second storey is being added to the plant of the Galt Motor Co. The addition will be of brick and used for the manufacture of two cycle engines.

LACHINE, QUE.—The Canadian Tube & Iron Co., of Ottawa, are contemplating the erection of a large plant here.

SARNIA.—An offer has been received from a party in Houston, Texas, to start a gas engine factory. The offer is conditional upon a free site and exemption from taxation.

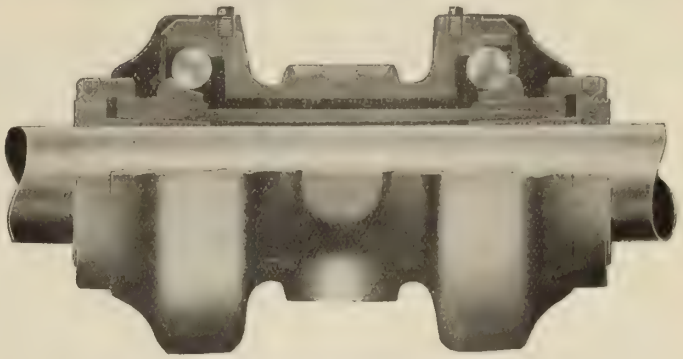
MONTREAL—It is officially announced that the amount to be expended by the Canadian Pacific Railway on improvements in connection with the Place Viger new passenger and freight terminals and freight shed is $3,000,000.

PORT ARTHUR—The steamship Beaverton brought a cargo of machinery to Port Arthur a few days ago for the Western Dry Dock & Shipbuilding Co.'s plant.

ST. BONIFACE, MAN.—The Rice Malting Co. will buy engines and elevators for its new $250,000 brewery.

P wer Talk No. 1—

¶ An Interesting Proposition to the Manufacturer Who Thinks He Needs a New Engine of Greater Horse Power



Assuming you need from *15% to 30% more power*, you naturally consider that a new engine or motor is necessary.

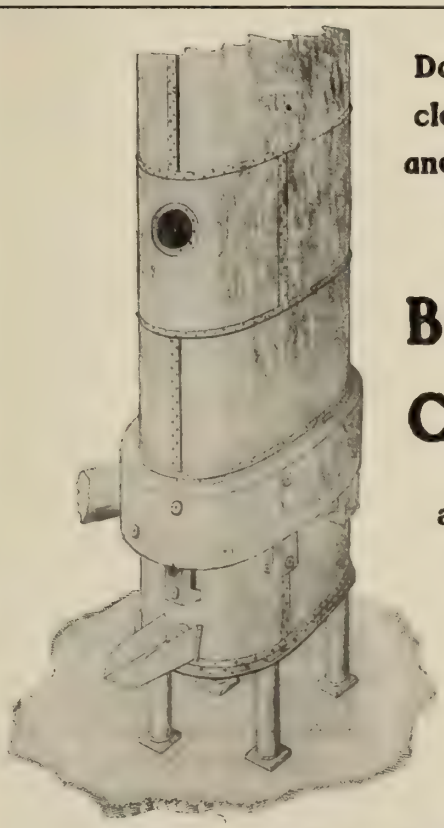
The important queston for you to decide is whether you are *delivering all the power to your machinery that your motor or engine is developing.*

The chances are that you are not, for in the average shop *the shafting is wasting from* ***20% to 70%*** *of the power before it reaches the machinery.* You can *turn this waste power into productive power by equipping your shafting with CHAPMAN DOUBLE BALL BEARINGS.* They fit any type of adjustable hanger.

Send us a sketch of your layout and we will give you figures on what Chapman Double Ball Bearings will save you.

The Chapman Double Ball Bearing Co. of Canada, Limited

339-351 SORAUREN AVENUE, TORONTO, CANADA



Do you want clean tuyeres and pure iron?

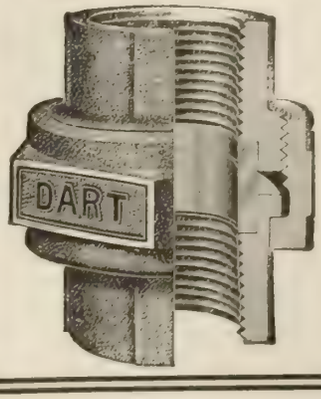
Tight Joints—Quick— That's what you get by using Dart Unions in making all pipe connections.



DART UNIONS

are made in two bronze-seated sections, as shown in the cut. These two sections meet in the form of a bronze-to-bronze ball joint that will never leak, never rust, never corrode—a joint that is everlastingly tight against steam, air, gas, oil and water. Ask your dealer to show you a Dart Union. Its construction always interests good mechanics.

DART UNION CO., Limited
93-97 Niagara Street, TORONTO, ONT.

WINNIPEG—The Winnipeg Tanning Co. will make extensive additions to its plant and install new machinery.

COBOURG—The Crossen Car Works here have been purchased by a syndicate composed of William Mackenzie, W. M. Aitken and Lazard Freres.

MONTREAL—The Canadian Radiator Co., of Toronto, is to establish a plant on the bank of the Lachine Canal which will give employment to 500 men.

PORT ARTHUR—The Ironclad Co., a branch of the Ironclad Co., of New York City, will shortly start building operations here. It is stated they will employ about 300 hands.

VANCOUVER—The B.C.E.R. Co. will require about 122 cars of various types for their branches and the expenditure on rolling stock for ensuing year is estimated at about $500,000.

Electrical Notes.

TORONTO—In all probability the night of Dec. 15 will witness the celebration of the coming of hydro-electric power to Toronto. Arrangements will be made to illuminate either the armories or St. Lawrence arena after the manner of the blaze of light at the Berlin festivities. The ceremonies will take place about 7 o'clock in the evening. There will be a banquet.

WINNIPEG—Tenders will be received until December 15th for an electric traveling crane, also for 500 K.W. motor generator sets. M. Peterson, secretary, Board of Control.

HALIFAX, N.S.—Daniel Adamson & Co., of Dukinfield, near Manchester, England, are putting in a new exhaust steam turbine engine at the Dominion Steel Corporation's No. 2 Colliery, Glace Bay, N.S. It is to provide 1,400 h.p. of electrical power for the plants there. This is said to be the only exhaust steam turbine installed in Canada. Two similar engines will, it is said, be installed by the Nova Scotia Steel & Coal Co. at its New Glasgow works. Exhaust steam from the rolling mills is to be used to generate electricity. The engines are to be 680-h.p. low pressure turbines. The statement is made that two 3,000-h.p. mixed pressure turbines are to be set up for blowing purposes in connection with Canadian blast furnaces.

NEW HAMBURG, ONT.—A large addition is being made to the municipal power house here in preparation for the installation of transformers for the Hydro-Electric system.

LONDON—Willis McLachlan, of Toronto, has been appointed electrical engineer for London. Mr. McLachlan was an engineer in the hydro-electric station at Niagara Falls.

PARIS—The Grand Valley Electric Railway Co., will construct a 40,000 volt transmission line from Brantford to Galt. The line is for their own use but the company are willing to sell power to municipalities on or near their right-of-way. Plans have been prepared for the contemplated erection of a transformer house in Paris.

ST. CATHARINES—On Nov. 14 a short circuit caused a lively blaze in the transformer room of the Packard Electric Co. The loss was covered by insurance.

MONTREAL—Ross & Holgate, Montreal, are preparing to build a large power house on the Magog river.

VANCOUVER—There is to be installed in this city in the near future an electric time service. The B.C. Electric Ry. Co. will control the service, and the master clock will be in the Co.'s head office. This clock is controlled by telegraphic communication, and electric connection ensures accurate time for the clocks receiving the ervice.

MACLEOD, ALTA.—The local branch of the Bremner Electric Co. has been purchased by H. E. Perry, a former manager of the company. The business is now known as the Perry Electrical Co.

BELLEVILLE—The establishment of a power plant to cost $500,000 is contemplated by the Sidney Electric Power Co.

RENFREW—The power house of the Renfrew Electric Light Co. was totally destroyed by fire on Oct. 20th. The loss is in the neighborhood of $2,000; no insurance was carried.

SARNIA—A representative of an English syndicate of capitalists was here on Oct. 24th, making inquiries relative to the proposed building of an electric line from London to Sarnia.

MONTREAL—The contract with the Saraguay Electric Co. for the lighting of Notre Dame de Grace has been changed. The new agreement effects a saving for the city of $20,000 a year over the original plan.

CALGARY—Application is being made by the Alberta Electric Ry. to the Dominion Parliament for a charter enabling the company to operate an electric railway from Medicine Hat to Calgary; also to install telegraph and telephone lines.

ENGLEHART, ONT.—It has been decided to sell debentures for $30,000, covering a period of 30 years, for the purpose of developing the power at High Falls to generate electricity for the town.

EDMONTON—Numerous municipalities of the province are uniting with this city to urge the provincial governmeot to develop electric energy from the water falls throughout Alberta and dispose of the same as the hydro-electric commission is doing in Ontario.

OTTAWA—A meeting of Carleton county citizens was held on Nov. 2 when preliminary steps were taken for the formation of a company to build an electric railway from Ottawa to Kingston. Provisional directors were appointed.

TORONTO—C. T. Bowring has served his connection with the ffiNew York office of the Westinghouse Electric Co. and opened an office in the Temple Building, this city. Mr. Bowring will represent European electtical and hydraulic manufacturing firms.

MONTREAL—1,290 men are at work on the plant of the Canadian Power Co., at St. Timothy, opposite the Cedar Rapids. On March 1 next, it is expected that 12,000 h.p. will be ready for delivery in Montreal and district. The maximum capacity of the plant when finished will be 72,000 h.p.

TORONTO—The board of directors of the Canadian National Exhibition have requested the city council to arrange for wiring the buildings and grounds. The estimated cost is $80,000.

OTTAWA—The tender of the Ottawa Electric Co. to supply electric fixtures for the city hall for $2,004 was accepted. This tender was the lowest.

PORT ARTHUR—Owing to the Current River running dry the power house has been unable to supply sufficient electric energy to meet the demand. The substation at Kakabeka Falls will be ready by Dec. 1 but in the meantime the old steam plant at the Current River power house is doing all the work.

YORKTON, SASK.—An oil engine will be installed in the municipal electric light plant here to supply motive power.

TORONTO—In the spring the National Electric & Heating Co. will move from Galt, Ont., to Toronto, where a large building is being constructed for it.

TILLSONBURG, ONT.—Plans furnished by the Hydro-Electric Commission for a power house to be built here were approved on Nov 8 and the contract let to the Tillson Co. at $1,548.

Municipal Undertakings.

SOURIS, MAN.—Tenders will be received until Februgry 1st for the following material for delivery during spring and summer of 1911: Approximately 40 tons of 12-inch standard B.I. waterpipes. Approximately 85 tons of 8-inch standard C.I. waterpipes. Approximately 200 tons of 6-inch standard C.I. waterpipes, Approximately 150 tons of 4-inch standard C.I. waterpipes. And special castings. ESTABLISH A MODERN TAX-FREE ALCOHOL DISTILLERY
We have a Good Proposition for Motor Mfrs.

Having exported our Stills in large amounts for many years, and already having several far Eastern agencies we are now open to establish additional agencies and invite correspondence to that end, looking after our old customers and prospective buyers by special successful demonstrative methods for making Alcohol, Apple Jack, Aguardicnte, Mescal, Teguila, Peach Brandy, Whiskey, etc. Most modern and simple. All sizes, 5 to 500 gallons daily capacity distilling apparatus.

ARE YOU LOOKING FOR information relating to INDUSTRIAL or DENATURED ALCOHOL DISTILLING APPARATUS and the amazing possibilities of the utilization of waste farm products and wood waste by superheated steam distillation, the distilling apparatus as used by us; the principle involved, also the methods of chemical control and disposal of the product and by-products? We will gladly say to you:

Denatured Alcohol to-day is of the greatest untold benefit to the American motor people. It opens an absolutely new field for investment for progressive paper pulp and chemical fibre mills, paint, varnish, soap and candle makers, gardeners, farms and garbage plants, saw-mills, lumbermen and canneries. The Automobiles and the Navies of the world clamor for this new tax-free cheaper industrial alcohol. May we expect some encouragement from the more patrotic pioneers for this new American Industry? The field is new and profitable, and you can practically have the business your own way by starting now. We are makers of an apparatus for the production of this denatured or industrial alcohol; we build and install plants—large or small. The initial cost of a plant is small; the financial risk—if any—is trifling. The equipment is such that it can be added to at any time without disturbing the original installation. Address

NORTH COWICHAN, B.C.—The by-law to provide an electric light system here was carried. A brick building is being erected to house the plant. Steam will furnish the generating power.

DUNNVILLE, ONT.—A by-law will be submitto the ratepayers providing for the expenditure of $15,000 for the extension and improvement of the waterworks system.

WELLAND, ONT.—The ratepayers of Welland have ratified a by-law providing for the expenditure of $52,000 on water works.

MAPLE CREEK, SASK.—Tenders for the erection and installation of an electric light plant and flour mill are invited by the mayor and council of Maple Creek.

STEELTON, ONT.—A by-law will be submitted to the ratepayers of Steelton, to authorize the expenditure of $30,000 for the construction of a lighting plant.

CALGARY—The power committee of the city council are making arrangements to obtain reports on power sites for Calgary on the Pow and Elbow rivers.

VANCOUVER—The ratepayers will vote on January 11 on the expenditure of $500,000 for sewer extension.

General Manufacturing News.

GEORGETOWN, ONT.—The paper coating mills here are completing a new mill building 75 x 300 ft. and 3 storeys.

OWEN SOUND—The North American Furniture Co. is building a large factory at Owen Sound.

PORTAGE LA PRAIRIE, MAN.—Thompson Brothers will build a large new shoe factory at Portage La Prairie.

WINNIPEG—The B. F. Nelson Co., of Minneapolis, will build a large branch factory in Winnipeg to manufacture roofing and building papers.

EDMONTON—E. F. Wayman will equip a $40,000 soap factory at Edmonton.

HAMILTON—The Hamilton Mirror Plate Co. is extending its plant.

WINNIPEG—L. B. Lincoln, of Montreal is building a large peat-producing plant at Winnipeg.

FORT WILLIAM—C. Whitehead, representing Ely Bros., London, Eng., manufacturers of ammunition will recommend that their Canadian plant for the assembling of parts be established here.

CORNWALL—The Ives Modern Bedstead Co. is making a large addition to its plant.

BUCKINGHAM, QUE.—The Graphite Co. at Buckingham, proposes to move its mill to the pits in the vicinity of the town and make improvements in the plant.

TORONTO—The Alexander Brown Milling Co., of this city, purpose erecting a large flour mill and elevator at a cost of $500,000. The mill is to have a capacity of 6,000 barrels per day and the elevator will accommodate 1,000,000 bushels of grain. The new buildings may be erected in Welland though some plans have been made for their erection as an addition to their present plant.

WALLACEBURG, ONT.—The Dominion Carlite Explosive Co., capitalized at $100,000, have had plans prepared for a factory to be erected here. An explosive called carlite is to be manufactured.

OTTAWA—A factory is to be built here by the Ottawa Vacuum Cleaner Co., for the manufacture of a new departure cleaner. The company's capital is $150,000.

MONTREAL—A company manufacturing a high grade of eyeglasses will move to this city from Southbridge, Mass. An average of 300 hands are employed and in busy seasons 500.

GUELPH—A new factory to manufacture carpet sweepers, vacuum cleaners, clothes washers and other household articles is to be started in Guelph by W. W. Hesson and W. E. Rothwell, of Toronto.

ST. THOMAS—The Monarch Knitting Co., of Dunnville, will erect a $10,000 factory here. The city is furnishing a loan of $30,000 for five years and a fixed assessment of $10,000 for ten years.

BRANTFORD—Tindall & Co., of Woodstock, have the contract for a $50,000 factory to be erected in this city for the Penman Woollen Co., of Paris.

QUEBEC—Price Bros., London, England, who have secured the controlling interest in the Jonquiere Pulp Co., are contemplating the erection of a large paper mill at Lac Au Sable, in the Saguenay country. The company are offering an additional issue of bonds amounting to $6,000,000.

EDMONTON—E. F. Wayman, of Regina, will start a soap factory here. A capital of $23,000 has already been subscribed. $40,000 is required.

RED DEER, ALTA.—The Alberta Pacific Elevator Co. are installing machinery for the production of flour. At present only local trade will be supplied but if that proves satisfactory a larger plant will be installed.

PETROLIA—The 3-storey flour mill here owned by W. W. Pating was completely destroyed by fire on Nov. 17. Loss $10,000; insurance $5,600.

PERTH—The Fallbrooke Roller Mills, owned by A. B. Lees were destroyed by fire on Nov. 16. The loss is between $8,000 and $9,000; insurance, $3,500.

NIAGARA FALLS—The plant of the Oneida Community Silver Co. was damaged by fire on Nov. 17.

CHATHAM—The American Pad & Textile Co., of Greenfield, Ohio, will erect a branch here to employ 75 hands.

SAULT STE. MARIE—A contradiction is given the report current a month ago that American capital would erect a $10,000,000 pulp mill at Sault Ste. Marie. The Lake Superior Corporation, whose present mill the American interests were supposed to be contemplating the purchase of, has arranged for the erection of a paper mill, the estimated value of which is $1,000,000.

SPANISH RIVER, ONT.—A reorganization of the Spanish River Pulp & Paper Co. has been effected and next year a paper mill with a daily capacity of 200 tons will be erected.

PEMBROKE—A company composed of Jas. Munro, president; J. A. Forgie, secretary-treasurer, will erect a box factory here at once, it is stated. Capitalization, $100,000.

SMITH'S FALLS—The Canadian Cooperage Co., of Chatham, are stated to have decided to locate a branch here and erect their own buildings.

MOOSE JAW—It is reported that the Moose Jaw Pressed Brick Co. will build a plant of which the estimated cost is, including machinery, about $100,000.

Planing and Saw Mill News.

FORT GEORGE, B.C.—The lumber company here has been reorganized and the name changed to the Fort George Timber & Transportation Co. New capital has become identified with the industry and business will be done on an enlarged scale.

QUEBEC—The mill of the Lake Megantic Lumber Co. has shut down after six months' cutting which amounted to approximately 10,000,000 feet of sawn lumber.

NORTH BAY—New machinery will be added to the plant of the Northern Planing Mills.

WELLAND.—Cutler's planing mill was destroyed by fire on Nov. 7. The total loss is $15,000, of which $3,500 is covered by insurance. It is stated that another mill will be erected.

NEW WESTMINSTER, B.C.—The Bailey Lumber Co.'s new sawmill at Port Hammond is nearing completion. Its full capacity will be 25,000 ft. per day. In another year it is expected a planing mill, lath mill and dry kilns will be erected.

ONE MAN

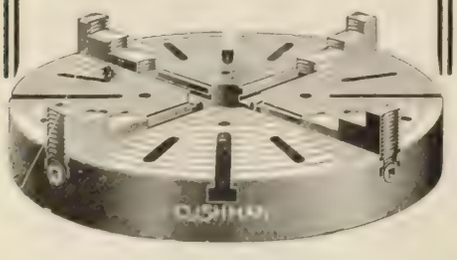
The Cushman Chuck Co.
Hartford, Conn., U.S.A.
Established 1862



NELSON, B.C.—The new lumber mill at Castlegar has commenced operations. It has a capacity of 60,000 ft. per day.

NELSON, B.C.—The sawmill of the Elk Lumber Co. has closed for the season but the planing mill will operate throughout the winter.

GUELPH—The new planing mill being erected by Mr. Green at the foot of Alice Street is progressing rapidly. Operations will commence as soon as possible.

FESSERTON, ONT.—The stave mill belonging to W. W. Carter was destroyed by fire with all the machinery, on Oct. 25. The mill had been closed for some time.

NANAIMO, B.C.—The Ladysmith Lumber Co., on Nov. 1, purchased the holdings in this city of the Red Fir Lumber Co. It is the intention of the new owners to overhaul the mill and install new machinery.

CROFTON, B.C.—The Empire Co. will spend $1,000,000 equipping the largest sawmills in British Columbia.

BERLIN—The Wunder Furniture Co. are erecting a large addition to their factory.

HALIFAX—H. E. Macarthur's woodworking factory was destroyed by fire on Oct. 20. Loss about $5,000.

BURTON, N.B.—The McLellan-Smith Lumber Co., it is stated, will rebuild their mill which was destroyed by fire on the 16th of October. Estimated loss, about $7,000.

DALHOUSIE JCT., N.B.—Hicks & Thompson have registered in connection with the sawmill here.

ABBOTSFORD, B.C.—The Abbotsford Shingle Co. has assigned.

LETHBRIDGE—Work on the sash and door factory of the South Alberta Lumber Co. has been commenced. The contract, which is in the hands of W. R. Virtue, amounts to $20,000 and calls for a building 60 x 140 ft. with a basement and two storeys.

YMIR, B.C.—The Active Gold Mining Co. are preparing to erect a sawmill at Porcupine Creek.

VICTORIA, B.C.—A number of financiers from British Columbia are endeavoring to secure support for lumber propositions in London, England.

PENTICON, B.C.—The Penticon Lumber Co. has been incorporated for the purpose of manufacturing piping for irrigation purposes. The company owns 11,000 acres of tamarac and is capitalized at $200,000. A saw mill and factory will be erected.

ST. CYRILLE DE WENDOVER, QUE.—The sash and door factory owned by C. Caron here has been destroyed by fire with a loss estimated at $15,000.

LINDSAY—The Carew Lumber Co. are building a 2-storey addition to their box factory here. The new structure will be 35 x 40 ft. and is to be used as a planing mill. New machinery will be installed.

EDSON, ALTA.—A report says that T. A. Burrows, of Winnipeg, will establish a $60,000 saw mill near Medicine Lodge, on the G.T.P.

SHAKESPEARE, ONT.—An extension 60 x 25 ft. is being made to the planing mill here; a new office is also being built.

VICTORIA, B.C.—Col. Dempster, an English financier, and Sir George Doughty, have arranged for a $5,000,000 lumber merger involving B.C. mills principally.

Structural Steel.

WINNIPEG, MAN.—The Manitoba Iron and Bridge Works has been awarded contracts for the steel and erection of the new C.N.R. train shed and a 150 ft. viaduct. For the viaduct 900 tons of steel will be required and for the train shed 730 tons.

QUEBEC—Mr. Vantelet, a member of the Board of Engineers the government has put in charge of the construction of the Quebec bridge, says that the bridge will be 88 ft. high, as compared with 67 ft. as the hight of the bridge formerly under construction there. The span will be 1,758 ft., which is 42 ft. less than that of

Awarded Silver Medal.

[illegible] & Chesson, St. Nicholas Bldg., Montreal, have been awarded the silver medal for [illegible] of transmission machinery at the Canadian National Exhibition, Toronto, 1910. The exhibit included Renold chain drives and belting and gear drives. The Silver Medal is the highest award. Hans Renold, Manchester, Eng., whose principals have been awarded the Grand Prix at the Brussels Exposition, 1910.

Holden-Morgan Co.

The announcement has been made of the formation of a new company for the purpose of constructing and manufacturing automobile parts and engines, as well as jigs, tools and special machinery for all manufacturing purposes. The name of the company will be the Holden-Morgan Co., with head office and factory in Toronto. Mr. Holden is well known in Toronto and has had years of experience in the building of special machinery, as well as automobile and motor boat engines and accessories, and in 1905 Mr. Holden joined forces with R. Schofield and formed the well known firm of Schofield-Holden Machine Co. Mr. Holden has lately sold his interest to Mr. Schofield and formed the Holden-Morgan Co. Philip Morgan has been connected with the Office Specialty Mfg. Co., of Newmarket, for the last twelve years as mechanical expert and has had years of experience in building and designing tools, jigs and special machinery for interchangeable parts and labor saving devices. The new factory will be equipped with modern machinery and will be one of the finest machine shops in Canada for precision work. The company will locate in temporary premises at 50 Pearl St., until spring, when they intend to build a suitable factory.

Lumen Bearing Co. Enlarging.

The Lumen Bearing Co. has just taken out permits for the erection of a fireproof addition to their plant, which will increase their floor space by about eleven hundred square feet. The addition has been necessitated by the increase of their business, and they report an excellent business in all their branches, both die castings as well as brass, bronze and aluminum castings. This is the second increase in their plant this year, having increased their floor space by about three thousand square feet in July.

New Fort William Foundry.

Work has commenced on the foundry of the Lumby-Stenhouse Co., Fort William an incorporated company with a capital of $40,000. Plans for the other buildings are being prepared and contracts will be let as soon as these are ready. A 12 ton cupola and brass melting furnace will be installed and the machine shop will be equipped for the manufacture of two or three staple lines and for machine work.

New Manufacturers' Agency.

Dingman & McCombe have opened up offices at 55 St. Nicholas St., Montreal, and will represent the Trimont Mfg. Co., manufacturers of Trimont pipe wrenches and pipe cutters; Luther Grinder Mfg. Co., Milwaukee; John Watson Mfg. Co., Ayr, manufacturers of warehouse and factory trucks; Yellow Bros., Cowbit Heath, manufacturers of chains and anchors; Jos. Tomey & Sons, manufacturers of "Eureka" gauge glasses; Jevons & Co., Liverpool, Eng., tinplate, metals and Swedish iron and a number of other companies.

Anniversary Number "Grits and Grinds."

Each month the Norton Grinding Co., Worcester, Mass., issue an interesting bulletin on grinding containing practical methods to obtain maximum production. To celebrate the twenty-fifth anniversary of the Norton Co., manufacturers of grinding wheels, etc., and the tenth anniversary of the Norton Grinding Co., Manufacturers of plain and cylindrical grinders, a special edition has been issued, which gives the interesting history of the grinding machine and their own industries with photographs and names of employes, photographs of works, products, etc. "Grits and Grinds" is a valuable bulletin which should be received by every mechanical man. A postal to the Norton Co. mentioning Canadian Machinery will bring copies by return mail.

Machinery for N. T. R. Shop.

The specifications for the supply of the machine equipment for the National Transcontinental Ry. repair shop at the 18-stall roundhouse, at Lake Superior Junction, Ont., as the place is called in the advertisement, or Graham, Ont., as it is called in the specifications and accompanying blue prints, provide for the supply and erection complete of the machinery, with the necessary motive power, as follows:—

Engine, Generator and Switchboard.—One 50 k.w., d.c. generator, 250 volts, to be mounted on extension base or engine; calculated to deliver its full rated load continuously, with a rise in temperature not to exceed 20 deg. C., in any part of the machine, and carrying 25 per cent. overload for a period of two hours immediately following the above, with a temperature not exceeding 55 deg. C.

One simple non-condensing steam engine, to be direct connected to above generator both units to be mounted on the same base. The engine to be of the enclosed type, horizontal sidecrank; steam pressure 110 lbs., maximum back pressure 5 lbs.; it shall develop its full load rating at ¼ cut off, and shall be desgigned to carry an overload of 50 per cent. continuously without overheating in any part.

The switchboard is to consist of one generator panel and one feeder panel.

Air Compressor.—One horizontal, duplex, steam driven air compressor, designed for steam pressure at 110 lbs., maximum back pressure 5 lbs., capacity 708 to 800 cubic ft. of free air a minute, at a speed not exceeding 100 revolutions a minute. Automatic speed and pressure regulator to be provided, and to be operated by the air pressure in the receiver.

One vertical air receiver 54 by 12 in., of the best steel, riveted, and to be tested to 175 lbs., water pressure, and guaranteed safe and tight for a working pressure of 125 lbs., and equipped with necessary screwed openings, valves, etc.

Machines.—One 28 in. by 116 ft., motor driven gap lathe complete, with 26 in. four-jaw independent chuck, large and small face plates, six lathe dogs and standard equipment.

One 20 in. by 10 ft. motor driven double back geared engine lathe with taper attachment, with 18 in. four-jaw independent chuck, large and small face plates, six lathe dogs, three tool holders, with tools, complete with standard equipment.

One 16 in. by 8 ft. motor driven high speed double back geared engine lathe with quick change gears, 16 in. four-jaw independent chuck, etc., as for the 20 in. lathe.

One 1¼ in. by 6 ft. portable motor driven bolt turning lathe, with standard equipment.

One 30 in. by 30 in. by 8 ft. bed motor driven planer, with one tool head on cross rail, and standard equipment.

One 4 ft. motor driven radial drill, with set of taper sockets and standard equipment.

One 20 in. motor driven vertical back geared drill, with set of sockets, and standard equipment.

One motor driven crank shaper, one motor driven pipe machine to take from one to four inch, right and left hand; one motor driven single head bolt cutter, one motor driven combined punch and shear, 12 in. throat, ¾ in. hole, ¾ in. plate and to cut ¾ in plate; one 500 lb. motor driven self-contained power hammer, 18 lb. stroke; one 6 in. by 36 in. motor driven grindstone; one double emery grinder, with two 16 in. wheels; one 30 in. motor driven band saw, one 20 in. motor driven buzz planer, two 60 in. updraft circular forges with tanks, complete with stacks two electric forge blowers, with motors direct connected.

One 50 ton portable forcing press, mounted on four wheels, four column type, with hand operated pump; one three ton portable crane, two swage blocks, 150 lbs., planed true, and the necessary in a repair shop of this size.

CATALOGUES.

Handling Stone, Ore, etc.—The Jeffrey Mfg. Co., Columbus, O., in their booklet No. 28 describe their methods for handling and treating stone, ore, sand, gravel, cement, etc. The booklet, which has 28 pages, contains but little descriptive matter, but is full of illustrations of recent installations.

Die Heads.—A four-page leaflet describes the new stationary die head for pipe threading recently put on the market by the Landis Machine Co., Waynesboro, Pa. This new head is fully described and the advantage to the user enumerated. The different sizes are listed.

Our Furnaces Heat Steel with the Cheapest Fuel on Earth—
SOFT, SLACK COAL

They are all fired with "American" Mechanical Stokers, which burn bituminous slack coal automatically and without smoke, and give a clear, steady, soft, non-scaling flame. You get increased production, at about one-third to one-half the operating cost of oil or hard coal. This is a fact. If you burn money to heat steel why not burn less of it, and write us at once?

The Standard Engineering Company Limited
47 Wellington Street East Toronto, Canada

Machinery Wanted and For Sale

AGENT WANTED.

AGENT WANTED by old established London firm for the sale of Electric Passenger and Goods Lifts in Canada. Must have recognised business and good connection. Box 20, CANADIAN MACHINERY, 88 Fleet St., London, Eng. (11)

FOR SALE.

FOR SALE—Waterloo Iron Works, in town of Waterloo, Quebec, in centre of the Eastern Townships. Plant comprises foundry, machine shop, stove mounting and wood shops, and boilerhouse brick buildings, galvanized iron roofs—all in good repair. Canadian Pacific and Central Vermont Railways run through the town—works situated only a few rods from former. Splendid opportunity for any who wish to engage in manufacturing. Terms reasonable. Address, Waterloo Iron Works, Waterloo, Quebec. (8)

FOR SALE.—Jobbing Machine Shop and Foundry Business, located in Western New York, established over 50 years. Has large and very profitable trade. 75% of the capital stock can be bought for $65,000.00, worth $100,000.00 at least. Fine equipment of tools and well organized working force. This is not a debt encumbered concern that needs financing, no extra capital required for operating, but a going concern that owners want to sell on account of other interests preventing personal attention. For further particulars, address R. W. Gardner, 821 Railway Exchange Building, Chicago, Ill. (10)

FOR SALE—Belting, pipe rails, pulleys, shafting, hangers, chains, all sizes, new and used, half-price. Also cotton waste and wipers. Imperial Waste and Metal Co., Queen St., Montreal. (11-11)

MACHINERY FOR SALE.

FOR SALE—One single hoisting friction engine, with extra large boiler on wheels, in perfect order. 12 horse power. Apply William Welsh, 77 Jurors Street, Montreal. (12)

MARINE GASOLINE MOTORS of unexcelled quality; jump spark type; two to eighteen horsepower; pleased to show our motors; send for new catalogue. Midland Engine Works Company, Midland, Ont. (1-11)

FOR SALE—2 new 34" square x 10 ft. Planers, double heads. 2 second-hand 40" x 46" x 10 ft. Planers, double heads, rebuilt, practically good as new, immediate delivery. NEW HAVEN MFG. CO., New Haven, Conn. (7)

FOR SALE—A complete set of patterns and equipment for the manufacture of an improved line of iron toys, such as trains, hose carts, hook and ladders, engines, pistols, banks, stoves, etc. An established demand for this particular line of toys. Everything necessary for the successful manufacturing of same. Very fine proposition for anyone interested. Reason for discontinuing manufacture lack of factory room on account of heavy lines of other materials. Address Box 107, CANADIAN MACHINERY, Toronto.

FOR SALE—One 14" x 6' Porter Lathe, second-hand, complete with chuck. In excellent condition. KELLOGG & CO., 196 King St. West, Toronto.

THE PEMBROKE ELECTRIC LIGHT CO., LTD., have the following Machinery for sale, which will be sold separately, or as a unit.

This Plant comprises the complete outfit of their steam station, and is in first class running order.

2 return boilers—14' x 66" (tubular)
1 " " 12' x 54" "
1 Wheelock Engine—15" x 34", speed 95 R.P.M.
1 " Tandem Compound Engine—9" x 24" & 17" x 24"—speed 95 R.P.M.
1 Generator, 3 phase, 225 K.W., 60 cycles, 2200 volts, 450 revolutions.
1 40 amp. Exciter.
1 Marble Panel with Instruments.
1 Jet Condenser.
1 Duplex Steam Pump.
50 feet 4" shaft with pulleys, including 2 friction pulleys.
1 double leather belt—50' x 30".
1 " " " —73' x 22".
1 " " " —70' x 16".

PEMBROKE ELECTRIC LIGHT CO., LTD.
Pembroke, Ontario (tf)

MACHINERY WANTED.

ONE PRESS, foot power preferred. Also ¼ or ½ h.p. alt. current motor, 104 volt, 60 cycle. E. D. Smith, Magog, Que.

FOR LEASE.

FOR LEASE—Brass and Aluminum Foundry in Indianapolis, Indiana. Thoroughly modern in equipment and appliances. Did a business last year of nearly $200.000. Second largest automobile centre in the United States, over thirty automobile factories in city and vicinity. Present owner engaged in other business requiring his time. Address Frank E. Janes, care F. E. Janes Coal and Grain Co. Indianapolis, Ind. (6)

BUSINESS CHANCES.

WANTED—A small Machine Shop to rent, with option of buying. Box 91, CANADIAN MACHINERY, Toronto (11)

POSITIONS WANTED.

ENGINEER, power gas, take charge of complete plant, engines and producers. Experience erecting, testing and running; undertake all repairs; first class electrical experience, sound technical knowledge, excellent references; prefer Ontario or British Columbia. R. BELL, 128 14th St., Brandon, Man.

FOREMAN Moulder is desirous of a change. First-class moulder; well up in modern methods of foundry practice; exceptional experience; good references. Box 88, CANADIAN MACHINERY, Toronto. (9)

PRACTICAL MACHINIST desires position as general foreman or superintendent. Good systematizer, with executive ability. Can handle all grades of labor. Box 106, CANADIAN MACHINERY, Toronto. (6)

PATTERN MAKER — Young energetic pattern maker, fourteen years' experience, two as foreman, desires position as foreman. Good executive ability and thorough knowledge of drawing and foundry practice. Address Box 90, CANADIAN MACHINERY, Toronto (11)

SITUATIONS VACANT.

WANTED—Mechanical Draughtsman on jig and tool design and general mechanical shop equipment. Give particulars of previous experience and salary expected. Box 89, CANADIAN MACHINERY, Toronto (11)

WANTED — Competent foreman for plate shop where layer out is kept. Work consists principally of water and air-tight tanks, and some light steel fabrication, such as fire escapes. Apply Box 92, CANADIAN MACHINERY, Toronto. (11)

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

MANUFACTURING CENTRES.

FREE FACTORY SITES—Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

TRAVELER WANTED.

ENGLISH FIRM of high class machine tool makers requires services Canadian representative to work on commission. Apply Box No. 27, CANADIAN MACHINERY, 88 Fleet St., London, England. (8)

PATENTS.

THE PROPRIETOR of the Canadian Patents, Nos. 119683 and 114649, "Improvements in Multiple Cylinder, Internal Combustion Engines," and "Improvements in Reversible Valve-Gear for Internal Combustion Engines, Steam Engines, Air Compressors and the like," is desirous of entering into arrangements by way of license or otherwise for practically working the patents. For particulars apply KLAUSER & CO., 9 Friedrich St., Berlin, Germany. (6)

MISCELLANEOUS.

A BOOK-KEEPING STAFF IN ITSELF — doing the work with machine-precision and accuracy, the National Cash Register. Write us for demonstration literature. National Cash Register Co., 285 Yonge St., Toronto.

A BOON TO EVERY ENGINEER — A perfectly reliable fountain pen is to be found in the Beaumel "Rival" Pen. Easy to fill, non-leakable, and writes with exceptional smoothness. Go'd nibs of thicknesses to suit every style of handwriting. Guaranteed in every respect. Sold by all stationers. A. R. MacDougall & Co., Canadian Agents, Toronto.

ACCURATE COST KEEPING IS EASY if you have a Dey Cost Keeper. It automatically records actual time spent on each operation down to the decimal fraction of an hour. Several operations of jobs can be recorded on one card. For small firms we recommend this as an excellent combination—employees' time register and cost keeper. Whether you employ a few or hundreds of hands, we can supply you with a machine suited to your requirements. Write for catalog. International Time Recording Company of Canada, Ltd. Office and factory, 29 Alice Street, Toronto.

BY PAYING A SMALL AMOUNT EACH MONTH you can buy a first class rebuilt typewriter from us at bargain prices. Stock-taking is only a month away. We do not want to carry any of those machines over. We can give you any make. THE MONARCH TYPEWRITER COMPANY, LIMITED. 98 King Street West, Toronto.

BUSINESS MEN, professional men, merchants and church workers, find innumerable uses for Fulton Sign and Price Markers. The Fulton Rubber Type Company of Elizabeth, N.J., are makers of Ink Pads, Daters and Business Outfits of high quality. Sold by all stationers. A. R. MacDougall & Co., Toronto, Canadian Agents.

COPELAND-CHATTERSON SYSTEMS — Short, simple. Adapted to all classes of business. Copeland-Chatterson-Crain, Ltd., Toronto and Ottawa. (tf)

DOUBLE YOUR FLOOR SPACE. An Otis-Fensom hand-power elevator will double your floor space, enable you to use that upper floor either as stock room or as extra selling space, at the same time increasing space on your ground floor. Costs only $70. Write for catalogue "B." The Otis-Fensom Elevator Co., Traders Bank Building, Toronto. (tf)

EGRY business systems are devised to suit every department of every business. They are labor and time savers. Produce results up to the requirements of merchants and manufacturers. Inquire from our nearest office. Egry Register Co., Dayton, Ohio; 123 Bay St., Toronto; 258½ Portage Ave., Winnipeg; 308 Richards St., Vancouver.

ELLIOTT-FISHER STANDARD WRITING-ADDING MACHINES make toil easier. Elliot, Fisher, Limited, Room 314, Stair Building-Toronto.

ERRORS AVOIDED—LABOR SAVED—Using the Shouperior Autographic Register. Three copies issued at one writing. 1st, invoice; 2nd, delivery ticket; 3rd, charge sheet, perforated for filing. No handling of carbons. High grade printing and neat invoices. Make full inquiry. Autographic Register Co., 191-193-195 Dorchester St. East, Montreal.

MISCELLANEOUS.

COUNTER CHECK BOOKS — Write us to-day for samples. We are manufacturers of the famous SURETY NON-SMUT duplicating and triplicating Counter Check Books, and Single Carbon Pads in all varieties. Dominion Register Co., Ltd., Toronto.

ELIMINATE FIRE RISK, save insurance, reduce maintenance costs and save money on your actual building work by using the Kahn System of Fireproof Construction. Used in many of the largest business premises on this continent. Write for catalogue. Trussed Concrete Steel Company of Canada, Limited, Walker Rd., Walkerville, Ont.

GET THE BUSINESS—Increase your sales—Use Multigraph typewritten letters. The Multigraph does absolutely every form of printing. Saves you 25 p.c. to 75 p.c. of your printing bill. Multigraph your office forms, letterheads, circular letters. Write us. American Multigraph Sales Co., Ltd., 129 Bay Street, Toronto.

IF YOU have been afflicted with one of those fountain pens that won't write when you want it to, or leaks when you don't want it to, give it away to one of your poor relations and buy a Moore Non-Leakable Fountain Pen and you will be happy. Consult your stationer. W. J. Gage & Co., Toronto, sole agents for Canada.

INDISPENSABLE in office, store, home—Canadian Almanac, 1911—a National Directory. Complete classified information on every subject of Dominion interest. Full Postage, Customs, Banking, Insurance, Legal, Educational, Newspaper, Army, Clerical, Governmental, Particulars of leading Institutions and Societies. Paper Covers, 60c. Cloth, Leather Back, 75c. All stationers, or sent postpaid on receipt of price by The Copp-Clark Co., Ltd., Toronto.

KAY'S FURNITURE CATALOGUE No. 306 contains 160 pages of fine half-tone engravings of newest designs in Carpets, Rugs, Furniture, Draperies, Wall Papers and Pottery with Cash prices. Write for a copy—it's free. John Kay Company, Ltd., 36 King St. West, Toronto.

MODERN FIREPROOF CONSTRUCTION—Our system of reinforced concrete work, as successfully used in many of Canada's largest buildings, gives better results at lower cost. "A strong statement," you will say. Write us and let us prove our claims. That's fair. Leach Concrete Co., Ltd., 100 King St. West, Toronto. (tf)

MR BUSINESS MAN, are you progressive? It's up to you to test "Consolidated," our new process carbon paper. Because it costs less. Soft finish, without smutting, and clear, permanent copies. Write for sample sheets and prices. "Consolidated." Stratford, Ont.

FIRE INSURANCE. INSURE IN THE HARTFORD. Agencies everywhere in Canada. (tf)

"SYSTEMS" stand for all that is best in loose-leaf binders and supplies, letter-heads, statements and in fact your office stationery of every description. Send us samples of what you are using—we will send you prices that will interest you. Business Systems, Limited, Manufacturing Stationers, Toronto. (tf)

WAREHOUSE AND FACTORY HEATING SYSTEMS. Taylor-Forbes Company, Limited. Supplied by the trade throughout Canada. (tf)

SHOP AGENT WANTED.

WE want an agent in every machine shop in Canada where fifteen or more men are employed, to take subscriptions to this Journal. Subscriptions are easily obtained and the work can be carried on by giving a few minutes to it in the noon hour. Liberal commissions allowed both for new subscriptions and for renewals. Write for terms. Agents' Dept. CANADIAN MACHINERY, 143-149 University Ave., Toronto.

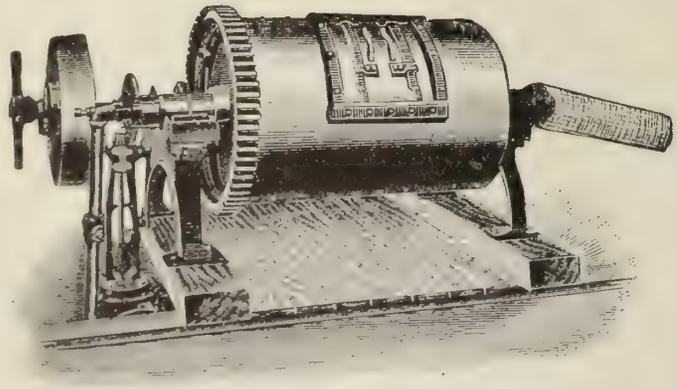
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture leaning Mills Dust Arresters, Sand Blast and Foundry Equipment.

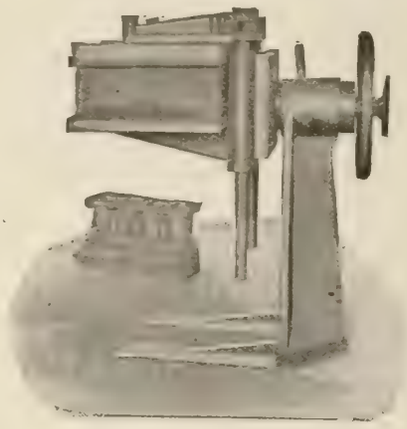
Don't fail to mention "Canadian Machinery" in writing to advertisers.

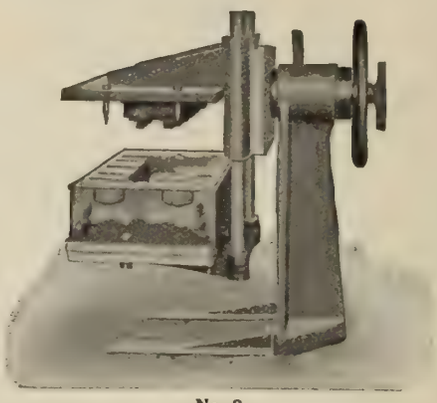
Grimes Roll-Over Molding Machine



No. 1

This is a simple, standard machine, requiring small floor space.

It is perfectly balanced, requiring no counter-balancing mechanism, as centre of gravity is centre of rotation.



No. 2

By means of small hand wheel shown in cut, one man can turn largest flask smoothly and without jerk.

Pattern is drawn by absolutely straight gravity drop.

This machine is adjustable for deep flasks and can readily take care of flask 24 in. x 36 in. and 4 to 12 in. in depth, with maximum pattern draft of 12 in.

Positive adjustable pins at four corners of clamping device, Fig 2, compensate for unevenness of floor boards.

PRICE, f.o.b. cars Windsor, $125.00

HIGH GRADE CASTINGS are not made with low grade materials. Think this over when you see a poorly finished casting in your cleaning room, and remember, if you please, if you wisb to place the pattern in the high grade class, our No. 48 Plumbago will do it, also that the saving in cleaning room expense would pay for three times the necessary No. 48 Plumbago to have made it high grade.

Another vital point is that you have a core wash which will peel clean and not run before the metal. Try our Eureka Blacking, the best core wash on the market.

If you wish a light colored parting equal to Lycopodium, Try our Eureka Parting.

HOW TO MAKE GOOD CORES ECONOMICALLY

USE GLUTRIN

"Bear in mind that no matter how well your iron is purchased and mixed by expert metallurgists, no matter how hot it comes from the cupola by the best of melting practice, and no matter how perfect and clean a mold you have made, if you put into that mold a poor core, your casting will be scrap and your expert labor instead of yielding revenue will be a complete loss."

We say, without any fear of contradiction, that there is 200 per cent. more GLUTRIN used in Canada than all of the other liquid core binders advertised.

We have customers using it in proportions varying from 1 to 50 to 1 to 125.

There is only one substitute for GLUTRIN and that is linseed oil. GLUTRIN is 20c. per gallon always---linseed oil to-day is $1.11, probably $1.25 to-morrow.

If you have been using linseed oil, have your cost clerk figure out how much money you have lost during the past year. It will make interesting reading.

We will send a barrel of GLUTRIN to any foundry in Canada for trial purposes, with the understanding that, if not satisfactory, same is not to be paid for.

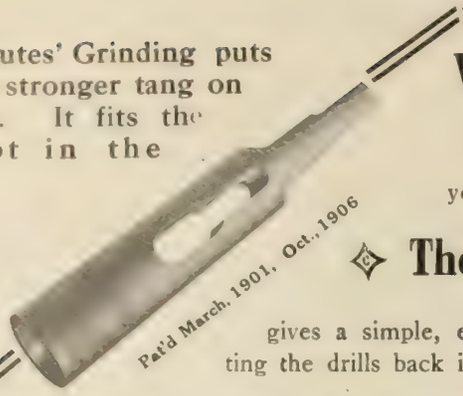
GLUTRIN can be used successfully with any sand known to the coremaker, yet in view of the fact that the variety of these sands is almost without limit, it is necessary, now and then, to prepare special instructions for our users, which we will be glad to do upon request.

FRANCIS HYDE & COMPANY

31 Wellington Street, MONTREAL, QUE.

P.S.—Remember we manufacture all equipment and supplies for brass, steel or iron foundries

Three Minutes' Grinding puts a new and stronger tang on the shank. It fits the lower slot in the socket.



What Do Your Twisted-Off Tangs Cost?

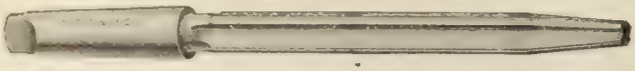
Keep account for a time of the new drills used to replace those thrown into the scrap heap because of twisted-off tangs, and you will see. These scrapped drills are all right in every other respect.

The "PERFECT" Double-Tang Socket

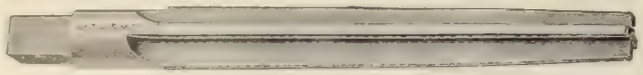
gives a simple, effective, and inexpensive means of eliminating this cost and putting the drills back in money-earning shape. **Write for Folder A.**

The CLEVELAND Twist Drill Co. CLEVELAND Chicago New York

Straight Reamers With Taper End



These Reamers from 1/4 to 5/8, inclusive, have 4 flutes; from 1 1/16 to 1 1/4, inclusive, have 5 flutes; from 1 5/16 to 1 1/2, inclusive, 6 flutes.

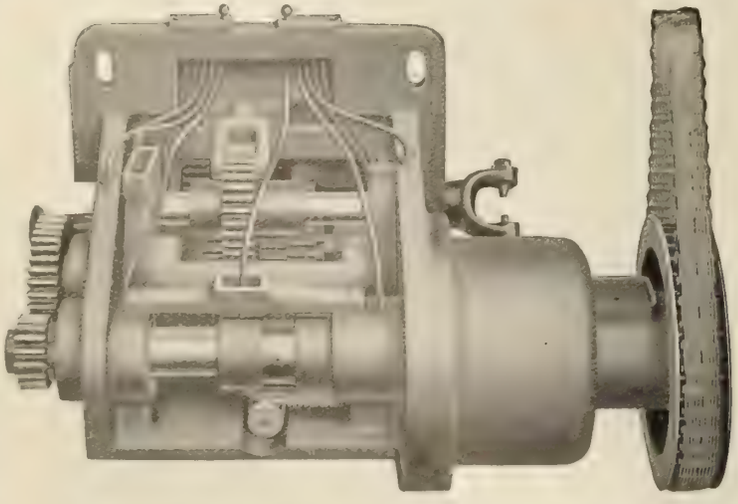


These Reamers are especially designed for use in Structural Iron and Steel, Boiler Plate and Bridge and Ship Building. They are cleared before hardening and are used for a rough, heavy class of work. They are now used to a great extent with air tools.

Morse Twist Drill and Machine Co.
New Bedford, Mass., U.S.A.

Our goods are handled by—Rice Lewis & Son, Ltd., Toronto; Aikenhead Hardware Co., Ltd., Toronto; Frothingham & Workman, Montreal: Mechanics Supply Co., Quebec.

There are two important features of the feed box on B. & S. MIILLING MACHINES: Instant engagement of gears; strength to withstand the sudden shock of throwing in gears when machine is running.



Instant engagement of the gears is secured by the special form of the teeth which are made long and pointed with chamfered ends.

This form also gives extra thickness at the bottom of the tooth, which, coupled with the fact that each gear is carefully hardened, provides strength to the teeth to withstand the sudden shock of being thrown in mesh while the machine is running.

Send for our "Features of the Original Constant Speed Drive Milling Machine."

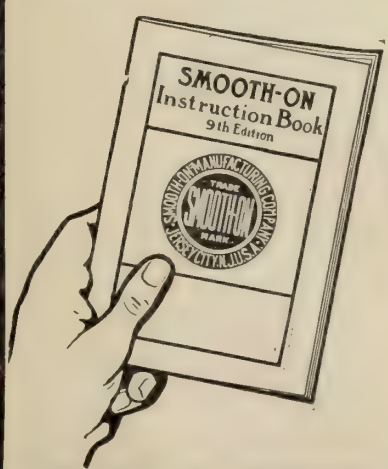
FREE SMOOTH-ON BOOK

This book tells how to make many permanent repairs to castings, boilers, engines, tanks, piping, etc., using the well-known SMOOTH-ON IRON CEMENTS.

Every Foundryman, Engineer and Machinist should have a copy.



Smooth-On is for sale by supply houses.

	NET PRICE s.	d
INVENTIONS, PATENTS AND DESIGNS, with notes and the full text of the new British Patents and Designs Act, 1907. By G. Croydon Marks, M.P. 126 pages. In handsome cloth. Now offered in a **Popular Edition** at the reduced price of	2	0
Workshop Costs, for Engineers, etc., by S. and F. Pearn. 2nd Edition	12	6
How to Use Water Power (Chatley), illustrated	2	6
Modern Steam Traps (English and American) by Gordon Stewart	3	0
Sand and Clay: Their Analysis and Physical Properties, by A. Passmore	2	0
Air Compressors and Blowing Engines, by Chas. H. Innes, M.A.	4	6
The Fan; including the Theory and Practice of Centrifugal and Axial Fans, by Ch. H. Innes, M.A	4	0
The Proportions and Movement of Slide Valves, by W. D. Wansbrough	4	6
Machines and Tools Employed in the Working of Sheet Metals, by R. B. Hodgson, A.M.I.M.E.	4	6
Governors and Governing Mechanism, by Hall	4	0
Specification of a Modern Lancashire Boiler and its Seating (200 lbs. pressure), by "Inspector" M.E.	2	6
Continuous Current Dynamos and Motors and their Control, by W. R. Kelsey, B.Sc., A.I.E.E., F Ph.S.	5	0
Notes on Construction and Working of Pumps, Marks	4	6
Modern Ironfoundry Practice, by G. R. Bale, A.M.I.C.E.		
Part I., Hand Moulding,	5	0
Part II., Machine Moulding,	3	6
Modern Gas and Oil Engines, by F. Grover, A.M.I.C.E., M.I.M.E. 4th Edition	5	0
The Indicator and its Diagrams, by Chas. Day, Wh. Sc. 4th Edition	4	6
The Chemistry of Materials of Engineering, by A. H. Sexton. 2nd Edition	5	0
The Management of Small Engineering Workshops, A. H. Barker, B.A., B.Sc., Wh. Sc., etc.	7	6
Problems in Machine Design, by C. H. Innes, M.A. 2nd Edition	4	6
Heat and Heat Engines; a Treatise on Thermo-Dynamics, by W. C. Popplewell, M.Sc.	6	0
Centrifugal Pumps, Turbines and Water Motors. By C. H. Innes, M.A. 4th Edition. Revised and enlarged	4	6
Application of Graphic Methods to the Design of Structures. 2nd Edition. W. W. F. Pullen, Wh. Sc., A.M.I.M.E.	5	0
Engineering Estimates and Cost Accounts, Burton.	3	0
Graphic Methods of Engine Design, Barker. 2nd Ed.	3	6
Injectors: Theory, Construction and Working, Pullen.	3	6
Construction of Cranes and Lifting Machinery, Marks.	3	6
Marine Engineers: Their Qualifications and Duties	5	0
A.B.C. of the Differential Calculus, Wansbrough	3	0
The Theta-Phi Diagram Applied to Steam, Gas, Oil, and Air Engines, by H. A. Golding, A.M.I.M.E.	3	0
Mechanical Engineering Materials, 2nd Ed., by Marks	2	6
The Naval Engineer and Command of the Sea, Burton	2	6
Directions for Splicing Wire Rope, by W. N. Brunlon & Son	0	7

MR. MANUFACTURER:

Are you looking for a location where you may establish your factory?

St. Mary's is looking for you.

Please take time to consider its advantages.

Located in the heart of the finest agricultural district in Canada. Niagara power always on tap. C.P.R. and G.T.R. One million population within a radius of one hundred miles. Splendid water. Healthy surroundings. Beautiful. Good schools and churches. Abundance of labor. Get in touch with T. M. CLARK,

Secretary Industries Commission.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

To Our Readers—Use this directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

To Our Advertisers—Send in your name for insertion under the heading of the lines you make or sell.

To Non-Advertisers—A nominal rate of $1 per line a year is charged non-advertisers.

FIRE BRICK *for* Cupolas

¶ The standard Fire Clays by which all other Clays are judged are those of Pennsylvania.

¶ They're the ones from which our Cupola Brick are made.

¶ The cost per thousand means nothing unless you know the results the Brick are giving.

¶ Write us for definite examples of how our material affects your melting costs.

HARBISON-WALKER REFRACTORIES COMPANY,

PITTSBURGH, PENNSYLVANIA

THE BEST FIREBRICKS

ARE

GLENBOIG AND GARTCOSH

MADE IN SCOTLAND

and BEST RESULTS can only be got by using these brands, as they will stand the highest heat without melting.

Are also largely used for building purposes where a handsome appearance is desired.

ALEXANDER GIBB

13 St. John Street : MONTREAL

Sole Agent for Canada

EVERYTHING FOR THE FOUNDRY

and ELECTRO-PLATING and BUFFING SUPPLIES

Is there anything you require ? Write us, we have it.

PLATING SUPPLIES

Black Tripoli
Ideal White Finish
Lustre Brass Finish
Emery Cake
Ground Pumice
Nickel Salts
Copper and Zinc
Cyanide Potassium

—SPECIALTY—

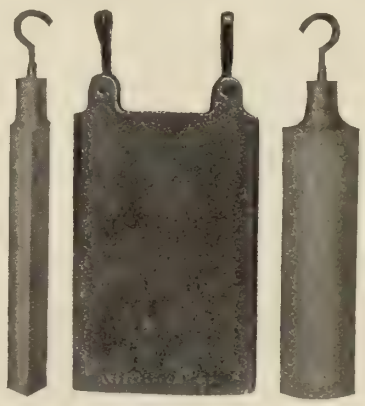
We make a specialty of installing complete plating outfits. Estimates given on anything you require.

TAYLOR CRUCIBLES

The Crucible of Quality

"Made in Canada"

NICKEL ANODES



"Made in Canada"

We are sole sales agents for Hanson Van Winkle Co. and carry a large stock in Toronto.

FOUNDRY SUPPLIES

Canadian Plumbagos
Heavy Bag Facings
Charcoal Parting
" Perfection " Parting
Georgia Soapstone

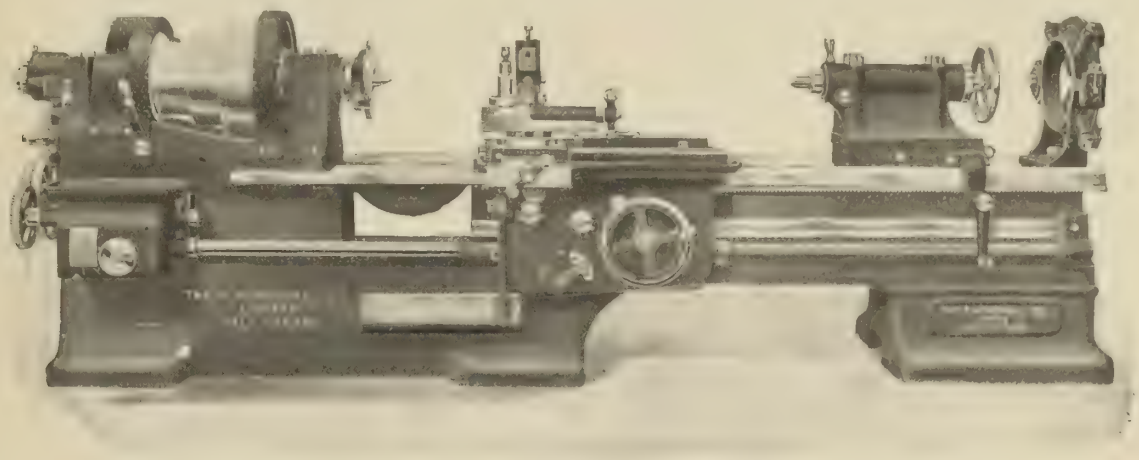
The Gap Lathe of Highest Quality

Extreme accuracy and speed, the best materials, a strongly supported and non-vibrating bed at gap, where many lathes of this type are weak, and extreme flexibility in speed adjustment—these put the McDougall Gap Lathe in a position by itself among machines where quality and cost of work done must meet exacting demands. You need a McDougall Lathe for all such work.



Made in sizes 18 x 30, 20 x 36, 22 x 40, and 26 x 48 in any length of bed

Headstock construction prevents chattering, and deep oil chambers fitted with ring oilers make spindles and bearings self-oiling and always well lubricated.

Tailstock of a special type, and sleeve is clamped by a quick acting locking device. Tailstock is secured to bed by bolts adjusted from the top where they are easily accessible.

Bed, non-springing and webbed, and braced to secure rigidity.

Gap, vibration absolutely prevented by use of brace supports to carriage.

Spindle, high carbon hammered steel in solid chilled cast iron bearings, accurately fitted and self oiling.

Carriage and Apron, non-springing under severest strain, full "V" bearings and flat bearings in addition on front ways.

Double Back Gears give eighteen distinct spindle speeds, suiting lathe to work on widely different diameters.

Compound Rest, with graduated base, accurately fitted taper gibs, end adjusted. Screws in both rest and cross slide read to thousandths.

Friction, Safety Feeds, screw and rod feeds cannot be both engaged at the same time. Quick changes of $1\frac{1}{4}$, $2\frac{1}{2}$ and 5 times thread being cut.

Gears and Racks, cut from solid and steel where necessary.

Screw Cutting, full range of commercial threads provided for.

Equipment, Compound rest, steady rest, follow rest, large and small face plates, wrenches, two-speed, friction countershaft furnished with each lathe.

Accuracy, Strength, Solidity, Wear. These are the paramount features behind all McDougall Machines. Made **to meet extreme demands.**
